v.3

A

GENERAL HISTORY

OF THE

DICHLAMYDEOUS PLANTS,

COMPRISING COMPLETE

DESCRIPTIONS OF THE DIFFERENT ORDERS;

TOGETHER WITH THE

CHARACTERS OF THE GENERA AND SPECIES, AND AN ENUMERATION OF THE CULTIVATED VARIETIES;

THEIR PLACES OF GROWTH, TIME OF FLOWERING, MODE OF CULTURE, AND

USES IN MEDICINE AND DOMESTIC ECONOMY;

THE SCIENTIFIC NAMES ACCENTUATED, THEIR ETYMOLOGIES EXPLAINED, AND THE CLASSES AND ORDERS

ILLUSTRATED BY ENGRAVINGS,

) THE LINNÆAN AND NATURAL SYSTEMS,

)F THE TERMS USED:

WHOLE

'O THE NATURAL SYSTEM.

G. Don.
A general history of the dichlamydeous plants. 3.

(Above title appeared first on new t.p. supplied with vol. 4. Original t.p. read: 'A general system of gardening and botany, etc.' See preface to vol. 4, and Pritzel 2366)

E DON, F.L.S.

VOLUMES.

Vol. III.—CALYCIFLORÆ.

MISSOURI BOTANICAL
RECEIVED
APR 26 1923
GARDEN LIBRARY

LONDON:

PRINTED FOR J. G. AND F. RIVINGTON; J. AND W. T. CLARKE; LONGMAN AND CO.; T. CADELL; J. RICHARDSON; JEFFERY AND SON; BALDWIN AND CRADOCK; J. BOOKER; J. BOOTH; HARVEY AND DARTON; S. BAGSTER; SHERWOOD AND CO.; HARDING AND LEPARD; J. F. SETCHEL; WHITTAKER AND CO.; SIMPKIN AND MARSHALL; AND E. HODGSON.

MDCCCXXXIV.

LONDON :
GILBERT & RIVINGTON, PRINTERS,
ST. JOHN'S SQUARE.

INDEX TO THE THIRD VOLUME,

COMPRISING THE

SYSTEMATIC AND ENGLISH GENERIC NAMES, AND THE ENGLISH AND SYSTEMATIC SYNONYMES.

*** In this Index the systematic names used, and the English names in common use, are in *Roman letters;* the synonymes in *Italics;* the names of Classes, Sub-classes, and Orders in *large capitals;* and the names of Sub-orders and Tribes in *small capitals.*

THE

GARDENER'S AND BOTANIST'S DICTIONARY.

ORDER CIII. CUCURBITA'CEÆ (plants agreeing with *Cucúrbita* in important characters). Juss. gen. p. 393. D. C. fl. fr. 3. p. 688. Aug. St. Hil. in mem. mus. 9. p. 190-221. Ser. in mem soc. hist. nat. gen. vol. 3. p. 1. D. C. prod. 3. p. 297. Lindl. introd. nat. syst. p. 192.

Flowers hermaphrodite, monoecious or dioecious (f. 1. *b. c.* f. 3. *b. c.*), axillary. Calyx gamosepalous (f. 3. *a. b.*), 5-toothed, sometimes obsolete. Corolla 5-petalled (f. 2. *a.* f. 1. *c.* f. 3. *c.*), but usually only 5-parted, distinct from the calyx, and sometimes somewhat continuous with it, rising from the margin of the torus, sometimes fringed, constantly yellow, white, or red, very cellular, with strongly marked, reticulated veins. Stamens 5, either distinct, or joined in 3 parcels, and sometimes all together; filaments rarely pilose; anthers 2-celled, very long, sinuous, rarely ovate and short. Style rarely almost wanting, crowned by 3-5 2-lobed stigmas, which are thick and velvety, but rarely fringed. Ovarium 1-celled, with 3 parietal placentas. Fruit fleshy, more or less succulent, crowned by the scar formed by the calyx, 1-celled (f. 3. *e.* f. 2. *b.*), with 3 parietal placentas, which are indicated on the outside by nerves. Umbilical funicle tumid towards the seeds. Seeds frequently obovate, flat, fixed to the parietes of the fruit, enveloped in an arillus, which is either juicy, or dry and membranous; testa coriaceous, often thick at the margins; hylum oblique at the top of the seed. Embryo straight, flat, without albumen. Cotyledons foliaceous, palmately nerved; radicle basilar, directed towards the hylum.—Roots annual or perennial, fibrous or tuberous. Stems herbaceous, climbing by means of tendrils. Leaves palmate, or with palmate ribs, succulent, covered with numerous asperities. Tendrils solitary, lateral, divided or undivided. Flowers solitary, panicled, or in fascicles. Bracteas usually wanting. Branches rising between the leaves and tendrils.

This order is nearly related to *Passiflòreæ*, to which they are so closely allied, as hardly to be distinguishable, except in their monopetalous corolla, sinuous stamens, unisexual flowers, and exalbuminous seeds, the habit of both being nearly the same. There is an affinity between the order and *Campanulàceæ* in the perigynous insertion of the stamens, the inferior ovarium, the single style with several stigmas, the quinary division of the flower, connected with the ternary division of the fruit, and some analogy in the nature of the floral envelopes. The small tribe *Nhandiròbeæ* consists of plants having the habit of *Cucurbitàceæ*, but some resemblance in their fruit to that of *Lecythídeæ*, which, as is well known, border close upon *Myrtàceæ*; but beyond this resemblance of the fruit, which appears altogether to be a structure of analogy rather than that of affinity, there is nothing to confirm the approachment. *Cucurbitàceæ* is one of the most useful orders in the vegetable kingdom, comprehending the melon, the cucumber, the choco, and the various species of gourd and pumpkin, all useful as food for man. A bitter laxative quality perhaps pervades all these, which in the colocynth is so concentrated as to become an active purgative principle. The colocynth of the shops is prepared from the pulp of *Cúcumus colocýnthus*; it is of so drastic and irritating a nature, as to be classed by Orfila among his poisons; but, according to Thunberg, this gourd is rendered perfectly mild at the Cape of Good Hope, by being properly pickled, Ainslie 1. p. 85. The bitter resinous matter in which the active principles of colocynth are supposed to exist, is called by chemists colocynthine. A waxy substance is secreted by the fruit of *Benincàsa cerífera*. It is produced in most abundance at the time of its ripening. Delisle descrip. The leaf of *Feuíllea cordifòlia*, is asserted by M. Drapiez to be a powerful antidote against vegetable poisons. Edinb. phil. journ. 4. p. 221. The fruit of *Trichosánthes palmàta*, pounded small, and intimately blended with warm cocoa-nut oil, is considered a valuable application in India for cleansing and healing the offensive sores which sometimes take place in the inside of the ears. It is also supposed to be a useful remedy poured up the nostrils in cases of ozæma. Ainslie 2. p. 85. The root of *Bryònia* possesses powerful purgative properties, but is said to be capable of becoming wholesome food, if properly cooked. The perennial roots of all the order appear to contain similar bitter drastic virtues, especially that of *Momórdica elatèrium* or Squirting

Cucumber. An extremely active poisonous principle, called elatine, has also been found in the placentas of the fruit of this plant. It exists in such extremely small quantity, that Dr. Clutterbuck only obtained 6 grains from 40 fruit. Edinb. phil. journ. 3. p. 307. An ingenious explanation of the cause of the singular ejection of the seeds of this plant will be found in Dutrochet's *Nouvelles Recherches sur l'Exosmose*. The root of *Bryònia rostràta* is prescribed in India internally in electuary in cases of piles. It is also used as a demulcent, in the form of powder. That of *Bryònia cordifòlia* is considered cooling, and to possess virtues in complaints requiring expectorants. Ainslie 2. p. 21. The root of *Bryònia epigæ'a* was once supposed to be the famous colomba-root, to which it approaches very nearly in quality. The tender shoots and leaves of *Bryònia scàbra* are aperient, having been previously roasted. Ainslie 2. p. 212. The seeds of all the species are sweet and oily, and capable of forming very readily an emulsion. Those of *Ampelosícyos scándens* are as large as chestnuts, and said to be as good as almonds, having a very agreeable flavour. When pressed they yield an abundance of oil, equal to that of the finest olives. De Candolle remarks that the seeds of this family never participate in the property of the pulp that surrounds them.

Synopsis of the Genera.

TRIBE I.

NHANDIRO'BEÆ. *Tendrils axillary, in the place of peduncles. Flowers dioecious.*

1 FEUI'LLEA. Calyx of the male flowers 5-cleft. Petals 5, joined at the base. Stamens 5, inserted with the petals, sometimes 10, but 5 of them are sterile. Calyx of the female flowers 5-cleft. Petals 5, distinct. Styles 3; stigmas broad, bifid. Fruit globose, fleshy.

2 ZANÒNIA. Male flowers. Calyx 3-lobed (f. 1. *a.*). Petals 5, joined into a 5-parted rotate, spreading corolla (f. 1. *b. c.*). Stamens 5, joined at the base; anthers 1-celled. Female flowers. Calyx with a long turbinate tube, and a 5-lobed limb. Corolla as in the male flowers. Styles 3, spreading, bifid at the apex. Fruit long, turbinate, fleshy; seeds winged (f. 1. *d. e.*).

TRIBE II.

CUCURBI'TEÆ. *Tendrils lateral, stipular. Flowers hermaphrodite, dioecious, or monoecious.*

3 LAGENA'RIA. Calyx campanulate, with subulate or broadish segments; corolla white; petals obovate. Stamens 5, triadelphous. Stigmas 3, thick, 2-lobed. Fruit 3-5-celled. Flowers dioecious.

4 CU'CUMIS. Calyx tubularly-campanulate, with subulate segments. Petals almost distinct. Stamens 5, in 3 parcels. Stigmas 3, thick, bipartite. Fruit 3-6-celled. Flowers monoecious or hermaphrodite, yellow.

5 LU'FFA. Male flowers panicled; tube of calyx hemispherical. Petals distinct. Stamens 5, free; anthers very sinuous. Female flowers solitary; tube of calyx clavate. Stigmas reniform. Fruit ovate, 3-celled. Flowers yellow.

6 BENINCA'SA. Flowers polygamous, monoecious, solitary; calycine segments with undulated, toothed margins. Petals obovate, spreading, curled. Stamens in 3 parcels; anthers irregular, with distant circumvolutions. Stigmas very thick. Flowers yellow.

7 ERYTHROPA'LUM. Flowers monoecious. Limb of calyx obsoletely 5-toothed. Petals 5, bicallous at base inside. Stamens 5, rising from the edge of the tube. Style short. Fruit clavate, 1-celled, 3-valved, 1-seeded.

8 TU'RIA. Flowers monoecious. Male ones umbellate. Calyx 5-parted. Corolla 5-petalled. Stamens 5, in 3 parcels; anthers irregularly undulated. Stamens barren in the female flowers. Stigmas 3, 2-lobed. Fruit cylindrical, villous, warted.

9 BRYÒNIA. Flowers monoecious or dioecious; petals almost distinct. Male flowers. Calyx 5-toothed. Stamens in 3 parcels. Anthers flexuous. Female flowers. Style trifid. Fruit ovate or globose, smooth. Tendrils usually simple, seldom bifid.

10 SI'CYOS. Flowers monoecious. Male flowers. Calyx 5-toothed. Corolla 5-parted. Filaments 3. Female flower. Style trifid; stigmas thickish, trifid. Fruit 1-seeded from abortion, usually beset with spines. Peduncles many-flowered.

11 ELATE'RIUM. Flowers monoecious; male ones racemose or corymbose. Calyx with inconspicuous teeth. Corolla hardly gamopetalous. Filaments and anthers joined. Female flowers solitary. Calyx echinated at the base, with the neck filiform. Style crowned by a capitate stigma. Capsule coriaceous, reniform, echinated, 1-celled, 2-3-valved, many-seeded, bursting elastically. Flowers yellow or white.

12 MOMÓRDICA. Flowers monoecious; peduncles filiform, unibracteate. Male flowers. Calyx 5-cleft, with a very short tube. Corolla 5-parted. Stamens in 3 parcels; anthers connected. Female flowers with 3 sterile filaments. Style trifid. Ovarium 3-celled. Fruit generally muricated, bursting elastically when mature.

13 NEUROSPE'RMA. Flowers monoecious. Male flowers. Calyx and corolla 5-parted. Stamens 5, diadelphous, having 2 glands alternating with the bundles. Female flowers. Calyx and corolla parted. Ovarium beset with 8 series of warts. Style trifid, girded by 3 glands at the base; stigmas 2-lobed. Fruit fleshy, 3-celled, but when mature 1-celled, 3-9-seeded.

14 SE'CHIUM. Flowers monoecious, yellow. Calyx 5-toothed, with 10 foveolæ. Corolla joined with the calyx. Stamens 4-5, monadelphous. Style thick; stigma capitate, 3-5-cleft. Fruit obcordate, 1-seeded.

15 MELÓTHRIA. Flowers monoecious. Calyx 5-toothed. Corolla campanulate; petals ciliated or toothed, never fringed. Filaments 5, in 3 parcels. Style 1; stigmas 3, fringed. Fruit 3-celled, many-seeded.

16 TRICHOSA'NTHES. Flowers monoecious, white. Male flowers. Calyx subclavate, 5-parted, appendiculate. Corolla 5-parted, ciliated (f. 2. *a.*). Filaments 3. Anthers joined. Female flowers. Calyx 5-toothed. Corolla 5-parted, laciniately ciliated (f. 2. *a.*). Style trifid (f. 2. *d.*). Stigmas oblong, subulate. Fruit oblong (f. 2. *b.*), 1 or 3-9-celled.

17 AMPELOSÍCYOS. Flowers dioecious. Male flowers. Calyx turbinate, 5-cleft (f. 3. *a.*); segments denticulated (f. 3. *b.*).

Corolla 5-petalled (f. 3. *c.*); petals oblong, fringed (f. 3. *d.*). Stamens 5, in 3 parcels. Female flowers. Limb of calyx 5-toothed. Corolla as in the male. Stigma capitate, 3-lobed, ex Bojer. Fruit fleshy, 2-3 feet long, and 8 inches thick, elongated, furrowed (f. 3. *e.*). Flowers purple.

18 Cucu'rbita. Flowers monoecious, yellow. Petals joined together, and with the calyx. Male flowers. Calyx campanulate. Stamens 5, in 3 bundles and syngenesious. Anthers curved at both ends. Female flowers. Calyx clavate, narrowed towards the apex. Stigmas 3, thickish, 2-lobed. Fruit 3-5-celled.

19 Involucra'ria. Flowers monoecious. Male ones umbellate, sessile; bracteas reniform, fringe-toothed, involucrum-formed. Tube of calyx obconical; sepals linear, acute. Anthers joined together. Female flowers solitary, on long peduncles.

20 Muri'cia. Flowers monoecious. Calyx 5-parted, inclosed in a large undivided, 1-flowered sheath. Corolla campanulate, 5-petalled. Stamens 5, in 3 bundles, and syngenesious. Style 1; stigmas 3, sagittate, horizontal. Berry muricated, 1-celled, many-seeded.

21 Angu'ria. Flowers monoecious. Male flowers. Calyx campanulate, 5-toothed. Corolla joined with the calyx, ventricose, red, 5-parted. Stamens 2. Female flowers with a calyx and corolla as in the males, and 2 sterile stamens. Style semibifid; stigmas bifid. Fruit 2-4-celled, many-seeded, somewhat tetragonal.

† *Genera not sufficiently known.*

22 Zu'cca. Flowers solitary, axillary. Bractea large, concave, involving a large, coloured, 5-sepalled calyx, and girded by 5 scales at the base. Stamens 5.

23 Alla'sia. Flowers hermaphrodite. Calyx gamosepalous, girded by a short involucrum. Segments 5, acutish, pilose. Corolla 4-petalled; petals pilose. Stamens 4, but more probably 8, joined by twos; anthers 2-lobed. Style subulate, crowned by an acute stigma. Berry fleshy, large, oblong, obtuse, 1-celled, many-seeded.

24 Gronòvia. Flowers hermaphrodite. Calyx funnel-shaped, 5-parted; scales 5, linear, petal-formed, pellucid, alternate with the calycine segments. Stamens 5, free, alternating with the scales. Style crowned by a capitate stigma. Berry dry, nearly globose, 1-seeded, crowned by the dry permanent calyx.

25 Kólbia. Flowers dioecious? Calyx gamosepalous, with a crenulated edge. Corolla gamopetalous, 5-lobed; lobes with glandular edges. Nectary? 5-leaved; lobes with feathery ciliated edges. Stamens 5, monadelphous; filaments short; anthers long, conniving.

Tribe I.

NHANDIRO'BEÆ (plants agreeing with *Nhandiròba* in important characters). St. Hil. ann. mus. 9. p. 215. Turp. dict. sc. nat. atlas. icon. 2. D. C. prod. 3. p. 297. Tendrils axillary, peduncular. Flowers dioecious.

I. FEUI'LLEA (in honour of Louis Feuillée, a traveller in Chili; author of Journal des Observations physiques, mathématiques, et botaniques, faites dans l'Amerique Meridionale, &c. 3 vols. 4to. Paris. vols. 1 and 2. 1714. and 3. 1725.). Lin. gen. 1118. Juss. gen. 397. Lam. ill. t. 815. D. C. prod. 3. p. 297.—Fevíllea, Pers. syst. regl. ed. 15. p. 929.—Nhandiròba, Plum. gen. 20. t. 27.

Lin. syst. *Dioècia, Pentándria.* Flowers dioecious. Male flowers. Calyx 5-cleft beyond the middle. Petals 5, rather joined at the base, inserted in the throat of the calyx, and alternating with the sepals. Stamens 5, inserted with the petals, and alternating with them, sometimes 10, but when this is the case, 5 of which are always sterile. (ex Juss.) Anthers 2-celled, didymous. Female flowers. Tube of calyx adnate to the ovarium; limb 5-cleft. Petals 5, distinct, or joined at the base, oblong. Lamellæ or abortive stamens 5, sometimes alternating with the petals (ex Juss.). Styles 3. Stigmas broad, bluntly bifid. Fruit globose, fleshy, 3-celled, indehiscent, with solid bark and a large fleshy trigonal central axis; cells many ovulate. Ovula erect from the centre. Seeds compressed, oval. Embryo straight. Cotyledons flat, rather fleshy.—Intratropical American, rather frutescent climbing herbs. Leaves alternate, petiolate, exstipulate, palmately nerved, cordate, glabrous. Tendrils axillary, spirally twisted, in place of peduncles. Peduncles axillary, 1 or many-flowered. Flowers small. Seeds oily, bitter. This genus has a habit emulating *Passiflòra.* Fruit in the form of that of *Couroupìta,* a genus of *Lecythideæ.*

1 F. puncta'ta (Poir. dict. 4. p. 418.) leaves 3-lobed or ternate, beset with glandular dots on both surfaces along the nerves, but more especially beneath; lobes of leaves lanceolate, rather cut. ♃. ⌒. S. Native of St. Domingo. Trichosánthes punctàta, Lin. spec. 1432. amœn. acad. 3. p. 423. exclusive of the country. Fevíllea trilobàta, Reich. syst. 4. p. 253.

Dotted-leaved Feuillea. Pl. cl.

2 F. triloba'ta (Lin. spec. ed. 1. p. 1014.) leaves rather glandular on both surfaces, 3-parted or trifid; lower lobes obtuse, upper ones acute. ♃. ⌒. S. Native of Brazil. F. scándens *β*, Lin. spec. ed. 2. p. 1457. F. hederàcea, Poir. dict. 4. p. 419. Chandiròba or Nhandiròba, Margr. bras. 46. lower figure.

Three-lobed-leaved Feuillea. Pl. cl.

3 F. cordifòlia (Poir. dict. 4. p. 418.) leaves glandless, cordate, acuminated, or somewhat 3-lobed, and rather serrated. ♃. ⌒. S. Native of the West Indies. Plum. ed Burm. t. 209. F. scándens *α*, Lin. spec. ed. 2. p. 1457. F. hederàcea, Turp. in dict. sc. nat. with a figure. The leaves of this species are said to be a powerful antidote against vegetable poisons.

Heart-leaved Feuillea. Pl. cl.

4 F. Javílla (H. B. et Kunth, nov. gen. amer. 2. p. 124.) leaves glandless, roundish, sinuately cordate, acuminated. ♃. ⌒. S. Native of New Granada, in woods near Turbaco, where it is called *Javilla* by the inhabitants. Seeds with subalate margins, hence this species agrees with the genus *Zanònia.*

Javilla Feuillea. Pl. cl.

Cult. A light rich soil will suit the species of *Feuíllea;* and cuttings of them will root readily under a hand-glass, in heat. They are well fitted for training up rafters in stoves.

II. ZANO'NIA (named in memory of Giacomo Zanoni, formerly Prefect of the Botanic Garden at Bologna, author of Istoria Botanica, Bol. 1675. fol. edited in Latin by Monti, 1742. He died 1682, aged 67.). Lin. gen. 1117. Juss. gen. 397. Lam. ill. t. 816. Blum. bijdr. p. 937. D. C. prod. 3. p. 298. but not of Plum.

Lin. syst. *Dioècia, Monadélphia.* Flowers dioecious. Male. Calyx 3-lobed (f. 1. *a.*). Petals 5, joined into a 5-parted rotate corolla (f. 1. *b. c.*). Stamens 5 (f. 1. *c.*); filaments flat, connected at the base; anthers 1-celled, adnate to the tops of the filaments. Female. Tube of calyx long, turbinate; limb 5-

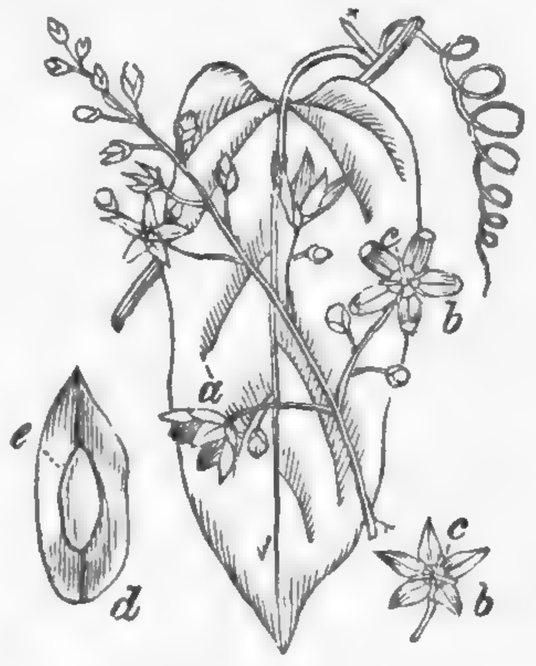
lobed. Corolla as in the male. Styles 3, spreading, bifid at the apex. Fruit long, turbinate, fleshy, having a circular line at the apex, formed from the vestige of the calyx, opening by 3 valves at the top, 3-celled; the rind solid: central placenta fleshy, large, trigonal; cells biovulate. Seeds ovate, margined by a foliaceous wing (f. l. *e. d.*),, exalbuminous. Embryo inverted.—Smooth, climbing, Indian plants. Leaves alternate, petiolate, exstipulate, ovate-lanceolate, cordate at the base, acuminated, quite entire. Tendrils axillary. Peduncles also axillary and racemose. This genus, from the general form of the fruit, is like the genus *Couritàri*, but from the characters it is allied to *Feuíllea*. The interior fabric of the seeds is unknown.

Sect. I. Zanònia (see genus for derivation). Blum. l. c. Cells of fruit 2-seeded. Fruit elongated, somewhat tetragonal.

1 Z. I'ndica (Lin. spec. 1157.) leaves elliptic, acute, rather cordate at the base; racemes axillary. ♄. ⌒. S. Native of Malabar, Ceylon, and Java. Blum. l. c. Penarválli, Rheed. mal. 8. t. 47 and 48.

Indian Zanonia. Pl. cl.

FIG. 1.



Fruit hemispherical, truncate at the apex, or elongated.

Sect. II. Alsomìtra (from αλσος, *alsos*, a grove, and μιτρα, *mitra*, a girdle; the plants grow in groves and entwine round the trees by means of ring-like tendrils.). Blum. l. c. Cells of ovarium many-seeded.

2 Z. macroca'rpa (Blum. l. c.) leaves ovate-elliptic, acutish, rounded at the base; racemes axillary. ♄. ◡. S. Native of Java, on the mountains of Parang.

Large-fruited Zanonia. Pl. cl.

3 Z. sarcophy'lla (Wall. pl. rar. asiat. 2. p. 28. t. 133.) leaves trifoliate; leaflets thick, fleshy, ovate, obtuse, quite entire. ♄. ◡. S. Native of the East Indies, in sterile exposed situations along the banks of the Irawaddi. The plant climbs by means of simple and slender tendrils. The leaves are of a pale glaucous colour. Flowers small, very numerous, forming ample, greenish, nodding panicles. The different sexes are produced in distinct plants.

Fleshy-leaved Zanonia. Shrub cl.

4 Z. clavígera (Wall. l. c.) smooth; leaves trifoliate; leaflets oblong, acuminated, quite entire; fruit large, clavate. ♄. ◡. S. Native of Silhet, where it is called in the Bengalee language *Kishnobera*. The fruit is 3 inches long, and as thick as a thumb.

Club-bearing Zanonia. Shrub cl.

5 Z. angula'ta (Wall. l. c.) smooth; stem angular; leaves simple, somewhat hastately lanceolate, cordate at the base; fruit large, clavate. ♄. ◡. S. Native of Silhet. The fruit is as long as a finger, and very thick.

Angular-stemmed Zanonia. Shrub cl.

6 Z. cissioìdes (Wall. l. c.) stem filiform, angular; leaves pedate, with 5 or 7 leaflets; leaflets lanceolate, acuminated at both ends, coarsely and cuspidately serrated; petioles and peduncles pilose. ♄. ◡. S. Native of Nipaul.

Cissus-like Zanonia. Shrub cl.

7 Z. la'xa (Wall. l. c. p. 29.) stem filiform, much branched, bifariously pilose; leaves trifoliate; leaflets acuminated, serrated, intermediate one lanceolate, lateral ones half cordate; petioles and peduncles pilose. ♄. ◡. S. Native of Silhet.

Loose Zanonia. Shrub cl.

8 Z. heterospe'rma (Wall. l. c.) stem filiform, very slender; leaves pedate, with 5 leaflets; leaflets lanceolate, acuminated, serrated; capsule clavate, angular, borne on very long capillaceous peduncles; seeds scabrous from scales. ♄. ◡. S. Native of Mount Taong Dong, near Ava. Capsule chartaceous, trigonal, 8 lines long, with a 3-toothed mouth. The scales on the seeds are elegantly imbricated, and girded by a narrow margin.

Variable-seeded Zanonia. Shrub cl.

Cult. See *Feuíllea*, p. 3. for the culture and propagation of the species.

Tribe II.

CUCURBI'TEÆ (plants agreeing with *Cucúrbita* in important characters). D. C. prod. 3. p. 299. Tendrils lateral, stipular. Flowers hermaphrodite, dioecious, or monoecious.

III. LAGENA'RIA (from *lagena*, a bottle; form of fruit of some of the species). Ser. diss. l. c. D. C. prod. 3. p. 299.—Cucúrbita species of authors.

Lin. syst. *Dioècia, Polydélphia.* Calyx campanulate; segments subulate or broadish, shorter than the tube. Corolla white; petals obovate, rising from beneath the margin of the calyx. Male. Stamens 5, in 3 parcels, the fifth one free. Female. Style almost wanting; stigmas 3, thick, 2-lobed, granular. Fruit 3-5? celled. Seeds obovate, compressed, 2-lobed at the apex, with tumid margins. Flowers monoecious.

1 L. vulga'ris (Ser. mss. ex D. C. prod. 3. p. 299.) plant musky scented, clothed with soft pubescence; stems climbing; tendrils 3-4-cleft; leaves cordate, nearly entire, biglandular at the base, pilose, rather glaucescent; flowers monoecious, stellate, spreading much, in fascicles; connectives of anthers beset with oblong-ovate, acute papillæ; fruit pubescent, but when mature quite smooth; flesh white, edible. ⊙. ◡. H. Native within the tropics. Cucúrbita lagenària, Lin. spec. 1434. Sieb. hort. 1. t. 69.—Rumph. amb. 5. t. 144.—Mor. hist. 2. p. 23. sect. 57. t. 5. f. 1, 2, 3. Flowers large, white. Fruit shaped like a bottle; when ripe of a pale yellow colour, some near 6 feet long, with a roundish bottom and a neck; the rind becoming hard, and being dried, contains water; it is then of a pale bay colour. The bottle-gourd is called *Charrah* by the Arabians. The poor people eat it, boiled with vinegar, or fill the shells with rice and meat, thus making a kind of pudding of it. It grows in all parts of Egypt and Arabia, wherever the mountains are covered with rich soil. In Jamaica and many other places within the tropics, the shells are generally used for holding water or palm wine, and serve as bottles. The pulp of the fruit is often employed in resolutive poultices; it is bitter and purgative, and may be used instead of colocynth.

Var. α, goúrda (Ser. mss. ex D. C. l. c) fruit unequally biventricose.—Moris. hist. sect. 1. t. 5. f. 1. Dodon. pempt. 668. f. 1. Bottle gourd. *Gourde des pélerins.*

Var. β, gougoúrda (Ser. l. c.) fruit ventricose at the base, neck oblong.—Rumph. amb. 5. p. 398. t. 144. Braam. icon. chin. t. 17. Commonly called *Gougourde.*

Var. γ, depréssa (Ser. l. c.) fruit globose, depressed.

Var. δ, turbinàta (Ser. l. c.) fruit somewhat campanulately pear-shaped. Mor. hist. sect. 1. t. 5. f. 2. Dodon. pempt. t. 669. f. 1.

Var. ε, clavàta (Ser. mss.) fruit obovate-oblong, club-shaped.—Moris. hist. sect. 1. t. 5. f. 3. Dodon. pempt. 669. f. 2. *Gourde trompette, Gourde massue*, or Trumpet gourd.

Common Bottle Gourd. Fl. Jul. Sept. Clt. 1597. Pl. trail.

2 L. vitta'ta (Ser. l. c.) leaves roundish-cordate, somewhat repand, obsoletely denticulated, rough; peduncles crowded, 1-flowered; fruit pear-shaped, striped lengthwise, puberulous.

⊙. H. Native country unknown, but collected in the gardens of India. *Bonteng-suri* of the Hindoos. Cucúrbita vittàta, Blum, bijdr. p. 932.

Ribbed Gourd. Pl. cl.

3 L.? HI'SPIDA (Ser. l. c.) greyish, pilose; leaves cordate, 5-angled, acuminated, denticulated, beset with pedicellate glands beneath; stem and petioles densely hispid; flowers densely clothed with ferruginous hairs. ⊙. F. Native of Japan and the East Indies. Cucúrbita híspida, Thunb. fl. jap p. 322. and Willd. spec. 4. p. 608. *Waluh* of the Indians. Perhaps only a variety of *L. vulgàris*.

Hispid Gourd. Pl. trailing.

4 L.? IDOLA'TRICA (Ser. l. c.) leaves cordate, cuspidate, obsoletely 3-lobed, pubescent, biglandular at the base; lateral lobes very short and cuspidate; fruit pear-shaped. ⊙. F. Native of Guinea and the East Indies. Cucúrbita Idolátrica, Willd. spec. 4. p. 607. Blum. bijdr. p. 930. *Labu-eyer* and *Kukuk* of the Hindoos. Perhaps only a variety of *L. vulgàris*. In India the fruit of this plant is held in great veneration by the Hindoos, in their religious ceremonies.

Worshipped Gourd. Pl. trailing.

Cult. See *Cucúrbita*, p. 41. for culture and propagation.

IV. CU'CUMIS (said to be from κικυος or Σικυος. Varro says, "Cucumeres dicuntur a curvore, ut curvimeres dicti"). Lin. gen. no. 1479. Juss. gen. p. 395. Gærtn. fruct. t. 88. D. C. prod. 3. p. 299.—Cùcumis and Melo, Tourn. inst. p. 104. Colocínthis, Tourn, inst. p. 107.—Rigocárpus, Neck. elem. bot. no. 386.

LIN. SYST. *Dioècia, Polyadélphia.* Calyx tubularly campanulate; segments subulate, hardly the length of the tube. Petals hardly joined together or to the calyx.—Male. Stamens 5, in 3 parcels.—Female. Stigmas 3, thick, bipartite. Fruit 3-6-celled. Seeds ovate, compressed, not marginate. Flowers monoecious or hermaphrodite, yellow.

1 C. ME'LO (Lin. spec. 1436.) stem trailing, scabrous, cirrhiferous; leaves roundish, angular, petiolate; male flowers having the tube of the calyx rather ventricose at the base, and rather dilated at the apex; stamens inclosed; anthers shorter than their connectives; the hermaphrodite flowers with the anthers as in the males; stigmas 3-4, shortly 2-lobed; fruit ovate or sub-globose, 8-12-furrowed; flesh sugary, yellow, red, or white. ⊙. F. Native of Asia. Called *rhetimou* by the Hindoos; *Melon*, Engl. and Fr.; *Melone*, Germ.; *Mellone*, Ital.

The *melon* is a tender annual, producing one of the richest fruits brought to the dessert, and has been cultivated in England since 1570, but the precise time of its introduction is unknown. It was originally brought to this country from Jamaica, and was, till within the last fifty years, called the *musk-melon*. The fruit, to be grown to perfection, requires the aid of artificial heat and glass throughout every stage of its culture. Its minimum temperature may be estimated at 65°, in which it will germinate and grow; but it requires a heat of from 75° to 80° to ripen its fruit, which, in ordinary cases, it does in 4 months from the time of sowing the seed.

Varieties.—There are numerous varieties, many of which, especially those raised from seeds brought from Italy and Spain, are not worth cultivating. The best sorts are included under the name of *Cantaloups*, an appellation bestowed on them from a seat of the Pope near Rome, where this variety is supposed to have been originally produced. The general character of the *Cantaloups* is a roundish form, rough, warty, or netted outer rind; neither very large in fruit or leaves. The *Romanas*, an Italian sort, is next in esteem, are generally oval-shaped, regularly netted; the fruit and leaves middle-sized, and the plants great bearers. Many varieties of both these sorts, however, that were formerly in esteem, are now lost, degenerated, or supplanted by others of Spanish or Persian origin. The following is a descriptive list of the sorts.

List of Melons.

Var. a, reticulàtus (Ser. in D. C. prod. 3. p. 300.) fruit roundish or oblong, with a grey reticulated rind.—Blackw. herb. t. 329. The following sorts of melons belong to this variety:—

1 *Beechwood melon.* This is an excellent, early, greenish yellow kind, with a netted rind and a greenish-white flesh, of a middle size.

2 *Melon maraicher.* The flesh of this sort is very thick and watery; hardly sweet-scented.

3 *Melon de Honfleur.* A late melon, with a thin yellow rind, and pale red sugary flesh. It is of inferior quality but large in size.

4 *Melon des Carmes.* A well-flavoured large fruit, with a thick orange rind, and juicy sugary pulp.

5 *Melon de Langeais.* A middle-sized, ribbed fruit, with orange-coloured, sugary, sweet-scented flesh.

6 *Melon sucrin de Tours.* Fruit large, with firm, sugary, orange-coloured flesh.

7 *Sucrin à chair blanche.*

8 *Sucrin à chassis.*

9 *Sucrin vert.*

10 *Sucrin à petits grains.*

11 *Succada.* A late green middle-sized netted melon.

Var. β, Cantalùpo (Ser. in D. C. prod. 3. p. 300.) fruit large, with broadly ribbed, and furrowed, warted, thick rind. The following sorts belong to this variety.

1 *Early Cantaloup.* A deep-furrowed, early, middle-sized kind, with white, deeply-furrowed, thin skin; and orange-coloured flesh, not very highly flavoured. It sets well, and is a great bearer.

2 *Silver cantaloup. Cantaloup argenté.* A shallow-furrowed, middle-sized fruit, and before it is full grown is mixed with silver and green.

3 *Large black Holland cantaloup. Cantaloup gros noir de Hollande.* A large fruit, with green, furrowed, thin rind: and red rather coarse flesh.

4 *Hybrid cantaloup.* A small good early fruit, with a whitish rind and red pulp.

5 *Montagu cantaloup.* This is a variety produced from the Italian green-fleshed and the smooth scarlet-fleshed *cantaloup*. A middle-sized, early good fruit, but with a thick, yellow, furrowed rind and pale red flesh, which is soft and juicy, and completely melting in the mouth.

6 *Netted cantaloup*, or *White-seeded cantaloup.* This is a very juicy, highly-flavoured, small fruit, with a thin, netted, yellow rind.

7 *Orange cantaloup.* A small, round, pale yellow, netted fruit. The flesh, when just fit for cutting, is orange; but when riper it is more red. In respect to flavour, it is excelled by none of the melon tribe, being juicy, sugary, and rich. The plant is a free grower, an early setter, and a great bearer.

8 *Black rock cantaloup.* A large late melon, with a thick dark green rind, and salmon-coloured flesh. It is juicy, but not very high flavoured.

9 *Carbuncled rock cantaloup.* Very like the *black rock*, as to colour and flavour, but differs in being cheese-shaped. There are a small and a large kind of this; the smaller kind is the best.

10 *Lee's rock cantaloup.* Rather long than round, and more green than black. Much the same in flavour as the preceding.

11 *Scarlet-fleshed cantaloup.* A middle-sized early good fruit, with a thick yellow rind and red sweet flesh. It is particularly high flavoured.

12 *Italian green-fleshed.* A middle-sized early good fruit, with a thick yellow rind and green flesh: in flavour both rich and sweet.

13 *Ionian green-fleshed cantaloup.* A large thin-skinned lemon-coloured and lemon-scented fruit, of excellent flavour, but not a great bearer.

14 *Egyptian green-fleshed.* A middle-sized early good fruit, with a thin white netted skin and green flesh: in flavour resembling the preceding.

15 *Dutch green-fleshed.* An indifferent sort.

16 *Crimea green-fleshed.* A useless late fruit, of middling size, with a thin green skin and pale red flesh.

17 *Persian green-fleshed.* A middle-sized, green, thin-skinned sort, with green flesh. Not good.

18 *Green-fleshed Masulipatam.* A very small and excellent early sort, with green skin and green flesh.

19 *Green-fleshed Valparaiso.* Not very good.

20 *Red-fleshed Valparaiso.*

21 *Dutch rock.* A rather large good fruit, with a thick yellow rind, and orange-coloured flesh.

22 *Early rock.* A good early fruit.

23 *Golden rock.* A middle-sized fruit, with a thick yellow rind and pale red flesh, of excellent flavour.

24 *Scarlet rock.*

25 *Silver rock.* A large late fruit, with a thick yellow rind, and pale red flesh, which is juicy, sweet, and well-flavoured.

26 *Netted scarlet-fleshed.* A good sort.

27 *Smooth scarlet-fleshed.* A middle-sized fruit, of excellent flavour. The rind is thick, smooth, and yellow, and the flesh orange-coloured.

28 *Windsor scarlet-fleshed.* A rather large, excellent-flavoured, late kind, with thick green rind, and salmon-coloured flesh.

29 *Lee's Romana.* A middle-sized, longish, shallow-furrowed fruit. Rind hard, partly netted, and pale yellow: the flesh full yellow and pretty high flavoured, but not very juicy.

30 *Large netted Romana.* The largest of the romanas, regularly netted all over, and shallow-furrowed, often attaining a large size. Rind hard and pale yellow, the flesh full yellow, but not very juicy: very high-flavoured, if eaten sharp ripe.

31 *Fair's Romana.* A small oval fruit, the rind greenish yellow when ripe, and the flesh a pale yellow, not very juicy; but well-flavoured and agreeable.

32 *Early Polignac.* An early rich middle-sized fruit, with a thick yellow rind, and pale red flesh. It is in frequent cultivation.

33 *Portugal.* There are two varieties of this kind, a small and a large sort; they are noted as good bearers and early.

34 *Sweet Italian.* A large orange-coloured sort, of moderate quality.

35 *Netted succado.* A middle-sized late green-skinned sort.

36 *Small Levant.* A middle-sized sort, with a thick green skin and pale red flesh. Not of good quality.

37 *Smooth yellow-fleshed Valparaiso.* A middle-sized, late, green, thin-skinned sort; the flesh white, of moderate flavour.

38 *Brasilian.* An inferior middle-sized sort, with thin green skin and orange-coloured flesh.

39 *Melon d'été d'Odesse.* A rather large, later, indifferent fruit, with thin orange skin and white flesh.

40 *Melon d'Olor.* A very small fruit, with yellow skin and white flesh, of good quality.

41 *Netted French melon.* A rather large late fruit, with a thick yellow rind and yellow flesh, of bad quality.

42 *Nutmeg.* A late green, thick-skinned sort, with white flesh.

43 *Queen Ann's melon, early queen, or queen's pocket melon.* A very small fruit, with ornamental striped thin skin, and white flesh.

44 *Carthagena.* A large high-flavoured fruit, with a thick orange-coloured rind and pale red flesh.

45 *Cassabar.* A large late fruit, with green thin skin, and white flesh.

46 *Cephalonia.* A large oblong fruit, with thin yellow skin and green flesh, of tolerable flavour.

47 *Choufleur.* A large fruit of little use; the skin is thick and yellow, and the flesh pale red.

48 *Gahoon.* A large late fruit, of little value; with yellow skin and yellow flesh.

49 *Geree, ostrich egg.* A middle-sized late fruit, of excellent flavour: the skin as well as the flesh is green. The plant is rather tender.

50 *Gros Prescott fond blanc.* A large late fruit, with a thick yellow rind, and orange-coloured flesh.

51 *Petit Prescott.* Fruit depressed, crowned at the top; ribs warted: flesh delicious.

52 *Cantaloup natif d'Allemagne.* An early fruit, with a greenish-yellow smoothish rind, but not of good quality.

53 *Cantaloup boule de Siam.* Fruit very much depressed, with a dark green rind, full of warted ribs.

54 *Hardy ridge.* A middle-sized late fruit, with a thick yellow rind and red flesh, of good flavour.

A list of melons which are hardly known; but none of them are perhaps worth cultivation.

1 *De Andalousie.* 2 *Cantaloup à chair verte.* 3 *Cantaloup à fond noir.* 5 *Cantaloup Galleux.* 6 *Chili musk.* 7 *Crimea.* 8 *Citron.* 9 *D'Espagne.* 10 *Fagos.* 11 *Fin hatif.* 12 *Golden egg.* 13 *Grand Mogul.* 14 *Green Spanish oval.* 15 *Gros Galleux à chair verte.* 16 *Hardy scarlet-fleshed.* 17 *Highclere.* 18 *D'Hiver.* 19 *Large Astrachan.* 20 *Levant.* 21 *Melon gris des Carmes.* 22 *Melon of Honda.* 23 *Melon of Jaffa.* 24 *Melon Turc.* 25 *Madeira.* 26 *Mendoza.* 27 *Le Mogul.* 28 *Du Peron.* 29 *Pine apple or Melon d'Ananas.* 30 *Musk melon.* 31 *Carthagena musk melon.* 32 *Murray's pine-apple.* 33 *Noir de Hollande très gros.* 34 *Turkish melon.* 35 *Valentia or winter melon.* 36 *Wynestay.*

Var. γ, *Malténsis* (Ser. in D. C. prod. 3. p. 300.) fruit with a smooth thin rind. This variety is divisible into two parts, as Maltese Melons and Persian Melons.

* *Maltese melons.*

1 *Melon de Malte blanc* or *Melon de Malte à chair blanche.* An early middle-sized ovate-oblong fruit, with white watery sugary flesh.

2 *Melon de Malte jaune.* Flesh of fruit orange-coloured, sweet-scented.

3 *Melon de la Morée ou de Candie,* or *Melon de Malte d'hiver.* This kind is cultivated in various countries bordering on the Mediterranean sea, and particularly in the orange gardens at Hiers, near Toulon, whence its fruit is sent to Paris. The skin is thin; the flesh white, firm, sugary, and juicy; not rich, but pleasant. The shape oval, size about a foot long and eight inches broad; of a dark green colour. This fruit is regularly imported, and may be had in the fruit shops from September to January.

* * *Persian melons.*

1 *Daree.* A good-sized fruit; skin thin and green; flesh white, high-flavoured. A late fruit.

2 *Dampsha melon.* An excellent, late, rather large fruit, of nearly a cylindrical form, and netted; rind thin and yellow when ripe; flesh green, quite melting, and of excellent flavour. The fruit will keep, if hung up by its stalk, for some time.

3 *Large germek.* An excellent early green-skinned sort, of considerable size; flesh green.

4 *Small germek.* This is much smaller than the last-named sort; the skin is yellow and the flesh green.

5 *Goorgab.* A middle-sized late fruit, with yellow rind and white flesh. A useless sort.

6 *Green Hoosainee.* A middle-sized late sort, of good quality; rind thin, green; flesh white.

7 *Striped Hoosainee.* A very good late sort, with greenish-yellow rind, and white flesh.

8 *Kasan sugar melon.* A good sort.

9 *Keiseng.* This is said to be one of the best Persian melons; the skin is thin, pale yellow, and red, and the flesh white.

10 *Kurchaing.* A very good sort, of considerable size; the skin is lemon-coloured, and the flesh white.

11 *Melon of Erivan.*

12 *Melon of Gerger.* A middle-sized good fruit, with yellow skin and red flesh.

13 *Melon of Nukshevan.* This is an excellent late kind; the skin is yellow, and the pulp white.

14 *Melon of Nusserabad.*

15 *Melon of Seen.* A middle-sized fruit of indifferent quality. It is a late sort, with yellow rind and green flesh.

16 *Green Persian.* A fruit of indifferent flavour.

17 *Oldaker's Persian.* A fruit of considerable size but no merit; the rind is orange-coloured, and the flesh green.

18 *Sir Gore Ouseley's Persian.* A large fruit of good quality; the skin is yellow and the flesh white.

19 *Sweet melon of Ispahan.* This is said to be one of the very best melons. It grows to a large size; the skin is yellow and the flesh green, crisp, sugary, and rich in taste.

20 *Talibee melon.*

21 *Teheran melon.*

22 *Salonica.* A round fruit, with a gold-coloured rind, and white flesh; improves in flavour and richness till it becomes quite soft; consistence of its pulp nearly that of a water melon, and very sweet.

On the degeneracy of the larger varieties of Persian melons.—Mr. Knight thinks that it would be strange if every large and excellent variety of melon did not degenerate, under our ordinary modes of culture. For every large and excellent variety of melon, must necessarily have been the production of high culture and abundant food; and a continuance of the same measures to it, in its highly improved state, must be necessary to prevent its receding in successive generations from that state. Abundant food, it is true, is generally, perhaps always, given by the British gardener to his melon plants: but sufficient light, under the most favourable circumstances, can only be obtained during a part of the year, and a sufficient breadth of foliage to enable the melon plant properly to nourish a fruit of large size and rich saccharine quality, so that it may obtain the highest state of growth and perfection which it is capable of acquiring, has rarely, and probably never, been given in any season of the year, by any British gardener. Mr. Knight has cultivated the *Sweet Ispahan* melon, and found it a very superior variety. He has cultivated this variety generally in brick pits, surrounded by hollow walls, through which warm atmospheric air at all times enters abundantly; putting each plant in a separate large pot, and suffering it to bear one melon only: but the fruit sets sufficiently well in a common hot-bed. The rind of the *Ispahan* melon, being very soft and thin, the fruit is apt to sustain injury on the lower side; they should be raised above the ground a little by some means while young, so as the air may pass under them. When seeds of the *Ispahan* melon are only wanted, it is quite time enough to sow in the beginning of April, so that the fruit may ripen in August. Very valuable varieties of melons may be obtained, for one generation at least, by cross breeding among the smaller and more hardy varieties of green and white-fleshed melons and the large Persian varieties. It is generally supposed that the offspring of cross-bred plants, as of animals, usually present great irregularity and variety of character; but if a male of permanent character and habits, and, of course not cross-bred, be selected, that will completely overrule the disposition to sport irregularly in the cross-bred variety; alike in the animal and vegetable world, the permanent habit always controlling and prevailing over the variable. The finest varieties of melon are usually supposed by gardeners to be fruits of as easy culture as the pine-apple, but experience has led us to draw a contrary conclusion. If the leaves of the melon plant be suddenly exposed to the influence of the sun in a bright day, which has succeeded a few cloudy days, for a short time only, they frequently become irreparably injured. If the air of the bed be kept a little too damp, the stems of the plants often canker, and the leaves and stalks sustain injury in the common hot-bed; and, if the air be too dry, the plants, and consequently the fruit, are injured by the depredations of the red spider.—Loud. gard. mag. vol. 7. pp. 186, 187, 188.

In the cultivation of the melon, Knight observes, "it is a matter of much importance to procure proper seed. Some gardeners are so scrupulous on this point, that they will not sow the seed unless they have seen and tasted the fruit from which they were taken. It is proper, at least, not to trust to seeds which have not been collected by judicious persons. Some make it a rule to preserve always the seeds of those individual specimens which are first ripe, and even to take them from the ripest side of the fruit. A criterion of the goodness and probable fertility is generally sought by throwing them into a vessel containing water; such as sink are considered as good, and likely to prove fertile, and those that float imperfect. It is remarked of seeds brought from the Continent, that they must have more bottom heat, and the young plants less water, than are necessary for seeds ripened in this country, or young plants sprung from these."

The culture of the melon is an object of emulation among gardeners, and the fruit of the best sorts have a peculiarly rich flavour, thought by some to bear some resemblance to that of the pine-apple. "Ripe fruit," Abercrombie observes, "may be had by forcing at any season, but the main crops, raised for the general demand, are seldom cut, at the earliest, before May, and the last succession mostly ceases to yield fruit after October." "To ripen the best largest fine kinds," M'Phail observes, "as great an atmospherical heat, and a bottom heat to its roots also, is required as is sufficient to ripen the pine-apple in this country; but as the melon is produced from an annual plant, the seeds of which must be sown every year, it requires a different mode of culture. Different methods of culture, and various kinds of earth and of manures have been recommended and used successfully in rearing of melons. The great thing, after planting, is to give them plenty of atmospherical heat, and a sufficiency of external air, and water. Those methods which are most simple and the least expensive, and best calculated to assist in making a suitable climate for the melon to grow in and ripen its fruit well, should be preferred."

Soil.—Abercrombie says "The melon will succeed in any unexhausted loam, rich in vegetable rudiments, with a mixture of sand, but not too light. The following is a good compost: two-thirds of top-spit earth from a sheep common, adding sharp sand, if the earth contains little or none, till half is sand; one-sixth of vegetable mould; and one-sixth of well-consumed horse-dung. Or, if the earth is not obtained from a pasture, rotted sheep-dung may be substituted for the last. The ingredients should have been incorporated and pulverized by long previous exposure and turning over. The compost should be dried under shelter before it is used, and warmed in the frame

for potting." M'Phail says, "Melons will grow and produce fruit of a good flavour, if they be planted in any kind of earth, not of too light a texture, whether it be taken from a quarter of the kitchen garden or from a corn-field, mixed well with good rotten dung; but earth of a loamy nature is the best, because it retains moisture longer than lighter earth. Earth, dug from the surface of a common, where sheep and cattle have long been pastured, is excellent for the melon. It should be broken well, and lie a few months before it is used, and if it be exposed to a winter's frost it will do it good. This sort of earth, if it be taken from the surface of the common, will require no manure the first year of using. I would here mention that unless the earth which I used for the melon plants was very strong, I made it a practice, when the melon-beds were wholly earthed up, to tread the surface all over, which makes the earth retain its moisture longer than if it were left loose." Earth for melons, according to Nicol, "may be thus composed: one-half strong brown loam from a pasture, a quarter light sandy earth, an eighth part vegetable mould of decayed tree leaves, and an eighth part rotten stable-yard dung. The mould for both cucumbers and melons should be well incorporated, should be exposed to frost, and be frequently turned over to ameliorate." It appears from a passage in Morier's second journey into Persia, p. 147., that pigeons' dung has from time immemorial been much sought after for manuring melons. Immense pigeon-houses are built on purpose to collect it, and when there is a dearth, as melons produce the earliest return of food, every one is eager to cultivate them, and that kind of manure, being then in great demand, sells very high. During the famine in Samaria, mentioned in 2 Kings, ch. vi. it is said to have sold for five pieces of silver the cub.

A correspondent in the gard. mag. 2. p. 404. on melon compost, and on the influence of soil on *Hydrángea horténsis*, has always used for his melons the compost to which the Dutch so strongly adhere, viz. one-third strong hazel loam, one-third scouring of ditches, and one-third rotten dung, exposing the mixture two years to the influence of the summer and winter, to evaporate what noxious qualities may lurk in the earths: for it is well known, that in proportion to the degree of salt of iron, it will be proportionably sterile. He had often observed the leaves of his melon plants turn yellow, occasionally plants died, for which he could not account; he suspected iron, as it pervaded his district, to be the cause; but as a magnet would not take up any of the compost, his attention was diverted from that point. Similar results in future seasons again called his attention to it, and he added lime, to correct the sulphate of iron, if any; but he lost his whole crop, which he fancied by the application of the lime. As during winter a red oxide filtered from the compost heap, he again felt certain of the presence of iron. He submitted the compost to the test of burning, and having by that means got rid of the superabundant carbon, the magnet immediately detected the iron. He changed his soil, and has never lost since any melon plants. The experiment proves that the old test of the loadstone may be defeated by the presence of other adherent matter; for though it was inactive over the cold soil, it acted in full force upon the soil when, by roasting, it had discharged its gas. While a profitable experiment resulted on the one hand, a great amusement occurred on the other, with some greenhouse plants. He mixed the compost fresh from the ditch with water, and found a precipitation of iron. He used the soil and water to *Hydrángea horténsis*, a cutting from the common pink variety, and it so altered the pink colour of the flower to purple, as to form a new plant. He applied the same to other plants, in some of which it altered the colour of the flowers, but in others it had no effect.

Estimate of sorts.—Examine the list. The *cantaloups* are in the highest estimation for quality and neatness, although not uniformly such great bearers as others in the list.

Time of beginning to force.—"From the time of sowing, ripe fruit may be cut in about fifteen weeks, as an average period; when many short and winter days fall in the course, it may last eighteen weeks; but when the forcing is not commenced until the days are nearly twelve hours long, and continually lengthening, ripe fruit is sometimes cut in ten weeks. The period also depends upon the sort. Little time is gained by beginning excessively early. The early and main crops are commonly originated from the middle of January to the first week of February, the latter or succession crops at the beginning of March; and late crops, intended to fruit at the end of summer, in the middle of April. M'Phail and Nicol sow in January. "The latter says, "I formerly cut melons for three years successively on the 15th, 12th, and 10th of May, and never sowed before the last week of January or 1st of February. In 1788, when at Rainham Hall in Norfolk, I sowed melons on the 12th of March, and cut ripe fruit on the 20th of May. The kind was the *Early golden cantaloup*. This shows how little is to be gained, or rather how much may be lost by early forcing."

Forming the seed-bed.—The plants may be originated in a cucumber-bed, and this is the general practice; but Abercrombie prefers a separate bed, built a slight degree higher than for the cucumber at the same season, and adapted to a one or two-light frame, according to the quantity to be raised." Nicol raises the melon almost exactly in the same manner as he does the cucumber.

Choice of seed.—"Seed under the age of two years is apt to run too much to vine, and show more male than female blossoms; but new seed may be mellowed by being carried in the pocket a fortnight or more, till the heat of the body has dried and hardened it. Seed 20 years old has been known to grow and make fruitful plants, but seed that has been kept 3 or 4 years is quite old enough, and less likely to fail than older." M'Phail says it is best not to sow melon seed till it be 2 or 3 years old. It cannot be too old if it be sound and grow well. Nicol says, "I have sown melon seeds 20 years old, from which I have raised very healthy and fruitful plants." Kal. p. 396. Miller and Nicol say young melon seeds may be worn in the pocket, near the body, for several months previous to sowing, which has the effect of fully maturing them. "If seeds of the last season," Nicol observes, "be sown without taking this precaution, or something similar, the plants will not be fruitful, but will run much to vine, and show chiefly male blossoms."—Kal. p. 396.

Sowing.—Abercrombie says, "Having moulded the bed, and proved the heat, sow in pans 3 inches or pots 4 inches deep, rather than in the earth of the bed. Sow a second portion in 5 or 7 days, to provide against failure. Do not at once plunge the pots to the rims."—Pr. gard. p. 108.

Treatment till removed to the fruiting-pit.—"As soon as the plants appear, give air cautiously, guarding the aperture with matting at night and on frosty or gloomy days. At favourable opportunities wipe the condensed steam from the glasses. When the seed-leaves are about half an inch broad, prick the plants into small pots, 5 inches in diameter, 3 in each pot, giving a little aired water just to their roots, then plunge the pots into the earth of the hot-bed partially or to the rims, according to the heat. Admit fresh air every day in moderate weather, at the upper end of the lights, raised an inch or two, according to the temperature of the external air, more freely when sunny than cloudy, shutting closer or quite close as the afternoon advances towards the evening, or sooner, if the weather changes cuttingly cold, and cover the glasses every night with mats, and uncover in the morning, as soon as the sun is high enough to reach the

frames. Give occasionally a very light watering, when the earth appears dry. As the plants advance into the first rough leaves, the first runner-bud in the centre should be stopped, by cutting or pinching the top off, close to the first or second joint, an operation which strengthens the plants, and promotes a lateral issue of fruitful runners. Be careful to support a regular tenor of heat in the bed, by laying first an outward casing of straw-litter round the sides, to defend it from the weather; afterwards, if the heat declines, remove the above casing, and apply a moderate lining of hot dung to one or more of the sides. In matting at night, be careful not to drive the rank steam of the linings into the beds, by letting the ends of the mats hang down."

Fruiting-bed.—Form it as directed for the cucumber-bed, but 6 inches deeper. M'Phail says, " 4 feet high, and after it has stood about a week, tread it down, and make it level, and set the frames upon it."

Moulding the bed.—Abercrombie directs to " mould it by degrees to 8, 10, or 12 inches' depth, first laying the compost in little hills of that thickness, one under each light, with the intervals earthed only 2 or 3 inches for the present, till the general heat is moderated." M'Phail lays in, under each light, a small hill of earth about 1 foot high.

Planting.—When the earth of the hills is warmed by the heat of the bed, and the plants have leaves 2 or 3 inches broad, or have begun to push lateral runners, turn them out of the pots, with the ball of earth entire; set a ball containing one plant in the middle of each hill, inserted clean over the ball; or set at most 2 plants under the centre of a large light. After planting, give a gentle watering over the hills and round the roots, avoiding to wet the shanks of the plants; shut down the glasses close, till the heat and steam arise, then give air moderately. Extend a slight shade over the glasses in the middle part of warm summer days, if the plants shrink or flag their leaves before fully rooted in the hills, which they will be in 2, 3, or 4 days after planting."

Temperature.—" The melon requires a minimum heat of about 65° from the time of germination till the fructification, and the heat of about 75° to fruit in."—Abercrombie. M'Phail, as appears from the table in his " Gardener's Remembrancer," kept his melon and cucumber frames at the same temperature; stating, that if any person kept melon or cucumber plants in the same degrees of heat, they will not fail of success. Nicol's medium heat for melons is 70°. The proper temperature must be kept up by repeated linings, at least till the middle of July. After that, sun-heat may suffice to ripen the crop. Till this season the greatest care is necessary not to burn or overheat the plants. M'Phail says, " examine daily with your hand the heat of the bed, pushing your fingers into the dung immediately under the hills of earth in which the plants grow; and if you find the heat likely to be too powerful, pour cold water all round the bottom of the hills of earth, to lower the heat of the bed. Remember this must be daily attended to till the heat of the bed be so declined in the middle, that the roots of the plants be in no danger of being hurt by the heat of the dung under them. In case this necessary precaution has been neglected, till the heat immediately under the stems of the plants has become too hot, pour plenty of water 80° warm round about the sides of the hills in which the plants grow, and among the stems of the plants, which will bring the earth and dung immediately under the plants to the same degree of heat as the water which is poured into it. When the heat in the middle of the bed becomes so cool that there is no fear of its being too great for the roots of the plants, watering that part of the bed to keep the burning heat down of course must cease, and as the roots of the plants extend, earth may be added to the hills. As soon as the heat of the bed declines, linings must be applied to it, which will set it into a fresh fermentation, and then the surface upon the bed must be examined occasionally, by pushing the hand into it in different parts, and when a burning heat is felt, pour in some water as before directed. In this way you should persevere, still keeping a strong heat in the linings. Remember that the surface of the bed all round about the hills should be left uncovered with earth, and the dung should be loosened occasionally, to let the heat rise freely to nourish the plants." In July, " melons will do without heat in the linings, but I found by experience that they do best by keeping a heat in the linings all the summer. If a heat be kept on constantly in the linings, and the plants watered sufficiently, they will continue to produce fruit till the middle of October."

Air.—As long as weak steam is perceived to rise from the bed, leave an aperture, even at night, for it to escape; guarding against the influx of cold air by a curtain of matting. Admit fresh air to the plants by tilting the glasses more or less at the most favourable hours in a dry day. After the bed has come to a sweet heat, shut down close at night. As the fruit enlarges, it becomes more necessary to seize every proper opportunity of admitting air; raising the lights from 1 to 4 inches, according to the season, the heat of the bed, and temperature of the external air, shutting close if that should turn cold, and always timely towards evening. As confirmed summer approaches, admit air still more freely. Nicol says, " air should be freely admitted, though not in such quantity as for the cucumbers, which do not require so high a temperature as melons do. In sunshine, however, the mercury in the thermometer should be kept down, by the admission of air to about 80° or 75°." M'Phail says, " look into your melon-pits in the morning, and if there is a dew on them, standing like beads round the edges of the young leaves, it is a good sign; but if there is no dew on them, in the form I have described, they are not in a very prosperous condition. The air in the frames is not sweet; they either want water or sprinkling of water, or else the heat of the air in the frames is too great in the night. In hot weather melons are better to have air left at them all night, and in very warm weather to take the glasses entirely off in the evening, and put them on again in the morning: by this means the plants will get refreshment from the dew in the night."

Water.—After the plants are placed on the hills, give opportunely gentle waterings, increasing them as the season and the growth of the plants advance. " Water circumspectly and scantily while the fruit is setting or young in growth, as too much moisture would make it decay. Take a warm morning for watering before the middle of May; in summer the afternoon or evening. Use soft water warmed to the air of the frame, and let as little as possible fall on the setting or new set young fruit; nor much near the main head of the plants, for fear of rotting that part. Shut down the lights after watering for a short time; and if in the morning part, and a strong sun, spread a mat over, to prevent the sun from injuring the plants by acting on the water lodged on the spray of the leaves. As a strong steam will now arise, remove the mats in an hour or two, and raise the glasses at the top, to give vent to the steam and give air to the plants. As the fruit becomes nearly ripe, lessen the quantity of water given, barely keeping the plant from flagging, and withhold water when the fruit begins to turn colour." Nicol says, " water once in 4 or 5 days in the afternoon, watering over the foliage. Repeat the waterings oftener, as the season and the growth of the plants and fruit advance, in order to swell them out the better."—Kalendar, p. 387. M'Phail says, " If the weather is warm and dry, the melons will probably sometimes require water twice a week; if the weather is wet and cloudy, they will not require it so often."—Gard.

Rem. p. 300. Knight, finding that the leaves of melons sustained great injury from the weight of the water falling from the watering-pot, pours the water on the tiles which cover the surface of the bed. See *Training*.

Earthing.—Perform this operation as directed for the cucumber, after the heat of the dung has become moderate, earthing up by degrees the intervals between the hills, till the depth of the earth becomes equal. Eight or ten inches' depth of earth M'Phail states to be enough for the roots of the plants to run in, provided the bed or fermenting mass beneath be made of leaves of trees, or of dung well prepared; for if the bed under the earth be in a good state, the roots will grow into it, and draw from thence considerable nourishment to the plants. The roots of the melon do not naturally run deep, they extend horizontally not far from the surface, especially in forcing frames, where the moist warm air is more confined than in the open atmosphere.—Gard. Rem. p. 63. In early forcing, leave unfilled up with earth a space of about 7 or 8 inches wide, against the inside of the frames, immediately adjoining the hot linings. "By this method the heat of the linings do more powerfully warm the air in the frames, than if the earth was made level home to the sides of the boards of the frames to which the linings adjoin. But if melons be not planted earlier than the month of May, this precaution need not be attended to, unless the weather prove uncommonly cold, and but little sunshine."

Training.—As the plants advance into the first runners, 3 or four joints in length, if no fruit be shown, stop them at the third joint, in order that they may produce fruitful laterals; and as the runners extend, train them over the surface of the bed with neat pegs. Many of these runners, as the plant proceeds, will show embryo fruit at the joints; but a great many barren ones are occasionally produced, and hence it becomes necessary to regulate them. Abercrombie says, "cut out the superabundant, unfruitful, or evidently useless shoots, especially the very weak and most luxuriant, for the middle-sized are the most fertile." Nicol says, "melons should be kept moderately thin of vines, though not so thin as cucumbers (the foliage being smaller), which should never be much lopped at one time, as they are also apt to bleed. All bruised, damped, or decayed leaves should be carefully picked off as they appear, and the plants should be kept clear from weeds, or any rubbish that may be conveyed into the frames by wind or otherwise. M'Phail directs to "cut out from the melon-frames all superfluous or decaying shoots. Stop shoots a joint or two before the fruit, and also cut off the ends of the long running shoots immediately before showing fruit, if there is a leading shoot coming out by the side of it; for you ought to remember always in pruning melons, that a fruit will not swell well except there be a growing shoot before it; and this shoot, which is called a leader, because it leads or draws the sap from the roots to and past the fruit, should be stopped before a joint, that will, if the plant is in good health, sprout out again. Do not let your plants get too full of leaves, and cut off the oldest and worst leaves first. This ought to be done at least once or twice a week, by which method they will be nearly always in a medium state of thinness, and the plants and fruit will derive advantages which they would be deprived of were they suffered to become over-crowded with leaves and shoots, and then a great many cut out at one time. If melons are of a large kind, no more than one or two should be left on a plant to swell off at one time; if smaller three or four fruit may be left."—Gard. Rem. p. 278. Knight, in an ingenious and philosophical paper on the culture of the melon, states "that his crops of melons failed, because watering over the foliage, pruning, weeding, &c. had removed the leaves, on the extended branches, from their proper position, and these leaves, being heavy, broad, slender and feeble, on long footstalks, were never able to regain it. In consequence, a large portion of that foliage which preceded or was formed at the same period with the blossoms, and which nature intended to generate sap to feed the fruit, became diseased and sickly, and consequently out of office, before the fruit acquired maturity." To remedy this defect, the plants were placed at greater distances from each other, viz. one plant of the *Salonica* variety, to each light of 6 feet long by 4 feet wide. The earth was covered with tiles, and the branches trained in all directions, and hooked down over them with pegs. They were thus secured from being disturbed from their first position, the leaves were held erect, and at an equal distance from the glass, and enabled, if slightly moved from their proper position, to regain it. "I, however, still found that the leaves sustained great injury from the weight of the water falling from the watering-pot; and I therefore ordered the water to be poured from a vessel of a proper construction, upon the brick tiles, between the leaves without at all touching them, and thus managed, I had the pleasure to see that the foliage remained erect and healthy. The fruit also grew with very extraordinary rapidity, ripened in an unusually short time, and acquired a degree of perfection which I had never previously seen. As soon as a sufficient quantity of fruit, between 20 and 30 pounds on each plant, is set, I would recommend the further production of foliage to be prevented, by pinching off the lateral shoots as soon as produced, wherever more foliage cannot be exposed to the light. No part of the full grown leaves should ever be destroyed; however distant from the fruit and growing on a distinct branch of the plant, they still contribute to its support; and hence it arises, that when a plant has as great a number of growing fruit upon part of its branches, as it is capable of feeding, the blossoms upon other branches, which extend in an opposite direction, prove abortive."—Loud. encycl. gard. p. 648.

Setting.—"As the fruit bearers come into blossom, you may assist the setting of the fruit, by impregnating some of the female blossoms with the male flowers, as described for the cucumber. The melon, however, will also set naturally, and produce fertile seeds, if the time of fructification fall at a season when the glasses can be left almost constantly open."—Abercrombie. Nicol says, "he has proved experimentally, that melons not impregnated will not swell off so fair and handsome as impregnated ones, and, therefore, considers it more necessary to attend to this operation in melons than in cucumbers. Therefore let nature be assisted in this work, considering that she is more under restraint here than if the plants grew in the open air, where the wind, insects, and other casualties, might be helped."—Kalend. p. 384.

Care of fruit.—"As the fruit increases to the size of a walnut, place a flat tile or slate under each to protect it from the damp of the earth; the slab thus interposed will also assist the fruit to ripen, by reflecting the rays of the sun."—Abercrombie. M'Phail says, "The fruit should lie upon dry tiles. When the fruit is young, it is better to have a gentle shade of leaves, but when it is full swelled, it should be entirely exposed to the sun." Nicol advises placing the fruit on bits of slate or glass some time before it begins to ripen, as the flavour might else be tainted, but by no means slate or moss the whole surface of the bed, lest you encourage the red spider. Think on the reflection of the sun upon the slates or tiles, in hot weather particularly, and of his additional force in shining through glass. It is more consonant to the nature of the plants that they be trained on the earth. By mossing the surface, the indolent may find a pretext, as it no doubt, in some measure, lessens the labour of watering. But it is wrong to do so, in so far as it harbours and encourages the breeding of various insects, and as the fruit approaches to maturity, taints it with an unpleasant effluvia."

Time of maturation.—"The interval between the setting of the fruit and perfect maturity is generally from 30 to 40 days; but the plants in the same bed, and the vines on the same plant, often show some difference in the time of reaching maturity."—Abercrombie.

Cutting the fruit.—"Ripe melons are distinguished by their full size; sometimes by turning yellowish, more constantly by imparting an agreeable odour, often by the base of the footstalk, close to the fruit, cracking in a little circle. On these indications, the fruit should be cut before too mellow or dead ripe, that it may eat with a lively sharp flavour. The morning is the time for cutting." Melons, Nicol observes, "if allowed to remain on the plant till they be of a deep yellow colour (which many do) lose much of their flavour. They should, therefore, be cut as soon as they begin to change to a greenish yellow, or rather, as soon as they begin to smell ripe. They may lie in the frame for a day or two, if not immediately wanted, where they will acquire sufficient colour. But if they are let remain many days in the frame, they will become as insipid as if they had been left too long on the plant."

Saving seed.—"The ordinary mode is to request the seeds of particularly fine fruits, of approved sorts, to be returned from table. The best way, however, is to pick some of the best ripe fruit, take out the seed, clean it from the pulp, and let it be well dried and hardened, and then put it up in paper."—Abercrombie. Nicol says, "wash it very clean, skimming off the light seeds, as those only that sink in water will grow."—Kal. p. 396. Great care must be taken that the sorts, from which seeds are saved, are genuine and distinct. When different sorts are planted in the same frame, this cannot be the case.

Second crop from the same plants.—"When the fruit of the first crop is off, a second crop may be obtained from the stools, which often proves more productive than the first. If the first crop is taken before the middle of June, the second will come in at a very good time. For this purpose, as soon as the fruit is cut, prune the plant, shorten the vigorous healthy runners at a promising joint. At the same time take off all decayed leaves, stir the surface of the mould, and renew it partially by 3 inches' depth of fresh compost. Water the plant copiously, shutting down the glasses for the night. Shade in the middle of hot days, and give but little air until the plants have made new radicles and shoots. Afterwards repeat the course of culture above described, from the stage when the first runners are sent out till the fruit is cut." Nicol says, "When all the fruit of the first crop are cut, suppose in 3 or 4 weeks, the plants may be pruned for the production of a second crop, equal and perhaps superior to the first. They should be cut pretty much in, in order to cause them to push plenty of new vines, which will be very fruitful, observing always to cut at a joint of some promise, and to thin out all decayed or unhealthy vines, dead leaves, &c. Observe also to cut an inch or two above the joint you expect to push, and then to bruise the end of the stem so lopped with the thumb and finger, which will, in a great measure, prevent it from bleeding. The plants should be shaded from the mid-day sun for a week or ten days, exposing them to his full rays by degrees. Now, also, let the mould in the frame be well watered, in order to put the roots in a state of active vegetation; point over the surface with a small stick, or little wedge, and cover the whole with about 2 inches of fresh mould. This will greatly encourage the plants, and cause them to make new fibres near the surface. At this period air need not be admitted very freely, especially while the glasses are covered, but rather as it were endeavour to force the plants into new life. After they begin to shoot, water, admit air, prune, train, and otherwise manage the plants as before directed. If the season be fine, they may yield you a third crop by a repetition of the above rules, coming in in September, which might be very gratifying. I once had 52 full-sized fruit produced in a 3-light frame, a second crop, and two dozen on a third off the same plants, the *early golden cantaloupe*. Of the first crop 26 fruit, two were cut the 10th of May. Thus, a 3-light box produced, in one season 102 full matured melons." M'Phail says "if you intend to have melons as long as there is a sufficiency of sun to ripen them tolerably well, you had best put linings of warm dung to some of your beds. These, if applied in time and kept on, will cast fresh heat into the beds, and, with other necessary assistance, the plants will grow as long as you want them."

Plan of obtaining a second crop of melons.—"When the first crop of fruit is nearly gathered, cuttings are taken from the extremities of the shoots which show the most fruit; these are cut off close under the second advanced joint, or about the fifth leaf from the top; the two largest leaves at the bottom of the cutting are taken off, and thus prepared, are inserted in 24-sized pots, two in each pot, in light rich soil, gently shaken down. After being watered, the pots are placed in a 1-light frame, on a hot-bed previously prepared, and plunged in the moderately dry soil, with which it is covered. The frame is kept close and shaded for a few days, and in a week the cuttings will have struck root. The old melon-plants, with the soil in which they grew, are now all cleared out of the frames, fresh soil to the depth of 12 inches put in, and the beds well lined with fresh dung. In 10 days from the time of inserting the cuttings they will be ready to plant out, which is done in the usual way. When the plants have pushed about 14 inches, the end of each shoot is pinched off, to cause them to produce fresh runners, and the fruit which showed on the cuttings will swell rapidly, and in 3 weeks after replanting the beds, abundance of fine fruit may be expected. This way of getting a second crop is far more certain than either pruning back the old plants, or planting seedlings; because cuttings grow less luxuriantly, are less liable to casualties, and are much more prolific."—Harrison ex Loud. gard. mag. 2. p. 414.

Cultivation of the Persian varieties of the melon.—T. A. Knight (Hort. reg. no. 6. p. 263.) erected a small forcing-house for the exclusive culture of this fruit, and grew them by means of fire heat. This house consists of a back wall, nearly nine feet high, and a front wall nearly 6 feet, inclosing a horizontal space 9 feet wide and 30 feet long. The fire-place is at the east end and very near the front wall; and the flue passes to the other end of the house, within 4 inches of the front wall, and returns back again, leaving a space of 8 inches only between the advancing and returning course of it, and the smoke escapes at the north-east corner of the building. The front flue is composed of bricks laid flat, in order to give a temperate permanent heat, and the returning one with them standing on their edges, the usual way. The space between the flues is filled with fragments of burnt bricks, which absorb much water, and generally give out moisture to the air of the house. Air is admitted through apertures in the front wall, which are 4 inches wide and nearly 3 in height, and which are situated level with the top of the flues, and are 18 inches distant from each other. The air escapes through similar apertures near the top of the back wall. These are left open, or partially or wholly closed, as circumstances require. Thirty-two pots are placed upon the flues, each being 16 inches wide and 14 inches deep; but they are raised by a piece of stone or brick to prevent their coming in actual contact with the flues. In each of these pots one melon-plant is put, and afterwards trained upon a trellis, placed about 14 inches distant from the glass, and each plant is permitted to bear but one melon only. The height from the ground at which the trellis is placed, is such as can be con-

veniently walked under, to discover the appearance of red spiders or other noxious insects; and by this method two, and even three crops may be obtained in one season. Being so liable to burst, Mr. Knight raised the points of the fruit higher than the stems, and not one failed to ripen in a perfect state; they were found to ripen very well hanging perpendicularly, but the *Ispahan* grew very deformed.

Late crop on old hot-beds.—To ripen melons, not earlier than the month of August, M'Phail " generally made beds of dung which had first been used for linings to the early cucumber and melon-beds. For this purpose, this kind of dung is better than new dung, because it does not heat violently, and for a considerable time keeps its heat. Leaves of trees make very good melon-beds, but they do not produce heat enough alone for linings; but of whatever materials melon-beds be made, the air in the frames among the plants should be kept sweet and strong, otherwise the plants will not grow freely. It may be known whether the air be sweet or whether it be not, by putting the head in under the lights and smelling it. But it frequently happens to be difficult to bring dung-beds into a requisite state of kindliness for these delicate plants, for if the dung by any means get and retain too much water, before its noxious vapours pass off by evaporation, it will stagnate and become sour, and until these pernicious qualities be removed, which requires time and patience, the plants will not grow kindly; and besides this, although corrupted, stinking air hinders the growth of plants of the melon kind, it greatly promotes the health and forwards the breeding of different kinds of insects, which feed upon and otherwise hurt fruits and plants, and esculent vegetables of various kinds."

A method of growing the melon, adopted by Mr. Lovell, (Gard. mag. 7. p. 461.) varies in one or two very essential points from any that he has seen practised; first in well bedding and firmly rooting the plants to support a good crop of fruit; second in early setting and preserviug the first fruit, and forcing the whole of the plants luxuriantly through the whole of the period necessary for their maturity. To effect this he prepares his bed with dung well watered and fermented, or tan, not wishing such a strong heat as for cucumbers. He sows his seeds in pots, in which the plants remain until they are turned into the hills, leaving only 3 plants in each pot. These he places in the dung, in order to start them as soon as the bed is made up, unless there should be another bed in use at the same time. As soon as the second rough leaf appears, he puts a hill of good melon soil under each light, composed of good loam and turf, adding a sixth part of good rotten dung, well mixed with the spade, but not sifted. This he waters if dry, and treads in the hills firmly, making a hole in the centre, and turning out a pot of plants with the ball entire into each hole. Should the weather be very warm, he waters them overhead abundantly, and in the space of a fortnight they will have grown to four or five joints each: he then stops them down to three joints. By this time the heat of the bed will have become reduced to such a temperature as to allow of moulding up the plants, well heading in and watering as you proceed. As the plants will at this time be strongly rooted, and in vigorous growth, in the course of three days they will have pushed a strong shoot from each of the three eyes in a horizontal direction, and they will seldom fail of showing fruit at the first joint; you may rely at least on two out of three of these fruits setting. Before the fruit comes to blossom, the bed must be covered $1\frac{1}{2}$ inch thick with dry sand, but mould will do, and do not water the bed any more for at least 3 weeks. This prevents the newly formed fruit from turning yellow and damping off. All shoots that appear, except the three above mentioned, must be removed. As these shoots will show fruit at the first or second joint, if such fruit be set and taken care of, it will be three parts grown before the vines will have reached the outside of the bed, arriving at perfection in nearly half the time it would have done if the vines had been left in confusion. Particular care must be taken in pruning, never to stop the three shoots that bear the fruit, nor yet the lateral ones produced from the same joint as the fruit. These lateral shoots will show fruit at the first joint, which fruit must be preserved until the other is swelling, then take off this lateral shoot, but do not stop the vine. But should any accident happen to the other fruit, the shoot bearing it must be taken off, and the lateral shoot treated as a main one, when the fruit on it will swell accordingly; and all the laterals that spring from the main shoot must be stopped, leaving one joint and leaf only.

On the cultivation of the melon.—J. Holland (Gard. mag. 7. p. 575.) plants off his seedlings singly in 60-sized pots, and when sufficiently advanced in growth they are stopped so near the seed-leaf, as only to admit of them throwing out 2 lateral shoots, and when these principal leaders extend to 2 or 3 joints, they are finally planted out into frames or pits, having the bottom heat arranged according to the advanced state of the spring months. Five melons were produced by a plant set in the centre of a two-light frame in the beginning of May, upon an old bed that had been previously employed for raising radishes. A dung lining was added to the back and one end of the frame, which was all the artificial heat the plant received, one vine was trained to the back and the other to the front of the frame. His practice is never to stop the vines until they have extended as far as their confinement will permit, and the laterals from the two leading vines, as they advance in growth, are trained to the right and left over the bed with neat pegs, and every fruit blossom, as it expands, is carefully impregnated and placed upon a tile under the shade of a neighbouring leaf. In a day or two, or as soon as he thinks the fruit will set, he stops the vine at the first or second joint beyond it. In this way he proceeds, in setting all the fruit he can, until the surface of the bed is covered with foliage, which is never deranged more than can be avoided. While the fruit is setting, he gives air very freely, sometimes he draws the lights quite off for a few hours on sunny days, and he also, by applying or withholding heat or water, endeavours to keep them in a state betwixt luxuriance and debility, for in either extreme they will not set well. Having advanced thus far, he commences swelling them off. He begins this with pinching off all the ends of the lateral shoots that have not already been stopped to assist the young fruit. He now gives no more air than will prevent the sun from scorching their leaves. He looks over them every morning, and takes off all the blossoms as they appear, and stops every young shoot back to one joint above that of the vine which produces it. He watches over them every afternoon in fine weather, and before the sun has quite left the frame, he syringes or waters them all over, leaves, fruit, and all, and shuts down the glasses for the night. He always prefers performing this while the departing rays of the sun have sufficient strength to raise a sweet vaporous heat of about 90°, which serves them to feast upon long after the sun has disappeared. A few days of such treatment will determine which fruit will take the lead in swelling off, out of which he selects 2 or 3 to each plant, according to the sort, and all the rest he cuts away. As the fruit advances in growth, it is necessary at intervals to turn them a little on the tiles, to prevent them from growing flat, and discolouring on one side, and also from rotting. When they have attained as large a size as he thinks the sort will admit, he leaves off watering, and again gives all the air he can, by taking the lights entirely off when the weather is favorable; and if the season is not too far advanced, he leaves them to ripen without any other assist-

ance. For an early crop of melons, he grows the small early *cantaloup*, 1 plant in a light when the frame is narrow, and 2 if wide, with 2 or 3 fruit on each plant, which in general weigh from 2 to 3 pounds each. He succeeds these with the *scarlet* and *green-flesh*, planted and trained as above, the produce of which is from 2 to 6 pounds. His principal crop is, however, from the *black rock*, which he has grown of all sizes up to $13\frac{1}{2}$ lbs. weight; the plants are much more hardy than many other sorts, it is a good bearer, the fruit handsome, and the flavour excellent. The sort which he grew so large was originally from France, and in its primeval state was a *rock;* but it has lately been strongly impregnated with the *scarlet flesh*, which fruit it now resembles in all its characters, except in growing much larger. The largest melon weighed $24\frac{1}{2}$ lbs. The above is Mr. Holland's general practice of cultivating the melon, which practice he says he will still continue to adhere to unless fully convinced he can adopt a better.

Insects and diseases.—To prevent *melon* plants from being infested with insects or injured by diseases of any kind, no better method can be adopted than to keep the plants constantly in a healthy, vigorous, growing state; for this purpose, M'Phail observes, "they must be constantly attended to, giving them plenty of heat and water. In warm weather in the spring and the summer, they should be watered occasionally all over the fruit and leaves, till the earth in which they grow be thoroughly moistened, and a stronger heat than usual be kept in the frames about the plants for a few hours; also the lights should be shut down every afternoon, with a good strong heat among the plants. If there be sufficient moisture in the earth the greatest sun heat in the afternoon will not hurt the plants, but it might scorch the sides of the large fruit, exposed to the sun-beams operating upon the glass, which should be guarded against. The frames and lights should be kept clean and painted over once every year. Melon plants are subject to be infested and hurt by the mildew and by the canker. These diseases come upon them because they are not in a good climate, they have not a sufficiency of heat, or the dung and earth of the bed is in a stagnated state. Melon plants are liable to be greatly injured by an insect called the red spider, which increases surprisingly in hot dry weather. As I said before, nothing will prevent plants from the inroads of disease and insects but heat, sweet air, and a sufficiency of water, which sweetens the atmosphere, and makes it healthy for vegetables as well as for animals. And nothing will eradicate disease and insects from melon plants but good management, strong heat, and plenty of water given all over them. Diseased plants, or plants much infested with insects, cannot produce good healthy fruit. The mildew is a most pernicious disease to all sorts of plants. On melons it generally makes its first appearance on the oldest leaves and on the extremities of the young shoots. The cause of it, I apprehend, is unhealthy nourishment comprehended in the elements, or their not harmonising in the promotion of the growth of the plant; for by practitioners it may be observed, that when a dung hotbed gets into a stagnated sour state, the plants do not grow kindly, the air in the frames is saturated with unhealthy particles, and so also must be the juices drawn into the plants by their roots. These must breed diseases, if preventive means be not applied. It cannot be reasonably supposed that plants of a delicate nature will continue in a healthy state growing upon a heap of stinking dung, and in confined air. When melon plants have become diseased, or much infested with the red spider, they should either be destroyed, or effectual means used to cure them. To destroy the plants is easy; to cure them let the following methods be put in practice: get plenty of horse-dung thrown up in a large heap, turn it over once or twice, shaking and mixing it well, and let it lie till its rankness be somewhat evaporated, and if there be linings at the beds, take them entirely away, examine the dung of the beds, and if it be wet and has a bad smell, take a sharp-pointed stake, and make holes all round in the sides of the beds unto their centre, in such a slanting way that the water may easily run out of them; then make a strong lining of the prepared dung all round the beds, and by occasional augmentations, keep up the linings nearly to a level with the surface of the earth in which the plants grow. As soon as the linings have cast a strong heat into the beds, scatter some flour of sulphur all over the plants, and keep as strong a heat in the frames as the plants can bear; a heat of 120° will not destroy them, if the steam of the linings be prevented from getting in among the plants. Water the plants all over their leaves about once a week, with clean water 100° warm, and if the sun shine keep the lights close shut down all day, and cover them up in the evenings, leaving a little air all night at each light, to prevent a stagnation of air among the plants. Continue this process till the mildew and the insects disappear, and the plants appear to grow freely, and afterwards manage them in the usual way, taking care to keep up a good strong heat in the linings. This method sets the old stagnated bed in a state of fermentation, which makes the moisture run out of it, and dries it so, that water given to the plants has free liberty to pass off. If the linings do not heat the air in the frames sufficiently, let some of the earth in the inside all round the sides of the boards be removed, to let the heat from the linings rise freely in the frame."

Culture of melons in a dung-pit.—"A glazed pit to receive either stable-dung, leaves, or tanners' bark, is calculated to ripen superior fine fruit. The well of the pit may be formed either by a nine-inch wall, or by strong planking, a yard in depth, from 6-8 feet wide, and in length from 10-20 feet or more as required. A low glass-case is to be fitted to it, adapted to the growth of the melon. Having raised the plants in a small seed-bed, as for the frame crop, ridge them out into the pit in the usual manner. Give the proper subsequent culture, and when the strength of the fermenting mass begins to decline, add linings outside the pit, if inclosed by boards, but if inclosed by a nine-inch wall, cut away as much of the dung and earth within, and throw it out, as will admit a lining of well-tempered dung." —Abercrombie.

Culture of melons in a flued pit.—One such as that proper for the nursing pinery is here understood; and the plants being raised in the usual way, and the bed, whether filled with dung, tan, or leaves, or a mixture of these, being moulded, plant about the end of July. Nicol prefers for such late crops "the *early golden cantaloup*, the *orange cantaloup*, and the *netted cantaloup*, planting a part of the pit with each." A very mild bottom heat is sufficient for the purpose here in view; and if the pit has been occupied in forcing asparagus, French-beans, or strawberries, on a bark, or a bark and dung, or on a bark and leaf heat, it will require no other preparation than to be stirred up and have a little fresh materials added, keeping the fresh bark, dung, or leaves well down, and finishing the bed with some of the smallest and best reduced. When it has settled a few days, let it be moulded all over to the thickness of 12 or 15 inches; previously laying on a little more of the above small materials, in order to keep the plants well up to the glass, as the bed will fall considerably in the settling. It should be formed, and the mould should be laid on in a sloping manner from back to front, so as in some measure to correspond with the glasses. All being ready for the plants, they may either be planted in a row, in the middle of the pit, at 2 feet apart, or may be planted in 4 rows at 4 feet apart; or, if they have been planted in nursing, 3 in a pot; plant in the centre of each light, as directed for the common hot-bed, in March. Let them have a little water

and be shaded from the sun for a few days, exposing them to his rays by degrees. The future management of the plants differ in nothing from that of melons in a hot-bed till September, when it will be proper to apply fire heat."—" About the beginning of September it will be proper to apply fire heat, in order to further the progress of late fruit, and to dry off damps. Let the fires be made very moderate at first, however, and increase their strength as the season becomes more cold and wet. Keep the mercury up to 70° in the night, and in the day by the addition of air keep it down to about 80° or 75°. Very little water will now suffice for the plants, as their roots will be fully established, and be spread over the whole bed; the heat of which will also now have subsided. They should only, therefore, have a little water once in 8 or 10 days, and as the fruit begin to ripen off, entirely withhold it. Keep the plants moderately thin of vines and foliage; be careful to pick off all damped leaves as they appear; and fully expose the fruit to the sun as it ripens, in the manner directed for melons in the hot-bed. In this manner I have often had melons in October and November fully swelled, and in good, but not of course in high perfection, for want of sun to give them flavour. Any who have a pit of this kind, however, for the forcing of early vegetables, strawberries, flowers, &c. cannot, perhaps, occupy it to a better purpose in the latter part of the season, as the trouble is but little, and the expence not worth mentioning."

Culture of melons in M'Phail's pit.—The inventor of this pit says, " For the purpose of raising melons early, for many years I cultivated them on a brick bed, on the same construction as that which I invented for rearing early cucumbers, excepting only that through the pit of each 3-light box I carried no cross flues. When this bed was first set to work, I had the pits filled level with the surface of the flues, with well fermented dung or with the dung of old linings from the cucumber-bed. In each 3-light division I made the pit about 3 feet 6 inches wide and 10 feet long, and 3 feet deep below the surface of the flues. On the surface of the dung in the pits, I had laid about 10 inches thick of good earth, in a ridge of about 20 inches wide, from one end of the pit to the other. When this was done, I made a lining round the bed, and as soon as the earth became warm, I set the plants into the ridge of the earth, and gave them a little water, and kept a strong heat in the frames, and filled up the pit gradually as the roots and plants extended themselves."—" The dung or leaves of trees in the pit require not to be changed every year, neither need the earth for the plants be removed entirely every season, for by experience I found it to do very well by digging, and mixing with it some fresh earth and manure in winter, and exposing it to the rains, the frost, and the snow."—" In forcing melons early, the surface of the cross flues, as well as the surrounding and outside ones, should be kept bare of mould till the days of the spring get long, which will let the heat of the linings arise freely through the covers of the flues to warm the air among the plants. After the cross flues are covered with earth, those which surround each frame may be left uncovered till the month of May or June."—Gard. rem. p. 64.

The culture in the brick bed is, in other respects, the same as that already given for melons in frames, and cucumbers in brick beds. See the monthly table of temperature under the cucumber.

Culture under hand-glasses.—" A successive or late crop, to fruit in August and September, may be raised on hot-bed ridges under hand-glasses. Sow in a hot-bed from the middle of March to the middle of April. When the plants have been up a few days, while in the seed-leaves, prick some into small pots, two plants in each; water and plunge them into a hot-bed, managing as directed for the young frame plants, till the rough leaves are from 2-4 inches long, and the plants ready to shoot into runners. From the middle of March to the third week of May, when the plants are a month or five weeks old, they will be fit to ridge out under hand-glasses. With well-prepared stable-dung, or, with a mixture of fermented tree-leaves, build the hot-bed four feet wide and 2½ feet thick, the length according to the number of glasses intended, allotting the space of 4 feet to each. In a week or ten days, or when the dung and leaves are brought to a sweet or well-tempered heat, mould the bed 10 or 12 inches thick, then place the glasses along the middle, and keep them close till the bed has warmed the earth. The same, or next day, insert the plants; turn them out from the pots with the ball of earth entire, and allotting plants for each glass, insert the ball into the earth, clean down over the top, closing the mould about the stems. Give a little water and place the glasses over close. From about nine in the morning till three in the afternoon, of the first two or three days, shade the plants till they have taken root, when admit the sun more freely, yet only by degrees from day to day, till they can bear it fully without flagging much. Give air daily, in temperate weather, by tilting the edge of the glasses on the south side, an inch or two; but in the present stage of the plants shut close at night. Cover with mats till morning, constantly keeping the glasses over. Give occasional moderate waterings with aired water. Cover in the day time with mats in bad weather, or heavy or cold rains; and continue the night covering until confirmed summer in July. Meanwhile attend to the heat of the bed; if this be declined, so that the minimum temperature be not 65° at night, with the aid of matting, line the sides with hot dung, covered with a layer of mould. The revived heat from the linings will forward the plants in fruiting, while the earth at top will enlarge the surface for the runners, and the bed for the roots. When the runners have extended considerably and filled the glasses, they must be trained out. Accordingly, at the beginning of June, in favourable settled warm weather, train out the runners, cutting away dwindling and useless crowding shoots; then the glasses must be raised all round, 2 or 3 inches, upon props to remain day and night. Cover with mats in cold nights and bad weather, but first arch the bed over with rods or hoop-bands to support the mats. Apply moderate waterings as necessary in the morning or afternoon. Oiled paper frames, formed either archwise, or with 2 sloping sides, about 2 feet or 2½ feet high, and of the width of the bed, are very serviceable in this stage. Some persons use them from the first, under a deficiency of hand-glasses. But the proper time for having recourse to them, is when the plants have been forwarded in hand-glasses till the runners require training out beyond the limits of the glasses, some time in June; then removing the glasses, substitute the oiled frames, as these paper screens will entirely afford protection from heavy rains or tempests, as well as from nocturnal cold, and also screen the plants from the excessive heat of the sun, while, being pellucid, they admit its influence of light and warmth effectually. Give proper admission of free air below, and occasional watering. With respect, however, to the crop for which no oiled paper frames have been provided, continue the hand-glasses constantly on the bed, over the main head and stem of the plants throughout the season, to defend those capital parts from casual injuries by the weather. Throughout June, and thence to the decline of summer, be careful, if much rain or other unfavourable weather, or cold nights occur, to shelter the beds occasionally, with an awning of mats or canvass, particularly when the plants are in blossom. Likewise turn in some of the best full set exterior fruit under the glasses, or some spare glasses might be put over the outside melons, to forward them without check to maturity. Some will be ready to cut in July, others in August, the more general time, and in September; they being generally, after setting, from 30-40 days

in ripening. The crop coming in at the decline of summer will not ripen well, unless guarded from cold at nights, and assisted by linings. The fruit that do not ripen may be used for mangoes.

" *Wide ridge*, or the fruiting-bed, may be made 6, 7, or 8 feet wide, for the plants to have an ample surface for their extending runners, defended either with a regular frame, and glasses of proportionate dimensions, or a case formed of an inch and a half boarding, ranged connectedly along both sides of the bed, without any external cross divisions, other than top cross bars, to stay the sides and support the glasses."

Method of growing crops of melons in the open borders.—The mode of growing cucumbers on ridges of shallow beds of half-spent dung in the open air, is well known to gardeners; and in warm situations melons may be grown in the same manner. The sorts grown by Mr. Greenshields were the *black rocks, green-fleshed, netted, and early cantaloup*. The seeds of the first crop were sown about the middle of March, in pots in a cucumber-frame, and the bed or ridge was prepared in the first or second week in May, 4 feet wide, and 1 foot higher at the back or north side than in front. Hand-glasses, with 2 or 3 plants in each, are placed, 4 feet apart, along the centre of the bed. Very little air is given till the plants have filled the glasses, but when these appear to get crowded with vines, the glasses are raised up, and the plants allowed to grow up in the manner of ridged cucumbers. If the vines are very thick, a few of the weakest may be pinched off, and the top of each leading shoot or vine removed. No more pruning will be necessary for the season. Setting the fruit at this season of the year is quite necessary. To have handsome fruit, not more than one or two should be left on the plant. They will begin to ripen about the first week in August, and continue to be produced through that month and part of September. To prolong the season, seeds may be sown three weeks later, planted out like the first crop, and when there is appearance of frosty nights, a cucumber-frame and sashes may be placed over them. By this means tolerably good melons may be had till the end of October.—Greenshields, ex Loud. gard. mag. 3. p. 182.

There is another method of cultivating melons in the open air; that is, to raise a bed of old tan, and tramp it well and firmly down, placing some stakes and boards behind to keep up the tan, so that the bed may slope in front; 6 inches of mould should be placed on the tan, and the melon plants planted into it. Grass or leaves may be placed at the back of the bed to keep up the heat. The plants should be reared on a hot-bed.

Melon. Fl. July, Sept. Clt. 1597. Pl. tr.

2 C. delicìosus (Roth. cat. 3. p. 307.) angles of leaves blunt; fruit roundish-ovate, pubescent, with white, very fragrant flesh, and a thin rind. ⊙. F. Native of the East Indies, but now cultivated in Spain. Perhaps only a variety of the common melon.

Delicious Melon. Fl. June, Sept. Clt. 1818. Pl. tr.

3 C. satìvus (Lin. spec. 1437.) stems rough, bearing tendrils; leaves cordate, obscurely 5-lobed, petiolate, terminal lobe the largest; flowers on short peduncles, largish, usually by threes; male flowers having the tube of the calyx tubularly-campanulate, and with a spreading deflexed limb; fruit long, somewhat triquetrous, smooth or prickly, and usually shining, having the carpels distinctly separable in the inside. ⊙. F. Native of Tartary and the East Indies.—Blackw. herb. t. 4.—Lob. stirp. 363. f. 1. The cucumber is called *Ketimou* and *Timou* by the Hindoos. Flowers yellow, as in the rest of the species.

The cucumber is called *concombre* in French; *gurke* in German; and *Citriuolo* in Italian; it is a tender annual, a native of the East Indies, and was introduced in 1573. It is a trailing and climbing plant, with large, roundish, rough leaves, furnished with tendrils, and if sown in the open air in May, produces flowers from July to August. The cucumber is of nearly as great antiquity as the vine, for Moses, the earliest Jewish author, mentions it as abounding in Egypt when the children of Israel were there, above 3000 years ago. (Numbers, chap. ii.) In England it is cultivated generally and extensively in forcing frames, and in the open air, and especially near large cities and towns. " Not only gentlemen," as M'Phail observes, " but almost every tradesman who has a garden and dung, have their cucumber-frame." In Hertfordshire, whole fields are annually seen covered with cucumbers, without the aid of dung or glass, and the produce of which is sent to the metropolis for pickling. In march, cucumbers fetch in the London market a guinea a dozen; in August and September a penny a dozen. The village of Sandy, in Bedfordshire, has been known to furnish 10,000 bushels of pickling cucumbers in one week.

Use.—The green fruit is used as salad; it is also salted when half grown; and preserved in vinegar when young and small. In Germany and Poland, barrels of half, and also full grown cucumbers, are preserved from one year to another by immersion in deep wells, where the uniform temperature and exclusion of air seem to be the preserving agents.

Varieties.—The principal of these are as follow:—

List of cucumbers.

1 *Early long prickly.*—This fruit is from 5-7 inches long, of a green colour, with few prickles. The plant is a good bearer, and upon the whole this is the best cucumber for the general summer crop, the flesh being very crisp and pleasant.

2 *Largest green prickly.*—From 7-10 inches long; it has a dark green skin, closely set with small prickles. This is a hardy sort, but does not come early.

3 *Early short prickly.*—Not more than 4 inches long; the skin green and rather smooth, but with a few small black prickles. This is one of the hardiest and earliest sorts, and is often preferred for the first crop.

4 *Dutch or white short prickly.*—Though not much cultivated, is recommended by some as preferable even to the *early long prickly;* it has fewer seeds, is evidently different in taste from most other cucumbers, but of agreeable flavour.

5 *Cluster cucumber.*—A very early sort; the flowers appear in clusters of 3 or 4 together; the fruit is seldom more than 5 inches long; it is at first of a fine green colour, but becomes yellowish as it ripens. The stems of this variety are much inclined to climb by means of their tendrils upon sticks; the leaves are small, and the plant altogether occupies but little room.

6 *Smooth green Roman.*—An early sort; the fruit becomes large and long, and is quite smooth; the plants grow very strong, and require a good deal of room.

7 *White Turkey.*—The stalks and leaves are larger than in the other varieties; the fruit also is very long, sometimes from 10-15, or even 20 inches; it is quite straight, and has a smooth skin, destitute of prickles; it is produced sparingly, and late in the season.

8 *Long green Turkey.*—Sometimes sown for the late crop. Late cucumbers, however, are much less cultivated than the early varieties, most gardeners being of opinion, that those kinds which are best for the early crop, are also best for the late.

9 *Nipaul.*—Fruit very large, usually weighs upwards of 12 lbs., measures in girth 24 inches, and in length 17 inches; flavour pleasant, and esteemed for standing. It is a native of Nipaul, from whence it was introduced to the botanical garden at Calcutta; but it is not likely that it ever will be much cultivated in this country.

Culture.—The culture of the cucumber, as a table esculent,

is chiefly carried on by artificial heat, and is therefore treated of under that head. For pickling it is chiefly cultivated in the open ground, by what is termed drilling. To have a crop in the natural ground, the seed is sown in warm compartments of rich earth, towards the end of May or beginning of June, when the weather is settled, warm and dry. The plants should mostly remain where sown, to produce late fruit towards the end of July, or more generally in August and September; small for pickling, and in larger growth for ordinary consumption. Sow a portion in a warm border, and the main crop in an open compartment. Dig the ground neatly even. Trace lines with intervals of 5 or 6 feet; and in the lines mark stations 3½ feet distant, then with a trowel at each of these spots, form shallow circular saucer-form cavities in the surface, 10 or 12 inches wide and about an inch deep in the middle. Sow in the middle of each cavity 8 or 10 seeds, half an inch deep. When the plants are come up, and begin to put forth the first leaves in the centre, thin them to 3 or 4 of the strongest in each hole. Earth these up a little between and close round the stems, pressing them a little asunder, and give them some water to settle the earth below and above. In their advancing growth train out the leading runners, supplying them with requisite waterings in dry weather 2 or 3 times a-week, and sometimes every day in very dry hot weather, in July, August, or September. At this season water early in the morning and late in the afternoon towards evening."

Gathering.—"The crop comes in sometimes towards the end of July, but more generally not before August in full production; continuing till about the middle or end of September, when the plants decline. Be careful to gather the fruit in a fine state both for pickling and other purposes. They must be quite young for pickling, not exceeding 2 or 3 inches in length."—Abercrombie.

Forcing cucumbers.—To produce cucumbers at an early season, is an object of emulation with every gardener; and there is scarcely any person who has not a cucumber-bed in his garden. We shall lay down a systematic view of the practices of the most approved gardeners in the culture of this plant, as has been our usual custom with other garden plants. Cucumbers are forced in hot-beds, pits, and hot-houses, and the heat of fire, and warm water, and steam, and dung, have been applied to their culture; but dung, as the author last quoted observes, is the only thing yet found out, by the heat of which the cucumber may be advantageously cultivated.

Soil.—Cucumbers, like every other plant, will grow in any soil, though not with the same degree of vigour, provided they be supplied with a sufficiency of heat, light, water, and air. For early forcing, Abercrombie recommends a mould or compost of the following materials: "One third of rich top-spit earth, from an upland pasture, one-third of vegetable mould, and one-sixth of well decomposed horse-dung, with a small quantity of sand." M'Phail used vegetable mould made from a mixture (accidental) of the leaves of elm, lime, beech, sycamore, horse and sweet chestnut, spruce, and Scotch fir, walnut, laurel oak, evergreen oak, ash, &c. and among them withered grass and weeds of various kinds. "This vegetable mould," he says, "without a mixture of any thing besides, is what I used for growing cucumbers in, and by experience I found it preferable to any other moulds, earths, or composts whatever, either in my new method of a brick bed, or in the old method of a bed made of horse-dung." Nicol says, "soil thus composed will produce cucumbers in great abundance: three-fourths light rich black earth from a pasture, an eighth part vegetable mould of decayed tree-leaves, and an eighth part rotten cow-dung." Kal. p. 393. W. T. Aiton gives the following as the compost used in Kew Gardens: "Of light loam a few months from the common, one-third part, the best rotten dung one-third part, leaf-mould and heath-earth of equal parts, making one-third part. The whole well mixed for use." G. Mills states that the soil he uses "is half-bog or black mould, got from a dry heathy common, and half leaf-mould: after lying 12 months in a heap, the compost is fit for use."

Time of beginning to force.—Abercrombie says, "Managers who have to provide against demands for early cucumbers, must raise the seedlings from 10-12 weeks before the fruit will be required, according to the length of the days in the interval. In proportion as the entire course embraces a greater part of the mid-winter, the liability of failure from obstacles in the weather will be greater. The last fortnight in January, or first week in February, is a good time for beginning to force the most early crop. In the subsequent months, both main and secondary crops may be started as required, and will come forward more freely. To have a constant succession, seedlings should be raised twice a month. As the course of forcing more coincides with the natural growing season, the length of it will be reduced to 8, 7, or 6 weeks." M'Phail says, "those who are desirous of having cucumbers early, had best sow seeds about the 20th of October; they may be sown at any time of the year, but the spring and autumn are the best seasons. Cucumber plants may be made to bear fruit plentifully from about the middle of March till the middle of September; but from the middle of September till the middle of March their produce will be but scanty. Cucumber-plants, raised from seed in October, will begin to produce fruit in February or March, and will continue to bear till the following month of October, provided they be kept in frames and get plenty of heat and water." Nicol recommends the middle of January. He says "Some begin sooner, but it is striving hard against the stream to little purpose. If the dung be prepared and the bed be got ready, so as to sow about the first of February, the success will often be greater than by sowing a month earlier, the growth of the plants being frequently checked by bad weather, and sometimes they are entirely lost." Aiton, in the paper above quoted, sowed on the 12th and 20th of August, with a view to cultivate in stoves, a regular supply of this vegetable being annually required for the royal tables. G. Mills sows on the first of October.

Sorts.—Abercrombie recommends the *short prickly* for very early fruit, and the *long prickly* kinds for the chief early and main summer crops. Nicol says every gardener has his favourite sort of cucumber, and it is no easy matter to advise. He names as early sorts generally known, the *early short prickly* as the earliest; the *early smooth green*, a long fruit, the *long green prickly*, and the *white prickly*, a white fruit.

Choice of seed.—"It is advisable," Abercrombie observes, "to have that at least from 2-4 years old, in preference to newer seed, which is more apt to run luxuriantly in vine, and the plants from it do not show fruit so soon or so abundantly as those from seed of greater age. But when seed has been kept more than 4 years, it is sometimes found to be too much weakened."

Forming the seed-bed.—"A one-light frame," Abercrombie says, "will be large enough for ordinary purposes. Choose a dry sheltered part of the melon-ground, and form a bed for a 1-light frame. When high winds are suffered to blow against a cucumber-bed, they have a very powerful effect on it, for in that case the heat will not only be greatly abated, but also forced and driven into the corners of the frames, and, consequently, some parts thereof are rendered too cold, whilst other parts are made too hot, and of course the plants are all equally endangered, retarded in their growth, and perhaps some, if not all of them, totally destroyed. Therefore, when a cucumber-bed is about to be built, the first object of consideration should be, to have it, as well as possible, sheltered from the high winds and

boisterous, stormy weather." Having put on the frame and waited till the bed is fit for moulding, lay in five or six inches' depth of the proper earth or compost. M'Phail "makes up a bed of good dung, four feet high, for a 1-light box." Nicol " builds a bed of dung, carefully fermented, to the height of 5 feet at back, and 4 at front, keeping it a foot larger all round than a 1-light frame, or about five or six feet by three or three and a half. He then covers with turf, and on that lays fine sand, as free of earth as possible, to the depth of about 6 inches, laying in a sloping manner, corresponding with the glass and within 6 inches of it; over which lay an inch or two of dry light earth." Aiton and Mills also prepare a bed for a 1-light box; the latter forms it on a stratum of wood 1 foot high for drainage, and 8 inches higher in the middle than at the sides, as the sides are liable, from the weight of the frame, to settle faster than in the middle, which causes the piles of earth to crack; by which in fruiting-beds more especially the roots of the plants are greatly injured.

Sowing.—Abercrombie sows some seeds in the layer of the earth, which he spreads over the bed, putting them in half an inch deep. He also sows some seed in 2, 3, or more small pots of the same kind of earth, which may be plunged a little into that of the bed. M'Phail sows in a pot filled with rich earth, covers about 2 inches thick, and sets the pots on the surface of the naked dung on the bed. Nicol sows immediately after the bed is made, without waiting till the heat arises, which he says is losing time, and the opportunity of bringing on vegetation by degrees as the heat rises. He sows in a broad pan 4 inches deep, or in small pots 4 or 5 inches in diameter, and as much in depth. These he fills with " fine light earth" or vegetable mould, and covers the seeds 2 inches. He plunges these to the brim in the back part of the bed (which, it will be recollected contains a stratum of earth 6 inches thick, over one of sand and another of turf), puts on the light, and lets the frame be matted at night, in the ordinary way.

Raising plants from cuttings.—M'Phail says, " Instead of raising cucumber plants from seeds, they may be raised from cuttings, and thus kept on from year to year, in the following manner; the method of sticking them in is this: take a shoot which is just ready for stopping, cut it off just below the joint, behind the joint before which the shoot should have been stopped, then cut smooth the lower end of the shoot or cutting, and stick it in fine leaf or other rich mould, about an inch deep, and give it plenty of heat, and shade it from the rays of the sun till it be fairly struck. By this method, as well as by that of laying, cucumber plants may readily be propagated." J. Mearns, gardener at Shobden Court, near Leominster, propagates his cucumber-plants for a winter crop in this way, and " finds that the plants raised from cuttings are less succulent, and therefore do not so readily damp off, or suffer from the low temperature, to which they are liable to be exposed in severe weather; that they come into bearing immediately as they have formed roots of sufficient strength to support their fruit, and do not run so much to barren vine as seedlings are apt to do." He takes the cuttings from the tops of the bearing shoots, and plants them in pots 9 inches deep, half filled with mould. He then waters them, covers the tops of the pots with flat pieces of glass, and plunges them into a gentle bottom heat. " The sides of the pot act as a sufficient shade for the cuttings during the time they are striking, and the flat glass, in this and in similar operations, answers all the purposes of bell-glasses. The cuttings form roots, and are ready to pot off in a fortnight.

Temperature of the seed-bed.—Abercrombie says, " The minimum heat for the cucumber is 58° at the coldest time of night, in the day-time 65° is sufficient for the maximum; because air admitted, when the sun has great influence, will do more good than a higher heat. M'Phail says, " If it were possible to keep the heat in the frames always to 80°, with the concurrence of proper air and moisture, I am of opinion that that would be a sufficient heat for the production of the cucumber." Nicol keeps the air in the bed to about 65° in the night, allowing a few degrees of a rise in sunshine. Aiton rears and fruits his plants in a stove. Miller says, " The heat I wish to have in the seed-frame is from 65° to 75°."

Treatment of the plants until removed to the fruiting-bed.—After sowing, Abercrombie " continues the glasses on the frame, giving occasional vent above for the steam to evaporate, that the bed may keep a moderate heat, and not become too violent. The plants will be up in a few days, when it will be proper to admit air daily, but more guardedly, at the upper end of the light, which may be raised from half an inch to an inch or two, according to the temperature of the weather, that the plants may not draw up weak, or be injured by the steam. In frosty weather hang part of a mat over the aperture. When the plants are a little advanced, with the seed-leaves about half an inch broad, take them up, and prick some in small pots of light earth, previously warmed by the bed. Put 3 plants in each pot, and insert them a little slopingly, quite to the seed-leaves. Plunge the pots into the earth, and you may prick some plants also into the earth of the bed. Give a very little water just to the roots; the water should be previously warmed to the temperature of the bed. Draw on the glasses; but admit air daily to promote the growth of the plants, as well as to give vent to the steam rising in the bed, by tilting the lights behind, from half an inch to an inch or two high, in proportion to the heat of the bed and temperature of the weather. Cover the glasses every night with garden-mats, and remove them timely in the morning. Give twice a-week, once in two days, or daily, according to the season, a very light watering; keep up a moderate lively heat in the bed by requisite linings of hot dung to the sides." M'Phail, having sown, and placed the pots on the naked bed, says, " the plants will come up in a few days, and when they have fully expanded their seed-leaves, transplant them into small pots, 3 plants in each pot. Set them on the surface of the dung in the bed, and let a little air be left at the light day and night, to let the steam pass off freely."—" When the seedling plants have one or two joints, stop them, after which they generally put forth 2 shoots, each of which let run till they have made 1 or 2 clear joints, and then stop them, and afterwards continue throughout the season to stop the plants at every joint." Nicol directs to guard the seed from mice, which generally swarm about hot-beds, by laying a pane of glass over the pot or pan till they come up; and afterwards at night by covering with a pot of equal size, till the seed-leaves have expanded and the husks have dropped; for until then the plants are liable to be destroyed. The cover, however, should always be removed by sunrise, and be replaced in the evening. It is at night these vermin generally commit their depredations. No air need be admitted till the heat begins to rise, and steam begins to appear; but after that the lights should be tilted a little every day, in whatever state the weather may be, until the plants break ground. Air must then be admitted with more care, and if frosty or very chill, the end of a mat should be hung over the opening, that the air may sift through it, and not immediately strike the plants. A little aired water may be given once a day, from the time the seeds begin to chip; and if a very strong heat rise, the pots should be raised a little to prevent the roots from being injured. They should be frequently examined on this account, and if the heat be violent, should be set loosely on the sand, or be placed entirely on the surface. The air of the bed should be kept to about 65° in the night, allowing a few degrees of a rise in the sunshine. If the weather be severe, the mats must be doubled

or tripled, and if mild perhaps a single one will suffice. But unless in very bad weather they should always be removed by sunrise, in order to admit all the sun and light possible to the plants, which are very essential to their welfare. When the plants are about an inch and a half high, they are then fit to be pricked out into nursing pots. These pots should be about $3\frac{1}{2}$ or 4 inches in diameter at top, and as much in depth. The mould to be used should be the same as that in which the seeds are sown, and should be laid in the frame a few hours previous to potting, in order to bring it to a proper degree of warmth, that the tender fibres be not chilled by it. Let the pots be filled about one half with the earth, turn the plants carefully out of the seed-pot; place three in each, against the side of the pot, and so as their leaves may be just above its margin; then cover the roots with the mould, rubbing it fine between the fingers, and filling the pots nearly to the brim. Work over the sand in the frame to its full depth, plunge the pots to within an inch of their rims, and cover the whole surface with a little dry earth as at first, making it level with the tops of the pots. Then give a little aired water, in order to settle the earth to the roots of the plants. The plants will now require due attention. Let air be admitted to them as freely as the state of the weather will allow, and supply them moderately with water once in 2 or 3 days. Examine the pots frequently, if the heat be violent, lest the roots be scorched, setting them loosely or pulling them up in that case, or if thought necessary, placing them entirely on the surface. If much steam abound in the bed at this time, it may be proper to leave the light tilted half an inch in the night, observing to hang the lap of a single mat 2 or 3 inches over the tilt. But if the bed was carefully turfed over, as directed at making up, this will seldom be necessary, never but in thick hazy weather. Mat up carefully at night, but make a point to admit all the sun and light possible to the plants; therefore, uncover always by sun-rise; and frequently wash and wipe the glasses clean, outside and inside, as they are often clogged by a mixture of steam and dust. Also, occasionally stir the surface of the sand or earth in the frame with the point of a stick, in order to extirpate vapour, that hovers on the surface, and so purify the internal air of the bed. If the heat begin to decrease, and particularly if the weather be severe, it may be necessary to line one or more sides of the bed, that the plants may receive no check in their growth. If it be a 1-light box, both back and front may be lined at the same time, and, if necessary, in 10 or 12 days, the two sides; and if much steam arise from the linings after they come into heat, be careful in matting at night, to tuck up the edges of the mat, lest it be thrown into the bed." Mills, as soon as the seed-leaves of the plants are fully expanded, transplants them singly into pots of 48th size, gives a little water and air night and day. His temperature for seedlings, as already stated, is from 65° to 75°. With this heat and water, as the earth in the pots becomes dry, and a little air night and day, so as to keep the internal air in the frame sweet, and fluctuating between the degrees of heat above mentioned, the plants will be fit for finally transplanting out in a month, that is, by the 14th of November, into the fruiting-frames.

Forming the fruiting bed.—Abercrombie directs, "When the plants are advanced in some tolerable stocky growth, that is, when the first rough leaves are 2 or 3 inches broad, or when the plants have been raised about five weeks, transplant them to the larger hot-bed, with a 2-light or 3-light frame, sometimes called the ridging-out-bed." Form the bed on general principles, of superficial extent, according to the frame it is to support, leaving from 4 to 6 inches all round, and fixing the height according to the season. Thus in January, Abercrombie directs "the bed to be 3 feet 9 inches high in front, 4 feet 6 inches at the back, and 6 inches larger than the frame all round. In February, 3 feet 3 inches high at the front, 4 feet at the back, and 4 inches to spare round the frame. In March, 3 feet high in front, 3 feet 6 inches at back, and 4 inches beyond the frame every way." "Put on the frame and glasses presently after the body of the dung is built up, to defend it from the weather. At the same time raise the glasses a little at the upper end, in order both to draw up the heat sooner, and to give vent to the rising steam, until the bed is reduced to a regular temperature. In connection with the thermometer, the cultivator may be assisted to form a judgment of this by trying sticks, that is, 2 or more sharp-pointed smooth sticks, thrust down in different parts of the bed, which at intervals may be drawn up, and felt by a quick grasp of the hand. The smell of the vapour is also a criterion; it should not be strong and fetid, but mild and sweet. While taking care that the heat is not so intense as to burn the mould when applied as below, let it not be suffered to evaporate unnecessarily by delay. If the temperature appear to be not sufficiently high, take off the frame, and add another course of dung." M'Phail, when he fruits the cucumber on dung beds, begins to make preparation for the fruiting-bed, about 3 weeks before the plants are ready to be planted for good. The dung collected, after being well worked, is "made up into a bed of about 4 or 5 feet high, and the frames and lights set upon it. It is afterwards suffered to stand for a few days to settle, and until its violent heat be somewhat abated; and when it is thought to be in a fit state for the plants to grow in, its surface is made level, and a hill of mould laid in just under the middle of each light, and when the mould gets warm the plants are ridged out in it. After this, if the bed has become perfectly sweet, and there be heat enough in it, and the weather prove fine, the plants will grow freely." Nicol builds his fruiting-bed about 4 feet high in front, keeping it fully a foot broader than the frame all round. He turfs it, and lays on sand as in forming the seed-bed, if the dung has not been well fermented. "But otherwise, placing a thick round turf, a yard over, in the middle of each light, so as that its centre may be exactly under the plants, will generally be found sufficiently safe." The frames are now put on, and the beds matted up at night to make the heat rise the sooner. Mills says, "Well preparing the dung is of the greatest importance in forcing the cucumber, and if not done before it is made into a bed, it cannot be done after, as it requires turning and watering to cause it to ferment freely and sweetly; fresh dung from the stable will require at least 6 weeks' preparation before it will be fit to receive the plants. A month before it is made up into a bed, it should be laid up into a heap, turned three times and well shaken to pieces with a fork; and the outsides of the heap turned into the middle and the middle to the outsides, that the whole may have a regular fermentation, and if any appear dry, it should be made wet, keeping always between the two extremes of wet and dry. A dry spot of ground should be chosen to prepare the dung on, that the water may drain away from the bottom of the heap. The dung having been a month in heap, I make the bed as follows: I form a stratum one foot high of wood of any kind, but if larger the better (old roots of trees or any other of little value will do). This is to drain the water from the bottom of the bed, for after a month's preparation, with every care, it will frequently heat itself dry, and require water in large quantities, which, if not allowed to pass off freely, will cause an unwholesome steam to rise, in which the cucumber plant will not grow freely. On this bottom of wood, I make the bed 4 feet high with dung, gently beating it down with a fork. This is done about the 1st of November, and by the month of February the 4 feet of dung will not be more than 2 feet thick, which, with a foot of wood, at the bottom, will make the bed 3 feet high. This I consider a good height; for if lower, it cannot be so well heated by linings, which is the

only method of warming it in the months of February and March, as by that time the first heat of the bed will have quite declined. Having made the bed, I put on the frames and lights, which I shut close till the heat rises. I then give air night and day, sufficient to allow the steam to pass off, and once in 2 days I fork the surface over, about 9 inches deep, to sweeten it, and if in the operation I find any part dry, I carefully wet it. The bed being quite sweet, I prepare it for the mould, by making the middle about 8 inches lower than the sides, as the sides are liable from the weight of the frames to settle farther than the middle, which often causes the hills of earth to crack, by which the roots of the plants are greatly injured."—Mills ex Loud. encycl. gard. p. 632.

Moulding.—"As soon," Abercrombie observes, "as you deem the bed to have a lively, safe, well-tempered heat, which may be in a week or 10 days after building, proceed to mould it. Earth the middle of each light, laying the mould so as to form a little hill from 6 to 10 inches in height, according as seed is to be sown, or plants from the seed-bed inserted. Then earth over the intervals between the hills, and the sides of the frame only, from 2 to 4 inches, as a temporary measure, until the heat is ascertained to be within safe limits. After the whole bed has been for some time covered, examine the mould; if no traces of a burning effect appear discoverable by the mould turning of a whitish colour, and caking, it will be fit to receive the plants. But if the earth appears burnt, such part should be replaced by fresh, and vacuities made to give vent to the steam, by drawing every part of the hills from the centre. When the bed is in fit order, level the mould to 6 inches deep to receive the seeds; but to receive plants in pots the hills of earth should be kept 10 inches deep or more. If there be any motive for haste, while an excess of heat is to be suspected, the danger from burning may be obviated by leaving vacancies in the top of the mould; by placing patches of fresh cow-dung or decayed bark to receive the pots of seeds or plants; and by boring holes in the bed with a round pole, sharpened at the end, which holes should be filled up with hay or dung when the heat is sufficiently reduced. Some persons place a layer of turf with the sward downwards between the dung and the mould; but this, if ever expedient, is only in late forcing; for in winter the full effect of a sweet well-tempered heat is wanted, much of which, by being confined at the top, may be forced out at the sides." M'Phail, in moulding common hot-beds, also raises hills in the centre of each light in the usual way. Gard. rem. p. 51. Nicol gathers up from the surface of the beds a sufficient quantity of earth to raise hills whereon to plant; one exactly in the middle of each light, about a foot broad at top, and to within 6 inches of the glass. If the frames be a proper depth, they should be 12 or 15 inches high above the turf. Kal. p. 365. Mills puts under the centre of each light one solid foot of earth, the top of which is hardly within 9 inches of the glass, and the top of the plants when planted in it will be within 3 inches of the glass,

Planting out.—Abercrombie, when the temperature is ascertained to be right, brings the plants in their pots; turns over the hills of mould, forming them again properly, and then proceeds to planting. "Turn those in pots clean out, one pot at a time, with the ball of earth whole about the roots, and thus insert one patch of three plants which have grown together, with the ball of earth entire, into the middle of each hill, earthing them neatly round the stems. Also any not in pots, having been pricked into the earth of the bed if required for planting, may be taken up with a small ball of earth, and planted similarly. With water warmed to the air of the bed, give a very light watering about the roots, and shut down the glasses for the present, or till next morning. Shade the plants a little from the mid-day sun a few days till they have taken root in the hills, and cover the glasses every evening with large mats." Nicol, before planting, if the beds have settled anywise unequally, rectifies and sets level the frames, by placing boards, slates, or bricks under the low corners, so as to make them correct. He then makes up the outsides of the bed with dung a few inches higher than the bottoms of the frame, over which he lays some dry litter or fern fronds, and planks at top to walk on. He then takes the pots of plants, each of which are supposed to have got two or three rough leaves, and making a hole in each hill, full large enough to receive the balls, turns them out of the pots as entire as possible, placing them level with the surface of the hill, fitting the earth round their sides, and settling all with a little water. In the case of planting older plants than the above, at a farther advanced period of the season, or such as have quite filled the pots with their roots, the balls may be reduced a little, and the fibres should be singled out, if anywise matted. But the above plants are supposed to have barely filled the pots with roots, and then the balls should be kept entire, that they may not receive a check in transplanting.

Temperature for fruiting plants.—Abercrombie's minimum is 55°, and maximum in the day time 65°, the same as for the seed-bed. M'Phail says, "It appears that during the winter and spring months the medium heat of the air in the frames should be 75°, and the maximum heat 80°. But when the sun shines the heat of the air in the frames is increased to a much higher degree; so that reckoning this heat, the medium for that of the air in the frames may be 80°." Gard. rememb. p. 59. Nicol's medium heat for cucumbers is 60°; in sunshine he admits as much air as will keep down the thermometer to 65°. Kal. p. 366. Mills, in the fruiting frames, wishes "to have at all times from 70 to 80 degrees of heat, which I regularly keep up by applying linings of hot dung, prepared one month previously, in the same manner as that for the beds. For the first month I cover the glass with a single mat only; and as the nights become cold, I increase the covering, using hay, which I put on the glass, and cover that with a single mat. I regulate the heat at night by the warmth of the glass under the hay, for when the glass is warm, which should be in two hours after covering up, a little air is required. When the glass and hay covering are warm, which is easily known by putting the hand under the hay on the glass light, the internal heat of the bed will be about 78 degrees, in which degree of heat the cucumbers have grown in length in 16 hours one inch and a quarter. I give a little water round the insides of the frames, as often as I find them dry, which causes a fine steam to rise, and I think it better than watering the mould, for if this latter practice is often repeated in winter, when the sun's power is insufficient to absorb the moisture, and the glasses can be but little open to allow the damp to pass off, the earth in a few weeks will lose its vigour, and the roots of the plants will perish. Great care should also be taken, at this season, not to injure the roots by too much heat, which is not less detrimental than too much moisture: they can only be secured by keeping up a regular warmth, just sufficient to expel the damp, which arises in the night from the fermenting dung."

Linings.—The requisite degree of heat, Abercrombie is careful to support in the bed when declining, "by timely linings of hot fresh dung, which may be applied to the sides 15 or 18 inches in width, and as high as the dung of the bed. Generally line the back part first, and the other in a week, or from 10 days to a fortnight after, as may seem necessary by the degree of heat in the bed. Sometimes if the heat has fallen abruptly below the minimum degree, it may be proper to line both sides moderately, at once to recover the temperature sooner, and with better effect; but be particularly careful never to over line, which would cause a too violently renewed heat, and steam in the bed. The dung for linings must be fermented, as in first

building a bed." When the heat decreases, Nicol cuts away the old dung perpendicularly by the frame, and adds new linings, (generally beginning with the back first,) 2 feet broad to the height of 6 inches about the bottom of the bed frame. As it will sink considerably in heating, he adds to it in a few days. Mills applies linings of hot dung prepared a month previously.

Covering.—This must be nightly performed till June, proportioning the warmth of the cover to the heat of the air in the bed, and that of the external air. Mats are laid next the glass; on these a layer of hay, and over these mats, made fast by boards, but not hanging over the linings, is the usual mode, early in the season. M'Phail says, "My method of covering up was as follows: in the first place I laid clean single mats on the light in length and breadth, just or nearly to cover the sashes, taking care not to suffer any part of the mats to hang over the sashes, on or above the linings, for that would be the means of drawing the steam into the frames in the night time. On these mats was spread equally a covering of soft hay, and on the hay was laid another covering of single mats, upon which were laid two, or sometimes three or four rows of boards, to prevent the covering from being blown off by the wind. The mats laid on next to the glass are merely to keep the seeds and dust, which may happen to be in the hay, from getting into the frames among the plants. If the bed be high, in covering up steps or short ladders must be used by those whose office it is to cover and uncover; and great care must be taken not to break or injure the glass."

Air.—Abercrombie directs to "admit air every day when the weather is moderate, without much wind; and always more freely on sunny days, than when cloudy or cold and frosty. Open the lights behind, only a little at first, sooner or later in the day, according to the temperature of the season; increasing the opening from about half an inch to 1, 2, or 3 inches, or very little more (decrease the opening occasionally, if the weather in the early part of the season changes very cold); and shut close in the same gradual order towards afternoon, generally shutting close in the evening, unless in the early state of the bed, a considerable heat and steam continues. In this case you may occasionally leave open about half an inch, hanging the end of the mat before each opening." M'Phail says, "A cucumber plant delights in a strong heat, and in sweet wholesome air; but if the air in which it grows be contaminated, unhealthy, or impure, the plant will not continue long in a healthy flourishing condition. Whatever is disagreeable to the smell becomes in time hurtful to the cucumber plant; therefore whoever would wish to know if the air in a cucumber frame be in a healthy nature for the plants, should smell to it." He adds, in giving and taking away the air, do it gradually, that is, by little and little at a time, which without doubt is the best way: for sudden changes are always attended with unpleasant consequences. A due proportion and continual supply of fresh air is at all times necessary, and more or less is required according to the heat of the linings, the temperature of the weather, and the thickness of the coverings put on at nights. Gard. rememb. p. 42. Nicol admits air regularly in as large portions as the state of the weather will allow, being careful to let off rank steam, if it abound, by leaving a tilt, even in the night. Mills says, "My usual time of giving fresh air to the frames, and permitting the foul to escape, in the winter months, (that is, from the middle of November to the middle of February,) is as follows: between 8 and 9 in the morning I raise the lights, and let the confined air pass off, shutting them again; about 10 I give a little air; at 11 more; at one I lower the lights a little, and between 3 and 4 I close them entirely. About two hours after the covering of hay has been put on, I give a little air for the night. Should the weather be changeable, the lights must be raised or lowered more or less, as circumstances may require; but some air about the times of the day above mentioned is absolutely necessary to keep the plants in a free growing state."

Water.—"Give necessary waterings with water warmed to the air of the bed, mostly in the forenoon of a mild day, in early forcing; and in the morning or afternoon in the advanced season of hot sunny weather."—Abercrombie. M'Phail says, "The quantity of water requisite to be given to the plants depends upon the heat of the bed, the strength and age of the plants, and also on the temperature of the weather. When the weather is cold, wet, and gloomy, and the air moist, they require less water than when the weather is clear, and the air more dry. If too much water be given, or if water be given too often, it will hinder the fruit from setting and swelling kindly; and if too little water be given, the plants will grow weak, and the fruit hollow. I seldom watered the plants with water warmer than 85°, nor colder than 65°; although in general I tried by the thermometer the warmth of the water I used, yet it is not necessary so to do. A good way to know if the water be of a proper temperature is to take a mouthful of it, and when it feels neither hot nor cold, then it is in a fit state for accelerating the growth of the plants, or for making them grow fast. I made a constant rule never to water the plants but with clean sweet water; and if the water be clean and sweet, I am of opinion it makes little or no difference whether it be pump water, spring water, rain water, or river water. However, it is a good quality in water to bear soap, and make a lather therewith, which rain and river water readily do; but the pump and spring waters are found too hard to do it, yet this may easily be remedied in them, by letting them stand a few days in the open air, and sun's rays. With regard to the time of the day in which the watering ought to be performed, I think it is not material, nor did I ever make any rule with respect to the time, but gave them water at any hour of the day, when I saw they stood in need of it, and when it best suited my conveniency. Those who have hot-houses may get their water warmed there, and those who have no hot-houses may get some from the house, or from some other place where water is frequently heated. One gallon of hot water will properly water several gallons of cold water." Tate says "in spring and in the summer months the water may be warmed by exposure to the rays of the sun." Nicol airs his water "by some means or other;" waters once in two or three days after planting, and liberally from the rose of the watering pot as the plants advance. The time chosen is the afternoon about 4 or 5 o'clock, in order not to scorch the plants, which, he says, often happens, when, after morning waterings, the sun's rays suddenly dart on the plants. Kal. p. 366—385. J. Mearns, already mentioned, uses water impregnated with sheep's dung, as does Mr. Knight. Mearns tried this water first "on some cucumber plants in the pine stove, which had been planted in January, but which in consequence of dull weather had become weak, and of a pale green colour; he applied the liquor to the roots, and in a few days a great change in the appearance of the plants was produced; the foliage assumed a hardy green, the shoots acquired an unusual degree of strength, with short joints, and although the stove had scarcely any air given to it, yet the fruit swelled rapidly, and attained a large size." These plants continued in bearing till May, and were then cut back to within 6 inches of the root, when they started again with vigour. "No water was ever given over the leaves, but a continued supply of the liquid pigeon-dung manure to the roots." Mearn. ex Loud. ency. Gard. p. 635. For Mills's practice as to watering see his process under temperature.

Earthing.—"Observe," says Abercrombie, "in proper time when the first heat of the bed is moderate, to begin adding more earth between the hills, as the extending roots require to be

covered, or the runners to be supported with mould; raising it by degrees equal with the tops of the hills, all in level order from 8 to 10 inches thick." Pract. Gard. p. 72. Nicol, "by the time the plants have sent out runners, and the roots spread quite over the hills, enlarges them; beginning by stirring up the earth in the other parts of the frame to its full depth with a hand-fork or weeding-iron, breaking it fine if anywise caked by the heat. To this add fresh mould, sifted or finely broken, and in a dry state, so as to raise the surface nearly to the level of the hills; laying it in a sloping manner from back to front. Previously he rectifies the position and level of the frames, and raises them so that the glass may be eight or nine inches above the mould in the centre." Kal. p. 367.

Training.—To force the cucumber into early fruit, Abercrombie directs to "stop the runners as soon as the plants have made two rough leaves; as the bud that produces the runner is disclosed at the base of the second rough leaf, it may be cut off or picked out, or if the runner has already started it may be pinched off close. This is called stopping at the first joint, and is necessary for a stronger stocky growth, and an emission of fruitful laterals; and from these other prolific runners will be successively produced. The vines, without the process of stopping, would generally be both weaker, and so deficient of fertile runners, that they would sometimes extend 2 or 3 feet without showing fruit. When plants which have been once stopped have extended the first runners to three joints without showing fruit, they are to be again stopped for the purpose of strengthening the plant, and disposing it for bearing. As fertile runners extend, train them out regularly along the surface, fastening them down neatly with pegs." M'Phail stops his plants when they have two joints; and "when the plants shoot forth again after the second stopping, they seldom miss to show fruit at every joint, and also a tendril; and between the tendril and the showing fruit, may clearly be seen the rudiment of another shoot, and when the leading shoot has extended itself fairly past the showing fruit; so that in pinching off the tendril and the shoot, the showing fruit is not injured. This stopping the leading shoot stops the juices of the plant, and is the means of enabling the next shoot (the rudiment of which was apparent when the leading shoot was stopped,) to push vigorously, and the fruit thereby also receives benefit. When the plants are come into bearing, if the vines are suffered to make two joints before they are stopped, at the first of these joints, as I before said, will be seen showing fruit, a tendril, and the rudiment of a shoot; but at the second joint there is seldom to be seen either showing fruit or the rudiment of a shoot; but only a tendril, and the rudiments of male blossoms. It is therefore evident, and but reasonable, that the shoot should be stopped at the first of these joints; for were the shoot to be let run past the first joint, and stopped before the second, perhaps no shoot would ever spring forth at the said second joint, but only a cluster of male blossoms or leaves, which would serve for no good purpose, but would rather exhaust the juices of the plant, which ought to be thrown into the productive parts of it. If the plants are suffered to bear too many fruit, that will weaken them, and in such case some of the shoots will lose their leaders, that is, the rudiments of some of the shoots will not break forth, the numbers of fruit having deprived them of their proper share of the vegetative juices. The rudiments of some of the shoots may also be injured by accident, which sometimes prevents their pushing; but from whatever cause this happens it matters not, for by the losing of its leader the shoot is rendered unfruitful, and therefore should be cut entirely off. In the course of the spring and summer months, several shoots break forth here and there from the old ones. When too many break out, cut off the weakest of them close to the old shoots, and those which remain, with regard to stopping, serve nearly in the same manner as young plants. If the old shoot from which the new one bursts forth lie close to the moulds, it sometimes sends forth roots from the same joint from which the young shoot proceeded, by which the young shoot is much invigorated, and the old plant in some measure renovated. When this young plant is fairly formed on the old shoot, it somewhat resembles a young plant formed and struck root on a strawberry runner; and if the shoot were to be cut off on each side of the newly formed plant, and no part of the plant left in the frame but itself, by proper treatment it would soon extend itself all over the frame. In winter, when the plants are young, and before they come into bearing, it sometimes happens that they send forth too many shoots; in that case, cut the weakest of them off, not suffering them to become crowded and thick of vines, for that would weaken, and prevent the plants from bearing so early as they ought to do. Keep the leaves of the plants always regularly thin. The oldest and worst of them cut off first, and cut off close to the shoot on which they grow. This is necessary and right, for if any part of the stalk of the leaf were to be left, it would soon putrify and rot, and perhaps destroy by damp the main branch from which it proceeded." Nicol. "Cucumber plants will put out runners or vines, whether the heart-buds be picked out or not, which is a matter of trivial concern, although much insisted on by some, as being necessary to their doing so at all. For my own part I never could discover any difference, and I have repeatedly made the comparison in the same bed, which otherwise of course could not be fair. When the vines have grown to the length of 4 or 5 joints, and if fruit appear on them, they may be stopped at one joint above the fruit; but otherwise, they may be allowed to run the length of 7 or 8 joints, and may then be stopped, which will generally cause them to push fertile shoots. These should be regularly spread out, and be trained at the distance of 8 or 10 inches apart."

Pruning and training cucumber plants.—W. P. Vaughan, (Gard. mag. 7. p. 462.) considers the productiveness of cucumber plants as depending principally on pruning, and the age of the seed; his system of management is therefore as follows. As he saves a few seeds annually he has always some three years old; these he sows in shallow pans in a dung heat not under 70°, and by the time the plants have spread their seminal leaves, he has soil and 32-sized pots ready dried in the frames, and plants them so as they will just reach over the rim of the pot when planted 3 or 4 in each pot, making them form a triangle or square; he then fills the pots to within half an inch of the top, waters them, and keeps them in a brisk heat of from 65° to 75°. And as soon as they have spread their first rough leaves, he picks out the leading bud from each plant close to the second leaf, and in a few days afterwards each plant will put forth two shoots, and they are ready for plunging in the hills without breaking the balls of earth, that is, one potful in each hill. When the lateral shoots have made two joints, they must be stopped at the second as before, and pegged down with a piece of straight stick, 6 inches long, broken half through in two places, so as to form a square. Each shoot will now produce two more, which never fail to show fruit at the first joint, and must be stopped at the second, which operation must be done to all as they make two joints. Picking off the male blossoms and setting the fruit, as they open, should be done in the morning just before the sun comes strong on the frames, until the weather will admit of the lights being open a great part of the day; watering should also be performed at the same time, shutting the frame close for a few minutes after. Cuttings taken from the tops of the shoots about 4 inches long, and planted in a pot deep enough to admit a flat pane of glass on the top, will strike freely, and these plants so produced will come into bearing

sooner than those raised from seeds, but they are not of so long duration.

Upright training.—"Cucumber plants being climbers by means of their tendrils, some branchy sticks being placed to any advancing runners, they will ascend and produce fruit at a distance from the ground, in a clean growth, free from spots, and well flavoured."

Setting the fruit.—"The cucumber," Abercrombie observes, "bears male and female blossoms distinctly on the same plant. The latter only produce the fruit, which appears first in miniature, close under the base, even before the flower expands. There is never any in the males; but these are placed in the vicinity of the female blossoms: the fruit of which will not otherwise swell to its full size, and the seeds will be abortive. The early plants under glass, not having the full current of the natural air, nor the assistance of bees and other winged insects, to convey the farina, the artificial aid of the cultivator is necessary to effect the impregnation. At the time of fructification watch the plants daily; and as soon as a female flower, and some male blossoms are sufficiently expanded, proceed to set the fruit the same day, or next morning at farthest. Take off the male blossom, detaching it with part of the foot-stalk. Hold this between the finger and the thumb; pull away the flower leaf close to the stamens and anthers, which apply close to the stigma of the female flower, twisting it a little about, to discharge thereon some particles of pollen or fertilizing powder. Proceed thus to set every fruit, as the flowers of both sexes open, while of a lively full expansion, and generally perform it in the early part of the day, using a fresh male if possible for each impregnation, as the males are usually more abundant than the female blossoms. In consequence the young fruit will soon be observed to swell freely. Cucumbers attain the proper size for gathering in about 15, 18, or 20 days from the time of setting, and often in succession for 2 or 3 months or more in the same bed by good culture. The above artificial operation will be found both necessary and effectual in forcing the cucumber, between the decline of autumn and May, while the plants are mostly shut under glass. In plants more fully exposed to the free air, in the increasing warmth of spring, and in having the full open air in summer, from June and July till September, the impregnation is effected mostly or wholly by nature. The male flowers being by some ignorantly denominated false blossoms, are often plucked entirely off as useless, under the notion of strengthening the plant; but this should not be generally done. Where crowded too thick in clusters, some may be thinned out moderately; but their agency being absolutely necessary in fertilizing the females, they should only be displaced as they begin to decay, except where they are superabundant."—"It is the female blossoms of flowers," M'Phail observes, "that bear the fruit; but if they were not to be impregnated by the male flowers they would prove barren and unfruitful. The female blossoms are easily to be distinguished from the male ones, for the rudiment of the fruit is apparent at the bottom of the female flower, and the flowers have no stamina, but have three small pointed filaments, without summits; whereas the male blossoms have not any rudiment of fruit about them, but in the centre of the flower are three short stamina, which are inserted in the corolla. When the female or fruit blossoms are in full blow, take the male blossom which is in full blow, and holding it in one hand, with the other split and tear off the corolla, taking care not to part the stamina or male parts. Then hold the male blossom thus prepared between the finger and thumb of the right hand, and with the left hand gently lay hold of the female blossom, and holding it between the two fingers, put the prepared male blossom into the centre of the female blossom, and there the farina or pollen of the anthers clings or sticks to the stigmas, and thus the impregnation of the fruit is effectuated, and the plants are thereby rendered fruitful, which, being in frames in a climate by art made for them, would otherwise in a great degree be rendered barren and unproductive; and which I have frequently known to have been the case, even when at the same time the plants were in a vigorous flourishing state. Generally leave the prepared part of the male blossom sticking in the centre of the female one, and take a fresh male blossom to every female blossom. But if the male blossoms run scarce, which seldom or never happens, make one male blossom do for two or three females." Nicol states, that cucumbers will grow and will arrive at full size without the female flowers being impregnated: the seeds, however, will prove abortive. The directions he gives for impregnating are in substance the same as those of M'Phail. The fruit being set and swelling, some lay fragments of glass or slate beneath it in order to keep it clean, and to admit as much air and light as possible to the under side, so as to cause its approach in greenness to the upper.

On keeping a fine bloom on cucumbers.—The art of producing and keeping a fine natural bloom on cucumbers, either for a gentleman's table for show, or for the market, merits great attention, both as to the perfect appearance of the fruit, and also to the general culture of the plant, after the fruit is set. From that time a strong bottom heat should be given with dung linings; or, if late in the spring, short grass laid round the frame on the dung, will cause a very strong heat. Water ought then to be given plentifully, always at the back part of the frame; and at no time should the plants be watered over their leaves, when the fruit is wanted for its fine delicate bloom and long regular shape. A fine foliage over all the bed is likewise a very essential point; and leaves should never be picked off near the fruit, as it thereby deranges the juices of the plant, and consequently the fruit does not swell off finely. Air also should be given very sparingly in the middle of the day, even in bright sunshine, and generally there should be a little left in the night, when the bottom heat is very strong, as by that means the air in the frame is kept sweet. When the fruit is fit to eat, for any of the above purposes, great care should be taken to pack it in narrow wooden boxes, in the largest nettle-leaves that can be got, filling up the interstices with well-beaten moss, and covering over with soft leaves of any kind. It may then be sent to a great distance with a fine bloom, and, upon the whole, in a perfect state.—Geo. Fulton, ex Loud. gard. mag. 6. p. 709.

Gathering the crop.—Cucumbers are used green and unripe, and before they have attained their full size. They are cut and gathered when 4, 5, 6, or 8 inches long, according to the kinds. To this size they attain in 10 days or a fortnight in the best part of the season.

To save seed.—"Select some best summer fruit, from good productive plants, which permit to continue in full growth till they become yellow. Then cut them from the vine, and place them upright on end in the full sun for 2 or 3 weeks, when they may be cut open, and the seed being washed out from the pulp, spread it to dry and harden; then put it up in papers and bags for future sowing. It will remain good many years; and seed of 3 or 4 years' keeping is preferable for early frame crops."

On forcing cucumbers.—In growing cucumbers under lights, "the most obvious defects," according to Mr. Allen, "are compost of too light a quality," and "dung not sufficiently worked before it is earthed over." Mr. Allen has been in the habit of growing early cucumbers under frames, on common dung-beds, for twenty years, always producing abundance of fruit from March till October. In 1823 he worked 70 lights for the London market, the produce of which was 3360 cucumbers, or 4 dozen to a light, "a greater product than is usually obtained

by any of the ordinary methods of treatment." The beds are made in December or January, the hot horse-dung having been previously turned and watered 5 or 6 times. Before earthing it, round flat mats, about 15 inches in diameter, formed by coiling up a band of straw, 1 inch in diameter, and 10 feet long, are to be prepared and placed on the dung, under the centre of each light. Rye straw is preferred for these mats, as it does not encourage mice. A bushel of compost, consisting of loam and rotten dung, is placed on each mat, and 1 plant in preference to more, on the top of each hillock; the top of the plant should be left about 3 inches from the glass; the mould should then be dressed up round the hillock, and be pressed close to the roots, and within 1 inch of the seed-leaves of the plant; these, at no time of earthing, should be covered, for this is very apt to cause canker. The earth should be kept within the bounds of the straw mat, and not be suffered to mix with the dung, as that would cause a burning, which is not only troublesome, but in many instances fatal to the prosperity of the plant; because if the earth is once burnt, its vegetative quality is destroyed, and water will have no effect on it. The only remedy in such a case is to remove the mould, fork up and water the dung, lay on a little rye straw, and replace the earth. After ridging out, from one quarter to one inch of air is given in the day, and about one quarter during the night. The covering must be very slight for the first 3 or 4 weeks, and must not hang over the sides. "The heat must be kept up by augmenting the linings once a-week, turning over and watering them when they heat so as to become dry. The bed inside the frame will require forking up about 9 inches deep, 3 times a-week; the hillocks at the same time should be examined, and a round pointed stick, of about an inch in diameter and 18 inches long, must be thrust about 12 inches in the dung, under the straw mat, making 5 or 6 perforations under each hillock. Into each of the holes so formed, pour from the spout of a watering-pot as much water as the state of the bed seems to require; this may be ascertained from the facility with which the perforator goes into the bed. If the bed is husky or burning, the stick will go in with difficulty, and then a large pot of water is required to a hillock; on the contrary, if the bed is in a free state of working, the perforator will go into it very easily, and then a sprinkling from the rose of the pot will be sufficient." A great object of Mr. Allen seems to be to sweeten, rot, and moisten the dung under the frame for the roots of the plants, while the heat is principally supplied by the linings. "The dung," he says, "from the continued forking and watering, will become in a fine state to receive the roots of the plants; these, after passing through the proper depth of compost, placed over the dung, which is about 8 inches, will readily strike into the dung, and bear a productive crop of cucumbers throughout the summer, without their leaves flagging or requiring any shade. For ascertaining the proper periods to make additions to the earth, the best criterion is the appearance of the roots through the sides of the hillock. This should be earthed over about 3 inches, each time forking out the dung 2 inches below the mat, to give a greater depth of earth each time of performing the operation. The last time this is done, the depth of mould at the back of the frame should be 20 inches. It will be necessary to raise the frame and lights as the plants advance in growth." Water should be given plentifully 3 times a-week, without wetting the leaves or fruit, "pouring it against the back of the frame, for the mould will dry faster against the back than the front, in consequence of the heat being there greater, and the air being admitted there." "In pruning, the runners should not be cut or thinned out, the tops only should be pinched, and at every joint, beginning where the plant has 2 rough leaves, and the second rough leaf is about an inch in diameter. That will cause the plant to produce fruit and a fresh runner in succession at every joint; it will likewise add to the strength of the plant." Pinch off the tendrils and male blossoms, and fecundate artificially in the early part of the season. The sort of cucumber which Mr. Allen finds most productive is the *Southgate*, and he prefers seed 3 or 4 years old to new seed.—Loud. gard. mag. vol. 1. p. 416, 417.

Insects and diseases.—The thrips sometimes attack early cucumbers, and are to be destroyed by fumigation. The red spider rarely makes its appearance; when he does water must have been improperly withheld. Some soils produce canker in the shoots, especially where they branch from the main stem. When this is the case, the only resource is to renew the soil and the plants.

Growing the cucumber under hand-glasses.—The following method is given by M'Phail as that generally practised: "The seeds are sown some time about the middle of April in a cucumber or melon-bed, and when they come up, they are potted out into small pots, 2 or 3 plants in each pot, and are kept properly watered, and stopped at the first and second joints. About the middle of May, a warm situation, where the mould is very rich is pitched on, and a trench is dug out about 2 feet deep, 3 feet broad, and the length is proportioned according to the number of glasses it is intended for. This trench is filled with good warm dung, and when the dung has come to its full heat, it is covered over with 8, 10, or 12 inches' depth of rich mould. The glasses are then set upon it about 3 feet distant from each other, and when the mould gets warm under them, the plants are turned out of the pots with their balls whole, and plunged into the mould under the glasses, and a little water given them to settle the mould about their roots, the glasses set over them, and after they have made roots, and begin to grow, in fine days the glasses raised a little on one side, to let the plants have the free air; and as the weather gets warmer and warmer, air is given more plentifully to harden the plants, so that they may be able to bear the open air and run from under the glasses. When the plants begin to fill the glasses, they are trained out horizontally, and the glasses are set upon bricks or such like, to bear them from the plants. After this the plants require nothing more but to be supplied with water when the summer showers are not sufficient, and to stop them when they run too thin of branches, and thin them of leaves or branches when they are likely to become over-crowded. In warm summers and in warm situations, by this mode of management, the plants will bear plentifully for about 2 months, provided they be not attacked by insects or weakened by diseases." Abercrombie describes the practice somewhat different, but with his usual detail and order. He says, "To have a general summer crop, to fruit in hot-bed ridges under hand-glasses, sow some seed of the long prickly kind in a hot-bed, under a frame or hand-glass, or in any cucumber hot-bed in cultivation, about the middle of March, or thence till the middle of April. When the plants have been up 3, 4, or 5 days, prick some in the same or another hot-bed, 3 or 4 inches asunder. A portion may be put in small pots, 3 plants in each, and plunged in a bed. Give water, and shade from the sun till they take root; and manage as for the frame crop. In 3 or 4 weeks, when advanced in the first rough leaves, about 2 inches broad, and stopped at the first joint as directed in the early crop, the plants should be ridged out, that is, transplanted into hot-bed ridges, under hand-glasses, to remain for fruiting. The period for this may fluctuate from the middle of April to the beginning of May. Having a sufficient quantity of prepared dung, make a hot-bed on the level ground, $3\frac{1}{2}$ or 4 feet wide, and $2\frac{1}{2}$ feet high, the length as required, according to the number of hand-glasses intended. Earth it at top 6 or 8 inches thick, and place the hand-glasses along the

middle at $3\frac{1}{2}$ feet distance. Sometimes the bed is made in a moderate trench, 12 or 15 inches deep, in some good soil in the kitchen-garden, in order to have the excavated earth of the trench ready at hand for moulding the bed. When the earth under the glasses is warm, proceed to put in the plants, removing them from the nursery-bed, with as much earth as will adhere about the roots. If you have any plants in small pots, turn them out with the ball entire, and plant 3 plants under each glass. Give a light watering; put down the glasses, and shade the plants from the sun, till they have taken root, after which let them enjoy the sun and light fully, only covering the glasses and bed every night with mats till June, or commencement of warm weather. Admit air every mild day, by propping up the southward side of the glasses 1 or 2 inches; moderate waterings will be necessary twice a-week or oftener. As the plants push runners of considerable length, train them regularly. When extended to the limits of the glasses, and when the weather is settled warm, about the beginning or middle of June, they should be raised upon 3 props 2 or 3 inches high, and the runners trained out in regular order, but cover them on cold nights with mats, for the first week or two. Continue the glasses, and circumspectly water in dry weather, as may be necessary; the plants will produce fruit in June, July, August, &c. in plentiful succession. To obtain a crop from hot-bed ridges, under hand-glasses, you may, in default of plants raised in a previous nursery-bed for transplanting, sow seed under the glasses in April or May, inserting several seeds in the central part under each glass. When the plants have been up a few days or a week, thin them to 3 or 4 of the strongest in each patch, managing them afterwards as the others. They will come into bearing towards the end of June or July, and thence to September. (Should there be a scarcity of dung to make a regular bed,) in the last week of April, or in May, you may dig circular holes 2 feet wide, a spade deep, and 4 or 5 feet asunder; fill them with hot dung, trodden down moderately firm, and earthed over 6 inches. In these put either plants or seed, and place on the glasses; the plants will produce fruit in June or July till September. (In default of hand-glasses,) make a hot-bed, or holes of dung, as above, in May; put in plants or seed, and defend with oiled paper frames, to remain constantly, day and night, till settled warm weather in June or July. Give the additional protection of mats over the paper frame in cold nights and bad weather. In the culture of all the crops, give proper supplies of water in dry warm weather, 2 or 3 times a-week, or every day in the hottest season of June, July, and August. In the hot-bed ridges, made above ground in April or May, if in 3 or 4 weeks or more after making, the heat be much declined, and the nights or general season remain cold, let a moderate lining of hot dung be applied to the sides, which will both throw in a reviving heat, and widen the bed for the roots and runners of the plants to extend."

Cultivation of the cucumber in a flued pit.—Nicol says, "Those who would have cucumbers on the table at Christmas (a thing sometimes attempted), will find it more practicable, and less troublesome, if the plants be grown in a flued pit, in the manner of late melons, than if they be grown in a common hot-bed. In this case the cucumbers should take place of the melons planted in this compartment in July, and which will, by the middle or end of the month, have ripened off all their fruit of any consequence. The seeds of some of the early sorts (those best for early being also best for late) should be sown in small pots about the first of the month, and should be placed in the pit along with the melons, or under a hand-glass, on a slow dung heat; where let the plants be nursed, and be prepared for planting about the second or third week in the month, as hinted at above. Observe to sow old seeds, not those saved this season, which would run more to vine than to fruit. Let the pit be prepared for their reception, by trenching up the bark or dung, and by adding fresh materials, in so far as to produce a moderate growing heat; observing the directions given for preparing the pit for the melons in July, and moulding it (however with proper cucumber earth) all over to the depth of a foot or 14 inches. The plants may be placed closer in planting them out than is necessary in a spring hot-bed. They may be planted at the distance of a yard from each other, and 2 rows lengthwise in the pit, as they will not grow very vigorously at this late season. They should be moderately supplied with water once in 4 or 5 days, and should always be watered over the foliage, the more especially when strong fire-heat becomes necessary, as cucumbers naturally like a moist rather than a dry heat. The temperature should be kept up to about 64° or 65° in the night, by the aid of the flues, and by matting, or otherwise covering the pit. Air should be as freely admitted as the state of the weather will allow, and so as to keep the mercury down, in sunshine to about 70°. The plants will require little other pruning than to stop the vines, as they show fruit at the joint or two above it; for they will not push many superfluous shoots. Observe to pick off all damped leaves as they appear; and otherwise carefully attend to them, as above directed, while they continue to flourish, or to do any good worthy of such attendance."

Cultivation of the cucumber in M'Phail's brick-bed pit.—"When I used," observes M'Phail, "to cultivate cucumbers on a dung-bed, the fruit were sometimes watery and ill-tasted; but after I began to cultivate them on a brick bed, the fruit were constantly firm and well-flavoured, which is certainly occasioned by the goodness and wholesomeness of the food with which the plants are fed or nourished." M'Phail's pit has many advantages over a common hot-bed: there is no chance of burning the roots of the plants in it, the linings being placed all on the outside, without any dung underneath the plants. "All the materials of my newly-invented bed are clean and sweet; and the flues being made perfectly close, no tainted or bad-smelling air can get through them into the bed; so that it is of little or no concern whether the dung of the linings be sweet or otherwise, or whether the linings be made of dung or of any thing else, provided there be a sufficient heat kept in them, and no pernicious steam be drawn in among the plants by the current of air." A sheltered dry situation is of the first consequence for this pit. The bed being built, "when the frame is about to be set upon it, a layer of mortar is spread all round upon the upper course of brick-work, on which the bottoms of the frames are to rest. Thus the frames are set in mortar on the bricks; and the flues are, with a bricklayer's brush, well washed, and rubbed with a thick grout, made of lime and water, which stops every crack or hole, and prevents the steam of the linings from getting into the frames. This washing of the flues I had done once a-year, for no crack or hole must ever be suffered to remain unstopped in the flues. I found little or no trouble in keeping the flues perfectly close, nor is it indeed likely that they should become troublesome, if the bed stands on a sound foundation, for the heat of the dung has not that powerful effect on the flues, as fire-heat has on the flues of the hot-house; because the heat of dung is more steady and not so violent as the heat of the fire, and, besides, the flues of a cucumber-bed are almost always in a moist state, which is a preventive in them against cracking or rending. When the bed is first built, the pits are about 3 feet in depth below the surface of the flues. The pits I had filled up about a foot high, some of them with rough chalk, some of them with small stones, and some of them with brick-bats; this is to let the wet drain off freely from the mould of the beds. After this filling up with chalk, stones, and broken

bricks, there is a vacancy in the pits, about 4 feet deep below the surface of the flues; this vacancy I had filled to a level with the surface of the flues, with vegetable or leaf mould; and in putting it in, it was gently pressed, to prevent it from sinking too much afterwards. On the surface of the mould with which the pits were filled, under the middle of each light, and which is just in the centre of the mould in each pit, make hills of mould, in the same form as is commonly done on a dung-bed. These hills are to set the plants in, and are to be raised at first nearly close to or within a few inches of the glass. Raising the mould at first pretty nigh the glass is necessary, on account of the sinking of it; for as the frames are set on bricks, they cannot sink; but mould newly put in is sure to settle, and the measure of the settlement will ever depend upon the lightness and texture of the mould with which the pits are filled. Therefore, these and such-like matters must be left to the discretion of those who are intrusted with the direction and management of the frames. When the bed is thus finished, and ready for the reception of the plants, if the flues be strewed over with mould, so that their surface be just covered, to a stranger it is altogether a deception, for in every respect it has the appearance of a dung-bed. The sashes of the frames which I used were glazed in lead; but if any person who rears early cucumbers have lights which are not glazed in lead, but are slate-glazed, the vacancies between the glass had best be filled up close with putty, to prevent too much air from getting into the frames in the cold days of winter. The frames under my management were constantly kept in good repair, and painted over once every year. This method, I am clearly of opinion, is more profitable than if the frames were neglected for 2 or 3 years, and then have a thorough repair, with 2 or 3 coats of paint. When frames are new painted, they should be suffered to lie and sweeten for some time, at least for 2 or 3 weeks, or until the disagreeable smell of the paint is somewhat lessened. Although the frames I used were of a very good size, yet if they were a little smaller or larger, they would answer the purpose very well. Therefore those who intend to build a bed after my plan, have no occasion to make new frames merely for the purpose, but they may get the bed built to fit the frames they are already in possession of. The linings are to be applied to the bed a few days before the plants are ready for finally planting out, in order that the mould and every thing in the frames may be properly warmed for their reception. The dung, of which the linings are to be made, may either be cast together into a heap, to bring it to a heat before it be laid round the bed, or it may be laid round the bed as it is brought from the dung-yard; but whichever of these methods be taken, when the linings are making up, the dung should be well shaken, and laid up lightly, so that the heat of it may come up freely. As it takes some days before the linings are able to warm the earth in the bed sufficiently for the reception of the plants, the rank steam of the new dung linings is evaporated, unless the dung came immediately from the stables, which seldom is the case. The linings are to be made nearly 3 feet broad in their foundation, and tapered up to about 30 inches at the top, by which they will retain their heat long, and in sinking will keep close to the bed, which is what should at all times be paid proper attention to. In the winter and spring months, the linings should be trodden upon as little as possible, for treading on them would be the means of stagnating the heat. But should it at any time, in managing the plants, be found necessary to stand or kneel upon them, boards should be laid on their tops for that purpose; which will prevent the weight of a person from taking that effect on them which it otherwise would do. As the linings sink they are to be raised with fresh dung, but they should seldom be raised higher than the level of the mould in the frames on which the plants grow, especially when there is a strong heat in them; for when there is a great heat in them, if they are kept higher than the level of the mould, the heat dries the air in the frames too much. Nor should they be suffered to sink much below the level of the mould in the frames, for that, on the contrary, would cause too much moisture in the frames, especially in the winter and spring months. When the heat begins to be too little, notwithstanding the linings being kept to their proper height, the fresh unexhausted dung underneath should be taken away, and that which was laid aside put in the foundation, and fresh dung laid above it, in lieu of that which was carried away. Both the side linings may be raised at one time, but both of them should never be renewed together; for if both were to be renewed at the same time, it would for a time cool the frames too much, and when the heat of both came to their full strength, it would probably be too powerful to the roots of the plants when extended to the flues. I seldom or never renew the end linings, because I found the heat of the side ones fully sufficient; for as there are flues or vacuities in every part of the bed, the steam being fluid, circulates in and warms every part thereof. And for the very same reason there is no occasion for having a strong heat in both the side linings at one and the same time, except in very cold weather. In making up and pulling down the linings, care should be taken not to injure the brick-work. The covering the lights in the winter and spring is absolutely necessary; for, notwithstanding the heat of the linings, it would be impossible to keep up a proper degree of heat in the frames for the plants without covering. Therefore, the covering up in the evenings and uncovering in the mornings must be particularly attended to, and more or less put on according to the heat of the linings and temperature of the weather. After the bed is set to work, heat and sweet moisture are the two principal agents required for promoting the growth and vigour of the plants; therefore if there be a heat kept in the linings, strong enough to keep the heat in the centre of the pits of mould fluctuating between 80° and 90°, cold water may be poured on the flues twice or thrice a week. There is no danger of creating damps or impure air in the frames by watering the flues; for the water is no sooner poured on them, than it runs down their sides, and passes clear off through the drains of the bed; consequently, water being poured upon the flues, gives only a momentary check to the heat of the frames; for the flues being at all times full of hot steam, when the watering is finished, the heat quickly resumes its former vivacity, and raises a warm vapour in the frames, well adapted for promoting vegetation, and for increasing the growth, and invigorating the plant in all its parts. The mould round about the sides of the pits close against the inner sides of the flues, should be kept nearly on a level with the surface of the flues, and as it is the mould that joins to the flues which receives the first and greatest heat from the linings, it should be continually kept in a moist state; for if the mould against the flues be suffered to become dry and husky, air will be generated in the frames disagreeable to the plants." In all other respects, the culture of cucumber or melon, on M'Phail's brick-bed, corresponds with the culture of these fruits on common dung-beds. M'Phail has, in his "Gardeners' Remembrancer," as well as in his "Treatise on the Cucumber," given the temperature of one of his beds for every day in the year, of which the following table shows the extremes for every month:—

	morn.	*noon.*	*even.*
January	from 58° to 86°	from 56° to 86°	from 54° to 77°
February	—— 68 — 88	—— 66 — 90	—— 58 — 84
March	—— 62 — 83	—— 65 — 90	—— 62 — 85
April	—— 69 — 84	—— 68 — 93	—— 64 — 90
May	—— 67 — 79	—— 70 — 90	—— 66 — 95

	morn.	*noon.*	*even.*
June	from 62° to 85°	from 80° to 98°	from 67° to 90°
July	—— 61 — 79	—— 72 — 105	—— 69 — 95
August	—— 60 — 78	—— 80 — 96	—— 70 — 89
September	—— 69 — 80	—— 74 — 100	—— 72 — 97
October	—— 64 — 81	—— 71 — 101	—— 68 — 89
November	—— 62 — 82	—— 65 — 92	—— 61 — 80
December	—— 65 — 88	—— 64 — 77	—— 58 — 71

" By the heat described in these tables, and plenty of water, the cucumber plants, the seeds of which were sown on the 22d day of October, were maintained in a healthy fruit-bearing state in the brick frame of my inventing, from the month of January to the beginning of December." The melon plants in the management of the author, were kept in about the same degree of heat which he has given for the culture of the cucumber, in the forcing frames; and he ventures to predict that if any person keep melon or cucumber plants in nearly the same degrees of heat, as is set down in the foregoing plain tables, and manage the plants well in other respects, the way to do which he thinks he has clearly pointed out in this treatise, he is persuaded they will not fail in having success. He adds, that notwithstanding the objections of some who have not been successful in making trial of his bed, " it is now generally approved of, and in practice by numbers of the best gentlemen's gardeners in the kingdom, and by various market gardeners in the neighbourhood of London." West's pit, however, seems superior to M'Phail's, as requiring much less dung, presenting a much more neat and orderly appearance, and giving a greater command of temperature.

Cultivation of the cucumber in a common pit without flues.—Some form a narrow dung-bed along the middle of each pit, leaving room for adding a lining on each side when the heat declines. The method succeeds very well late in the season; but at an early period the sinking of the bed from the glass leaves the plants at a great distance from the light.

Cultivation of the cucumber in stoves.—" Cucumber plants," M'Phail observes, " will grow in a hot-house, where the pine-apple is cultivated; but they will not be very long lived there, for that is not a healthy climate for them." " In August sow the seeds in boxes filled with vegetable or other light earth, and place them on shelves on the back side of the hot-house, where the sun may not be interrupted from shining on them in the short days. They may perhaps produce a few fruit in the month of December or January." Gard. rememb. p. 301. Abercrombie says, " some gardeners, ambitious of early fruit, try a sowing in the stove under the disadvantages of December. Fruiting this plant in the house in narrow boxes 3 feet long, and full 20 inches deep, may be found more commodious than pots. The boxes may stand upon the crib-trellising over the flues, or be suspended near the back wall, 18 inches from the upper tier of lights, so as not to shade the regular house plants: this is the best situation for a very early crop. The plants may be originated in small pots, plunged into the bark-bed, in order to be transplanted with a half ball of earth into the borders. Those who aim to have fruit at Christmas introduce seedlings about the middle of August." " The chief deviation from the course of the hot-bed is, that the plants must be trained in the house upright, for which purpose form a light temporary trellis of laths. Give water every other day at least." Pract. Gard. p. 618. We have already quoted the particulars of Aiton's method of raising cucumber plants in August, with a view to their being fruited in the stove through the winter. We now subjoin the remainder of that paper. " The plants being raised on a well prepared one light hot-bed, when the cotyledons or seed-leaves became nearly of full growth, the plants were potted out, two into each pot, known to gardeners about London by the name of upright thirty-twos. When these pots became filled with roots, the plants were again shifted into larger ones, called sixteens, and removed from the seed-bed into a three light frame, with a sufficient bottom heat to allow a considerable portion of air being given day and night, both in the front and back of the frame. About the middle of September, the plants having again filled their pots with roots, and become stocky, were taken from the frame to the stove, and after a few days received the last shifting into larger pots of the following dimensions: at top 14 inches over, the bottom 10 inches across, and 12 inches deep, all inside measure; each pot at equal distances apart, having three side drain holes near the bottom, and a larger one in the centre of the bottom, and containing about three pecks of solid earth. The cucumber plants were fruited this season in a pinery. On the front edge of the back flue of this stove, a fascia-boarding, 6 inches deep, was affixed the whole length of the building, forming all along a trough or inclosure for a reserve of compost, after the exhaustion of the mould in the pots had taken place. The pots were now placed in regular order upon the mould-trough over the flue at 3 feet apart, and remained in this station for good, for succession. A setting of the second sowing was placed upon the end flues of the house; underneath each pot were set an upright circular garden pan, 6 inches deep, and 14 inches in diameter, which being filled with earth, the pots were plunged therein about 2 inches deep, and the drain holes being sufficiently covered with mould, served as outlets to the roots. From this time the fire heat of the stove was kept day and night at 60° or 65° of Fahrenheit's thermometer, varying only a few degrees when the sudden influences of the sun or steam produced an additional glow of climate. The plants being now established and vigorous, required stopping the laterals and fruit; and these second and third lateral shoots in their turn were stopped also, and the blossoms from time to time set, as usual, for succession of supply. Waterings were necessary only when the surface of the earth was evidently dry, and light sprinklings of soft water, tempered in the stove, were occasionally given over the leaves of the plants and path with good effect. Steam from a well regulated flue was considered always favorable to the cultivation, but applied sparingly on account of its scalding effect upon the leaves, when the vapour proved overheated. For the mildew, flower of brimstone, coloured leaf-green by a little soot, has been applied with the best success in all stages of the disease, and copious fumigations of tobacco were used for the destruction of the several species of the *aphis* tribe. Under this simple practice winter cucumbers have been produced abundantly in the months of October, November, December, and part of January, in all the royal gardens of His Majesty during a series of years." Aiton ex encycl. gard. p. 642, 643.

Cultivation of the cucumber in Week's patent frame.—Only two instances in which this ingenious invention has been tried are known to us, both of which are mentioned at the end of " Week's Forcer's Assistant." The chief objection to it is, that the bed or stratum of earth in which the plants are grown, being but of moderate depth, and surrounded by air above and below, is extremely difficult to retain at an equable moisture. There are several other structures for growing cucumbers and melons in besides those mentioned above; but none of them appear to us to be of much importance.

On a mode of producing a crop of cucumbers during winter.—James Reed, (Gard. mag. 3. p. 23.) places his winter cucumber bed in a vinery. In this vinery the air could be admitted both by the front and top lights. About the 20th of September the cucumber seeds were sown on a moderate hot-bed in the open air, and heated in the usual manner until they were ready to ridge out. This generally happened about the beginning of

November, at which time the shoots of the vines were withdrawn from the house, and a dung-bed formed in the floor of the vinery in the usual way. After placing the frame and mould on the bed, it may be left without the lights until the rank steam has passed off. After this, the plants being placed in the hills, and the sashes put on, the following are the leading features of management during the winter. Make fires in the evening, so as to warm the air of the house to from 56° to 60°, and in very severe frosts it may be raised to 70°. In the mornings of the coldest weather, and shortest days, make a strong fire, so as to raise the heat to nearly 70° when the house is shut up. About 8 o'clock, and from that time to half past 9, give plenty of fresh air, by opening the front sashes and top lights, after which, and during the remainder of the day, give plenty of air to the cucumbers, by tilting the sashes in the usual way. In mild weather, and during sunshine, the lights may be taken entirely off the cucumbers for some hours each day; and immediately after forming new linings, the top lights may be left open a little all night to permit the escape of rank steam. The advantage of this mode of growing cucumbers during winter is, the comparative certainty of an early and good crop at one-third of the trouble and expence of the common method out of doors. By this practice fruit may be cut in January. The vines may be introduced in the beginning of March, and will break beautifully and regularly in consequence of the genial steam of the dung. In April the shade of the vine leaves will have rendered the house too dark for the culture of the cucumber, and as by this time cucumbers are plentiful in the common hot-beds out of doors, the bed in the vinery may be cleared away, and the vines treated in the usual way till the following November.

Common or *Cultivated* Cucumber. Fl. July, Sept. Clt. 1573. Pl. trailing.

4 C. flexuòsus (Lin. spec. 1437.) stems trailing, scabrous, flexuous, cirrhiferous; leaves cordate-ovate, somewhat lobed, denticulated, stalked; flowers in fascicles in the axils of the leaves; calyx very pilose; fruit long, cylindrically-clavate, furrowed, flexuous, replicate, white or yellow. ⊙. F. Native of the East Indies.—Lob. stirp. p. 363. f. 2. Dodon. pempt. p. 66. f. 2. Ger. herb. p. 763. f. 3. Fruit the size of a large pear, eatable, and delicious. It is cultivated about Nagasaki and elsewhere in Japan; is ripe in June, and is called by the Dutch *Banket Melon*.

Var. β, reflèxus (Ser. mss.) leaves angularly-lobed. C. réflexus, Zieh.

Flexuous-fruited or Banket Melon. Fl. May, Sept. Clt. 1597. Pl. tr.

5 C. Jamaice'nsis (Bert. ex Spreng. syst. 3. p. 46.) leaves cordate, 3-lobed, quintuple-nerved, glabrous, quite entire, beset with scabrous dots beneath; lobes acuminated; fruit nearly globose. ⊙. F. Native of Jamaica.

Jamaica Melon. Fl. June, Sep. Clt. 1824. Pl. tr.

6 C. macroca'rpos (Wenderoth ex Mart. reise. bras. ex Linnæa. 5. p. 39.) leaves cordate, rather angular, acutish, sharply-denticulated, scabrous from hairs; fruit oblong, obsoletely striated and spotted, remotely tuberculated. ⊙. F. Native of Brazil.

Long-fruited Cucumber. Pl. tr.

7 C. Cha'te (Lin. spec. 1437.) plant very villous; stems trailing, bluntly pentagonal, flexuous; leaves petiolate, roundish, bluntly angled, denticulated; flowers small, on short peduncles; fruit pilose, elliptic, tapering to both ends. ⊙. F. Native of Egypt and Arabia.—Alp. exot. ægyp. p. 54. t. 40.—Bauh. hist. 2. p. 248. f. 3. The fruit is rather watery; the flesh almost of the same substance with the melon; the taste somewhat sweet, and cool as the water-melon. The grandees and Europeans in Egypt eat it as the most pleasant fruit they have, and that from which they have least to apprehend. With us it is very indifferent. It is most common in the fertile soil around Cairo, after the inundation of the Nile. *Chate* is the Egyptian name of the plant.

Chate or Hairy Cucumber or Melon. Fl. June, Aug. Clt. 1759. Pl. tr.

8 C. Duda'im (Lin. spec. 1437.) plant hispid; lower leaves roundish, upper ones somewhat 5-lobed, cordate at the base, denticulated; tendrils simple; petals ovate-roundish; male flowers having the calyx rounded at the base, the throat dilated, and with the connectives longer than the anthers; hermaphrodite flowers having the tube of the calyx ovate and pilose; stigmas 4-6; fruit globose, smoothish, variegated, rarely warted: with white sweet-scented, but insipid flesh. ⊙. F. Native of Persia. And. bot. rep. t. 548. C. odoratíssimus, Mœnch, meth. 654.—Dill. hort. elth. 223. t. 177. f. 218.—Walth. hort. p. 133. t. 21. The fruit is variegated with green and orange, and oblong unequal green spots; when full ripe becoming yellow, and at length whitish. It has a very fragrant vinous musky smell, and a whitish, flaccid, insipid pulp. *Dudaim* is the Hebrew name of the fruit, rendered *mandrake* in Scripture, which is perhaps *C. prophetàrum*.

Dudaim or Apple-shaped Melon. Fl.Jul.Aug. Clt.1705. Pl. tr.

9 C. Co'nomon (Thunb. jap. p. 324.) plant rather pilose; stem trailing, striated; leaves cordate, somewhat lobed, stalked, rather pilose; flowers small; fruit oblong, glabrous, 6-10-furrowed; flesh firm. ⊙. F. Native of Japan. Fruit larger than a man's head. Flowers aggregate, on rather hispid stalks. This plant is cultivated every where in Japan for the sake of its fruit, which, when preserved, is sold under the name of Connemon, and is a common food among the Japanese. It is also frequently eaten by the Dutch at Batavia, and is sometimes brought to Holland.

Conomon Melon. Pl. tr.

10 C. se'pium (Meyer, prim. esseq. p. 278.) leaves cordate-ovate, somewhat 5-lobed; fruit oval, muricated, acuminated at both ends. ⊙. F. Native of Guiana, in the island of Wachanama. C. angùria, Ræusch, but not of Lin. ex Steud. nom. It differs from our *C. angùria* in the leaves being subpalmate, with angular recesses, and in the fruit being globosely-elliptic.

Hedge Melon. Pl. tr.

11 C. linea'tus (Bosc. journ. hist. nat. 2. p. 251. t. 37.) stem climbing, pentagonal; tendrils trifid, longer than the leaves; leaves cordate, palmate, acutish, serrulated; petioles short; flowers usually twin, almost sessile; female ones having an oblong-ovate calyx, and lanceolate segments; petals ovate, retuse; fruit ovate-oblong, lined with green, 10-ribbed. ⊙. F. Native of Cayenne.

Lined-fruited Melon. Fl. June. Aug. Clt. 1825. Pl. tr.

12 C. propheta'rum (Lin. spec. 1436. amœn. acad. 4. p. 295.) stem trailing, striated; leaves cordate, 5-lobed, denticulated; lobes obtuse; flowers axillary, 2-5-together, stalked; male ones with a campanulate calyx, and obovate petals; calyx of the female flowers globose at the base, 12-striped, and hispid: limb campanulate, crowned by teeth; fruit globose, echinated, variegated, size of a cherry. ⊙. F. Native of Arabia. Jacq. hort. vind. 1. t. 9.—Blackw. herb. 589. C. grossularioìdes, Hortul. The plant has a nauseous odour. The fruit equals the Colocynth in bitterness.

Prophet's or Globe Cucumber. Fl. Ju.Sept. Clt. 1777. Pl. tr.

13 C. Africa'nus (Lin. fil. suppl. p. 423.) stems trailing, angular; leaves cordate, 5-lobed; lobes acutish; peduncles filiform; fruit ovate-oblong, much echinated. ♂. F. Native of the Cape of Good Hope. Lindl. bot. reg. t. 980.—Herm. par. p. 134. t. 36. Flowers small. Very like *C. prophetàrum*.

African Cucumber. Fl. June, Aug. Pl. tr.

14 C. angu'ria (Lin. spec. 1436. but not of Ræusch. ex Steud.

nom.) stems rather filiform, cirrhiferous; leaves palmately-sinuated, cordate at the base, scabrous; flowers usually solitary, size of those of *Bryònia dioíca*; fruit globose, echinated, white. ⊙. F. Native of Jamaica. C. echinàtus, Mœnch, meth. p. 654.—Mill. icon. t. 33.—Pluk. phyt. t. 170. f. 3. Very like *C. prophetàrum*. The fruit of this kind of cucumber is eaten when green by the inhabitants of the West India Islands; but these are far inferior to our common cucumber. The fruit seldom grows so large as a pullet's egg, and is shaped like it; and the rind is closely beset with blunt prickles. It is frequently used in the sugar islands with other herbs in soups, and is esteemed an agreeable and wholesome ingredient in them. *αγγουριον, angourion*, one of the Greek names of the cucumber; hence the specific name.

Anguria or Round Prickly-fruited Cucumber. Fl. June, Aug. Clt. 1692. Pl. tr.

15 C. citru'llus (Ser. mss. in D. C. prod. 3. p. 301.) plant very pilose; stems trailing, cirrhiferous; leaves bluntly pinnate, or many-parted, rather glaucous; flowers solitary, each furnished with one oblong bractea; fruit nearly globose, glabrous, with starry spots. ⊙. F. Native of tropical Africa and the East Indies. Cucúrbita citrúllus, Lin. spec. 1435. Cucúrbita angùria, Duchesn. in Lam. dict. 2. p. 158.—Blackw. herb. t. 157.—Lob. stirp. t. 361. f. 2. Park. Theatr. 771. f. 772.—Rumph. amb. 5. t. 146. f. 1. *Samanka* of the Hindoos.

Var. α, Pastèca (Ser. l. c.) flesh of fruit firm, yellow, but not very watery. This is the *Yellow-fleshed Water Melon* of the English, and the *Pasteque* of the French.

Var. β, Jàce (Ser. l. c.) flesh very watery, reddish. This is the *Red-fleshed Water Melon* of the English, *Melon d'eau* of the French, and the *Jace* of the Brazilians.

The *water-melon* is called *wasser-melon* in Germany, and *cocomero* in Italy. The plant serves both for food, drink, and physic to the Egyptians. The fruit is eaten in abundance during the season, which is from the beginning of May until the overflowing of the Nile, that is, to the end of July. It is the only medicine the common people use in ardent fevers: when it is ripe or almost putrid, they collect the juice, and mix it with rose-water and a little sugar. The fruit should be eaten cautiously by Europeans, especially when taken in the heat of the day; but it is much used within the tropics, and in Italy. The fruit is large, green externally, white fleshed, reddish towards the centre, juicy, and refreshing, but not high flavoured. It is generally considered the melon of the Jews, mentioned in various parts of the Bible. It requires nearly the same treatment as the common melon, but a larger frame to admit its more extended shoots to spread themselves.

Citrul or Water Melon. Fl. May, Sep. Clt. 1597. Pl. tr.

16 C. murica'tus (Willd. spec. 4. p. 613.) leaves cordate and angular, rather hoary; angles rounded; fruit cylindrical, muricated; male flowers aggregate, nearly sessile; female ones solitary. ⊙. F. Native of Tranquebar.

Warted Cucumber. Fl. June, Aug. Clt. 1817. Pl. tr.

17 C. megaca'rpus; leaves palmate; fruit long, ovate, very full of anastomosing fibres, which look like net-work when the fruit is dried up. ⊙. F. Native of Sierra Leone.

Large-fruited Cucumber. Pl. tr.

18 C. pube'scens (Willd. l. c. p. 614.) leaves cordate, rather angular, acutish, sharply toothed, scabrous: fruit, elliptic, obtuse, pubescent, green, painted with more obscure narrow stripes. ⊙. F. Native country unknown. Fruit 3 inches long, elliptic, and an inch thick, obtuse at both ends, covered with fine down.

Downy Cucumber. Fl. July, Sep. Clt. 1815. Pl. tr.

19 C. macula'tus (Willd spec. 4. p. 614.) leaves cordate, obsoletely angular, roundly obtuse, denticulated, scabrous; fruit elliptic, narrow at the base, glabrous, when young painted with broad green stripes; but when mature, white, variegated with green spots; connectives much longer than the anthers. ⊙. F. Native of Guinea. Fruit smooth. Ser. diss. l. c. t. 3.

Spotted Cucumber. Fl. June, Aug. Clt. 1820. Pl. tr.

20 C. colocy'nthis (Lin. spec. 1435.) stems trailing, rather hispid; leaves cordate-ovate, multifidly lobed, covered with white pili beneath; lobes obtuse; petioles equalling the limb of the leaf; tendrils short; flowers axillary, solitary, pedunculate; female ones having the tube of the calyx globose, and rather hispid, crowned by a spreading campanulate limb, and narrow segments; petals small; fruit globose, glabrous, yellowish at maturity, with a thin solid rind, and very bitter flesh. ⊙. F. Native of Japan and Turkey.—Blackw. herb. t. 441.—Sabb. hort. 1. t. 70.—Mor. hist. sect. 1. t. 6. f. 1. Fruit about the size of an orange. The colocynth is a native of Turkey. The fruit is about the size of an orange; its medullary part, freed from the rind and seeds, is alone made use of in medicine; this is very light, white, spongy, composed of membranous plates, of an extremely bitter, nauseous, acrimonious taste. The fruit is gathered in autumn, when it begins to turn yellow, and is then peeled and dried quickly, either in a stove or in the sun. Newmann got from 7680 parts, 1680 alcoholic extract, and then 2160 watery; and inversely 3600 watery, and 224 alcoholic. The seeds are perfectly bland, and highly nutritious; and we learn from Captain Lyon, that they constitute an important article of food in Northern Africa. The extract of colocynth is one of the most powerful and useful of cathartics, but there is no more efficacious way of lessening its violence than by reducing its dose.

Colocynth or Bitter Cucumber. Fl. May, Aug. Clt. 1551. Pl. tr.

21 C. Campechia'nus (H. B. et Kunth, nov. gen. amer. 2. p. 123.) stem cirrhiferous; leaves cordate-roundish, sinuately 5-lobed, toothed; lobes rounded, intermediate one the largest; male flowers racemose, few; tube of calyx villous; fruit unknown. ⊙. F. Native on the shores about Campeachy. Perhaps a variety of *C. prophetàrum*, according to Spreng. syst. 3. p. 47.

Campeachy Cucumber. Pl. tr.

22 C. pere'nnis (E. James, exped. rock. mount. 2. p. 345. and in isis. 1824. p. 235.) leaves triangularly cordate, with undulated margins; tendrils trichotomous; lobes of calyx subulate; fruit orbicular, smooth, usually 4-celled; seeds ovate, gibbous, with an acute margin. ♃. F. Native of or cultivated in North America. Flowers about the size of those of *Cucúrbita Pèpo*. Fruit nearly sessile.

Perennial Cucumber. Pl. tr.

Cult. See culture of the *Cucumber* and *Melon* in the open air in the proper place, for the culture of the rest of the species.

V. LU'FFA (*Louff* is the Arabic name of *L. Ægyptìaca*). Cav. icon. 1. p. 7. t. 9. D. C. prod. 3. p. 302.—Cùcumis species of authors, and Momórdica species of authors.

Lin. syst. *Monœ'cia, Pentándria*. Male flowers yellow, in panicles; tube of calyx hemispherical, with the segments longer than the tube. Petals free, deciduous from being ruptured at the base. Stamens 5, not joined. Anthers very flexuous. Female flowers solitary; tube of calyx oblong-clavated, with the segments shorter than the tube. Stamens almost abortive. Stigmas reniform. Fruit ovate, 3-celled. Seeds 2-lobed at the base, reticulated. Flowers yellow.

1 L. fœ'tida (Cav. icon. 1. p. 7. t. 9.) stem furrowed: leaves cordate, 5-7-angled, scabrous; the angles acute and serrated; tendrils umbellate; fruit mucronate, not crowned by the limb of the calyx. ⊙. F. Native of the East Indies, the islands of Bourbon and France, as well as in many places on the western

coast of Africa, in fields, hedges, and among bushes. Sims, bot. mag. 1638. *Ojong Bulustru* is its Hindoo name.

Fetid Luffa. Fl. June, Oct. Clt. 1812. Pl. tr.

2 L. cordifòlia (Blume, bijdr. p. 929.) leaves cordate, acuminated, sharply toothed, scabrous; flowers dioecious; male ones rather umbellate: female ones solitary; fruit furrowed and wrinkled. ⊙. F. Native of Java, on the mountains, where it is called by the natives *Aroy kajoraajan*, *Aroy Kalayar burriet*, but *Tiwuk* by the Hindoos.

Heart-leaved Luffa. Pl. tr.

3 L. acuta'ngula (Ser. in D. C. prod. 3. p. 302.) stem twisted; leaves cordate, somewhat 5-lobed, acutely toothed; tendrils undivided, or 2-3-cleft; fruit clavate, 10-angled, crowned by the linear calycine segments: the rind hard; seeds flat, roundish-oblong, black and shining at maturity. ⊙. F. Native of China, and plentiful in India near the habitations of the Indians Cùcumis acutángulus, Lin. spec. 1436. Jacq. hort. vind. 3. p. 73, 74. ex Lam. dict. 2. p. 74.—Rheed. mal. 8. t. 7. —Rumph. amb. 5. p. 408. t. 149. *Dringi* is the Hindoo name of the plant. Leaves like those of *Tussilàgo Petásites* or *Vìtis*, with the scent of *Datùra stramònium*. Male flowers umbellate, female ones solitary. Fruit insipid, but is eaten by the natives of India boiled or pickled.

Acute-angled Luffa. Fl. June, Oct. Clt. 1692. Pl. tr.

4 L. Plukenetia'na (Ser. mss. in D. C. prod. 3. p. 302.) leaves cordate, doubly toothed; tendrils 2-3-cleft; fruit obovate, crowned by the marcescent limb of the calyx. ⊙. F. Native of the East Indies. Cùcumis acutángulus β, Lam. dict. 2. p. 74.—Pluk. phyt. t. 172. f. 1.

Plukenet's Luffa. Pl. tr.

5 L. Ca'ttu-picínna (Ser. mss. in D. C. prod. 3. p. 303.) stem tetragonal; leaves cordate, roundish, somewhat 5-lobed, angular; sepals broadly ovate, acuminated; fruit oblong-elliptic, mucronate, lined with warts, and crowned by the calycine segments; seeds ovate. ⊙. F. Native of Malabar.—Cáttu-picínna, Rheed. mal. 8. p. 15. t. 8. Leaves nearly the size and form of those of *Althæ'a ròsea*. Male flowers size of those of *Pæònia tenuifòlia*.

Cattu-picinna Luffa. Pl. tr.

6 L. Ægyptìaca (Mill. dict.) leaves roundish-cordate, lobed; lobes angular, cut at the base, with incumbent margins; tendrils simple; fruit obovate-clavate, 10-angled, crowned by the segments of the calyx. ⊙. F. Native of Arabia. Momórdica Lúffa, Lin. spec. 1433. L. Arábum, Alp. pl. ægypt. p. 199. t. 58.—Mor. hist. 2. p. 35. sect. 1. t. 7. f. 1, 2.—Sabb. hort. 1. t. 62. The Arabians call the plant *Liff* or *Louff*; they cultivate it, and it climbs up the palm-trees, covering, and elegantly adorning their trunks. It is also cultivated largely in China and Cochin-china, if Loureiro's plant be the same (Coch. p. 590.). The fruit when young is made into a pickle, like the mango, but it has a disagreeable taste, and is not accounted very wholesome.

Egyptian Luffa. Fl. June, Oct. Clt. 1739. Pl. cl.

7 L. Pe'tola (Ser. mss. in D. C. prod. 3. p. 303.) stems terete; leaves cordate, 5-7-lobed; lobes acute, serrated, middle one very long; tendrils bifid; segments of the calyx oblong and bluntish; petals obcordate, toothed, shorter than the calycine segments; fruit obovate-clavate, mucronate, woolly, afterwards furrowed, green, spotted with white, with watery flesh. ⊙. F. Native of the East Indies.—Pétola, Rumph. amb. 5. p. 405. t. 147.

Petola Luffa. Pl. tr.

8 L. penta'ndra (Wall. cat. no. 6751.) leaves cordate, downy, 5-7-lobed, mucronately denticulated: middle lobe the longest; female peduncles 1-flowered, solitary: male ones umbellate? ⊙. F. Native of the East Indies, in Rungpur and Munggeri.

Pentandrous Luffa. Pl. tr.

9 L. grave'olens (Roxb. ex Wall. cat. no. 6752.) downy; leaves cordate, obsoletely lobed, and mucronately denticulated; flowers axillary, 2-4-together, on very short peduncles; fruit muricated. ⊙. F. Native of the East Indies, in Munikapur.

Strong-scented Luffa. Pl. tr.

10 L. ama'ra (Wall. cat. no. 6754.) scabrous; leaves cordate, 5-7-lobed, middle lobe the longest, all acute; female peduncles 1-flowered, solitary: male ones racemose; fruit long, downy. ⊙. F. Native of the East Indies, in Rungpur and Gualpara.

Bitter Luffa. Pl. tr.

11 L. hedera'cea (Wall. cat. no. 6755.) leaves cordate, palmately 5-lobed, mucronately denticulated; female peduncles 1-flowered, solitary: male ones racemose; fruit oblong. ⊙. F. Native of the Burman Empire, at Amherst, and below Melloon.

Ivy-like Luffa. Pl. tr.

12 L. echina'ta (Roxb. ex Wall. cat. no. 6756.) scabrous; leaves cordate, 5-lobed; lobes rounded, mucronately denticulated; female peduncles 1-flowered, solitary; male ones umbellately racemose; fruit roundish, echinated by spines. ⊙. F. Native of the East Indies, in Bandil, Deyra, and Dhoon.

Echinated-fruited Luffa. Pl. tr.

13 L. satpa'tia (Hamilt. ex Wall. cat. no. 6757.) scabrous; leaves cordate, angularly toothed; peduncles racemose. ⊙. F. Native of the East Indies, in Nathpur, where it is called *Satpatia*.

Satpatia Luffa. Pl. tr.

14 L. pa'rvula (Hamilt. ex Wall. cat. no. 6758.) roughish; leaves 5-7-lobed; lobes acuminated, mucronately denticulated; female peduncles 1-flowered, solitary; fruit long, downy when young. ⊙. H. Native of the East Indies, in Puraniya.

Small Luffa. Pl. tr.

Cult. Sow the seeds in a hot-bed, and afterwards treat the plants as recommended for ridging out cucumbers.

VI. BENINCA'SA (in honour of Count Benincasa, an Italian nobleman). Savi, mem. cucurb. 1818. p. 6. with a figure. Delile, mem. acad. sc. par. 1824. 7. p. 395. D. C. prod. 3. p. 303.

Lin. syst. *Polygàmia*, *Monoècia*. Flowers polygamous, monoecious, solitary, yellow. Segments of the calyx short, broad, with undulated, toothed margins. Stamens in 3 bundles in the male flowers, divaricate. Petals obovate-roundish, curled, and undulated; anthers very irregular, with distant convolutions. Female flowers with the stamens as in the males, but usually nearly abortive. Stigmas very thick and irregular. Seeds with thickish margins.

1 B. cerífera (Savi, l. c.) plant very hairy, with a musky scent; leaves cordate, somewhat 5-lobed; lobes acutish and crenated; tendrils simple; fruit ovate-cylindrical, woolly, pendulous, green. ⊙. F. Native of the East Indies. Cucúrbita cerífera, Fisch. cat. hort. Gorenk. ex Savi, l. c. B. cylíndrica, Hortul. Cumbùlam, Rheed. mal. 8. p. 5. t. 3. The fruit is either short or long, but always covered with numerous fragile hairs, and clothed with glaucous, glittering bloom. Flowers sometimes hermaphrodite.

Wax-bearing Benincasa. Fl. May, Jul. Clt. 1827. Pl. tr.

Cult. Sow the seeds on a hot-bed in spring; and afterwards treat the plants as in ridging out cucumbers.

VII. ERYTHROPA'LUM (from ερυθρος, *erythros*, red, and παλος, *palos*, a shaking; application not evident). Blum. bijdr. p. 921. D. C. prod. 3. p. 303.

Lin. syst. *Monoècia*, *Pentándria*. Flowers monoecious, perhaps only from abortion. Limb of calyx obsoletely 5-toothed. Petals 5, ovate, alternating with the teeth of the

calyx, bicallous at the base inside. Stamens 5, opposite the petals, borne at the margin of the tube; filaments short; anthers erect, dehiscing at the side. Style short. Fruit clavate, 1-celled, 3-valved; valves fleshy, partible into two. Seed one coated.

1 E. sca'ndens (Blum. bijdr. p. 922.) shrub climbing; leaves stalked, rather peltate, oblong, acuminated, quite entire, glabrous; peduncles branched, axillary; pedicels rather umbellate. ♄. ◡. S. Native of the East India Islands, on the mountains, particularly in Java, where it is called *Aroy wuat Ban kong* by the natives.

Climbing Erythropalum. Shrub cl.

Cult. A mixture of loam, peat, and sand, or vegetable mould, will suit this plant; and cuttings will grow freely in the same kind of soil, if placed in heat.

VIII. TU'RIA (Arabic name of one of the species). Forsk. fl. ægypt. p. 165. no. 35. Lam. dict. 8. p. 139. D. C. prod. 3. p. 303.

Lin. syst. *Monoècia, Pentándria.* Flowers monoecious, male ones umbellate. Calyx 5-parted; segments lanceolate, spreading. Corolla 5-petalled, rotate, yellow. Stamens 5, erect, filiform, in 3 bundles; anthers irregularly curled; rudiment of germ half globose. Female flowers having the calyx and corolla as in the male, but with the stamens castrated. Germen cylindrical, thickened. Stigmas 3, 2-lobed. Fruit cylindrical? attenuated, villous, warted.

1 T. cylíndrica (Forsk. l. c.) stems twining, 5-angled, scabrous; leaves palmate; lobes toothed; tendrils trifid; fruit terete, attenuated at both ends, villous, crowned by the style and calyx.—Native of Arabia Felix. Gmel syst. nat. 1. p. 403. ex Lam. dict. 8. p. 140. Flowers yellow.

Cylindrical-fruited Turia. Pl. tw.

2 T. Lelòja (Forsk. l. c. p. 165.) stem striated, mealy; leaves 3-lobed, cordate at the base; lobes angular, middle one longest, but not lobed; fruit conical, glabrous; seeds size of a small pea. ♃. F. Native of Arabia. Gmel. syst. nat. 1. p. 403. ex Lam. dict. 8. p. 140. *Leloja* is the Arabian name of the plant. Flowers green.

Leloja Turia. Pl. tw.

3 T. corda'ta (Lam. dict. 8. p. 140.) leaves cordate, angular, ciliated, 2 inches long.—Native of Arabia Felix. The fruit, when matured, opens at top by a lid, and ejects its seeds with force. Forsk. fl. ægypt. p. 166.

Cordate-leaved Turia. Pl. trailing.

4 T. Gíjef (Forsk. l. c. p. 166.) stem 6-angled, scabrous; leaves 3-lobed, denticulated, scabrous on both surfaces; fruit ovate, 10-furrowed, glabrous.—Native of Arabia. Flowers small, green. Fruit smaller than a nut, greyish at maturity, dehiscing, with revolute valves. *Gijef* is the Arabic name of the plant.

Gijef Turia. Pl. trailing.

5 T. Mo'ghadd (Forsk. ægypt. l. c.) stem terete, smooth; leaves 3-lobed, quite entire; lateral lobes somewhat 3-lobed; fruit oval-oblong, quite glabrous.—Native of Arabia Felix. Flowers large, white. Immature fruit green, spotted with white, but when mature yellow and eatable. *Moghadd* is the Arabian name of the species.

Moghadd Turia. Pl. trailing.

Cult. See *Cucúrbita*, p. 41. for culture and propagation.

IX. BRYO'NIA (from *βρυω, bryo*, to sprout up; in reference to the rapid growth of the annual stems, or because the species raise themselves by laying hold of other shrubs with their tendrils). Lin. gen. no. 1480. Juss. gen. p. 394. Gærtn. fruct. t. 88. D. C. prod. 3. p. 304. Solèna, Lour. coch. Cùcumis species of some authors. Cucumeroìdes, Gærtn. fruct. 2. p. 485. t. 180. f. 4.

Lin. syst. *Monoècia, Polyadélphia.* Flowers monoecious or dioecious. Petals joined at the base. Male flowers with a 5-toothed calyx. Stamens in 3 bundles; anthers flexuous. Female flowers with a trifid style. Fruit ovate or globose, smooth; perhaps always few-seeded. Seeds ovate, hardly compressed, more or less margined. Tendrils simple, rarely forked.

* *Leaves angular.*

1 B. rostra'ta (Rottl. nov. act. berol. 4. p. 212. and Willd. spec. 4. p. 616.) stem filiform, furrowed; leaves cordate, obtuse, denticulated, scabrous; peduncles axillary, solitary; fruit ovate, angular, acuminated. ⊙. F. Native of Tranquebar. Fruit the size of a pea. Plant scabrous, but when cultivated it becomes smooth in every part. The root of this species is prescribed in India internally in electuary, in cases of piles.

Rostrate-fruited Bryony. Pl. cl.

2 B. Perrotetia'na (Ser. mss. in D. C. prod. 3. p. 304.) tendrils simple, capillary; leaves broadly cordate, ungulate, sessile, villous, scabrous, with undulated margins; male flowers twin, on pilose peduncles: female flowers sessile; fruit ending in a long taper point, sessile, clothed with very long and very numerous hairs; seeds compressed, bay-coloured, granularly edged, and covered with adpressed hairs. ♃. S. Native of Senegal. Flowers white.

Perrotet's Bryony. Pl. cl.

3 B. mucrona'ta (Blume, bijdr. p. 923.) leaves cordate-ovate, mucronate, rather angular, and repandly denticulated, scabrous from dots above, and smooth beneath; flowers in fascicles, dioecious; berry oval. ♃. S. Native of the East Indies, on the mountains, where it is called *Pariagengie* by the natives.

Var. β, denticulàta (Ser. in D. C. prod. 3. p. 304.) leaves all undivided, obsoletely denticulated; fruit usually contracted in the middle. ♃. S. Growing among bushes about Buitenzorg in Java.

Mucronate-leaved Bryony. Pl. cl.

4 B. sca'bra (Thunb. prod. 13.) leaves cordate, angular, toothed, beset with callous dots above and with pili beneath, therefore scabrous on both surfaces; flowers umbellate; fruit globose; seeds smooth. ♃. G. Native of the Cape of Good Hope. The tender shoots of this plant are aperient, having been previously roasted.

Scabrous Bryony. Fl. Sept. Oct. Clt. 1774. Pl. cl.

5 B. verrucòsa (Ait. hort. kew. ed. 1. vol. 3. p. 285. ed. 2. vol. 5. p. 246.) leaves cordate, angular, beset with callous dots beneath as well as on the veins above; tendrils usually simple; fruit globose, nearly sessile. ♃. G. Native of the Canary Islands. Willd. spec. 4. p. 616. Fruit the size of a sloe.

Warted-leaved Bryony. Clt. 1779. Pl. cl.

6 B. scabra'ta (Blum. bijdr. p. 923.) leaves cordate, cuspidate, undivided, and somewhat angular, denticulated, scabrous above, rough on the veins beneath; flowers monoecious; umbels on short peduncles; fruit globose.—Native of the East Indies, on the mountains, particularly in Java. Cucúrbita scàbra, Blum. cat. hort. buit. no. 105. *Aroy korreg kottok* of the Javanese. Allied to *B. scàbra* and *B. Japónica.*

Rough Bryony. Pl. cl.

7 B. puncta'ta (Thunb. prod. 13.) leaves cordate, angular, callous above, and pilose beneath; peduncles 1-flowered. ♃. G. Native of the Cape of Good Hope.

Dotted-leaved Bryony. Pl. cl.

8 B. repa'nda (Blum. bijdr. p. 923.) leaves cordate, cuspidate, repandly denticulated, scabrous above and puberulous beneath; umbels pedunculate; flowers dioecious; berries globose.

ɥ. S. Native of Java, in the higher mountain woods of Burangrang.

Repand-leaved Bryony. Pl. cl.

9 B. corda'ta (Thunb. in Hoffm. phyt. blatt. 5. ex Pers. ench. 2. p. 594.) leaves cordate, scabrous, denticulated; flowers axillary, twin. ɥ. S. Native country unknown. B. Thunbergiàna, Dietr. ex Steud. nom.

Heart-leaved Bryony. Pl. cl.

10 B. angula'ta (Thunb. prod. 13.) leaves 5-angled, scabrous on both surfaces; flowers umbellate. ɥ. G. Native of the Cape of Good Hope.

Angular-leaved Bryony. Pl. cl.

11 B. leucoca'rpa (Blume, bijdr. p. 924.) leaves ovate-oblong, acuminated, deeply cordate at the base, somewhat repandly denticulated, beset with rough dots above, paler beneath; peduncles usually twin, few-flowered; flowers monoecious; berries globose. ɥ. S. Native of Java, at the foot of Mount Salak.

White-fruited Bryony. Pl. cl.

12 B. acuta'ngula (Thunb. prod. 13.) leaves angular, entire, smooth, glabrous. ɥ. G. Native of the Cape of Good Hope.

Acute-angled-leaved Bryony. Pl. cl.

13 B. gra'ndis (Lin. mant. p. 126.) leaves cordate, lobed, beset with callous dots above and glandular at the base beneath: terminal lobe obtuse; tendrils simple; fruit oblong, prickly at the base; prickles few, reflexed (ex icon. Burm.) reddish. ɥ. S. Native of the East Indies. Lour. coch. 595.—Rumph. amb. 5. t. 166. f. 1. Peduncles 1-flowered. Flowers large, whitish, androgynous. Berries red.

Great Bryony. Fl. May, Aug. Clt. 1783. Pl. cl.

14 B. Moimòi (Ser. mss. in D. C. prod. 3. p. 305.) leaves cordate, 5-angled, acutely denticulated: terminal angle elongated and acute; tendrils simple; fruit prickly at the base; prickles few, reflexed; fruit red. ɥ. S. Native of Ceylon and of Senegal, in hedges, in which last place it is called *Moimoi*, according to Adanson. Seneg. p. 159. Burm. zeyl. t. 19. f. 1. Flowers large, white.

Moimoi Bryony. Pl. cl.

15 B. gemina'ta (Blum. bijdr. p. 924.) leaves ovate-cordate, or somewhat hastate, bluntish, obsoletely denticulated, scabrous from dots; flowers pedunculate, twin, monoecious; berries oval. ɥ. S. Native of Java, about Linga-jattie at the foot of Mount Tjerimai, where it is called *Wawaluhan* by the natives.

Twin-flowered Bryony. Pl. cl.

16 B. Cochinchine'nsis (Lour. coch. 595.) leaves 5-angled, rough; flowers monoecious, large, axillary, solitary, on long peduncles; fruit ovate, acutish at both ends, 10-angled, red, smooth; seeds oblong-ovate, compressed, smooth. ɥ. G. Native of Cochin-china, in hedges. Flowers white.

Cochin-china Bryony. Pl. cl.

17 B. Abyssi'nica (Lam. dict. 1. p. 497.) stem villous at the apex; tendrils simple; leaves cordate, toothed, large, soft, nearly glabrous: upper ones angularly-lobed; petioles and peduncles very villous; flowers twin, yellow; fruit unknown. ɥ. G. Native of Abyssinia and neighbouring parts of Africa.

Abyssinian Bryony. Pl. cl.

18 B. Japónica (Thunb. jap. p. 325.) leaves cordate, undivided, and angular, toothed, green above, and beset with very minute hairs: pale beneath, and beset with scaly dots. ɥ. G. Native of Japan, near Nagasaki.

Japan Bryony. Pl. cl.

19 B. sagitta'ta (Blum. bijdr. p. 925.) leaves on short petioles, sagittate, glaucescent beneath; male peduncles subumbellate, female ones 1-flowered. ɥ. S. Native of Java, about Batavia, in humid bushy places. Allied to *B. heterophýlla* and *B. umbellàta*.

Sagittate-leaved Bryony. Pl. cl.

20 B. Blu'mei (Ser. mss. in D. C. prod. 3. p. 305.) leaves ovate-cordate, or cordately-sagittate, acuminated, repandly denticulated, scabrous; flowers monoecious, male ones umbellate, female ones solitary; berries oblong. ɥ. S. Native of Java, near Batavia, among bushes. B. heterophýlla, Blum. bijdr. p. 925., but not of Steud. Allied to *B. marginàta*.

Blume's Bryony. Pl. cl.

21 B. margina'ta (Blum. bijdr. p. 924.) leaves cordate-ovate, acuminated, rather angular at the base, obsoletely denticulated, marginate, rough; umbels on long peduncles; berries oblong. ɥ. S. Native of Java, about Rompien, where it is called *Korroronteng Kambien* by the natives.

Marginate-leaved Bryony. Pl. cl.

22 B. umbella'ta (Klein ex Willd. spec. 4. p. 618.) leaves oblong-cordate, glabrous on both surfaces, dotted above, remotely denticulated, rather angular at the base: upper ones hastately 2-lobed; peduncles axillary, umbellate; fruit unknown. ɥ. S. Native of the East Indies. B. Teedónda, Roxb. B. hastàta, Lour. coch. 594.?—Rheed. mal. 8. p. 51. t. 26.? Flowers white. Berries red.

Umbellate-flowered Bryony. Pl. cl.

23 B. amplexicau'lis (Lam. dict. 1. p. 496.) stem angular, glabrous; leaves smooth, cordate, rather angular, stem-clasping, dotted, and glaucous beneath; upper leaves generally narrowly 3-lobed; flowers small, solitary, axillary, pedunculate; fruit solitary, acuminated, smooth. ɥ. S. Native of the East Indies. Flowers white.

Stem-clasping leaved Bryony. Pl. cl.

24 B.? heterophy'lla (Steud. nom. p. 123.) lower leaves cordate, upper ones cordate or denticulated; tendrils solitary; flowers solitary, pedunculate, hermaphrodite; fruit scarlet; seeds blackish. ɥ. S. Native of Cochin-china and China. Solèna heterophýlla, Lour. coch. p. 514. Flowers pale.

Variable-leaved Bryony. Pl. cl.

25 B. pube'scens (Poir. dict. suppl. 1. p. 731.) stem pilose; leaves cordate, somewhat 5-lobed; lobes acute, with spiny teeth; petioles villous; tendrils long, much branched; flowers small, white, downy, umbellate. ɥ. G. Native of the Levant. Flowers whitish.

Downy Bryony. Pl. cl.

26 B. Maderaspata'na (Berg. pl. cap. p. 351.) stem angular, cirrhose, glabrous; leaves cordate, oblong, acuminated, toothed, scabrous from small callose dots above, hairy beneath; stipulas? awl-shaped, solitary; flowers twin, axillary. ⊙. S. Native of the East Indies. Cùcumis Maderaspatàna, Lin. spec. 1438.—Pluk. alm. t. 170. f. 2.

Madras Bryony. Pl. cl.

27 B. hederæfòlia (Jacq. fragm. 73. no. 230. t. 113.) dioecious; root thick, fleshy; stem terete, glabrous, with the internodes distant; tendrils very long, simple; leaves cordate, somewhat 5-angled, quite entire, rather wrinkled above, and hispid beneath; racemes simple, many-flowered; calycine segments of the male flowers lanceolate and acute; lobes of the corolla ovate, acute, yellowish. ɥ. S. Native of Teneriffe. Flowers yellowish.

Ivy-leaved Bryony. Pl. cl.

28 B. althæoìdes (Ser. mss. in D. C. prod. 3. p. 306.) stem filiform, furrowed, rough, with the internodes longer than the leaves; tendrils simple, narrow, and spirally twisted; leaves cordate, lanceolate, on short petioles, somewhat 5-angled, bluntly toothed, clothed with a kind of rough tomentum beneath; terminal lobe elongated; fruit thin, globose, sessile, smooth; seeds wrinkled from dots, girded by a slender zone. ɥ. S. Native of the island of Timor. Flowers white,

Althæa-like Bryony. Pl. cl.

29 B.? pedunculòsa (Ser. mss. in D. C. prod. 3. p. 306.)

plant pilose; stem filiform, striated, having distant internodes; tendrils bifid; leaves on long petioles, cordate, long-acuminated, crenately toothed, beset with long, distant hairs; flowers large, in loose racemes; peduncles longer than the leaves; pedicels long, pilose; fruit unknown. ♃. G. Native of Nipaul.

Long-peduncled Bryony. Pl. cl.

30 B. Rhe'edii (Blum. bijdr. p. 925.) leaves on short petioles, oblong, cordate, rather angular at the base, remotely denticulated, smoothish, dotted above, glaucous beneath; upper leaves hastately 3-lobed; male pedicels disposed in dense racemes, 1-flowered, bearing one bractea in the middle of each, female pedicels solitary, 1-flowered. ♃. S. Native of Java and Malabar, on the mountains. Rheed. mal. 8. t. 26. The plant is called *Aroy-hui-Walleh* by the natives of Java.

Rheede's Bryony. Pl. cl.

* * *Leaves lobed.*

31 B. epigæ'a (Rottl. in nov. act. berol. 4. p. 223.) stem furrowed, glabrous; leaves coriaceous, somewhat cordately 3-lobed, obsoletely denticulated, rough: lateral lobes somewhat 2-lobed, intermediate one elongated, acuminated; flowers monoecious, male ones umbellate, female ones solitary; berries globose. ♃. S. Native of Java, about Rompien, in corn fields. Willd. spec. 4. p. 610.—Blum. bijdr. p. 925. *Corro-konteng* of the natives of Java. The root of this species was once supposed to be the famous colomba-root, to which it approaches very nearly in quality.

Earth Bryony. Clt. 1815. Pl. cl.

32 B. scabre'lla (Lin. suppl. 424.) stem muricated, hispid; leaves 3-lobed, toothed, callosely hispid on both surfaces: lateral lobes dilated, angular, intermediate one elongated; petioles hispid; flowers axillary, nearly sessile, numerous; fruit nearly globose, beset with a few obverse strigæ; seeds muricated. ⊙. F. Native of the East Indies. Willd. spec. 4. p. 619. *Baboon tengang* of the Hindoos. Flowers yellow. Habit of *Melòthria*.

Var. α; leaves smaller; seeds tuberculated. Blume, l. c.

Var. β; leaves coarsely toothed, as in the preceding variety, and beset with setaceous strigæ; berries elliptic-globose. Blume, l. c.

Roughish Bryony. Fl. May, July. Clt. 1781. Pl. cl.

33 B. latebròsa (Ait. hort. kew. ed. 1. vol. 3. p. 384. ed. 2. vol. 5. p. 347.) leaves somewhat 3-lobed, pilose, attenuated at the base, hardly cordate, running down the petiole on one side only. ♃. G. Native of the Canary Islands. Flowers whitish.

Dark Bryony. Fl. June. Clt. 1779. Pl. cl.

34 B. triloba'ta (Thunb. prod. 13. but not of Lour.) leaves 3-lobed, smooth above, and scabrous beneath. ♃. G. Native of the Cape of Good Hope.

Three-lobed-leaved Bryony. Pl. cl.

35 B. stipula'cea (Willd. spec. 4. p. 620.) stem shrubby? furrowed; tendrils trifid; leaves cordate, 3-lobed, toothed, glabrous, smooth on both surfaces; stipulas roundish, concave, serrated; flowers monoecious, solitary; fruit ovate, acutish, glabrous, yellow, 5-celled, many-seeded. ♃. G. Native of Cochinchina. B. tríloba, Lour. coch. p. 595. but not of Thunb. B. agréstis, Ræusch. ex Steud. nom. phan. p. 123. Flowers white.

Var. β; perpusílla (Blum. bijdr. p. 926.) leaves membranous, deeply cordate, 3-lobed, obsoletely denticulated, scabrous from dots above, smooth beneath: lateral lobes rather angular, intermediate one elongated, acuminated; flowers umbellate, monoecious; fruit pea-formed. ♃. S. Cucúrbita perpusílla, Blum. cat. hort. buit. p. 105. Native of Java, in the shady parts of mountains. The plant is called *Hampru Bogor*, and *Korres koda* by the Javanese.

Large-stipuled Bryony. Pl. cl.

36 B. America'na (Lam. dict. 1. p. 498.) root thick; stem angular; leaves cordate, 3-lobed, angular, wrinkled, with spine-formed teeth; lobes of corolla narrow, white inside; fruit ovate, red, few-seeded; seeds compressed. ♃. S. Native of the Antillis.—Plum. spec. 3. icon. p. 66. ex Willd. spec. 4. p. 620.

American Bryony. Pl. cl.

37 B. Guinee'nsis; leaves cordate, petiolate, 5-lobed; lobes acute, toothed; peduncles axillary, many-flowered; tendrils axillary. ♃. S. Native of Sierra Leone. Flowers red.

Guinea Bryony. Pl. tw.

38 B. cordifòlia (Lin. spec. p. 1438.) leaves cordate, oblong, 5-lobed, toothed, scabrous, bidentate at the top of the petiole. ♃. S. Native of Ceylon. Flowers white. The root of this plant is considered cooling, and to possess virtues in complaints requiring expectorants.

Heart-leaved Bryony. Pl. cl.

39 B. a'lba (Lin. spec. p. 621.) stem climbing; leaves cordate, 5-lobed, toothed, scabrous from callous dots; terminal lobe hardly longer than the rest; tendrils twin; flowers racemose, monoecious; stamens distinct; fruit globose, black; seeds unknown. ♃. H. Native of Europe, in woods and hedges, as in Sweden, Denmark, and Carniola. Lam. ill. t. 769. Fl. dan. t. 813. Flowers whitish or yellowish.

Black-berried *white* Bryony. Fl. Ju. Jul. Clt. 1807. Pl. cl.

40 B. dioi'ca (Jacq. fl. austr. t. 199.) stem climbing: leaves cordate, palmately 5-lobed, toothed, scabrous from callous points; terminal lobe the longest and very dissimilar, perhaps always; tendrils simple; flowers racemose, dioecious; filaments pilose at the base; fruit globose, red; seeds obovate-globose, rather compressed, grey, variegated with black. ♃. H. Native of Europe, in hedges; plentiful in England, particularly in calcareous counties. Smith, engl. bot. t. 439. Mill. fig t. 71.—Blackw. herb. t. 37. B. álba, Huds. 437. Wood. med. bot. t. 189. Flowers white, with elegant green ribs and veins. The root grows sometimes to an immense size; it is a famous hydrogogue, and highly purgative and acrid, a drachm of it in substance, or half an ounce of it infused in wine, is said to be a full dose; others give 2 drachms in dropsical cases. As a purgative it has great effect on some, while on others it has hardly any; but it frequently becomes diuretic and diaphoretic. A cold infusion in water is used externally in sciatic pains. A cataplasm of it is a most powerful discutient The best season to take up the roots for use is in autumn. It is called in English, *white wild vine, wild hops, white Bryony, wild nep, Tetter-berry.*

Var. β, lùtea (Ser. mss. in D. C. prod. l. c.) leaves deeply lobed; lateral lobes nearly linear, terminal one lanceolate, bidentate laterally; fruit and seeds yellow. ♃. H. Native of Auvergne, in hedges and woods.

Dioecious-flowered or red-berried white Bryony. Fl. May, Sept. Britain. Pl. cl.

41 B. nítida (Link. enum. 2. p. 404.) leaves cordate, 5-lobed, apiculated, scabrous from hairs: peduncles umbelliferous. ♃. H. Native country unknown.

Shining Bryony. Fl. July, Sept. Clt. 1824. Pl. cl.

42 B. Cre'tica (Lin. spec. 1439.) root fleshy; stems climbing; leaves cordate, 5-lobed, quite entire, ciliated, muricated on both surfaces: terminal lobe the largest; tendrils simple, spiral; flowers dioecious: female ones axillary, twin; fruit globose, red; seeds smooth, obovate. ⊙. H. Native of Candia. Desf. coroll. p. 91. t. 70. ann. mus. 12. t. 17. Flowers pale.

Cretan Bryony. Fl. July, Sept. Clt. 1759. Pl. cl.

43 B. quinque'loba (Thunb. prod. 13.) flowers dioecious; leaves 5-lobed, scabrous above; lobes very blunt, mucronately toothed, auricled behind; tendrils simple; peduncles of male flowers 1-flowered, twin; calyx broadly campanulate, and acutely toothed; corolla campanulate, half 5-cleft; fruit unknown. ♃. G. Native of the Cape of Good Hope. Ker, bot. reg. 82. Sims, bot. mag. 1820. Flowers brown.

Five-lobed-leaved Bryony. Fl. June, Oct. Clt.? Pl. cl.

44 B. Nipaule'nsis (Ser. mss. in D. C. prod. 3. p. 307.) stems numerous; leaves palmately 5-lobed, scabrous above, smooth beneath; lobes narrow, very acute, almost entire: terminal one very long: lateral ones divaricate, lower ones very short or wanting; petioles short; male flowers in fascicles, numerous, small; peduncles unequal; fruit unknown. ⊙.? H. Native of Nipaul.

Nipaul Bryony. Pl. cl.

45 B. ficifòlia (Lam. dict. 1. p. 498.) leaves 5-lobed, somewhat denticulated; lobes deep, obtuse; petioles and stem hispid. ♃. G. Native of Buenos Ayres. B. Bonariénsis, Mill. dict. —Dill. hort. elth. p. 58. t. 50. f. 58. Flowers whitish.

Fig-leaved Bryony. Fl. July, Aug. Clt. 1710. Pl. cl.

46 B.? acu'ta (Desf. fl. atl. 2. p. 360.) stem slender; leaves somewhat 7-lobed; lobes lanceolate, acute, entire, or toothed; tendrils simple; male peduncles many-flowered; calycine segments narrow, acute; fruit unknown. ♃. H. Native of the kingdom of Tunis, in hedges. Corolla campanulate, spreadingly 5-cleft, twice the size of that of *B. álba*.

Acute-lobed Bryony. Pl. cl.

47 B. variega'ta (Mill. dict.) leaves palmate, with lanceolate segments, which are dotted above and smooth beneath. ♃. S. Native of America. Fruit ovate, scattered.

Variegated Bryony. Pl. cl.

48 B. macrophy'lla (Ser. in D. C. prod. 3. p. 308) stem thick, striated; leaves cordate, lobed; angles cut; lobes toothed; petioles long; male flowers large, racemose, on long peduncles: female ones solitary, pedunculate; fruit oblong, pilose. ♃. S. Native country unknown. Leaves large, size of those of the common vine.

Large-leaved Bryony. Pl. cl.

* * * *Leaves palmate.*

49 B. racemòsa (Mill. dict. and Swartz, prod. 116. fl. ind. occid. 2. p. 1148.) lower leaves rather palmate, upper ones 3-lobed and undivided; segments of the leaves ovate; flowers racemose; pedicels rather secund; fruit oval. ♃. S. Native of Jamaica and St. Domingo, in woods and hedges.—Plum. amer. 83. t. 97. Root oblong, fleshy. Flowers yellowish.

Racemose-flowered Bryony. Pl. cl.

50 B. pinnatífida (Burch. cat. geogr. no. 2098. voy. 1. p. 547.) leaves ternately pedate, with pinnatifid lobes, and linear and oblong, obtuse, veinless segments. ♃. G. Native of the Cape of Good Hope.

Pinnatifid-leaved Bryony. Fl. Jul. Aug. Clt. 1815. Pl. cl.

51 B. tenuifòlia (Gill. mss. ex Hook. et Arn. in bot. misc. 3. p. 234.) leaves 3-parted; segments bipinnatifid; female peduncles solitary, simple, equal in length to the petioles; fruit oval, smooth, 2-seeded. ♃. ◡. G. Native of Chili, in the Pampas, in the province of Cordova; and in sandy places near Santa Fe, and also of Buenos Ayres. The vernacular name of the plant is *Agi del Torvo*.

Fine-leaved Bryony. Pl. cl.

52 B. læ'vis (Thunb. prod. 13.) leaves cordate, palmate, serrated, smooth; flowers axillary, rather umbellate. ♃. G. Native of the Cape of Good Hope.

Smooth Bryony. Pl. cl.

53 B. palma'ta (Lin. spec. 1438.) leaves cordate, palmate, smooth, 5-parted, with lanceolate, repandly serrated segments, lateral segments the shortest; fruit large, globose. ♃. S. Native of Ceylon.

Palmate-leaved Bryony. Fl. Jul. Aug. Clt. 1778. Pl. cl.

54 B.? Garcìni (Willd. spec. 4. p. 623.) leaves palmately 5-parted, with roundish-obovate, toothed lobes, scabrous above; stipulas, (probably bracteas,) kidney-shaped and ciliated. ♃. S. Native of Ceylon. Burm. fl. ind. 311. t. 57. f. 3. Sícyos Garcìni, Lin. mant. 297. Perhaps a species of *Momórdica*.

Garcin's Bryony. Fl. July, Aug. Clt. 1812. Pl. cl.

55 B. alceæfòlia (Willd. l. c. p. 624.) leaves palmately 5-parted: with linear-lanceolate, 3-parted lobes, having scabrous margins; tendrils simple; peduncles axillary, 1-flowered. ♃. S. Native of the East Indies.

Hollyhock-leaved Bryony. Pl. cl.

56 B. laciniòsa (Lin. spec. 624.) leaves palmately 5-parted, cordate, rough, and blistered: with oblong-lanceolate, acuminated, serrated segments; petioles muricated; peduncles 1-flowered, muricated; corollas hairy inside, or tomentose, but smooth on the outside; fruit the size of a cherry, striated with white; seeds obovate, circled by a longitudinal elevated zone. ♃. S. Native of Ceylon. Herm. hort. lugd. 95. t. 97. *Aroy-periaginge* of the Hindoos. Flowers yellow.

Jagged-leaved Bryony. Fl. July, Aug. Clt. 1710. Pl. cl.

57 B.? cucumeroìdes (Ser. in D. C. prod. 3. p. 308.) seeds rusty, transversely oblong, surrounded by a very thick dotted zone. ♃. S. Native country unknown. Cucumeroìdes, Thunb. ex Gærtn. fruct. 2. p. 485.

Cucumber-like Bryony. Pl. cl.

58 B. Africa'na (Thunb. prod. 13. but not of Lin.) root tuberous; upper leaves palmately 5-parted; lobes oblong, deeply toothed; lower leaves cordate, having the angles toothed. ♃. G. Native of the Cape of Good Hope. Willd. spec. 4. p. 624.—Herm. par. 107. t. 108. Male flowers in subumbellate panicles. Fruit mucronate.

African Bryony. Fl. July, Aug. Clt. 1759. Pl. cl.

59 B. na'na (Lam. dict. 1. p. 497.) stems slender; lower leaves roundish-cordate, quite entire: upper ones deeply 3-lobed; lobes obtuse. ♃. S. Native of Africa.

Dwarf Bryony. Pl. cl.

60 B. disse'cta (Thunb. prod. 1. p. 497.) leaves palmately 5-parted: with linear pinnatifid segments, having revolute scabrous margins; male flowers? umbellate; fruit solitary, roundish, mucronate, bluntly angular, yellow; seeds 3-4. ♃. G. Native of the Cape of Good Hope. Willd. spec. 4. p. 625. B. Africàna, Lin. spec. 1438. Flowers white? Probably distinct from the preceding species.

Dissected-leaved Bryony. Fl. July, Aug. Clt. 1710. Pl. cl.

61 B. digita'ta (Thunb. prod. 13.) leaves digitate: with linear 2-lobed scabrous segments; flowers umbellate. ♃. G. Native of the Cape of Good Hope.

Digitate-leaved Bryony. Pl. cl.

62 B. Wallichia'na (Ser. mss. ex D. C. prod. 3. p. 309.) stem filiform, striated; leaves nearly sessile, sagittate, rugged from warts; terminal lobe lanceolate-linear, very long, somewhat denticulated; lateral lobes oblong, reflexed, remotely denticulated; male flowers in fascicles, numerous, on short peduncles; fruit unknown. ♃. G. Native of Nipaul. B. filifórmis, Roxb.

Wallich's Bryony. Pl. cl.

Cult. The hardy perennial species are plants of easy culture, only requiring to be planted in the ground. The stove perennial species should be grown in pots, and the stems trained up the rafters. The seeds of annual kinds require to be sown in a hotbed in spring, and when the plants are of sufficient size may be planted out in a sheltered situation. All the species are propagated by seeds. None of them are worth growing, except in botanic gardens.

X. SI'CYOS (from σικυος, *sicyos*, the Greek name for the cucumber; resemblance and affinity). Lin. gen. no. 1481. Juss. gen. no. 394. Gærtn. fruct. 2. p. 45. t. 88. f. 1. Sicyoìdes, Tourn. inst. 103. t. 28.

Lin. syst. *Monœ`cia, Polyadélphia.* Flowers monoecious; male ones with a 5-toothed calyx, and a 5-parted corolla; teeth of calyx subulate. Filaments 3 ? or more probably 5, in 3 bundles. Female flowers with a trifid style, and a thickish trifid stigma. Fruit 1-seeded from abortion, usually beset with spines. Seed obovate. Male and female peduncles many-flowered, usually rising together from the same axillæ.

1 S. angula`tus (Lin. spec. 1438.) leaves cordate, angular, denticulated, scabrous; lobes 3-5, acuminated; tendrils umbellate; male flowers in corymbose heads, each head on a long common peduncle; female flowers sessile, in bundles at the tops of the peduncles; fruit ovate, spinescent, and tomentose; seeds truncate at the base, and very blunt at the apex. ⊙. F. Native of North America. Lam. ill. t. 796. f. 2.—Dill. elth. 58. t. 51. f. 59. Flowers sulphur-coloured. Fruit beset with yellow spines, and curling tomentum.

Angular-leaved Single-seeded Cucumber. Fl. June, July. Clt. 1710. Pl. tr.

2 S. bryoniæfòlius (Moris, hort. taur. sem. 1831.) leaves cordate and angular, denticulated, hispid below; teeth of calyx obsolete; capsule clammy and warted. ⊙. ◡. S. Native country unknown. This species differs from *S. angulàtus* and *S. parviflòrus* in the stem being hardly pilose about the joints, the rest smooth; in the peduncles being short, the flowers umbellate; male ones 5-8 pedicellate, female ones almost sessile.

Bryony-leaved Single-seeded Cucumber. Pl. cl.

3 S. parviflòrus (Willd. spec. 4. p. 626.) branches glabrous; leaves cordate, rather angular, denticulated, roughish; tendrils trifid; male flowers racemose, on long pedicels: female ones in sessile capitate umbels; fruit crowned by the permanent calyx, size of an orange; seeds unknown. ⊙. F. Native in the temperate parts of mountains about Quito, near Chillo, at the height of 4000 feet. Not of Mexico, H. B. et Kunth, nov. gen. amer. 2. p. 119. Flowers whitish. Fruit rarely solitary.

Small-flowered Single-seeded Cucumber. Fl. June, Sep. Clt. 1823. Pl. cl.

4 S. Baderòa (Hook. et Arn. in bot. misc. 3. p. 234.) leaves cordate, angular, minutely denticulated, glabrous on both surfaces; angles acuminated; lobes at the base of the leaf lying over each other; tendrils trifid; flowers few, capitate in both sexes; female peduncles one-half shorter than the male ones; fruit ovate while young. ♃. ◡. G. Native about Valparaiso. Baderòa bryoniæfòlia, Bertero.

Badero's Single-seeded Cucumber. Pl. cl.

5 S. penta'ndrus (Wall. cat. no. 6682.) leaves cordate, denticulated; flowers racemose; racemes numerous, sometimes aggregate, and branched. ♄. ◡. S. Native of the East Indies.

Pentandrous Single-seeded Cucumber. Shrub cl.

6 S. De'ppei; leaves broadly cordate, 7-lobed; lobes acuminated, middle lobe the longest; margins acutely denticulated, rough on both surfaces from conical hairs; male racemes elongated; fruit glomerate, ovate, nearly glabrous, but beset with strong retrograde prickles. ⊙. S. Native of Mexico, near Jalapa. Flowers smaller than those of *S. angulàtus*, but larger than those of *S. parviflòrus*. Sicyos, nov. spec. Schlecht. et Cham. in Linnæa. vol. 5. p. 88. Seeds the size of those of *Cìtrus mèdica*.

Deppe's Single-seeded Cucumber. Pl. tr.

7 S. acu`tus (Rafin, fl. lud. p. 113.) climbing; leaves lobed; fruit glomerate, ovate, acute, bristly; bristles echinated, interwoven. ⊙. F. Native of Louisiana.

Acute-fruited Single-seeded Cucumber. Pl. cl.

8 S. microphy'llus (H. B. et Kunth, gen. et spec. amer. 2. p. 119.) branches roughish; leaves sinuately-cordate, 7-lobed, denticulated, roughish; tendrils smoothish, trifid; male flowers on long peduncles and pedicels; female flowers in crowded, nearly sessile heads; fruit echinated from bristle-formed hairs, size of an apple seed; seeds unknown. ⊙. F. Native of Mexico, on the burning Mount Jorullo, at the height of 1620 feet.

Small-leaved Single-seeded Cucumber. Fl. July, Sep. Clt. 1823. Pl. tr.

9 S. pachyca'rpus (Hook. et Arnott, in Beech. bot. p. 83.) branches glabrous; leaves cordate, 5-7-lobed, denticulated, glabrous above and papillose, scabrous beneath; tendrils glabrous, trifid; male flowers in panicles; female ones in crowded heads; fruit ovate, rostrate, unarmed. ⊙. F. Native of the Island of Oahu, on the Diamond Hill among the volcanic rocks. Allied to *S. microphýllus*.

Thick-fruited Single-seeded Cucumber. Pl. prostrate.

10 S. vitifòlius (Willd. spec. 4. p. 626.) the whole plant clothed with very fine clammy down; leaves cordate, with a roundish recess, 5-lobed, toothed. ⊙. F. Native country unknown. Flowers yellow, twice the size of those of *S. angulàtus*.

Vine-leaved Single-seeded Cucumbers. Clt. ? Pl. tr.

11 S. lacinia`tus (Lin. spec. 1459.) stem glabrous; leaves cordate, palmate, glabrous above, but echinated from stiff hairs beneath; lobes lobulate; petioles short; tendrils trifid; male flowers somewhat panicled: female ones glomerate, sessile; peduncles short; fruit very spiny. ⊙. F. Native of South America.—Plum. ed. Burm. pl. amer. t. 243. Flowers yellow.

Jagged leaved Single-seeded Cucumber. Fl. July, Aug. Clt. 1824. Pl. tr.

12 S. tríqueter (Moc. et Sesse, fl. mex. ined. ex D. C. prod. 3. p. 309.) stem bluntly furrowed; leaves cordate, 5-lobed; lobes broad, obtuse, somewhat denticulated; tendrils much branched; calycine and corolline lobes 3 ? male flowers racemose, pedunculate, aggregately subverticillate; female flowers subumbellate; fruit elongated, unarmed, triquetrous; seed oblong-cylindrical. ⊙. F. Native of Mexico, in Chilappa. Flowers yellow. Fruit 6 lines long, acuminated, somewhat 3-winged.

Triquetrous-fruited Single-seeded Cucumber. Pl. tr.

Cult. Sow the seeds in the hot-bed in spring, and treat the plants as directed for *Gourds*, p. 42. Not worth growing except for curiosity.

XI. ELATE`RIUM (from ελατηρ, *elater*, an impeller; in reference to the elastic seed vessels). Lin. gen. no. 1398. Juss. gen. p. 394. Jacq. amer. 241. t. 154. D. C. prod. 3. p. 310.—Momórdica, Neck. elem. bot. no. 390.

Lin. syst. *Monœ`cia, Monadélphia.* Flowers monoecious, white or yellow; male ones disposed in racemes or corymbs; calyx petaloid, campanulate, with hardly conspicuous teeth, and with the corolla hardly gamopetalous. Female flowers solitary, or rising from the same axils with the males. Calyx elongated, petaloid, echinated at the base, and girding the carpels; neck filiform, more or less elongated, at length dilated, and bearing the corolla and stamens. Style thick; stigma capitate. Capsule coriaceous, reniform, echinated, 1-celled, 2-3-valved, many-seeded, opening elastically, and ejecting the seeds.

1 E. geme'llum (D. C. prod. 3. p. 310.) leaves cordately subsagittate, somewhat 5-angled, with the middle angle acuminated; tendrils bifid; male flowers in long racemes; neck of calyx long, campanulate; petals ovate, acutish; fruit curved, 3-celled; prickles distant. ⊙. F. Native of Mexico. Moc. et Sess. fl. mex. icon. ined.

Twin-tendrilled Squirting Cucumber. Pl. cl.

2 E. Carthagene'nse (Lin. spec. 1375.) leaves cordate, angular, denticulated, petiolate, roughish above; flowers white, sweet-scented: male ones in panicles: female ones solitary; tube of calyx terete above the ovarium, not dilated at the apex; petals linear-lanceolate, acute; fruit kidney-shaped, hispid;

seeds winged? flat, tridentate at the base, ex Kunth. ⊙. F. Native of South America, in the hot regions of the province of Caraccas, on the shore of Lake Tacarigna, in Laguna de Valencia; and in the Island of Cura, at the height of 690 feet. Lam. ill. t. 743. Jacq. amer. 241. t. 154. icon. pict. p. 118. t. 232. Corolla yellow. Fruit size of an olive.

Carthagenian Squirting Cucumber. Fl. June, July. Clt. 1823. Pl. cl.

3 E. tamnoìdes (Willd. enum. p. 950.) leaves cordate, acuminated, remotely serrated, smoothish above, and hairy beneath; flowers yellowish; female flowers having the tube of the calyx campanulate above the ovarium; petals 4-7, ovate; style very short; stigma large, flat; fruit 2-valved, few-seeded; seeds unknown. ⊙. F. Native of Mexico. E. hastàtum, Brouss. but not of H. B. et Kunth.

Tamus-like Squirting Cucumber. Fl. June, July. Clt. 1820. Pl. tr.

4 E. hasta`tum (H. B. et Kunth, nov. gen. amer. 2. p. 120.) leaves cordately sinuated, triangularly hastate, acuminated, denticulated, rather scabrous above, and glabrous beneath; tendrils simple or bifid; male flowers racemose, pedicellate, minute; fruit oblong, reniform, muricated, 2-valved, size of an olive; seeds 6, roundish, compressed, tridentate at the base. ⊙. F. Native of Mexico, on the declivities of the burning Mount Jorullo, and the temperate regions near Patzcuara, at the height of 1620 or 3390 feet. Habit of *Melóthria péndula*, according to Kunth.

Hastate-leaved Squirting Cucumber. Pl. tr.

5 E. quadrífidum (D. C. prod. 3. p. 310.) stem, peduncles, petioles, and tendrils downy; leaves cordate, orbicular, 7-angled; tendrils bifid, pilose; male flowers umbellate; calyx long, tubular, articulated towards the base, and dilated at the apex, with the limb hardly evident; petals 4, linear-lanceolate, acute; female flowers hardly pedunculate, like the male ones; style filiform, crowned by an ovate stigma; fruit very pilose. ⊙. F. Native of Mexico. Moc. et Sesse, fl. mex. icon. ined. Flowers white.

Quadrifid Squirting Cucumber. Pl. tr.

6 E. brachysta`chyum (D. C. prod. 3. p. 310.) leaves 3-lobed, quite entire, ciliated: middle lobe oblong, acuminated; flowers cream-coloured; male ones in spikes; tube of calyx campanulate at the apex; female flowers with a very gibbous hispid calyx, and a short neck, which is campanulate at the apex; capsule oblique, incurved, echinated with 8-10 long soft prickles, 2-3-valved, larger than those of the other species. ⊙. F. Native of Mexico.

Short-spiked Squirting Cucumber. Pl. tr.

7 E. torqua`tum (D. C. prod. 3. p. 310.) leaves somewhat peltately cordate, 5-lobed, denticulated; terminal lobe the longest, and acuminated; tendrils trifid; flowers greenish-white; males ones in racemes: female ones solitary, echinated at the base, with the neck long and bell-shaped at the apex; petals oblong, bluntish; capsule oblong, 2-valved, acuminated, echinated, with soft prickles. ⊙. F. Native of Mexico. Fl. mex. icon. ined.

Collared Squirting Cucumber. Pl. tr.

8 E. trifolia`tum (Spreng. syst. 3. p. 47.) leaves ternate, cut. ⊙. F. Native of Virginia.

Trifoliate-leaved Squirting Cucumber. Pl. tr.

Cult. Sow the seeds in a hot-bed in spring, and put the plants out as directed for *Gourds*, p. 42.

XII. MOMO'RDICA (from *mordeo*, to bite; the seeds have the appearance of being bitten). Lin. gen. no. 1477. Juss. gen. 395. Gærtn. fr. 2. p. 48. t. 88. f. 4. D. C. prod. 3. p. 311. —Elatèrium and Sícyos species of authors.—Amórdica, Neck. elem. bot. no. 392.—Poppy`a, Neck. l. c. no. 391.—Ecbàlium, Rich.

Lin. syst. *Monœ`cia, Polyadélphia.* Flowers monoecious, white or yellow, on filiform unibracteate peduncles, perhaps always. Male flowers with a 5-cleft calyx, and a very short tube. Corolla 5-parted. Stamens in 3 bundles; anthers connate. Female flowers with 3 sterile filaments, or probably 5, joined in 3 bundles, a trifid style, and a 3-celled ovarium. Fruit usually muricated, (perhaps always) opening elastically at maturity, and expelling the seeds. Seeds compressed, reticulated, perhaps always.

1 M. Balsa`mea (Lin. spec. 1453.) leaves palmately 5-lobed, toothed, glabrous, shining; fruit roundish-ovate, attenuated at both ends, angular, tuberculated, orange-coloured, splitting irregularly and laterally; bractea cordate, toothed, in the middle of the peduncle; aril red. ⊙. F. Native of the East Indies. Lam. ill. t. 794. f. 1. Charántia, Lob. pempt. t. 670.—Ludvo. ect. t. 127.—Blackw. herb. 6. t. 539. a. b. Flowers yellow. This plant is famous in Syria for curing wounds. They cut open the unripe fruit, and infuse it in sweet oil, and expose it to the sun for some days until the oil becomes red. It is applied to a fresh wound on cotton. The Syrians esteem this next to balsam of Mecca. The plant is also used to form arbours or bowers.

Balsam Apple. Fl. June, July. Clt. 1568. Pl. cl.

2 M. murica`ta (Willd. spec. 4. p. 602.) leaves somewhat palmately 7-lobed, cordate at the base; lobes remotely toothed, acuminated; tendrils almost simple; fruit ovate, acuminated, muricated; bractea cordate, quite entire. ⊙. F. Native of the East Indies. Pavel, Rheed. mal. 8. t. 10.

Muricated Momordica. Fl. June, July. Clt. 1817. Pl. tr.

3 M. Chara'ntia (Lin. spec. 1438.) leaves somewhat palmately 7-lobed, dentate, rather hairy; tendrils downy; fruit oblong, acuminated, angular, tuberculated, copper-coloured or red; pulp yellow and soft; bractea cordate, quite entire, below the middle of the pedicel; seeds oblong, tuberculated (ex Rumph); arillus of a reddish blood-colour. ⊙. F. Native of the East Indies. Sims, bot. mag. t. 2455.—Rheed. mal. 8. p. 17. t. 9. *Papareh* of the Hindoos. Corolla yellow. Seeds wrinkled very irregularly, yellow bay-coloured, and irregularly tubercled towards the margin. Allied to the preceding species, but very distinct.

Var. β, abbreviàta (Ser. in D. C. prod. 3. p. 311.) fruit shorter than that of the species, very ventricose, beset with acute tubercles. M. Zeylánica, Mill. dict. 3. ex Lam. dict. 4. p. 239.

Charantia or Hairy Momordica. Fl. June, July. Clt. 1710. Pl. cl.

4 M. Roxburghia`na; downy; leaves cordate, palmately 7-9-lobed, and lobately toothed; tendrils simple; peduncles 1-flowered, solitary, bearing a bractea under each flower; fruit long, muricated. ⊙. H. Native of the East Indies, in Patna. M. charántia β of authors. M. muricàta, Roxb. but not of Willd.

Roxburgh's Momordica. Pl. tr.

5 M. Senegale'nsis (Lam. dict. 4. p. 239.) leaves deeply palmate, somewhat serrated, pale and villous beneath; fruit ovate, mucronate, tubercular, orange-coloured or red. ⊙. F. Native of Senegal.

Senegal Momordica. Fl. July, Aug. Clt. 1822. Pl. cl.

6 M. cyli'ndrica (Lin. spec. 1433.) stem 5-angled; leaves cordate, somewhat lobate, angular, toothed; flowers yellow; fruit cylindrical, very long, rather villous, reticulated; bractea quite entire at the base of the pedicel; seeds black. ⊙. F. Native of Ceylon and China. Willd. spec. 4. p. 605. The fruit of the species, according to Rumphius, does not open elastically, being composed of so many reticulated tough fibres.

Cylindrical-fruited Momordica. Pl. tr.

7 M. Heynea'na (Wall. cat. no. 6744.) leaves 3-lobed, mucronately denticulated; peduncles 1-flowered, solitary, furnished each with a large bractea under the flower, which encloses it before expansion; tendrils simple. ⊙.? F. Native of the East Indies. Flowers large.

Heyne's Momordica. Pl. tr.

8 M. subangula'ta (Blum. bijdr. p. 928.) leaves deeply cordate, acuminated, rather angular, mucronulately denticulated, scabrous above; flowers dioecious; bractea cordate, quite entire at the top of the peduncle. ⊙. F. Native of Java, on Mount Salak, where it is called by the natives *Aroy Gambas*. Allied to *M. cylíndrica* and *M. dioíca*. The inflorescence of this plant agrees with the figure in Rumph. amb. 5. t. 150. ex Blume. Fruit fibrous.

Angular-leaved Momordica. Pl. cl.

9 M. Pai'na (Hamilt. ex Wall. cat. no. 6742.) leaves cordate, triangular or hastate, sometimes lobed at the base, acuminated at the apex, coarsely toothed; tendrils simple; female peduncles 1-flowered, solitary; male ones racemose; racemes aggregate; fruit round, beset with a few scattered prickles. ⊙. F. Native of the East Indies, in Goyalpara.

Paina Momordica. Pl. tr.

10 M. tubiflòra (Roxb. ex Wall. cat. 6749.) plant white from down; leaves round, angularly and roundly lobed, cordate at the base; tendrils simple; fruit oblong, acuminated, ribbed; peduncles 1-flowered, solitary, bracteate. ⊙. F. Native of the East Indies.

Tube-flowered Momordica. Pl. tr.

11 M. pu'rgans (Mart. reise. bras. ex Linnæa. vol. 5. p. 40.) stems angular, climbing, clothed with resinous farina at top; leaves ovate-orbicular, acuminated, with a roundish recess, cordate, obsoletely 5-lobed, denticulated; male corymbs erect, axillary; female flowers solitary, axillary, drooping; fruit oblong, crested longitudinally from warts. ⊙. F. Native of Brazil.

Purging Momordica. Pl. cl.

12 M. opercula'ta (Lin. spec. 1433.) leaves 5-lobed, toothed; fruit elliptic, angular, tuberculated, operculated by a deciduous beak. ⊙. F. Native of America. Comm. rar. 22. t. 22. ex Lin. and Willd. spec. 4. p. 603. This plant is probably referrible to the genus *Lúffa*. The top falling off from the fruit when it is green.

Lid-fruited Momordica. Fl. June, Sep. Clt. 1731. Pl. cl.

13 M. elate'rium (Lin. spec. 1434.) plant scabrous, hispid, and glaucescent; stems dwarf, without tendrils; leaves cordate, somewhat lobed, crenate-toothed, very rugged, on long petioles; fruit ovate, obtuse, hispid, and scabrous, on long peduncles; seeds bay-coloured. ♃. F. or ⊙. H. Native of the south of Europe. Sims, bot. mag. t. 1914.—Blackw. herb. t. 108. Woodv. med. bot. t. 43. Elatèrium cordifòlium, Mœnch. meth. p. 563. Ecbàlium L. C. Rich. Root thick. Flowers yellow. Fruit green, expelling the seeds when ripe. Perhaps a proper genus. Dr. Clutterbuck has lately ascertained that the active principle of wild cucumber is contained almost exclusively in the juice around the seeds, and that genuine elaterium is the matter which subsides spontaneously from the juice obtained without pressure. He found that the eighth part of a grain thus prepared seldom failed to purge violently, and of this according to Dr. Barry, from 55 to 64 per cent, only were soluble in alcohol of 0·809. The bitter principle found in it is not in itself purgative, but quickens the action of elatin when combined with it. Elatin is a new principle obtained by Dr. Barry of a green colour; it is purgative in very minute quantities. In medicine a few grains of elaterium operates as a drastic purgative, and was sometimes used in dropsies. It is high priced, and seldom used, though recommended by Dr. Ferriar.

Elaterium or Common Squirting Cucumber. Fl. June, July. Clt. 1548. Pl. tr.

14 M.? Lambertia'na (Ser. in D. C. prod. 3. p. 311.) hispid; stems prostrate, flexuous; tendrils nearly simple; leaves cordate-roundish, 5-lobed, denticulated, scabrous; petioles short; flowers? fruit solitary, elliptic, pilose; peduncles short, hispid. ⊙. F. Native of the East Indies. Ecbàlium L. C. Rich. Allied to *M. elatèrium*, but distinct.

Lambert's Momordica. Pl. tr.

15 M. echina'ta (Muhl. ex Willd. spec. 4. p. 605.) leaves cordate, with 5 lobed angles; lobes acuminated, quite entire, glabrous; tendrils multifid; fruit roundish, 4-seeded, echinated by bristles. ⊙. H. Native of the western parts of Pennsylvania, near the river Ohio. Sícyos lobàta, Michx. amer. 2. p. 217. Fruit roundish, size of a gooseberry, beset with long subulate bristles, very like those of *Sícyos*, but 4-seeded. Flowers yellow.

Echinated-fruited Momordica. Pl. tr.

16 M. dioíca (Roxb. ex Willd. spec. 4. p. 605.) stem angular, climbing; leaves cordate, acuminated, toothed, glabrous on both surfaces; tendrils filiform; flowers dioecious; female ones solitary; fruit elliptic, muricated. ⊙. F. Native of the East Indies.

Dioecious-flowered Momordica. Pl. cl.

17 M. renígera (Wall. cat. no. 6743.) leaves cordate, dentate or distantly and mucronately denticulated; peduncles long, 1-flowered, solitary, furnished each with a kidney-shaped hooded bractea, just below the flower; tendrils simple. ♃. S. Native of the Burman Empire, about Prome.

Kidney-bearing Momordica. Pl. cl.

18 M. Hamiltonia'na (Wall. cat. no. 6748.) leaves cordate, toothed, crenated, acuminated; bractea toothed; peduncles 1-flowered, solitary; tendrils simple; fruit hispid. ♄. ◡. S. Native of the East Indies, in Goyapara and Gongachora. Flowers large.

Hamilton's Momordica. Pl. cl.

19 M. bi'color (Blum. bijdr. p. 928.) leaves deeply cordate, somewhat 5-angled, bluntish, glabrous, mucronately denticulated, with rather strigose margins (when dry dotted above), glandular beneath; flowers dioecious, pedunculate, axillary, usually 3-together; fruit oblong, glabrous, variegated with red. ⊙. F. Native of Java, in calcareous soil near Kuripan, where it is called *Aroy Pupassang* by the natives. Nearly allied to *M. dioíca*.

Var. α; base of leaves deeply cordate. Native of the Moluccas.

Var. β; leaves cordately 3-lobed; lateral lobes angular. Native of Java, on Mount Parang.

Two-coloured-fruited Momordica. Pl. tr. or cl.

20 M. acule'ata (Poir. dict. suppl. 3. p. 723.) stem slender, climbing; leaves palmately pedate, with 5-7 dentately lobed segments, having white scattered dots above, but with the nerves and petioles beset with short prickles beneath; petioles and middle nerves clothed with rough reflexed hairs; male flowers racemose, on long peduncles; female flowers solitary, hardly pedunculate; fruit subglobose, glabrous, size of a pea. ⊙. F. Native country unknown.

Prickly Momordica. Pl. cl.

21 M. hy'strix (Gill. mss. ex Hook. et Arn. in bot. misc. 3. p. 234.) leaves 5-lobed, glabrous, smooth, somewhat cuneated at the base; lobes mucronate, denticulated, middle lobe the longest; tendrils simple; male and female flowers rising from the same axils: male ones disposed in racemes: female ones solitary, pedunculate; fruit oblique, ovate, echinated with strong bristles. ⊙. F. Native of Buenos Ayres.

Porcupine Momordica. Pl. tr.

22 M. lana'ta (Thunb. prod. 13.) leaves ternately pinnatifid, scabrous; fruit woolly. ⊙. F. Native of the Cape of Good Hope.

Woolly-fruited Momordica. Pl. cl.

23 M.? sicyoìdes (Ser. in D. C. prod. 3. p. 312.) stems twining, terete; tendrils simple; leaves triangularly cordate, somewhat 5-lobed, serrulated; female flowers pedunculate, solitary; calyx ovate, pilose, with narrow linear segments; fruit ovate mucronate, very pilose, of a yellowish orange-colour at maturity; seeds subglobose. ⊙. F. Native of China —Braan. icon. chin. t. 12.

Sicyos-like Momordica. Pl. tw.

24 M. spica'ta (Lin. mss. ex Smith in Rees' cycl. vol. 23.) stems furrowed, rugged; leaves cordate, 3-5-lobed, undulated, rugged from tubercles; male flowers racemose; racemes on long peduncles; tube of calyx very long; bracteas dilated, toothed, scabrous; female flowers solitary, on short peduncles; seeds elliptic, furrowed, hispid. ⊙. F. Native country unknown.

Spike-flowered Momordica. Pl. cl.

Cult. *M. Elatèrium* and *M. Lambertiàna* being hardy, their seeds should be sown in the open border. The seeds of the rest of the species should be sown on a hot-bed in spring, and the plants planted out afterwards as directed for *Gourds*, p. 42.

XIII. NEUROSPE'RMA (from *νευρον*, *neuron*, a nerve, and *σπερμα*, *sperma*, a seed; in reference to the seeds, which are reticulated with anastomosing nerves). Rafin. in journ. phys. et chim. 1819. p. 101. Spreng. neue. entd. 1. p. 144. D. C. prod. 3. p. 312.

Lin. syst. *Monœ'cia*, *Monadélphia*. Flowers monoecious. Male flowers with a 5-parted calyx: and a 5-parted corolla, having an undulated erose margin. Stamens 5, diadelphous, having a gland alternating with each fascicle; one of the fascicles bearing 2 anthers, the other trigonal, and bearing 3 anthers. Anthers sessile, stellate. Female flowers with a parted corolla and calyx. Ovarium inferior, beset with 8 series of warts. Style trifid, girded by 3 glands at the base; stigmas 2-lobed. Fruit fleshy, 3-celled, but when mature 1-celled, 3-9-seeded. Seeds girded by mucilaginous red aril, flat, nerved, with anastomosing veins, and a rugged edge. Perhaps a proper genus.

1 N. cuspida'ta (Rafin. l. c.) Native of Kentucky, North America. Perhaps the same as *Momórdica balsàmea?*

Cuspidate Neurosperma. Pl. tr.

Cult. See *Sícyos* p. 34. for culture and propagation.

XIV. SE'CHIUM (from *σεκιζο*, *sekizo*, to fatten; given to hogs for that purpose). Browne in Lin. gen. no. 1482. Juss. gen. p. 391. Lam. dict. 7. p. 50. D. C. prod. 3. p. 313.

Lin. syst. *Monœ'cia*, *Monadélphia*. Flowers monoecious, yellow. Male flowers with a somewhat 5-toothed calyx, excavated into 10 hollows, and with the corolla joined with the calyx. Stamens 4-5, monadelphous, free at the apex, diverging; anthers cordate, distant. Female flowers with a calyx and corolla, as in the male, but without stamens. Style thick; stigma subcapitate, 3-5-cleft. Fruit obcordate, 1-seeded. Seed ovate, flat, compressed.

1 S. edu'le (Swartz, fl. ind. occid. 2. p. 1150.) stems terete, striated, smooth; leaves cordate, angular, rugged beneath; lobes conniving at the base, toothed; terminal angle longest and acuminated; tendrils 4-5 cleft; male flowers racemose; female flowers solitary, rising from the same axils as the males; fruit large, obovate, 5-furrowed, gibbous at the apex, echinated by stiff hairs. ⊙. F. Native of the West Indies, common. Sícyos edùlis, Swartz, prod. 116. Lam. dict. 1. p. 156.—Jacq. amer. p. 258. t. 163. Chayòta edùlis, Jacq. amer. 2. t. 245. This plant is known in South America under the name of *choko* and *chaiote*. The fruit is green, shining on the outside, whitish, and fleshy within, differing in size and singular in structure, containing one seed each, which is sometimes an inch long, and placed at the very top of the fruit; when it is ripe it protrudes itself a little, and puts forth many fibres at its extremity. In many of the West Indies the inhabitants put the fruit into soups or puddings, or boil it and eat it with their meat as a substitute for turnips or greens, in which state it is generally looked upon as wholesome and refreshing, but it is too insipid to be much liked. The fruit serves to fatten hogs in the mountains and inland parts of Jamaica, where the plant is much cultivated. The natives of Cuba notice two varieties; one which is most common they call simply *chayote:* it is beset with harmless prickles, sometimes in great abundance, and sometimes with very few, and is about 4 inches in length; the other, less frequent, called *chayote frances*, is for the most part entirely destitute of prickles, and is about the size of a hen's egg.

Eatable Choko. Fl. July, Aug. Clt. 1816. Pl. cl.

2 S. America'num (Lam. dict. 7. p. 50.) leaves cordate, angular; flowers racemose; fruit glabrous, a little compressed, size of a pigeon's egg; seed oval-elliptic. ⊙. F. Native of Jamaica. Fruit eatable like the last. This is perhaps the *chayote frances* mentioned above.

American Choko. Pl. cl.

3 S. palma'tum (Ser. in D. C. prod. 3. p. 313.) stems terete, bluntly furrowed; tendrils umbellate; leaves palmately lobed, scabrous; stipula or bractea sessile, cordate, deeply 3-lobed; male flowers racemose; common peduncle short, many-flowered; filaments monadelphous at the base, and divaricate towards the apex; female flowers twin, nearly sessile; fruit prickly, green, size of a filbert. ⊙. F. Native of Mexico, in Acahualtempa. S. palmàtum, Moc. et Sesse, fl. mex. icon. ined.

Palmate-leaved Choko. Pl. cl.

Cult. See *Cucúrbita*, p. 42. for culture and propagation.

XV. MELO'THRIA (*μελοθρον* of Theophrastus, supposed to be *Bryony*). Lin. gen. no. 68. Juss. gen. p. 395. D. C. prod. 3. p. 313.—Trichosánthes species of Jacq.

Lin. syst. *Monœ'cia*, *Polyadélphia*. Flowers monoecious. Male flowers with a 5-toothed calyx and a campanulate corolla; petals ciliated or toothed, not fringed. Filaments 5, in 3 parcels. Female flowers. Style 1; stigmas 3, fringed. Fruit 3-celled, many-seeded. Seeds unknown.

1 M. pe'ndula (Lin. spec. p. 49.) leaves cordate, 5-lobed, toothed; tendrils simple; female flowers solitary, on long peduncles; corolla rather pilose, denticulated; fruit ovate, nearly globose, pendulous. ♃. S. Native of South America, and the southern parts of North America. Lam. ill. t. 28. f. 3.—Pluk. alm. t. 85. f. 5.—Sloan. jam. p. 227. t. 142. f. 1.—Plum. spec. 3. t. 66. f. 2. Stems rooting at every joint. Flowers small, pale yellow. Fruit about the size of a pea, changing to black when ripe. In the West Indies these are pickled when green by the inhabitants.

Pendulous-fruited Melothria. Fl. Ju. Sept. Clt. 1752. Pl. cr.

2 M. fœ'tida (Desr. in Lam. dict. 4. p. 87.) root fleshy, turnip-formed; leaves cordate, a little toothed, pilose, almost sessile; tendrils simple; male flowers racemose; peduncles short, few-flowered; female flowers solitary, sessile along with the males; fruit ovate, muricated, mucronate, pilose, of a dirty yellow-colour; seeds obovate, compressed. ♃. S. Native of Guinea. Trichosánthes fœtidíssima, Jacq. coll. 2. p. 341. icon. rar. 3. t. 624. Flowers yellow. Herb fetid when bruised.

Fetid Melothria. Fl. June, Sept. Clt. 1820. Pl. cl.

3 M.? I'ndica (Lour. coch. p. 35.) stems angular; leaves triangular, denticulated, rough, small, on long petioles; flowers usually solitary, pedunculate, white; fruit ovate-oblong, smooth, small, whitish green. ♃. S. Native of Cochin-china, in hedges. —Rumph. amb. 5. t. 171. f. 2. ex Lour. l. c. Flowers white.

Indian Melothria. Pl. tr.

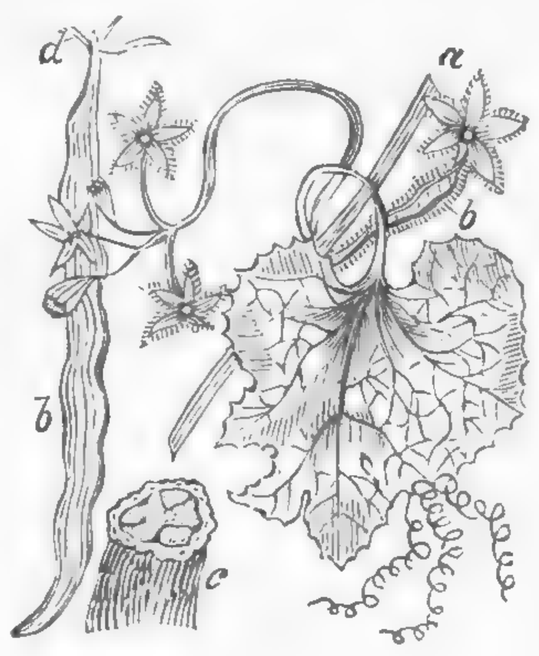
Cult. See *Sicyos*, p. 34. for culture and propagation. The plants will exist through winter if kept in a stove.

XVI. TRICHOSA'NTHES (from θριξ τριχος, *thrix trichos*, a hair, and ανθος, *anthos*, a flower; fringed or ciliated corollas). Lin. gen. no. 1476. D.C. prod. 3. p. 313.—Ceratosánthes, Juss. gen. p. 396.—Anguìna, Mich. gen. 12.

LIN. SYST. *Monœ'cia*, *Monadélphia*. Flowers monoecious, white. Male flowers. Calyx rather club-shaped, 5-parted; lobes appendiculated, furnished with 5 teeth on the outside, which alternate with the lobes. Corolla 5-parted, ciliated; filaments 3, but probably 5, joined by twos; anthers joined, with very flexuous cells. Female flowers. Calyx 5-toothed. Corolla 5-parted (f. 2. *a.*), ciliately jagged. Style trifid (f. 2. *d.*). Stigmas oblongly subulate. Fruit oblong, 1? or 3-9-celled (f. 2. *c.*). Seeds compressed, tunicated, blunt, very much deformed?

1 T. ANGUI'NA (Lin. spec. 1432.) stem pentagonal; leaves cordate, 3-lobed, repandly toothed, puberulous; tendrils trifid, very long; male flowers racemose; racemes on long peduncles; calycine lobes very short, tooth-formed; lobes of corolla ovate, ciliately jagged; fruit terete-oblong, ending in a long beak, hispid, splitting. ⊙. F. Native of China. Lam. ill. t. 794. Sims, bot. mag. 472.—Mill. fig. t. 32.—Mich. gen. 12. t. 9. Cùcumis anguìnus, Lin. spec. 1437. ex Lam. dict. 2. p. 75.—Rumph. amb. 5. p. 407. t. 148. *Kukukjanjang* of the Hindoos. Flowers white. Fruit near a foot long.

FIG. 2.



Snake-Gourd. Fl. May, June. Clt. 1755. Pl. tr.

2 T. COSTA'TA (Blum. bijdr. p. 933.) leaves cordate, 3-lobed, denticulated, scabrous; lateral lobes somewhat 2-lobed; male flowers racemose, bracteate; female ones solitary; fruit ovate, oblong-ribbed. ⊙. F. Native of Java, about Batavia and the western provinces, on the margins of rivers, where it is called *lopan* by the natives.

Ribbed-fruited Snake-Gourd. Pl. tr.

3 T. COLUBRÌNA (Jacq. fil. eclog. t. 128.) stems furrowed, thickish; tendrils bifid; leaves roundish, cordate, 3-5-lobed; lobes short, broad, toothed; male flowers in panicles; common peduncles very long; female flowers sessile, solitary or in the same axils with the males; calyx very long, with a reflexed limb; fruit nearly terete, very long, lined; seeds obovate, red. ⊙. F. Native country unknown.

Viper Snake-Gourd. Pl. tr.

4 T. NERVIFÒLIA (Lin. spec. 1432.) stem slender; leaves cordate, 3-nerved, toothed; petiole short; tendrils bifid; male flowers racemose; racemes on long peduncles; lobes of corolla oblong, ciliately jagged; female flowers solitary; fruit ovate, acutish, green, lined with white, about the size of a hen's egg. ⊙. F. Native of the East Indies. Rheed. hort. mal. 8. t. 17.

Nerve-leaved Snake-Gourd. Pl. tr.

5 T. OFFICINA'LIS (Hamilt. ex Wall. cat. no. 6694.) scabrous; leaves cordate, denticulated; petioles hispid; female peduncles 1-flowered, solitary; fruit round, smooth. ⊙. ◡. S. Native of the East Indies, in Chilmari.

Officinal Snake-Gourd. Pl. cl.

6 T. SCA'BRA (Lour. coch. p. 589.) branches woody, furrowed; leaves cordate, roundish, wrinkled, scabrous; tendrils bifid; flowers monoecious; corolla shortly ciliated; fruit roundish, red, 10-angled, 5-celled; seeds flat, oblong. ♄. G. Native of Cochin-china. Flowers white. Fruit small.

Scabrous Snake-Gourd. Shrub cl.

7 T. CUSPIDA'TA (Lam. dict. 1. p. 188.) stem twining; leaves cordate, oblong, acute, toothed; tendrils simple; male flowers unknown; female flowers nearly sessile, on short peduncles; calyx long, tubular, with nearly linear, acute, stalked, ciliately fringed segments; fruit ovate, ending in a long point. ⊙. F. Native of the East Indies.—Rheed. mal. 8. t. 16. T. caudàta, Willd. spec. 4. p. 600.

Cuspidate-fruited Snake-Gourd. Pl. tw.

8 T. ANGULA'TA (Lam. dict. 1. p. 190.) stems angular, very slender, villous; leaves cordate, roundish, small, angular; tendrils forked, longer than the leaves; male flowers panicled; common peduncles much longer than the leaves; female flowers solitary, pedunculate. ⊙. F. Native of the East Indies. Petals fringed.

Angular-stemmed Snake-Gourd. Pl. tr.

9 T. VILLÒSA (Blum. bijdr. p. 934.) leaves cordate, tricuspidate, obsoletely denticulated, villous; peduncles 1-flowered; fruit nearly globose, striated with white. ⊙. F. Native of Java, about Rompien and Buitenzorg, where it is called *Badujut* by the natives. Fruit indehiscent.

Villous Snake-Gourd. Pl. tr.

10 T. OVI'GERA (Blume, l. c.) leaves deeply cordate, mucronate, sometimes sinuated, mucronately denticulated, shining above, and rough beneath: female peduncles 1-flowered; fruit ovate, vittate. ⊙. F. Native of Java, on Mount Salak, where the plant is called *Tiwuk* by the natives.

Egg-bearing Snake-Gourd. Pl. tr.

11 T. GRANDIFLÒRA (Blum. l. c.) leaves large, quintuple-nerved, ovate, sometimes tricuspidate, quite entire, coriaceous, quite glabrous; flowers bracteate, disposed in dense spikes. ⊙. F. Native of Java, in humid places on the mountains, where the plant is called by the inhabitants *Kalayar Badak*.

Great-flowered Snake-Gourd. Pl. tr.

12 T. CORIA'CEA (Blum. l. c. p. 935.) leaves somewhat quintuple-nerved, cordate, acuminated, quite entire, coriaceous, reticulated above and glabrous, but paler and rough beneath; male flowers bracteolate, in loose racemes, on elongated peduncles. ⊙.? F. Native of Java, on Mount Salak, where the plant is called by the inhabitants *Piet-tjun-tjelling*. Allied to *T. grandiflòra*.

Coriaceous-leaved Snake-Gourd. Pl. tr.

13 T. HETERÓCLITA (Roxb. ex Wall. cat. 6684.) leaves smooth, coriaceous, 3-lobed, seldom 5-lobed; lobes acuminated, entire; peduncles racemose; tube of calyx long. ♄. ◡. S. Native of the East Indies, in Goyalpara.

Variable-hollowed Snake-Gourd. Shrub cl.

14 T. CUCUME'RINA (Lin. spec. 1432.) fetid; stems tetragonal, rather pilose; leaves cordate, angular, rather villous, petiolate, with white nerves, and muricated petioles; tendrils bifurcate; male flowers disposed in something like umbels; female flowers solitary, on short peduncles; calycine lobes ovate; petals fringed at the apex; fruit ovate, mucronate, smooth, green, lined with white, but at last becoming orange-coloured; seeds with sinuated margins. ⊙.? F. Native of Java, in the province of Bantam. Blum. bijdr. p. 934.—Rheed. mal. 8. t. 15. Flowers white. The seeds are sometimes used in disorders of the stomach and bowels, and the plant is celebrated for its virtues in Hortus Malabaricus.

Cucumber-like Snake-Gourd. Fl. Ju. Jul. Clt. 1804. Pl. tr.

15 T. AMA'RA (Lin. spec. 1432.) stems terete, glabrous; tendrils simple; leaves cordate, triangular, sinuated, scabrous from dots, stalked; female flowers solitary; peduncles longer than the leaves; calyx long, tubular, with lanceolate, acute segments; petals roundish-ovate, fringed; fruit obovate-oblong, 9-celled, green, striped with longitudinal white lines; flesh white and

bitter; seeds oblong, narrow. ⊙. F. Native of St. Domingo. —Plum. descr. pl. amer. t. 100.

Bitter-fruited Snake-Gourd. Pl. tr.

16 T. HEXASPE'RMA (Blum. bijdr. p. 935.) leaves 3-nerved, ovate, tricuspidate, quite entire, coriaceous, glabrous; male flowers bracteate, disposed in racemes: female flowers solitary; fruit globose, 6-seeded. ⊙.? F. Native of Java, at the foot of Mount Salak, where it is called *Aroy-pitjung-Tjelleng* by the natives.

Six-seeded Snake-Gourd. Pl. tr.

17 T. Russelia'na (Wall. cat. no. 6696.) smoothish; leaves cordate, hastately 3-lobed, nearly entire; tendrils simple; peduncles 1-flowered. ♄. ◡. S. Native of the East Indies.

Russel's Snake-Gourd. Shrub cl.

18 T. MACROCA'RPA (Blum. l. c.) leaves cordate, orbicular, 5-lobed, but sometimes 3-lobed, coriaceous, glabrous; lobes ovate, acuminated, quite entire: lateral lobes rather bifid; fruit large, globose; stem suffruticose. ♄. ◡. S. Native of Java, on the mountains.

Long-fruited Snake-Gourd. Shrub cl.

19 T. TRICUSPIDA'TA (Lour. coch. 589.) stems shrubby; tendrils trifid; leaves cordate, tricuspidate, denticulated, glabrous, many-nerved; stipulas roundish, thick, crenated; flowers spicate, or perhaps panicled; bracteas large, toothed; fruit yellow, small, ovate, 2-celled, 2-seeded. ⊙. F. Native of Cochin-china; and among bushes and on the margins of rivers in Java. Flowers white.

Tricuspidate-leaved Snake-Gourd. Pl. cl.

20 T. PILÒSA (Lour. coch. p. 588.) stems suffruticose, very long, furrowed; tendrils bifid; leaves cordate, denticulated, pilose on the veins, lower ones palmate, upper ones 3-lobed; male flowers? in spikes; bracteas large, lanceolate, ciliated; fruit ovate, acute, scarlet, 1-celled; seeds rhomboid, compressed, lobed, brown. ♄. ◡. S. Native of Cochin-china. Flowers white as in the rest of the species, fringed with curling hairs.

Pilose Snake-Gourd. Shrub cl.

21 T. LACINIÒSA (Klein, ex Willd. spec. 4. p. 601.) stems filiform, angular, glabrous; leaves deeply cordate, palmately 5-7-lobed, remotely toothed, glabrous on both surfaces; male flowers disposed 4 or 6 in a corymb: petals ovate, toothed; female flowers solitary: petals ciliately fringed. ⊙.? F. Native of the East Indies.

Jagged-leaved Snake-Gourd. Pl. tr.

22 T. CORNICULA'TA (Lam. dict. 1. p. 191.) root large, fleshy, warted; stems very long; tendrils simple; leaves digitately palmate; lobes oblong; petals crenulated, bearing each 2 curling horns towards the apex; male flowers in fascicles; fruit ovate-oblong, smooth, green, variegated with white, 4-celled. ♃. S. Native of the Antilles. T. tuberòsa, Willd. spec. 4. p. 601. Sims, bot. mag. t. 2703. Ceratosánthes tuberòsa, Spreng. syst. 3. p. 18.—Plum. ed. Burm. amer. fasc. 1. p. 14. t. 24. Flowers white.

Horned-petalled Snake-Gourd. Fl. Jul. Aug. Clt. 1810. Pl. cl.

23 T. CHINE'NSIS (Ser. in D. C. prod. 3. p. 315.) leaves cordate, triangular, bluntish, rather angular; petioles short; tendrils simple; male flowers solitary; calyx long, clavate, rather pilose; petals obovate, with fringed margins; female flowers solitary, almost sessile; tube of calyx ovate, acuminated, pilose: petals not fringed; fruit ovate, striated, ending in a long point. —Native of China. Braan. icon. t. 13.

China Snake-Gourd. Pl. tr.

24 T. TAMNIFÒLIA (Poir. dict. suppl. 1. p. 386.) stems glabrous, striated; tendrils simple; leaves ovate-roundish, rather lobed, or entire, scabrous above; male flowers small, in loose racemes; petals villous? reflexed; fruit ovate, mucronate, glabrous.—Native of Porto Rico.

Tamnus-leaved Snake-Gourd. Pl. tr.

25 T. PU'BERA (Blum. bijdr. p. 936.) leaves deeply cordate, tricuspidate, denticulated, rather tomentose beneath; female flowers solitary; fruit ovate, acute.—Native of Java, on the mountains, where the plant is called by the natives *Aroy-kalayar-burrum*.

Downy Snake-Gourd. Pl. tr.

26 T. GLOBÒSA (Blum. bijdr. p. 936.) leaves palmately 3 or 5-lobed, quite entire, glabrous; lobes linear, acute; male flowers bracteate, disposed in dense spikes, on thick peduncles; female flowers solitary; fruit globose.—Native of Java, on Mount Salak, where the plant is called *Aroy-jantang* by the natives.

Globose-fruited Snake-Gourd. Pl. cl.

27 T. PALMA'TA (Roxb. ex Wall. cat. 6688.) puberulous; leaves cordate, 3-5-lobed; lobes denticulated; peduncles racemose; corolla fringed. ♄. ◡. S. Native of the East Indies. Bracteas toothed.

Palmate-leaved Snake-Gourd. Shrub cl.

28 T. TRIFOLIA'TA (Blum. l. c.) leaves ternate; leaflets denticulated, scabrous: lateral ones gibbous at the base; male flowers bracteate, disposed in something like racemes; female flowers solitary; fruit ovate, muricated (ex Rumph); seeds complanate, denticulated?—Native of Java, in the province of Krawang, near Tjiradjas. Momórdica trifoliàta, Lin. spec. 1434. Amàra sylvéstris, Rump. amb. t. 152. f. 2.

Trifoliate-leaved Snake-Gourd. Pl. cl.

29 T. LOBA'TA (Wall. cat. no. 6693.) downy or puberulous; leaves 5-7-lobed; lobes mucronate at the apex, narrowest at the base, denticulated; tendrils branched; peduncles long, bearing a raceme of flowers at the top. ⊙. ◡. S. Native of the East Indies.

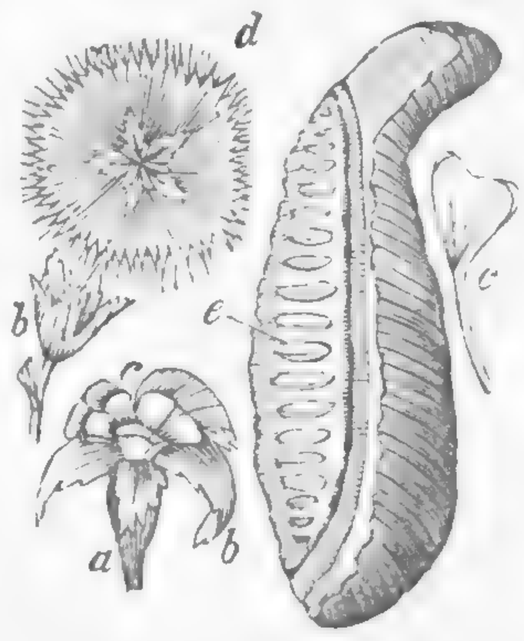
Lobed-leaved Snake-Gourd. Pl. cl.

Cult. Sow the seeds in a hot-bed in spring, and afterwards treat the plants as if they were cucumbers. The shrubby and perennial species should be protected from the frost and cold by placing them in the stove in winter: cuttings will root readily.

XVII. AMPELOSI'CYOS (from *αμπελος, ampelos*, a vine, and *σικυος, sicyos*, a cucumber; intermediate habit.) Pet. Th. veg. d'Afr. p. 68. t. 22.—Telfàiria, Hook, bot. mag. no. 2751. and 2752. (July 1827.) Feuillæ'a, spec. Smith, in bot. mag. t. 2681. Jolíffia, Bojer in litt. (1826.) and Delill. mem. soc. hist. par. vol. 3. p. 314. (July 1827).

Lin. syst. *Dioècia, Monadélphia.* Flowers dioecious. Male flowers. Calyx turbinate (f. 3. *a.*), 5-cleft; segments acutely denticulated (f. 3. *b.*). Corolla 5-petalled (f. 3. *c.*); petals oblong, fringed. Stamens 5, disposed in 3 bundles. Female flowers. Limb of calyx almost wanting, 5-toothed (ex Smith). Corolla as in the male. Stigma capitate, 3-lobed (ex Bojer), 5-lobed (ex Smith). Fruit fleshy (f. 3. *e.*), 2-3 feet long, and 8 inches thick, elongated and furrowed, divided into 3 twin cells (ex Bojer), into 5 (ex Smith). Seeds compressed, nearly orbicular, reticulated on the outside. Cotyledons thick, oily. A climbing plant, with pedate leaves and showy purple flowers.

FIG. 3.



1 A. SCA'NDENS (Pet. Th. l. c.) ♃. S. Native of the south-eastern coast of Africa, on the shores of Zanquebar. It has also been gathered in the Mauritius, where it is called by the negroes *Kouémé*. Feuillæ'a pedàta, Smith, l. c. t. 2681. a female plant. Telfàiria pedàta, Hook, bot. mag. t. 2751 and 2752. with male flowers and fruit. Jol-

líffia Africàna, Delill. l. c. t. 6. Male plant and seed. The seeds are as large as chestnuts, and as good as almonds, and when pressed they yield an abundance of oil, equal to that of the finest olives.

African Ampelosicyos. Fl. July. Clt. 1825. Pl. cl.

Cult. Any light soil will suit this plant, and cuttings root readily under a hand-glass, in heat. It is a strong coarse growing plant, and therefore requires a great deal of room, both for the roots and the branches, or it will not flower.

XVIII. CUCU'RBITA (from *curvitas*, crookedness, according to Scaliger; in reference to the shape). Lin. gen. no. 1478. Juss. gen. p. 396. Gærtn. fruct. 2. p. 49. t. 88. f. 5. exclusive of *C. Lagenària* of authors. Citrúllus, Neck. elem. bot. no. 389. Melópepo, Tourn. inst. p. 106. t. 34. Pèpo, Tourn. l. c. p. 105. t. 33.

Lin. syst. *Monoècia, Monadélphia.* Flowers monoecious. Corolla campanulate, yellow; petals joined together and to the calyx. Male flowers. Calyx hemispherically campanulate. Stamens 5, in 3 bundles, or joined at the apex; anthers abruptly curved, both at the base and the apex, the rest straight and parallel. Female flowers. Calyx obovate-clavate, narrowed towards the top, or campanulate, and always circumcised under the limb after flowering. Anthers usually sterile. Stigmas 3, thickish, 2-lobed. Fruit 3-5-celled. Seeds ovate, compressed, with hardly tumid margins.

1 C. ma'xima (Duch. in Lam. dict. 2. p. 151.) leaves cordate, very rugged; petioles hispid; tube of calyx obovate, ending in a short neck; fruit globose, somewhat depressed, yellow, red, or green. ⊙. F. Native country unknown. Tourn. inst. p. 106. no. 2. t. 34. Lob. icon. 641. f. 2. Cucúrbita Potìro, Pers. ench. 2. p. 593.

Var. α, Potìro (Ser in D. C. prod. 3. p. 316.) stems very long, climbing; tendrils strong; fruit large, yellow, or orange-coloured, hollow at maturity. *Common yellow gourd, potiron jaune commun, gourge* of the French. The shells of the fruit are generally used for holding water.

Var. β, víridis (Ser. in D. C. prod. 3. p. 316.) stems very long, climbing; fruit green, large, hollow at maturity. *Large green gourd. Gros potiron vert* of the French. The shells of the fruit of this sort are also used as calabashes.

Var. γ, Goúrgero (Ser. diss. in mem. soc. gen. vol. 3. pt. 2. t. 1.) stems assurgent, dwarf; nodes close; tendrils abortive; leaves ovate, cordate, 3-5-lobed, somewhat cochleate; lobes narrow; fruit small, green, or yellow, full at maturity. *Gourgeron* or *petit potiron vert.*

Large Hollow Gourd. Fl. Jul. Aug. Clt.? Pl. cl. or tr.

2 C. melópepo (Lin. spec. 1435.) leaves cordate, obtuse, somewhat 5-lobed, denticulated; tendrils usually transformed into very imperfect leaves; calyx hemispherically campanulate, short, having the throat much dilated; fruit depressed; carpels irregular, rising beyond the throat of the calyx; flesh dry, spongy, white; cells 4-5. ⊙. F. Native country unknown. Willd. spec. 4. p. 610. C. polymórpha Melópepo, Duch. in Lam. dict. 1. p. 157.—Bauh. hist. 2. p. 224. with a figure. Pèpo máximus clypeàtus, Mor. hist. 1. sect. 1. t. 8. Fruit flatted at both ends. It is of great use in long voyages, for it can be kept several months in a fresh state, and is commonly made into pies, like the pumpkin, or boiled and eaten with meat instead of turnips or potatoes. *Bonnet d'electeur, bonnet de prêtre,* and *pastisson* of the French.

Squash Gourd. Fl. May, Sept. Clt. 1597. Pl. tr.

3 C. moscha'ta (Duch. ex dict. scienc. nat. 11. p. 234.) corolla campanulate, very narrow at the base; leaves soft, tomentose; fruit oval or spherical, depressed; flesh yellow or orange-coloured, musky. ⊙. F. Native of Martinique. C. I'ndica rotúnda, Dalech. hist. 616. f. 3.

Musky Gourd. Fl. June, Aug. Clt.? Pl. tr.

4 C. ceratócreas (Mart. reise, in bras. ex Linnæa. 5. p. 39.) leaves cordate, nearly orbicular, bluntly somewhat 5-lobed, denticulated; fruit large, oblong-pear-shaped, or cylindrical, lined longitudinally, glabrous; flesh subgranular. ⊙. F. Native of Brazil.

Horned-fruited Cucurbita. Pl. tr.

5 C. villòsa (Blum. bijdr. p. 931.) leaves roundish, cordate, 5-lobed, scabrous; lobes acute, sinuately denticulated; peduncles 1-flowered, those of the male longer than those of the female flowers; fruit oblong, villous. ⊙. F. Gathered in the gardens in the East Indies. By the Javanese it is called *Baligo.*

Villous Gourd. Pl. tr.

6 C. Pe'po (Lin. spec. 1435.) leaves cordate, obtuse, somewhat 5-lobed, denticulated; calyx ending in a neck beneath the limb; fruit roundish or oblong, smooth. ⊙. F. Native of the Levant. C. polymórpha oblónga, Duch. in Lam. dict. 2. p. 155. This species is called *Pumpkin* and *pompion*, in English; *Giraumon, Citrouille iroquoise, gourge de Saint Jean* in French; *Popone* in Italian. There are several varieties of pompion, but the most striking are the two following:

Var. α, subrotúnda (Willd. spec. 4. p. 609.) fruit roundish. C. màjor subrotúnda, &c. Bauh. pin. 213.

Var. β, oblónga (Willd. l. c.) fruit oblong. Pèpo oblóngus, Bauh. pin. p. 311.

The pumpkin is the melon or millon of our early horticulturists, the true melon being formerly distinguished by the name of musk melon. Though commonly cultivated in gardens for curiosity, yet in some country villages in England, the inhabitants grow it on dunghills, and train the shoots to a great length on the grass. When the fruit is ripe, they cut a hole on one side, and having taken out the seeds, fill the void space with sliced apples, adding a little sugar and spice, and then having baked the whole, eat it with butter. On the Continent, as well as in many other parts of the world, the fruit is a good deal used in soups, and also stewed or fried in oil or butter. Pumpkin-pie is also very common in many parts of the world.

Modes of dressing some varieties of the gourd.—Mr. Crichton (Cal. mem. vol. 4.) prefers the cheese-gourd, some of which have weighed with him 1 cwt., and the vegetable marrow; but he very judiciously attaches much more importance to the kind of cooking than to the variety cultivated. He therefore subjoins two receipts for the use of the cheese-gourd, and one for vegetable marrow.

To make soup of cheese-gourd.—Take the fleshy part of the gourd when ripe, and cut it into small pieces; put it into a pan with a small bit of butter, set upon a slow fire until it melt down to a puré; then add milk, in the proportion of half a gallon to 4 lbs. of gourd, let it boil a short time with a little salt and sugar, enough to make it taste a little sweet; then cut some slices of bread very thin, toast them very well, and cut them into small dice, put them in a dish, and pour the puré over them, and serve it up.

Cheese-gourd dressed in the Spanish way.—When ripe cut the fleshy part into slices about half an inch, score it across into small dice about half through on one side of the slices; scrape a little of the fat of bacon, and put it into a saucepan, with a little parsley, shallots, and mushrooms chopped very small, adding a little salt and pepper; put them on a slow fire to fry a little, and place this seasoning upon the cut sides of the gourd slices. Put the whole into a quick oven, with a little butter or olive oil, and when baked a little serve up in a dish.

Pumpkin or Pompion. Fl. June, Aug. Clt. 1570. Pl. tr.

7 C. farinòsa (Blume, bijdr. p. 931.) leaves roundish, cordate, rather angularly 7-lobed, a little strigose; lobes acuminated, toothed; peduncles 1-flowered; fruit oblong, large, covered with a kind of glaucous mealiness. ⊙. F. Native of Java, in

fields and in gardens, where the plant is called *Daligo* by the natives. Allied to *C. Pèpo*. Compare Rumph. amb. 6. t. 143. according to Blume.

Mealy-fruited Gourd. Pl. tr.

8 C. verrucòsa (Lin. spec. 1435.) leaves cordate, deeply 5-lobed, denticulated; middle lobe narrow at the base; fruit roundish-elliptic, warted. ⊙. F. Native country unknown.—Bauh. hist. 2. p. 222. with a figure. C. polymórpha verrucòsa, Duch. in Lam. dict. 2. p. 155. The plant, flowers, and seed &c. are like those of *C. Pèpo*, but the fruit is smaller, with a harder, almost woody rind. Called *Barbarine*, and *Barbaresque sauvage* in French. The warted gourd is common in most parts of America, where it is cultivated as a culinary fruit. It varies in form and size, being round, flat, shaped like a bottle, or oblong; the rind is white when the fruit is ripe, and covered with large protuberances or warts. It is commonly gathered when half grown, and boiled by the inhabitants of America, to eat as a sauce to their meat. In England it is only cultivated as a curiosity.

Warted Gourd. Fl. June, July. Clt. 1658. Pl. tr.

9 C. subverrucòsa (Willd. spec. 4. p. 609.) leaves cordate, deeply 5-lobed, denticulated; middle lobe narrow at the base; fruit clavately-elliptic, rather warted. ⊙. F. Native country unknown. Perhaps a hybrid from *C. verrucòsa*, but the fruit is very different.

Subverrucose-fruited Gourd. Fl. June, Jul. Clt.? Pl. tr.

10 C. aura'ntia (Willd. l. c. p. 667.) plant very scabrous; leaves subcordate, 3-lobed, cuspidate, sharply denticulated; fruit globose, smooth, having the appearance and colour of an orange. ⊙. F. Native country unknown. The orange-gourd is rather more tender than the other sorts. It has been hitherto chiefly cultivated for curiosity, and when trained spirally round a pole, or against a wall, and loaded with its yellow fruit, it is very ornamental. The fruit should be used like those of other sorts of pumpkin or gourd.

Var. α, orángina (Ser. in D. C. prod. 3. p. 317.) fruit globose, 3-celled; pulp fibry, yellow, nearly dry, with a solid dark green rind, which at length becomes orange-coloured.—*Orangine* or *Fausse orange* in French; *orange-gourd*, English.

Var. β, colocynthoìdes (Ser. in D. C. prod. 3. p. 317.) rind of fruit thinner and variegated; pulp dry. Called *Coloquinelle* or *Fausse coloquinte* in French, and *False colocynth* in English.

Orange Gourd. Fl. June, Aug. Clt. 1802. Pl. cl.

11 C. coccínea; fruit round, scarlet, about the size of an orange. ⊙. F. Native of Sierra Leone.

Scarlet-fruited Gourd. Pl. tr.

12 C. ovífera (Lin. mant. p. 126.) leaves cordate, angular, 5-lobed, denticulated, pubescent; calyx obovate, ending in a short neck, and cut round after flowering to the neck. ⊙. F. Native of Astracan. C. polymórpha pyridàris, Duch. in Lam. dict. 2. p. 154.—J. Bauh. hist. 2. p. 222 and 223. f. 1. C. sylvéstris, Dod. pempt. 670. f. 1. C. pyrifórmis, Lob. hist. 367. f. 2. Herb and flowers very like those of *C. Pèpo*, but less scabrous. Fruit obovate or ovate, smooth, greenish or yellowish, figure of an egg. Called in French *Gougourdette*, and *Vegetable marrow*, in English.

Var. α, pyrifórmis (Ser. diss. l. c. t. 1.) leaves 5-lobed with undulated margins; lobes oblong-obovate, denticulated, rarely lobulate; fruit pear-shaped, green, or yellow, lined longitudinally with white.

Var. β, subglobòsa (Ser. in D. C. prod. 3. p. 318.) leaves bluntly lobed; lobes broad, short; fruit obovate, globose, green lined with white; flesh red.

Var. γ, grísea (Ser. l. c.) leaves 3-5-lobed, narrow; middle lobe trapeziform, usually lobulate; fruit larger, greenish grey, spotted with white, hardly lined.

Var. δ, ovàta; fruit large, ovate, whitish when ripe.

The first kind of vegetable marrow was introduced to Britain from Persia within the last few years, where it is called *Cicader*. The fruit of this sort is of a uniform pale yellow or light sulphur colour: when full grown it is about 9 inches in length, 4 inches in diameter, of an elliptic shape, the surface being rendered slightly uneven by irregular longitudinal ribs, the terminations of which uniting form a projecting apex at the end of the fruit, which is very unusual in the gourd or pompion tribe. It is useful for culinary purposes in every stage of its growth; when very young, it is good if fried with butter; when large, or about half grown, it is excellent either plain boiled or stewed with rich sauce; for either of these purposes it should be cut in slices. The flesh has a peculiar tenderness or softness, from which circumstance it has received its name, much resembling the buttery quality of the *beurre-pear*, and this property remains with it until it is full grown, when it is used for pies. It is, however, in its intermediate state of growth that it is likely to be most approved. There are now several kinds of vegetable marrow in cultivation.

To dress vegetable marrow.—Take the fruit when about half grown; cut it lengthwise through the middle (if large cut it into 3 or 4 slices); take off the outer skin, cut it into small dice, about half through one side of the slices, then scrape a little of the fat of bacon, and put it into a saucepan, with a little parsley, shallots, and mushrooms, chopped very small, and let them fry a little; then add about a table spoonful of flour, with a little salt and pepper, mixed all together; then put the slices of the vegetable marrow into a stewpan with a cover, and put the fried seasoning over the slices, and let them stew a little on a slow fire, with a little fire on the cover. When enough done, serve up."—Crichton, Cal. mem. vol. 4. The Caledonian Horticultural Society's silver medal was given to Mr. Chrichton for this receipt, and the other two upon the cheese-gourd. We think it ought to have been given to the cook.

Egg-bearing Gourd or Vegetable-marrow. Fl. July, Sept. Clt.? Pl. tr.

13 C. fœtidíssima (H. B. et Kunth, nov. gen. amer. 2. p. 123.) leaves deeply cordate, ovate, sinuately angular, narrowed above, toothed, strigose above, but white and villous beneath; female flowers axillary, solitary, pedunculate; calyx campanulately funnel-shaped above, with ovate-oblong, acute segments. ⊙. F. Native of Mexico, near Guanaxuato, at the height of 3240 feet.

Very fœtid Gourd. Pl. cl. or tr.

14 C. umbella'ta (Klein, ex Willd. spec. p. 608.) stem furrowed, glabrous; leaves cordate, with 5 narrow, denticulated scabrous lobes; male flowers in umbels, female ones solitary, pedunculate; fruit elliptic, tomentose. ⊙. F. Native of the East Indies.

Umbellate-flowered Gourd. Pl. tr.

15 C. aspera'ta (Gill. mss. ex Hook et Arn. in bot. misc. 3. p. 234.) flowers dioecious; stems glabrous; leaves palmately 5-parted, rough from callous dots on both surfaces, which are more numerous beneath; segments sinuately pinnatifid; tendrils simple; male flowers in capitate racemes, on short peduncles, female ones pedunculate, solitary; fruit nearly globose, few-seeded. ⊙. F. Native of Chili, in the province of Mendoza, in uncultivated places, where it is called by the natives *Sandillo del campos*. This plant agrees in many respects with the *C. mammeàta*, Mol. but that species is from Chili.

Rough Gourd. Pl. tr.

16 C. cicera'ria (Molina, Chili ed germ. p. 316.) leaves roundish, angular, tomentose; fruit woody, globose. ⊙. F. Native of Chili.

Intoxicating Gourd. Fl. June, Aug. Clt. 1824. Pl. tr.

17 C. MAMMEA'TA (Molina, l. c.) leaves many-parted; fruit spherical, beset with protuberances. ⊙. F. Native of Chili.

Teated Gourd. Pl. tr.

18 C. LIGNÒSA (Mill. dict.) leaves rough, lobed; fruit woody. ⊙. F. Native of South America. This is a large gourd, and is cultivated for the sake of the shell of the fruit, which will frequently contain between 2 and 3 quarts. Where aloes is manufactured in any quantity, it is commonly preserved in these shells; but in Jamaica they are used to hold water, and small grain.

Woody-fruited Gourd. Fl. June, Aug. Clt.? Pl. tr.

19 C. MULTIFLÒRA (Forst. ex Spreng. syst. 5. p. 45.) leaves broadly cordate, 3-lobed, acute, denticulated, glabrous; flowers minute, crowded in cymes. ⊙. F. Native of the Society Islands.

Many-flowered Gourd. Pl. tr.

Cult. The species of *Cucúrbita* are propagated from seeds, which are large, and require to be covered nearly an inch. Sow in April in a hot-bed, under a frame or hand-glass, to raise plants for transferring to the open garden at the end of May, under a warm aspect, or for planting out in the middle of May on a trench of hot dung under a hand-glass or half shelter; otherwise sow at the beginning of May, under a hand-glass, without bottom heat, for transplanting into a favorable situation; or sow 3 weeks later (after the 20th) at once in the open garden, under a south wall, for the plants to remain. The smaller fruited kinds do best trained to an upright pole or trellis. From time to time earth up the stems of the plants. As the shoots extend 5 feet or more, peg down at a joint, and they will take root. Water copiously whenever warm weather without showers makes the ground arid. Mr. Gray (Gard. mag. vol. 1. p. 150.) plants in paths between asparagus beds, and lets the vines of the gourds run over them; and he considers that their large leaves do good to the asparagus roots, by protecting them from the sun, while the tall stems of the asparagus afford a shelter to the leaves of the gourds. In very dry seasons they are an excellent substitute for cabbages and turnips, when the drought is apt to burn up these vegetables. Mr. Gray therefore recommends, especially where the soil is liable to be burnt up in summer, planting the vegetable marrow and other cucurbitaceous plants as a reserve crop. The tender tops of all the edible species of *Cucurbitàceæ*, boiled as greens or spinage, are a fully more delicate vegetable than the fruit. It must be worth something to gardeners and cooks to know that either or both may be used for this purpose when scarcely any thing else can be got.

XIX. INVOLUCRA'RIA (*involucrum*, an involucre; in reference to the umbels of male flowers being involucrated by bracteas). Ser. diss. in mem. soc. hist. nat. gen. vol. 3. pt. 2. D.C. prod. 3. p. 318.

Lin. syst. *Monoècia*, *Monadélphia*. Flowers monoecious. Male flowers umbellate, sessile, involucrated by reniform bracteas, which are dentately fringed at the apex; common peduncle very long, furnished each with an oblong bractea at the base. Alabastra nearly like those of the rose. Tube of calyx obconical; limb with acute linear sepals. Corolla, stamens, and filaments unknown. Anthers joined, with the cells as in the rest of the *Cucurbitàceæ*. Female flowers solitary on long peduncles, rising from the same axillæ as the males, as well as of the same form.

1 I. WALLICHIA'NA (Ser. l. c. t. 4.) leaves deeply 5-lobed, cut, scabrous; lobes obovate-oblong, coarsely toothed; tendrils quinquefid. ⊙.? F. Native of Nipaul.

Wallich's Involucraria. Pl. cl.

Cult. See *Cucúrbita* for culture and propagation.

XX. MURI'CIA (from *muricatus*, muricated; in reference to the warted berries). Lour. coch. p. 596. D. C. prod. 3. p. 318.

Lin. syst. *Monoècia*, *Monadélphia*. Flowers monoecious. Calyx of 5 sepals, inclosed in a large, undivided, 1-flowered sheath; sepals subulate, striated, coloured, joined together at the base. Corolla campanulate; petals 5, ovate-lanceolate, nerved. Stamens 5, in 3 bundles, and with the anthers connected at the apex. Style 1; stigmas 3, sagittate, horizontal. Berry muricated, 1-celled, many-seeded. Seeds orbicular, large, reticulated, with tubercular margins.

1 M. COCHINCHINE'NSIS (Lour. l. c. p. 596.) a large shrub, with 5-lobed leaves, the 3 superior lobes acuminated, and the inferior ones obtuse, short, and denticulated; flowers yellow, solitary, on long peduncles; fruit reddish purple both inside and outside, scentless. ♄. G. Native of Cochin-china and China. Momórdica Cochinchinénsis, Spreng. syst. 3. p. 14. The seeds and leaves are aperient and abstergent.

Cochin-china Muricia. Shrub.

Cult. A mixture of peat and sand will answer this shrub; and cuttings will root in the same kind of soil.

XXI. ANGU'RIA (one of the Greek names for the cucumber, from αγγος, *angos*, a vessel; shape of fruit). Lin. gen. no. 399. Juss. gen. p. 395. Lam. ill. t. 747. D. C. prod. 3. p. 318.—Momórdica spec. of authors.—Psigùria, Neck. elem. bot. no. 384.

Lin. syst. *Monoècia*, *Diándria*. Flowers monoecious. Male flowers. Calyx campanulate, 5-toothed. Corolla joined to the calyx, ventricose, red, with a 5-parted spreading border. Stamens 2, opposite. Female flowers with a calyx and corolla, as in the males. Stamens 2, sterile. Style semi-bifid; stigmas bifid. Fruit 2-4-celled, many-seeded, somewhat tetragonal. Seeds unknown. Roots thick, warted.

1 A. INTEGRIFÒLIA (Nees et Mart. in nov. act. bonn. 12. p. 9.) leaves ovate, denticulated, 3-nerved, glabrous; peduncles 4-6-flowered, bractless; female flowers unknown.—Native of Brazil, at the river Ilheos. Flowers red.

Intire-leaved Anguria. Pl. cl.

2 A. TRILOBA'TA (Lin. spec. 1376.) root bitter; stems slender; leaves deeply 3-lobed, or somewhat 5-lobed, veiny; lobes a little toothed; tendrils simple; male flowers large, in racemes, female ones solitary, almost sessile; fruit ovate-oblong, umbilicate, green, spotted with white; seeds oblong, fulvous. ♃. ب. S. Native of Martinico.—Plum. ed. Burm. pl. amer. t. 22. Jacq. amer. p. 243. t. 156. ed. pict. p. 119. t. 234. Flowers vermilion coloured.

Three-lobed-leaved Anguria. Fl. Ju. Jul. Clt. 1793. Pl. cl.

3 A. PEDATISE'CTA (Nees et Mart. in nov. act. bonn. 12. p. 10.) leaves pedately 5-parted; lobes quite entire; tendrils subumbellate; corymbs many-flowered; flowers triandrous? fruit oblong, striated, attenuated both at the base and apex; pulp white, spongy, rather acid: aril black. ⊙. ب. F. Native of Peru. Momórdica pedisécta, Lin. spec. 1434. Lam. dict. 4. p. 241.—Feuill. per. 1. p. 754. t. 41. Flowers white. Two outer segments of leaves lobed. The Peruvians use the fruit in soups.

Pedate-cut-leaved Anguria. Pl. cl.

4 A. PEDA'TA (Lin. spec. p. 1376.) stems slender, terete; leaves pedately 5-parted; lobes lanceolate, toothed; tendrils longer than the leaves; flowers inodorous, male ones in racemes; racemes on long peduncles; female ones solitary; fruit oval-oblong, green, variegated with white. ♃. ب. S. Native of St. Domingo. Jacq. amer. 242. t. 155. ed. pict. t. 233.—Plum. ed. Burm. pl. amer. 23.? Flowers with orange-coloured petals.

Pedate-leaved Anguria. Fl. Ju. Jul. Clt. 1820. Pl. cl.

5 A. rò'sea (H. B. et Kunth, nov. gen. amer. 2. p. 122.) branches glabrous; leaves truncately cordate at the base, quite entire, 3-lobed at the apex, glabrous, membranous; tendrils undivided, glabrous; male flowers disposed in racemes; calyx cylindrically campanulate, ventricose at the base, with a 5-parted rose-coloured limb, having the segments roundish and longer than the tube; stamens 2, sessile. ♃. ◡. S. Native of New Granada, in temperate places near Turbaco, at the height of 6000 feet. Flowers rose-coloured.

Rose-coloured-flowered Anguria. Pl. cl.

6 A. umbrò'sa (H. B. et Kunth, l. c. p. 121.) leaves pedately 5-parted, sinuately cordate; lobes quite entire, ovate-lanceolate, outer ones much the shortest and divaricate; flowers panicled; peduncles very long; calyx roughish, having the tube ventricose at the base, of a vermilion colour; stamens 2, free; anthers linear; female flowers unknown. ♃. ◡. S. Native of the temperate provinces of New Andalusia, near Bordones and Cumanacoa.

Shaded Anguria. Fl. June, July. Clt. 1827. Pl. cl.

7 A. trifolia'ta (Lin. spec. 1576.) stems thickish, terete, rugged; tendrils simple; leaves palmately ternate; leaflets entire: lateral ones unequal-sided; male flowers in racemes purple; tube of calyx long and ventricose; peduncles short; fruit irregularly ovate-oblong, bluntly mucronate, 4-celled, green, lined with white; flesh of fruit red, and sweet. ♃. ◡. S. Native of St. Domingo.—Plum. pl. amer. t. 99.

Trifoliate Anguria. Fl. June, July. Pl. cl.

Cult. The species of this genus delight in a light rich soil, and may be propagated either from seeds or cuttings.

† *Genera allied to Cucurbitàceæ, but are not sufficiently known.*

XXII. ZU'CCA (meaning unknown). Comm. in Poir. suppl. 5. p. 526. Ser. in D. C. prod. 3. p. 319.

Lin. syst. unknown. Flowers solitary, axillary. Bractea large, concave, involving a large, coloured, 5-sepalled calyx, and girded by 5 scales at the base. Stamens 5.—A doubtful genus, said to be related to the order *Passiflòreæ;* but according to St. Hilaire (mem. mus. 9. p. 190.) it belongs to *Cucurbitàceæ*, from the lateral situation of the tendrils.

1 Z. Commersonia'na (Ser. in D. C. prod. 3. p. 319.) Native country unknown.

Commerson's Zucca. Pl. cl.

Cult. See *Angùria* for culture and propagation.

XXIII. ALLA'SIA (αλλας, *allas*, a sausage; from the colour and form of the fruit resembling a sausage). Lour. coch. p. 85. D. C. prod. 3. p. 319.

Lin. syst. *Tetrándria, Monogýnia.* Flowers hermaphrodite. Calyx gamosepalous, girded by a short involucrum; segments 5, acutish, hairy. Corolla 4-petalled; petals roundish, very hairy, small. Stamens 4 or perhaps 8 joined by twos; anthers 2-lobed? Style subulate; stigma acute. Berry fleshy, large, oblong, obtuse, pendulous, 1-celled. Seeds imbedded in the pulp, ovate, compressed, tumid.

1 A. Pa'yos (Lour. l. c.) a tree, with spreading unarmed branches; opposite digitate leaves; the lobes 5, oval, quite entire and pilose; flowers nearly terminal, pale; peduncles many-flowered. ♄. S. Native of the eastern coast of Africa, on the shores of Mozambique. Jaracàtia Brasiliàna, Pison, bras. p. 160. ex Lour. l. c. Flowers pale. Fruit brownish-red.

Payos Allasia. Tree.

Cult. A light rich soil will suit this tree, and cuttings will strike root in the same kind of soil under a hand-glass in heat.

XXIV. GRONO'VIA (so named by Houston, in honour of John Frederick Gronovius, M.D. a learned botanist of Leyden). Lin. gen. no. 391. Juss. gen. p. 394. H. B. et Kunth, nov. gen. amer. 2. p. 119.

Lin. syst. *Pentándria, Monogýnia.* Flowers hermaphrodite. Calyx funnel-shaped, 5-parted, coloured. Scales 5, linear, petal-formed, pellucid, alternating with the calycine segments. Stamens 5, free, alternating with the scales. Ovarium inferior. Style 1, crowned by a subcapitate stigma. Berry dry, nearly globose, 1-seeded, crowned by the dry permanent calyx.—Climbing herbs, adhering by tendrils, with leaves like those of *Bryònia.* Peduncles opposite, rather umbellate. Flowers disposed in unilateral spikes, cymose, sessile, bracteate.

1 G. sca'ndens (Lin. spec. 292.) ☉. ◡. S. Native of Vera Cruz. Jacq. coll. 3. p. 197. icon. rar. t. 338. Lam. ill. t. 144. f. 2. G. Humboldtiàna, Rœm. et Schult. syst. 5. p. 492. Fruit ribbed, while young. Flowers greenish-yellow. Leaves 5-lobed. The hairs on the leaves sting like those of a nettle.

Climbing Gronovia. Fl. June, July. Clt. 1731. Pl. cl.

Cult. Being a tender annual plant, the seeds of it require to be sown on a hot-bed; and after the plants have grown a sufficient size in the seed-pot, they should be potted off singly into other pots, and after a time placed in the stove, and trained upon sticks.

XXV. KO'LBIA (this genus is dedicated to Peter Kolbe or Kolben, a German traveller, who published a description of the Cape of Good Hope). Beauv. fl. d'ow. 2. p. 91. t. 120. D. C. prod. 3. p. 320.

Lin. syst. *Diœ'cia, Monadélphia.* Flowers dioecious. Male flowers with a gamosepalous calyx, composed of 5 joined sepals, having a crenulated margin; the corolla is gamopetalous, and 5-lobed; lobes lanceolate, with glandular edges. Nectarium? 5-leaved, having lanceolate lobes, which taper to the base, with their edges plumosely ciliated. Stamens 5, monadelphous; filaments short; anthers long, conniving. Pistillum unknown.

1 K. e'legans (Beauv. l. c.) stem sarmentose, bearing tendrils; leaves glabrous, petiolate, cordate; peduncles 4-flowered. ♃. ◡. S. Native of the western coast of Africa, in the kingdom of Benin. Flowers red. Nectarium blue.

Elegant Kolbia. Pl. cl.

Cult. A light rich soil will suit this elegant plant, and cuttings will root in the same kind of mould under a hand-glass in heat.

Order CIV. PAPAYA'CEÆ (this order contains only the Papaw trees). Martius, 1829.—Papàyæ, Agardh. 1824.—Caríceæ, Turp. in atl. du dict. des sc. nat.

Flowers unisexual. Calyx inferior, minute, 5-toothed. Corolla monopetalous; in the male tubular, with 5 lobes and 10 stamens, all arising from the same line, and of which those that are opposite the lobes are sessile, the others on short filaments; anthers adnate, 2-celled, bursting longitudinally; in the female divided nearly to the base into 5 segments. Ovarium superior, 1-celled, with 5 parietal polyspermous placentas. Stigma sessile, 5-lobed, lacerated. Fruit succulent, indehiscent, 1-celled, with 5 polyspermous parietal placentas. Seeds enveloped in a loose mucous coat, with a brittle pitted testa. Embryo in the axis of the fleshy albumen, with flat cotyledons, and a terete radicle, turned towards the hilum.—Trees, without branches, yielding an acrid milky juice. Leaves alternate, palmately lobed, standing on long terete petioles.

It was the opinion of Jussieu that the genus upon which this

order is founded, held a sort of middle station between *Urtíceæ* and *Cucurbitàceæ*. Auguste St. Hilaire has, however, well remarked upon this subject, that the only relation that it has with *Urtíceæ* consists in the separation of sexes, its milky juice, its habit, which is like that of some species of *Fìcus* or *Fig*, its foliage, which is not very different from the *Cecròpia*, and the position of its stigma; and to these he wisely attaches very little importance. Its fruit brings it near *Cucurbitàceæ;* but its true place is probably nearer to *Passiflòreæ*, with which it altogether agrees in the appearance of its testa, in its unilocular fruit, with parietal polyspermous placentas, and its having a calyx and corolla present, differing, however, widely in its habit, and monopetalous flowers.

The fruit of the Papaw is eaten when cooked, and is esteemed by some persons; but it appears to have little to recommend it. Its great peculiarities are, that the juice of the unripe fruit is a most powerful and most efficient vermifuge; the powder of the seed even answers the same purpose, and that a principal constituent of this juice is febrine, a principle otherwise supposed peculiar to the animal kingdom, and to fungi. The tree has moreover, the singular property of rendering the toughest animal substances tender, by causing a separation of the muscular fibre; its very vapour even does this.

I. CA'RICA (erroneously supposed to be a native of Caria). Lin. gen. no. 1127. Schreb. 1536.—Papàya, Tourn. 441. Juss. 399.

Lin. syst. *Diœ'cia, Decándria.* Character the same as the order.

1 C. Papa'ya (Lin. spec. 1466.) leaves palmately 7-lobed; segments deeply lobed, oblong, acute; male flowers corymbose. ♄. S. Native of both Indies.—Rumph. amb. 1. t. 50, 51.—Merian, Surim. t. 40. Rheed. mal. 1. t. 15. f. 1. Hook. bot. mag. 2898. Ker. bot. reg. 459. The papaw tree is a native of South America and the West Indies, whence it was brought by the Spaniards and Portuguese to the Philippines and the Moluccas; and from these Islands, it being of very quick growth, it spread to all the other countries of India. In three years from seed a papaw tree will be 20 feet high, and loaded with flowers and fruit; and for the sake of this fruit the plant is generally cultivated; it has a pleasant sweetish taste, and is much liked by many people; when young it is generally used for sauce; and when boiled and mixed with lime-juice and sugar, is not unlike, or much inferior to, that made of real apples, for which it is commonly substituted. But Sloane says, the fruit is not in general gathered before it is ripe; cut into slices, soaked in water till the milky juice is out, and is then boiled and eaten as turnips, or baked as apples. The juice of the pulp, according to Descourtilz, in the "Flore Medicale des Antilles," is used as a cosmetic to remove freckles on the skin, caused by the sun; and the negroes in the French colonies employ the leaves to wash their linen instead of soap. As a medicinal plant the papaw tree is particularly deserving of notice. Hernandez long ago spoke of the milky juice of the unripe fruit as a powerful vermifuge; which has been confirmed by M. Charpenter-Cossigni, as mentioned in the Asiatic Researches by Dr. Heming (vol. 2. p. 162.). A single dose, that gentleman says, is sufficient to cure the disease, however abundant the worms may be. Another writer (Pourpee Desportes) recommends the use of the powder of the seed instead of the juice. But the most extraordinary property of the papaw tree, is that which is related first, I believe by Browne, in his natural history of Jamaica, namely, that "water impregnated with the milky juice of this tree is thought to make all sorts of meat washed in it tender: but 8 or 10 minutes' steeping, it is said, will make it so soft that it will drop in pieces from the spit before it is well roasted, or turn soon to rags in the boiling." This circumstance has been repeatedly confirmed, and moreover, that old hogs and old poultry which are fed upon the leaves and fruit, however tough the meat they afford might otherwise be, is thus rendered perfectly tender, and good if eaten as soon as killed, but that the flesh passes very soon into a state of putridity. In the third volume of the Wernerian Society's Memoirs there is a highly interesting paper on the properties of the juice of the papaw tree, by Dr. Holder, who has witnessed its effects in the Island of Barbadoes, and speaks of them as known to all the inhabitants. The juice causes a separation of the muscular fibres. Nay, the very vapour of the tree serves this purpose; hence many people suspend the joints of meat, fowls, &c. in the upper part of the tree in order to prepare them for the table. Such is the effect upon hogs that feed upon the fruit, that the good housewives reject the flesh of such if it be destined for salting, well knowing that it is not sufficiently firm for the purpose. It is not known whether the power of hastening the decay of meat be attributable to the animal matter or febrine contained in the juice of the Papaw. Two specimens of the juice were brought from the Isle of France; in the one the juice had been evaporated to dryness, and was in the state of an extract; in the other the juice was preserved by being mixed with equal bulk of rum. "Both were subjected to analysis by Vauquelin. The first was of a yellowish white-colour, and semitransparent; its taste was sweetish; and it had no smell, and was pretty solid; but attracted moisture when kept in a damp place. The second was reddish brown, and had the smell and taste of boiled beef. When the first specimen was macerated in cold water, the greatest part of it dissolved; the solution frothed with soap. The addition of nitric acid coagulated it, and rendered it white; and when boiled, it threw down abundance of white flakes. When the juice of the papaw tree is heated with water, the greatest part dissolves; but there remains a substance insoluble, which has a greasy appearance. It softens in the air, and becomes viscid, brown, and semitransparent. When thrown on burning coals it melted, let drops of grease exude, emitted the noise of meat roasting, and produced a smoke which had the odour of fat volatilized. It left behind it no residue. The substance was febrine. The resemblance between the juice of the papaw tree and animal matter is so close, that one would be tempted to suspect some imposition, were not the evidence that it is really the juice of the tree quite unquestionable. Thomson's System of Chemistry, extracted from the Annales de Chimie, vol. 43. p. 267. Febrine had been previously supposed to belong exclusively to the animal kingdom; but it has since been found in other vegetables, especially in *Fúngi*. The name *papaw* is abridged from *papaia-marum*, its name in Malabar.

Common *Papaw* Tree. Fl. July. Clt. 1690. Tree 10 to 20 feet.

2 C. citrifo'rmis (Jacq. fil. ex Spreng. syst. 3. p. 905.) leaves palmately 7-cleft; segments oblong, acute, middle one trifid; fruit oval, smooth. ♄. S. Native of Peru, about Lima. Flowers yellow. Fruit the shape and size of an orange, edible like the rest.

Citron-formed Papaw. Clt. 1820. Tree 10 to 20 feet.

3 C. pyrifórmis (Willd. spec. 4. p. 815.) leaves cordate, 3-lobed; lobes angular; angles acute; flowers corymbose; fruit pear-shaped. ♄. S. Native of Peru, and Chili, on rocky cliffs along the shore of Valparaiso. Feuille, per. 2. p. 52. t. 39. f. 1. C. Prosopòsa, Lin. spec. 1466.? Flowers rose-coloured. Fruit

yellow, pear-shaped. A doubtful species of the genus, from its small size and branched stem.

Pear-shaped Papaw. Clt. 1823. Shrub 3 to 6 feet.

4 C. CAULIFLÒRA (Jacq. schœnbr. 3. p. 33. t. 311.) leaves palmately 5-lobed; intermediate lobe sinuated; segments lanceolate, acuminated; male peduncles usually 5-flowered, rising from tubercles on the trunk. ♄. S. Native of South America, in the province of Caraccas and of Trinidad. Flowers yellowish.

Stem-flowered Papaw. Clt. 1806. Tree 10 to 20 feet.

5 C. MICROCA'RPA (Jacq. schœnbr. 3. p. 32. t. 309 and 310.) leaves 3 or 5-lobed: intermediate lobe 3-lobed; male flowers corymbose. ♄. S. Native of Caraccas and Chili. Flowers yellowish. Fruit the size of a cherry.

Var. β, *monoïca* (Desf. in ann. mus. 1. p. 273.) lower leaves entire (smaller), cauline ones 3-lobed, upper ones 5-lobed; lobes somewhat pinnatifid; flowers monoecious, subracemose, erect. ♄. S. Native country unknown. Petioles channelled.

Small-fruited Papaw. Tree 10 to 12 feet.

6 C. SPINÒSA (Willd. spec. 4. p. 815.) leaves digitate; leaflets 7, oblong, acuminated, quite entire; trunk spiny. ♄. S. Native of Guiana and Brazil, in Maranham and Para. C. digitàta, Aubl. guian. 2. p. 908. t. 246. A branched tree.

Spiny Papaw. Clt. 1821. Tree 20 to 30 feet.

Cult. These trees grow well in any light rich soil. They may be brought into a fruit bearing state in our stoves, by planting them in large pots, or in tubs made for the purpose.

ORDER CV. PASSIFLO'REÆ (plants agreeing with *Passiflòra* in important characters). Juss. ann. mus. 6. p. 102. D. C. prod. 3. p. 321.

Calyx of 5 (f. 5. *a.*) or 10 sepals (f. 4. *a.* f. 6. *a.* f. 7. *a.*), combined into a short or elongated tube (f. 7. *e.*), free at the apex, disposed in 1 or 2 series; outer lobes large, foliaceous; inner ones alternating with the outer ones, and more petal-like than them, sometimes these last are wanting altogether; the sides or throat are lined by filamentous (f. 4. *a.*) or annular (f. 5. *b.* f. 6. *c.*) or membranous coloured processes, which are disposed in one or more series, having the bottom usually closed by a lid-formed appendage. Petals 5 in the tribe *Paropsièæ*, but wanting altogether in the tribe *Passiflòreæ*. Stamens 5 (f. 4. *b.* f. 5. *d.* f. 7. *c.*), but indefinite in the genus *Smeathmánnia*. Filaments opposite the exterior lobes of the calyx, joined into a long tube which sheaths the stipe of the ovarium; anthers fixed by the back, peltate (f. 4. *b.* f. 5. *c.*), reflexed, turned outwards, but reversed they are turned inwards, 2-celled, bursting lengthwise. Torus elongated into a long cylindrical stipe. Ovarium seated on the stipe, ovate, free. Styles 3, rising from the same point (f. 6. *e.* f. 5. *d.* f. 4. *d.*), crowned by a stigma each, which is somewhat 2-lobed. Fruit naked (f. 7. *g.*), or surrounded by the calyx (f. 8. *a.*), stalked, 1-celled, 3-valved, having a polyspermous parietal placenta in the middle of each valve; the valves sometimes dry and dehiscing, sometimes fleshy and indehiscent. Seeds attached in several rows to the placentas, usually clothed with a large pulpy aril, compressed, and generally scrobiculate. Embryo straight, in the centre of the fleshy thin albumen, having a terete radicle, which is turned towards the hylum; cotyledons flat and foliaceous.—Herbs or shrubs for the most part climbing. Leaves of many forms, alternate, stipulate, usually bearing glands on the limb or petiole. Peduncles axillary, some of which are changed into tendrils from abortion, others are simple, and bear 1 flower each, very rarely branched and many-flowered; however, all the peduncles are floriferous in the upright species, or those that do not climb: always articulated under the flower, and generally furnished with a 3-leaved involucrum at the articulation.

The real nature of the floral envelopes of this remarkable order, is a question upon which botanists entertain very different opinions, and their ideas of its affinities are consequently much at variance. According to Jussieu (Dict. scien. vol. 38. p. 49.) the "parts taken for petals are nothing but inner divisions of the calyx, usually in a coloured state, and wanting in several species;" and therefore, in the judgment of this venerable botanist, the order is apetalous, or monochlamydeous. De Candolle adopts the same view of the nature of the floral envelopes as Jussieu; but he nevertheless considers, we think with propriety, the order polypetalous. Other botanists consider the outer series of the floral envelopes as the calyx, and the inner as the corolla; the one is green and the other coloured. The nature of the filamentous appendages, or rays as they are called, which proceed from the orifice of the tube, and of the membranous or fleshy, entire or lobed, flat or plaited annular processes, which lie between the petals and the stamens, are ambiguous, but are probably abortive stamens. With regard to the affinity of *Passiflòreæ*, Jussieu, swayed by the opinion he entertains of their being apetalous, and De Candolle, who partly agrees and partly disagrees with Jussieu in his view of their structure, both assign the order a place near *Cucurbitàceæ;* but when we consider the stipitate fruit, occasionally valvular, the parietal placentas, the sometimes irregular flowers, the stipulate leaves, and the climbing habit of these plants, it is not difficult to admit their affinity with *Capparídeæ* and *Violarièæ*, the dilated disk of the former of which is probably analogous to the innermost of the annular processes of *Passiflòreæ*.

The plants composing the *Passiflòreæ*, are the produce of South America and the West Indies, where the woods are filled with their species, which climb about from tree to tree, bearing at one time flowers of the most striking beauty, and of so singular an appearance, that the zealous Catholics who discovered them adapted Christian traditions to these inhabitants of the South American wildernesses, and at other times fruit tempting to the eye and refreshing to the palate. Several are found in Africa, and a few in the East Indies, of which the greater part belong to the genus *Modécca*.

Nothing is known of the properties of this order, further than that the succulent fruit and pulp that surround the seeds are fragrant, juicy, cooling, and pleasant in several species.

Synopsis of the genera.

TRIBE I.

PAROPSIE'Æ. *Petals 5. Ovarium sessile. Upright shrubs without tendrils.*

1 SMEATHMA'NNIA. Nectarium 1-leaved, urceolate, surrounding the base of the stamens. Stamens indefinite; anthers incumbent. Stigmas 5, peltate. Capsule inflated, papery, 4-5-valved.

2 Parópsia. Capillary threads simple, disposed in 5 bundles, rising from the base of the calyx. Stamens 5; anthers erect. Capsule bladdery, 3-valved.

Tribe II.

Passiflòreæ-veræ. *Calyx 5-sepalled. Petals 5 or wanting. Stamens 5, in one species only 4. Ovarium stalked. Some of the pedicels changed into tendrils. Stems generally climbing.*

3 Passiflòra. Tube of calyx very short, having the throat ornamented with a filamentous crown (f. 4. *a.*). Berry usually pulpy, rarely membranous.

4 Dise'mma. Tube of calyx short, furrowed below, having a double crown in the throat; the outer crown composed of distinct threads, the inner one with the threads joined into an entire or toothed membrane. The rest as in *Passiflòra.*

5 Tacsònia. Tube of calyx long (f. 7. *e.*); limb 5-lobed. Petals 5. Throat of calyx furnished with a scaly membrane.

6 Murucu'ia. Tube of calyx furrowed below; crown of throat simple, erect, tubular, truncate (f. 5. *b.* f. 6. *c.*). Habit of *Passiflòra.*

7 Pascha'nthus. Flowers polygamous. Calyx tubular; limb 5-cleft. Petals 5, oblong-linear. Stamens 5, free; anthers linear, inserted by the base. Capsule subbaccate, 6-seeded. Habit of *Passiflòra.*

8 Mode'cca. Flowers dioecious. Calyx campanulate; limb 5-parted (f. 8. *b. a.*). Petals 5 (f. 8. *c.*). Scales 5-10 (f. 8. *c.*), rarely wanting, rising from the calyx. Stamens 5, inserted in the torus, monadelphous. Anthers standing. Ovarium on a short stipe. Stigmas 3, starry (f. 8. *e.*). Capsule bladdery.

9 Deida'mia. Calyx 5-8-parted; lobes petaloid; filamentous crown simple, rising from the outer part of the calyx. Stamens the same number as the lobes of the calyx; filaments joined into a column at the base. Styles 3-4. Capsule pedicellate, 3-4-valved.

10 Vare'ca. Flowers unknown. Berry 1-celled; pulp divided for the seeds into many partial cells. Placentas 3, parietal, polyspermous.

Tribe I.

PAROPSIE'Æ (this tribe contains plants agreeing in important characters with *Parópsia*). D. C. prod. 3. p. 322. Petals 5. Ovarium sessile. Upright shrubs without tendrils. Perhaps a proper order.

I. SMEATHMA'NNIA (in honour of Smeathmann, a German, who travelled in many parts of western Africa, and collected many specimens of plants, particularly at Sierra Leone). Sol. and Banks, herb. ex Brown. congo. p. 20. Lin. trans. vol. 13. p. 220. D. C. prod. 3. p. 322.

Lin. syst. *Polyándria, Polygýnia.* Nectarium 1-leaved, urceolate, surrounding the stamens at the base. Stamens numerous, distinct, seated on a short column; anthers incumbent. Stigmas 5, peltate. Capsule inflated, 4-5-valved. Seeds dotted.—Upright shrubs, with white, showy, axillary flowers.

1 S. pube'scens (Sol. in herb. Bank. ex R. Br. in Lin. trans. vol. 13. p. 221.) branches downy; leaves oblong-ovate; top of nectarium bearded. ♄. S. Native of Sierra Leone, in the low lands.

Downy Smeathmannia. Fl. Mar. Shrub 6 to 8 feet.

2 S. læviga'ta (Sol. l. c. ex R. Br. l. c.) branches glabrous; leaves oblong, acute at the base, shining; nectarium cut, beardless. ♄. S. Native of Sierra Leone, in the mountains, where we have seen it growing in great plenty, and where it forms beautiful upright bushes, loaded with delicate white flowers.

Smooth Smeathmannia. Fl. March, April. Clt. 1823. Shrub 6 to 8 feet.

3 S. me'dia (R. Br. in Lin. trans. 13. p. 221.) branches glabrous; leaves obovate-oblong, obtuse at the base, glabrous, rather opaque. ♄. S. Native of Sierra Leone. Flowers white.

Intermediate Smeathmannia. Shrub 6 to 8 feet.

Cult. These elegant shrubs grow best in a mixture of loam, peat, and sand; and young cuttings of them strike root freely in the same kind of soil under a bell-glass, in heat.

II. PARO'PSIA (from παροψις, *paropsis*, a dish of meat; the seeds are inclosed in a fleshy arillus, of an agreeable sweet taste, much esteemed by the natives of Madagascar, as well as by Europeans). Du Pet. Th. pl. afr. 2. p. 59. t. 19. D. C. prod. 3. p. 322.

Lin. syst. *Monadélphia, Pentándria.* Capillary threads disposed in 5 bundles, in a single series, rising from the base of the calyx. Stamens 5, monadelphous a short way at the base; anthers erect. Stigmas 3. Capsule bladdery, 3-valved.

1 P. edu'lis (Du Pet. Th. l. c.). ♄. S. Native of Madagascar. Shrubs 5-6 feet high. Leaves ovate-oblong, deeply serrated. Pedicels axillary, in bundles. Aril of seeds edible. Flowers white.

Edible Paropsia. Shrub 5 to 6 feet.

Cult. For culture and propagation see *Smeathmánnia.*

Tribe II.

PASSIFLO'REÆ-VERÆ (true passion-flowers). Calyx with a 5-parted limb. Petals 5 or wanting. Stamens 5 in all, except one plant, which has only 4. Ovarium pedicellate. Some of the pedicels changed to tendrils. Stems generally climbing.

III. PASSIFLO'RA (from *passio*, passion, and *flos*, a flower; resemblance in crown of appendages to the passion of Christ). Juss. gen. p. 397. D. C. prod. 3. p. 322.—Granadílla, Tourn. inst. t. 123, 124.

Lin. syst. *Monadélphia, Pentándria.* Tube of calyx very short, having the throat ornamented with a multiple filamentous crown (f. 4. *a.*). Berry generally pulpy, rarely somewhat membranous.

Sect. I. Astro'phea (from αστρον, *astron*, a star; starry flowers). D. C. mem. soc. gen. 1. pt. 2. p. 435. p. 322. Tendrils none. Involucrum none. Limb of calyx 5-lobed. Petals 5. Stems arboreous. Perhaps species of *Parópsia.*

1 P. glau'ca (Humb. et Bonpl. pl. equin. 1. t. 22.) arboreous; leaves obovate-oblong, glaucous beneath, and bearing glands in the axils of the veins; petioles glandless; peduncles dichotomous, 3-5-flowered. ♄. S. Native of South America, on Mount Quindiu. P. amethýstina, Mikan. P. arbòrea, Spreng. syst. 3. p. 42. Flowers white. Crown tipped with yellow.

Glaucous Passion-flower. Tree 20 to 30 feet.

2 P. emargina'ta (Humb. et Bonpl. l. c. t. 23.) arborescent; leaves obovate-lanceolate, acuminated, or emarginate, pubescent beneath, and biglandular at the base; petioles glandless; peduncles dichotomous, 3-5-flowered. ♄. S. Native of Peru, on the Andes. Flowers white?

Emarginate-leaved Passion-flower. Shrub 10 to 16 feet.

3 P. ova'ta (Martin. ined. D. C. prod. l. c.) arborescent; leaves oval, obtuse at both ends, somewhat cuneated at the base, glabrous, glandless beneath; petioles biglandular at the apex; peduncles 2-flowered. ♄. S. Native of French Guiana.

Ovate-leaved Passion-flower. Shrub.

Sect. II. Polya'nthema (from πολυ, *poly*, many, and ανθος *anthos*, a flower; in reference to the peduncles bearing many flowers). D. C. mem. soc. gen. 1. pt. 2. p. 435. prod. 3. p. 322. Peduncles many-flowered, sometimes twin, with a tendril in the middle, sometimes solitary and branched, the middle ending in a tendril. Involucrum wanting or very small. Limb of calyx 5-lobed. Petals 5. Stems climbing.

4 P. cirriflòra (Juss. in ann. mus. 6. t. 41. f. 1.) leaves pedate, glabrous; petiole branched, biglandular above the base; leaflets 7, ovate, with 1 tooth on each side at the base; peduncles branched, bearing flowers and tendrils. ♄. ◡. S. Native of French Guiana, in woods. Form of leaves like those of *P. pedàta*. Crown variegated with white, yellow, and red.

Tendril-flowered Passion-flower. Shrub cl.

5 P. septena'ta (D. C. prod. 3. p. 323.) leaves pedate; petioles branched, glandless; leaflets oblong, having 1 tooth on each side at the base; tendrils simple, distinct from the peduncles. ♄. ◡. S. Native country as well as the flowers unknown.

Septenate-leaved Passion-flower. Shrub cl.

6 P. holoserícea (Lin. amœn. 1. p. 226. f. 15.) clothed with soft velvety down; leaves ovate, somewhat 3-lobed, aristately toothed at the base; petioles biglandular. ♄. ◡. S. Native of Vera Cruz. Sims, bot. mag. t. 2015. Ker. bot. reg. t. 59. Flowers white, spotted with red. Rays variegated with purple and white.

Whole-silky Passion-flower. Fl. May, Aug. Clt. 1733. Sh. cl.

7 P. sexflòra (Juss. l. c. t. 37. f. 1.) clothed with soft velvety down; leaves cordate at the base, very broad, truncate at the apex, 3-lobed; petioles glandless. ♄. ◡. S. Native of St. Domingo and Jamaica.

Six-flowered Passion-flower. Shrub cl.

8 P. geminiflòra (D. C. prod. 3. p. 322.) pubescent; leaves cuneated at the base, very broad, truncate, sinuately 3-lobed at the apex, glandular beneath and shining above; petioles glandless. ♄. ◡. S. Native of Brazil.

Twin-flowered Passion-flower. Shrub cl.

9 P. Molucca'na (Reinw. in Blum. bijdr. p. 938.) leaves oblong, mucronate, somewhat emarginate at the base, quite entire; petioles biglandular; cymes bifid, many-flowered. ♄. ◡. S. Native of the Moluccas.

Molucca Passion-flower. Shrub cl.

Sect. III. Tetrapa'thea (from τετρα, *tetra*, four, and παθος, *pathos*, passion; signifying passion-flowers with 4-lobed flowers). D. C. in mem. soc. gen. 1. pt. 2. p. 435. prod. 3. p. 328. Calyx 4-lobed. Petals wanting. Stamens 4. Involucrum wanting or very small. Branches of peduncles 3-flowered. Tendrils simple, rising from different axils from those of the peduncles.

10 P. tetra'ndra (Banks, herb. ex D. C. prod. 3. p. 323.) glabrous; leaves oval-oblong, acuminated, quite entire, glandless. ♄. ◡. S. Native of New Zealand. Flowers small, greenish.

Tetrandrous Passion-flower. Shrub cl.

Sect. IV. Cie'ca (meaning unknown). Med. malv. p. 97. D.C. prod. 3. p. 323.—Asephanánthes and Monactineírma, Bory. ann. gen. 2. p. 138. Calyx 5-lobed. Petals wanting. Involucrum wanting or very small. Peduncles 1-flowered, and simple tendrils usually rising from the same axils.

11 P. pa'llida (Lin. amœn. 1. p. 218. t. 10. f. 2. exclusive of the synonymes) leaves glabrous, ovate, acuminated, 3-nerved; petioles biglandular above the middle; pedicels 1-3 together. ♄. ◡. S. Native of St. Domingo and Brazil.—Plum. amer. p. 73. t. 89. Ker. bot. mag. t. 660. Flowers small, yellowish-green.

Pale-flowered Passion-flower. Fl. Aug. Sept. Clt.? Sh. cl.

12 P. cu'prea (Lin. amœn. 1. p. 219. t. 10. f. 3.) leaves glabrous, ovate, glandular beneath, between the axils; petioles glandless; pedicels solitary. ♄. ◡. S. Native of the islands of Providence and Bahama, Jacq. icon. rar. 3. t. 606. Flowers blood-coloured, an inch and a half in diameter. Berries purplish.

Copper-coloured-flowered Passion-flower. Fl. July, Aug. Clt. 1724. Shrub cl.

13 P. Cavanille'sii (D. C. prod. 3. p. 323.) leaves glabrous, ovate, glandless, ciliated with stiff hairs; petioles glandless; pedicels solitary. ♄. ◡. S. Native of the West India Islands. P. cùprea, Cav. diss. 10. p. 448. t. 273. Flowers pale purple; crown copper-coloured, but violaceous at the base.

Cavanilles's Passion-flower. Clt. 1822. Shrub cl.

14 P. multiflòra (Lin. amœn. 1. p. 221. t. 10. f. 7.) leaves ovate-oblong, entire, clothed with velvety down beneath; petioles very short, biglandular at the apex; pedicels numerous in the axils of the leaves. ♄. ◡. S. Native of St. Domingo, Cav. diss. 10. t. 272. There are varieties with the leaves either glabrous or downy above. Plum. amer. t. 90. Flowers greenish. Style purplish.

Many-flowered Passion-flower. Fl. June, Sept. Clt. 1731. Shrub cl.

15 P. auricula'ta (H. B. et Kunth, nov. gen. amer. 2. p. 131.) leaves glabrous, ovate, rounded at the base, glandular beneath; petioles auricled by 2 glands beneath the middle; pedicels 1 or 2 together. ♄. ◡. S. Native of the banks of the Orinoco, in shady places, at the cataract of Maypure. Flowers whitish, but the calyx is greenish on the outside.

Auricled-leaved Passion-flower. Fl. June, Aug. Clt. 1820. Shrub cl.

16 P. Nipaule'nsis (Wall. tent. t. 11.) smooth; leaves cordate-acute, quite entire, 5-nerved, glandular beneath and on the petioles; peduncles bracteate, aggregate; crown triple, exceeding the calyx. ♄. ◡. S. Native of Nipaul, on woody hills in the great valley. Leaves glaucous, furnished with 2 glands underneath at the insertion of the nerves, and 2 in the middle of the petioles. Peduncles 2-3-flowered. Flowers small, white, with a greenish crown. Berry yellow, about the size of a small cherry.

Nipaul Passion-flower. Shrub cl.

17 P. littora'lis (H. B. et Kunth, l. c. p. 138.) leaves beset with silky hairs on both surfaces, hastately 3-lobed, and nearly entire; petioles bearing 2 stipitate glands above; pedicels 2-3 together. ♄. ◡. S. Native of Peru, on the sea-shore near Patibilca, and in the valley of Lima. Flowers with a green calyx.

Sea-shore Passion-flower. Shrub cl.

18 P. glabra'ta (H. B. et Kunth, l. c. p. 135.) leaves glabrous, shining, glandular beneath, half orbicular, truncately 2-lobed; lobes very short, spreading; petioles glandless; pedicels solitary, or twin. ♄. ◡. S. Native of New Granada, near Turbaco. Related to *Murucùja accellàta*. Flowers small, white; crown yellow.

Smooth Passion-flower. Shrub cl.

19 P. pube'scens (H. B. et Kunth, l. c. p. 132.) leaves semi-orbicular at the base, lunately 2-lobed; lobes ovate-oblong, acute, divaricate, with an awn in the recess between the lobes, and are as well as the petioles downy and glandless; pedicels solitary. ♄. ◡. S. Native of South America, in shady places of the province of Caraccas. P. Lockhártii, G. Don, in Loud. hort. brit. p. 269. Flowers small, greenish white.

Downy Passion-flower. Shrub cl.

20 P. biloba'ta (Juss. ann. mus. 6. p. 107. t. 37. f. 2.) leaves smooth, 2-lobed, rounded at the base, 3-nerved, glandless; lobes

obtuse, emarginate, rather diverging; petioles short, glandless; pedicels twin. ♄. ◡. S. Native of St. Domingo. Tacsònia bilobàta, Spreng. syst. 3. p. 44. Flowers very small, greenish?

Two-lobed-leaved Passion-flower. Shrub cl.

21 P. Mexica'na (Juss. l. c. p. 108. t. 38. f. 2.) leaves glabrous, 2-lobed, rounded at the base, 3-nerved; lobes oblong, diverging a little, glabrous beneath; petioles short, glandless; pedicels twin. ♄. ◡. S. Native of Mexico, about Acapulco. Flowers small, whitish.

Mexican Passion-flower. Clt. 1820. Shrub cl.

22 P. Dicta'mo (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 3. p. 324.) leaves glabrous, 2-lobed, somewhat emarginate at the base, 3-nerved, glandless beneath; lobes oblong, divaricate; petioles glandless; pedicels twin. ♄. ◡. S. Native of New Spain, where it is called *Dictamo*.

Dictamo Passion-flower. Shrub cl.

23 P. norma'lis (Lin. amœn. 5. p. 408.) leaves glabrous, 3-nerved at the base, somewhat cordate, glandular beneath, somewhat 3-lobed; middle lobe small, lateral ones so much divaricate as to form a straight angle; petioles very short, glandless. ♄. ◡. S. Native of Jamaica. Brown, jam. p. 328. Flowers small, pale coloured. Fruit purple, downy.

Normal Passion-flower. Fl. May, June. Clt. 1771. Sh. cl.

24 P. bauhinifòlia (H. B. et Kunth, l. c. p. 132.) leaves downy beneath, and rather glandular, elliptic, rounded at the base, 2-lobed at the apex; lobes obtuse; petioles glandless, downy; pedicels solitary or twin, downy. ♄. ◡. S. Native of Quito, in temperate places. Flowers small, whitish.

Bauhinia-leaved Passion-flower. Shrub cl.

25 P. trisetòsa (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 3. p. 324.) leaves glabrous, glandular beneath, ovate, 3-nerved, equally 3-lobed at the apex; lobes mucronated by a bristle each; petioles glandless; pedicels twin. ♄. ◡. S. Native of Mexico.

Three-bristled Passion-flower. Shrub cl.

26 P. mi'sera (H. B. et Kunth, nov. gen. amer. 2. p. 136.) leaves glabrous, reticulately 3-nerved, cordate, 3-lobed; lobes obtuse, emarginate, and are, as well as the petioles, glandless; pedicels solitary. ♄. ◡. S. Native of South America, between Turbaco and Carthagena, in very hot places. Flowers small, with a greenish calyx, and violaceous crown.

Miserable Passion-flower. Shrub cl.

27 P. coria'cea (Juss. in ann. mus. 6. p. 109. t. 39. f. 2.) leaves smooth, coriaceous, glandular beneath, peltate, 3-lobed; middle lobe obtuse: lateral ones acuminated, 2-nerved; petioles biglandular in the middle; pedicels twin. ♄. ◡. S. Native of South America, near Honda; and perhaps also in Mexico, according to icon. fl. mex. ined. Flowers small, greenish.

Coriaceous-leaved Passion-flower. Shrub cl.

28 P. diffórmis (H. B. et Kunth, l. c. p. 136.) leaves glabrous, coriaceous, glandular beneath, peltate, somewhat 3-lobed, transversely lanceolate; petioles biglandular in the middle; pedicels solitary? ♄. ◡. S. Native of New Granada, in temperate places on the Andes. Allied to *P. coriàcea*. Perhaps the same as the figure in Hern. mex. p. 435. upper figure. Flowers with a greenish calyx, and violaceous crown tipped with yellow.

Deformed Passion-flower. Shrub cl.

29 P. angustifòlia (Swartz, prod. p. 97.) leaves glabrous, glandless, somewhat peltate: lower ones ovate, the rest lanceolate, 2 or 3-lobed; petioles short, biglandular above the middle; pedicels solitary or twin. ♄. ◡. S. Native of the Caribbee Islands. Ker, bot. reg. t. 180. P. heterophýlla, Jacq. hort. schœnbr. t. 181. Cièca heterophýlla, Mœnch. P. longifòlia, Lam. dict. 3. p. 40. Flowers yellowish, with the rays purple at the base.

Narrow-leaved Passion-flower. Fl. June, Sept. Clt. 1773. Shrub cl.

30 P. macula'ta (Scan. cat. hort. bon. and Coll. hort. rip. p. 101.) leaves glabrous, deeply 3-lobed, painted with white on the upper surface; lobes nearly equal, oblong, acute: upper ones bluntly trifid, intermediate one rather larger than the others; petioles glandless; pedicels solitary or twin, rather pilose. ♄. ◡. S. Native of Curassoa. Pluk. t. 210. f. 3. Perhaps the same as P. mínima of Lin. Flowers greenish.

Spotted-leaved Passion-flower. Fl. June, July. Clt. 1820. Shrub cl.

31 P. gra'cilis (Link, enum. hort. berol. 2. p. 182.) leaves subcordate, glabrous, 3-lobed; lobes roundish, beset with 2-4 glands; petioles biglandular; peduncles axillary, solitary; fruit egg-shaped. ♄. ◡. S. Native country unknown. Lindl. bot. reg. t. 870. Flowers whitish. Rays blue and white.

Slender Passion-flower. Fl. Aug. Clt. 1823. Shrub cl.

32 P. lu'tea (Lin. amœn. 1. p. 224. t. 10. f. 13.) leaves almost glabrous, cordate, trifid; lobes ovate, mucronate by a bristle, and are, as well as the petioles, glandless; pedicels twin. ♃. ◡. H. Native of Virginia and Florida, and of the West Indies. Jacq. icon. rar. 3. t. 607. Ker. bot. reg. t. 79. Flowers pale yellow.

Yellow-flowered Passion-flower. Fl. May, June. Clt. 1714. Shrub cl.

33 P. mínima (Jacq. hort. vind. t. 20.) leaves glabrous, glandless, 5-nerved, trifid: lobes ovate, middle one drawn out most; petioles biglandular at the apex; pedicels twin. ♄. ◡. S. Native of South America. Sowerby in Lin. trans. 2. p. 27. t. 5. f. 6. Ker, bot. reg. t. 144. P. hederàcea, Lam. Flowers greenish yellow, with white rays. Nectarium fourfold, inner one with an entire brown rim, the outer plaited, of a dusky purple colour, the other ciliated, with capillary black hairs, with yellow tips; outmost one having the filamentous appendages twice as long as the others, dark purple at the base, and yellow from the middle to the tip.

Least Passion-flower. Fl. July, Aug. Clt. 1690. Shrub cl.

34 P. hirsu'ta (Lin. amœn. 1. p. 227. t. 10. f. 16. exclusive of the synonymes of Hern. and Pluk.) leaves rather hairy beneath, glandless, somewhat 5-nerved, 3 cleft; lobes ovate, middle one much the largest; petiole biglandular above the middle; pedicels twin. ♄. ◡. S. Native of the West Indies. Plum. amer. t. 88. A.-B. P. parvifòlia, Swartz, prod. p. 97. Flowers whitish.

Hairy Passion-flower. Fl. Sept. Clt. 1778. Shrub cl.

35 P. suberòsa (Lin. l. c. p. 226. t. 10. f. 14.) leaves glabrous, somewhat ciliated, 5-nerved at the base, ovate, somewhat cordate, usually 3-lobed; lobes ovate, acute: middle one larger than the rest; petioles biglandular above the middle; pedicels twin. ♄. ◡. S. Native of the West Indies and South America. Smith, exot. bot. 1. t. 28. Plum. amer. t. 84. Jacq. schœnbr. 2. t. 163. Flowers of a greenish yellow-colour; crown purple at the bottom. Fruit purple when ripe.

Cork-barked Passion-flower. Fl. June, Sept. Clt. 1759. Shrub cl.

36 P. pelta'ta (Cav. diss. 10. p. 447. t. 275.) leaves pubescent above, glandless, 3-nerved, rather peltate, 3-lobed beyond the middle; lobes lanceolate, divaricated; petioles biglandular in the middle; pedicels solitary. ♄. ◡. S. Native of the Antilles, in hedges, as well as in Virginia. Ker. bot. reg. 505. —Plum. amer. t. 85. Flowers greenish.

Peltate-leaved Passion-flower. Fl. Aug. Sept. Clt. 1778. Shrub cl.

37 P. hedera'cea (Cav. l. c. p. 448.) leaves somewhat puberulous, glandless, 3-nerved, trifid: lobes ovate, obtuse; petioles biglandular in the middle; pedicels solitary. ♄. ◡. S.

Native of the Antilles, in hedges. Plum. amer. t. 84. Flowers whitish ?

Ivy-like Passion-flower. Fl. June, Aug. Shrub cl.

38 P. pannòsa (Smith in Rees' cycl. no. 28.) leaves clothed with velvety hairs on both surfaces, glandless, cordate, unequally 3-lobed, rarely 2-lobed; lobes obtuse; petioles velvety; pedicels bearing 3 bracteoles each. ♄. ◡. S. Native of the West Indies. Allied to *P. rùbra*. Flowers small, greenish.

Cloth-leaved Passion-flower. Shrub cl.

39 P. Berteria'na (Balb. in litt. ex D. C. prod. 3. p. 325.) leaves glabrous, glandless, divided into 3 parts even to the base; leaflets petiolate, trifid, attenuated at the base, and very blunt at the apex; pedicels solitary or twin. ♄. ◡. S. Native of St. Domingo.

Bertero's Passion-flower. Shrub cl.

Sect. V. Deca'loba (from δεκα, *deka*, ten, and λοβος, *lobos*, a lobe; in reference to the 10 calycine lobes). D. C. mem. soc. gen. 1. pt. 2. p. 435. prod. 3. p. 325.—Passiflòra, Bory, ann. gen. 2. p. 138. Calyx 10-lobed, the 5 inner are probably petals. Involucrum wanting or very small, and distant from the flower. Peduncles 1-flowered, rising from the same axils as the simple tendrils.

40 P. perfolia'ta (Lin. l. c. p. 222. t. 10. f. 8.) leaves glabrous, cordate at the base, glandular beneath, somewhat 3-lobed: middle lobe very short; petiole glandless, very short; pedicels solitary or twin, rather downy. ♄. ◡. S. Native of Jamaica, in hedges on the mountains. Ker. bot. reg. t. 78. Murucùja perfòliata, Spreng. syst. 3. p. 43.—Sloan. jam. 1. p. 230. t. 142. f. 3, 4. Flowers crimson or scarlet; rays fleshy, green, with blunt scarlet tips.

Perfoliate-leaved Passion-flower. Fl. July, Aug. Clt. 1800. Shrub cl.

41 P. ru'bra (Lin. amœn. 1. p. 222. t. 10. f. 9.) leaves velvety, cordate at the base, 2-lobed, with an awn in the recess between the lobes, glandless beneath, and on the petioles; pedicels solitary; ovarium hairy, subglobose. ♄. ◡. S. Native of the West Indies and the adjacent continent. Plum. amer. t. 83. Ker. bot. reg. t. 95. Stem reddish, hairy. Flowers of a greenish yellow colour; crown red. Berry red.

Red-berried Passion-flower. Fl. April, Sept. Clt. 1831. Shrub cl.

42 P. capsula'ris (Lin. l. c. p. 234.) leaves downy, cordate at the base, 2-lobed, with an awn in the recess between the lobes, and are, as well as the petioles, glandless: pedicels solitary; ovarium elliptic-oblong, and is, as well as the fruit, acutely hexagonal, glabrous. ♄. ◡. S. Native of the West Indies. Plum. icon. amer. t. 138. f. 2. The flowers are reddish according to Plumier, but according to other authors they are whitish. Fruit small, purple when ripe.

Var. β, *acutíloba* (D. C. prod. 3. p. 325.) leaves deeply 2-lobed, hardly pubescent above, painted with white. ♄. ◡. S Native of Brazil.

Var. γ, *geminifòlia* (D. C. l. c.) leaves glabrous, hardly cordate at the base; branches triangular; pedicels twin. ♄. ◡. S. Native of Jamaica. P. capsulàris, Smith in Rees' cycl. no. 22.

Capsular Passion-flower. Fl. Ju. July. Clt. 1820. Shrub cl.

43 P. biflòra (Lam. dict. 1. no. 36.) leaves glabrous, glandular beneath, cordate at the base, 3-nerved, truncate, somewhat 2 or 3-lobed; petioles short, glandless; pedicels twin. ♄. ◡. S. Native of the West India Islands, and South America, P. lunàta, Smith, icon. pict. t. 1. Ker, bot. reg. 577. P. Vespertílio, Lawr. pass. t. 8. Flowers white; rays of crown yellow. The Mexican plant differs in the leaves being roundly cuneated at the base, not cordate, and in the lobes being less divaricate.

Two-flowered Passion-flower. Fl. Ju. Aug. Clt. 1800. Sh. cl.

44 P. Leschenau'ltii (D. C. prod. 3. p. 326.) leaves semiorbicular at the base, somewhat truncate at the apex, tricuspidate, pubescent on the nerves beneath, glandless; petioles biglandular in the middle; peduncles twin, 1-flowered. ♄. ◡. S. Native of the East Indies, among the Neelgherry Mountains, where it is called by the inhabitants *covaymonkou*. Bryònia tricuspidàta, Lesch. herb. Flowers unknown.

Leschenault's Passion-flower. Shrub cl.

45 P. Andersònii (D. C. l. c.) leaves glabrous, glandular beneath, cuneately-rounded at the base, 3-nerved, truncate at the apex, sublunate; petioles long, glandless; pedicels twin, hardly longer than the petioles. ♄. ◡. S. Native of the Island of St. Lucia. Flowers party-coloured.

Anderson's Passion-flower. Fl. July, Oct. Clt. 1823. Sh. cl.

46 P. Ro'hrii (D. C. l. c.) leaves nearly glabrous, ovate, somewhat truncate at the base, 3-nerved, blunt and somewhat 3-lobed at the apex; petioles biglandular, rather velvety; pedicels solitary. ♄. ◡. S. Native of Cayenne.

Rohr's Passion-flower. Shrub cl.

47 P. penduliflòra (Bert. in herb. Balb. ex D. C. l. c.) leaves glabrous, roundly obovate, 3-nerved, glandular beneath; nerves extending beyond the border of the leaf; petioles glandless; peduncles solitary or twin, much longer than the petioles, pendulous, bracteolate beneath the middle. ♄. ◡. S. Native of Jamaica, on the mountains. Flowers pale: threads of crown few and glandular.

Pendulous-flowered Passion-flower. Shrub cl.

48 P. hemicy'cla (Meyer, prim. esseq. p. 225.) leaves glabrous, glaucous and glandular beneath, 3-nerved at the base, semicircular, somewhat 3-lobed at the apex; petioles pubescent, glandless; pedicels twin, shorter than the petioles. ♄. ◡. S. Native of Guiana, about Essequibo; and of Trinidad. Flowers white.

Half-circular-leaved Passion-flower. Clt. 1817. Shrub cl.

49 P. vespertílio (Lin. amœn. 1. p. 223. t. 10. f. 11.) leaves glabrous, glandular beneath, 1-nerved, cuneated at the base, divaricately 2-lobed, rarely somewhat 3-lobed; petioles very short, glandless; pedicels solitary. ♄. ◡. S. Native of South America.—Dill. hort. elth. t. 137. f. 164. Flowers white, small.

Bat-wing-leaved Passion-flower. Fl. May, June. Clt. 1732. Shrub cl.

50 P. retu'sa (Hook. et Arnott, in bot. misc. 3. p. 235.) leaves smoothish, biglandular beneath, cuneated at the base, or rounded, 3-nerved, 3-lobed; lobes mucronulate, middle one truncate, lateral ones divaricate, prolonged; petioles glandless; peduncles solitary, exceeding the petioles. ♄. ◡. S. Native of Brazil, on the banks of the Uraguay; and at Santa Borga. Closely allied to *P. vespertílio*.

Retuse-leaved Passion-flower. Shrub cl.

51 P. Maximilia'na (Bory, ann. gen. 1819. vol. 2. p. 149. t. 24.) leaves glabrous, divaricately 2-lobed, drawn out a little in the middle, somewhat cordate at the base, red and biglandular beneath; petioles glandless; pedicels solitary or twin, longer than the petioles. ♄. ◡. S. Native of Brazil. P. díscolor, Link et Otto, abh. 1. p. 13. t. 5. Lodd. bot. cab. t. 565. P. vespertílio, Ker, bot. reg. t. 597. This plant differs from *P. vespertílio* in the leaves being cordate at the base, not cuneated, blood-coloured beneath; and in the pedicels being three or four times longer. Flowers greenish; crown white.

Prince Maximilian's Passion-flower. Fl. May, June. Clt. 1800. Shrub cl.

52 P. Jorulle'nsis (H. B. et Kunth, nov. gen. amer. 2. p. 133.) leaves glabrous, glandular beneath, semiorbicular at the base, 3-nerved, truncate at the apex, 2-lobed; petioles puberu-

lous and glandless; pedicels twin. ♄. ◡. S. Native of Mexico, on the burning Mount Jorullo. Flowers greenish?

Jorullo Passion-flower. Shrub cl.

53 P. sicyoìdes (Schlecht. et Cham. in Linnæa. vol. 5. p. 88.) leaves cordate, 3-lobed, sharply subdentate or quite entire, glaucous beneath, hairy, biglandular in the recesses, smoothish above; lobes triangularly acuminated, middle lobe the longest; petioles hairy, biglandular in the middle; glands large, clavate; stipulas half ovate, cuspidately acuminated; peduncles twin; bracteas filiform, small, approximating the flower. ♄. ◡. S. Native of Mexico, in woods near Jalapa. Flowers pale. Habit of *Bryònia*.

Sicyos-like Passion-flower. Shrub cl.

54 P. oblonga'ta (Swartz, prod. p. 97.) leaves glabrous, glandular beneath, oblong, rounded at the base, 3-nerved, 3-lobed at the apex; petioles glandless; pedicels solitary. ♄. ◡. S. Native of Jamaica, among bushes. P. elongàta, Poir. suppl. 2. p. 839.

Oblong-leaved Passion-flower. Fl. June, Aug. Clt. 1816. Shrub cl.

55 P. lyræfòlia (Tuss. ant. t. 4.) leaves glabrous, glandular beneath, ovate at the base, 3-nerved, 3-lobed at the apex; lobes straight, acuminated, middle lobe small; petioles glandless; pedicels solitary or twin. ♄. ◡. S. Native of Jamaica, on Mount St. George. Probably sufficiently distinct from the preceding and following species.

Lyre-leaved Passion-flower. Fl. Ju. July. Clt. 1816. Sh. cl.

56 P. tuberòsa (Jacq. hort. schœnbr. t. 496.) leaves glabrous, glandular beneath, rounded at the base, 3-nerved, 3-lobed at the apex; lobes oblong, acute, middle lobe very small; petioles glandless; pedicels twin; branches of root tuberous. ♄. ◡. S. Native of South America. Ker, bot. reg. t. 432. P. punctàta, Lodd. bot. cab. t. 110. Lower leaves usually painted with white on the upper surface. Flowers greenish white; outer crown green at the base, tipped with purple and white. Style purple.

Tuberous-rooted Passion-flower. Fl. June, Oct. Clt. 1810. Shrub cl.

57 P. rotundifòlia (Lin. l. c. p. 235.) leaves rather glandular, velvety beneath, nearly orbicular, 3-nerved, 3-lobed; petioles glandless; pedicels twin; berries globose, hairy. ♄. ◡. S. Native of the Antilles. Plum. icon. amer. t. 138. f. 1. Cav. diss. t. 290. Flowers whitish.

Var. β, Jacquìni (D. C. l. c.) leaves glabrous beneath; pedicels solitary; leaflets of involucrum ovate. ♄. ◡. S. Native of Carthagena, in the woods. P. rotundifòlia, Jacq. obs. t. 46. f. 1. Petals whitish; rays of crown yellow.

Var. γ, Swártzii (D. C. prod. 3. p. 327.) leaves glabrous beneath; berry ovate, glabrous. ♄. ◡. S. Native of the south of Jamaica. P. rotundifòlia, Swartz, obs. p. 337. Flowers greenish.

Round-leaved Passion-flower. Fl. May, Aug. Clt. 1779. Shrub cl.

58 P. alnifòlia (H. B. et Kunth, nov. gen. amer. 2. p. 136.) leaves puberulous beneath, glandular, ovate, roundly truncate at the base, 3-nerved, roundly 3-lobed at the apex; middle lobe emarginate; petioles glandless, and are, as well as the pedicels, downy, and twin; berries spherical, glabrous. ♄. ◡. S. Native of South America, on Mount Quindiu, at the river Cuello. Flowers large.

Alder-leaved Passion-flower. Shrub cl.

59 P. obscu'ra; leaves 3-lobed, somewhat cordate, truncate, velvety: lateral lobes divaricate: intermediate one obsolete, emarginate; petals emarginate, shorter than the calyx; tube of calyx rotate, depressed; inner crown pubescent, plicate, lying on the base of the stipe, in the disc, outer crown radiate; ovarium villous. ♄. ◡. S. Native of the north-eastern coast of South America, but in what place we gathered it is now forgotten. Flowers small, pale green, with a downy pedicel: the inner crown is downy and purple: the outer crown has its lower half purple, and its upper white. This species seems to come nearest to P. alnifòlia of Bonpland.

Obscure Passion-flower. Fl. Aug. Nov. Clt. 1823. Sh. cl.

60 P. mo'llis (H. B. et Kunth, l. c. p. 137.) leaves canescent beneath, glandular, ovate-cordate at the base, 3-nerved, 3-lobed at the apex: lateral lobes very small; petioles glandless, and are, as well as the pedicels, pubescent; pedicels twin; berries globose, puberulous. ♄. ◡. S. Native of South America, on Mount Quindiu. Flowers not seen.

Soft Passion-flower. Shrub cl.

61 P. puncta'ta (Lin. amœn. 1. p. 224. t. 10. f. 12.) leaves glabrous, transversely oval, glandular beneath, 3-nerved at the base, and emarginately cordate, very bluntly 3-lobed at the apex; petioles glandless; pedicels solitary, longer than the petioles. ♄. ◡. G. Native of Peru. Feuill. per. 2. t. 11. Flowers with whitish petals: and violet rays, tipped with yellow.

Dotted-leaved Passion-flower. Shrub cl.

62 P. bryonioìdes (H. B. et Kunth, l. c. p. 140.) leaves hispid, cordate at the base, 5-nerved, palmately 5-lobed, sharply-toothed; petioles biglandular at the apex, hairy; pedicels hairy, twin; berries elliptic, glabrous. ♄. ◡. S. Native of Mexico, near Santa Rosa. Flowers greenish.

Bryony-like Passion-flower. Shrub cl.

Sect. VI. Granadílla (*Granadilla* or *Granadille* is the French name of some Passion-flowers, so called from the resemblance of the fruit, in size and colour, to a pomegranate, with this difference, that it is not crowned by the calyx). D. C. in mem. soc. gen. 1. pt. 2. p. 435. prod. 3. p. 327.—Anthactínia, Bory, ann. gen. 2. p. 138. Involucrum 3-leaved under the flower; leaflets entire or toothed, never jagged. Calyx 10-lobed; the 5 inner lobes are probably petals. Pedicels 1-flowered, rising from the same axils as the tendrils, which are simple.

* *Leaves entire.*

63 P. serratifòlia (Lin. amœn. 1. p. 217. t. 10. f. 1.) leaves pubescent beneath, ovate-lanceolate, acute, serrulated, feather-nerved; petioles bearing 4 glands, and are, as well as the pedicels, pubescent. ♄. ◡. S. Native of South America. Cav. diss. t. 279. Sims, bot. mag. t. 651. Jacq. hort. schœnb. 1. p. 4. t. 10. Mart. dec. 4. t. 36. Flowers with purple petals, and the filaments of the crown pale purple at the base, and from thence bluish.

Saw-leaved Passion-flower. Fl. May, Oct. Clt. 1731. Sh. cl.

64 P. ni'tida (H. B. et Kunth, l. c. p. 130.) leaves glabrous, oblong-elliptic, acuminated, serrulated, feather-nerved; petioles biglandular. ♄. ◡. S. Native in woods about the Orinoco. Very nearly allied to the preceding species. Flowers about the size of those of *P. cœrùlea*, with a reddish calyx: crown with blue filaments, ringed with white.

Shining-leaved Passion-flower. Shrub cl.

65 P. guazumæfòlia (Juss. ann. mus. 6. t. 39. f. 1.) leaves glabrous, ovate-oblong, acuminated, denticulated; petioles biglandular; crown one-half shorter than the calycine lobes. ♄. ◡. S. Native of New Granada, in very hot places. Flowers large, with a whitish calyx.

Guazuma-leaved Passion-flower. Shrub cl.

66 P. cocci'nea (Aubl. guian. 2. t. 324.) leaves glabrous, ovate, coarsely toothed, acutish; petioles bearing 4-6 glands; bracteas ovate, subserrated, velvety. ♄. ◡. S. Native of Guiana, where it is also cultivated; and Maranham, in Brazil. Cav. diss. t. 280. Flowers scarlet, with orange-coloured rays. Fruit full of juicy sweet edible pulp.

Scarlet-flowered Passion-flower or Granadilla. Fl. June, Nov. Clt. 1820. Shrub cl.

67 P. vetuti'na (D. C. prod. 3. p. 327.) young leaves pubescent, at length glabrous, cordate, acutish, sinuately lobed, serrated; petioles biglandular; bracteas glandularly serrated. ♄. ◡. S. Native of Brazil. Allied to *P. coccínea*. Flowers perhaps red or scarlet.

Velvety Passion-flower. Shrub cl.

68 P. glandulòsa (Cav. diss. t. 281.) leaves glabrous, ovate, coarsely toothed, acutish; petioles biglandular; bracteas entire, biglandular at the base. ♄. ◡. S. Native of Cayenne. Tacsònia glandulòsa, Spreng. syst. 3. p. 43. Fruit the size of a hen's egg.

Glandular Passion-flower. Shrub cl.

69 P. mucrona'ta (Lam. dict. 3. p. 33.) leaves glabrous, ovate-cordate, obtuse, entire; petioles biglandular; stipulas broad-ovate, awned; bracteas oblong, serrate-crenated. ♄. ◡. S. Native of Brazil, at Rio Janeiro. Cav. diss. t. 282.

Mucronate-leaved Passion-flower. Fl. June, Aug. Clt. 1820. Shrub cl.

70 P. malifo'rmis (Lin. amœn. 1. p. 220. t. 10. f. 5.) leaves glabrous, ovate, somewhat cordate at the base, acuminated, entire; petioles biglandular; bracteas ovate, acute, joined at the base, larger than the flower. ♄. ◡. S. Native of St. Domingo, Porto-Rico, &c. Plum. icon. amer. t. 82. Ker, bot. reg. t. 94. Leaves long and broad. Flowers large, sweet-scented, and beautiful, of various shades; the petals white, and the rays blue; the outer divisions of flowers are red. This species is called the apple-fruited *Granadilla* or sweet calabash. The fruit round, smooth, about 2 inches in diameter, of a dingy yellow-colour when ripe; the coat is hard and stringy, nearly a quarter of an inch in thickness, full of very agreeable gelatinous pale yellow pulp, which is eaten with wine and sugar.

Apple-formed-fruited Passion-flower or Granadilla. Fl. July, Nov. Clt. 1731. Shrub cl.

71 P. tiliæfòlia (Lin. amœn. 1. p. 219. t. 10. f. 4.) leaves glabrous, cordate, entire, acute; petioles glandless; stipulas and bracteas entire, oval, acuminated. ♄. ◡. G. Native of Peru. Feuil. per. 2. t. 12. Flowers red; rays crimson, with a white line. Fruit globose, variegated with red and yellow, containing a sweet watery pulp. (f. 4.)

FIG. 4.

Lime-tree-leaved Passion-flower or Granadilla. Fl. June. Clt. 1823. Shrub cl.

72 P. serratistípula (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 3. p. 328.) leaves glabrous, cordate, acute, entire; petioles bearing 4 glands; stipulas and bracteas ovate, acute, serrated. ♄. ◡. S. Native of Mexico. Fruit edible.

Serrate-stipuled Passion-flower. Shrub cl.

73 P. ligula'ris (Juss. ann. mus. 6. t. 40.) leaves glabrous, cordate, acuminated, entire; petioles bearing 4-6 cylindrical glands; stipulas ovate-lanceolate, acuminated; bracteas ovate, entire. ♄. ◡. S. Native of Peru. Flowers party-coloured.

Var. β, geminiflòra (D. C. prod. 3. p. 328.) pedicels twin. Native of Caraccas.

Ligular-stipuled Passion-flower. Fl. Sept. Clt. 1819. Sh. cl.

74 P. quadrangula'ris (Lin. spec. 1356.) leaves glabrous, cordate at the base, ovate, acuminated; petioles bearing 4-6 glands; stipulas ovate, and are, as well as the bracteas, entire; branches tetragonally winged. ♄. ◡. S. Native of Jamaica and South America. Ker, bot. reg. t. 14.—Jacq. amer. t. 143. pict. 218. Flowers highly odoriferous; calycine lobes white within; petals of the same shape, red within, and white outside. Crown 5-fold; outer rays in a double row, longer than the petals, round, white, and variegated with violet. The *common granadilla* or *gronadilla vine* bears large fruit, of an oblong shape, about 6 inches in diameter, and 15 inches in circumference. It is externally of a greenish yellow, when ripe soft and leathery to the touch, and quite smooth; the rind is very thick, and contains a succulent pulp of a purple colour, which is the edible part. Wine and sugar are commonly added to it. The flavour is sweet and slightly acid, and is very grateful to the taste, and cooling in a hot climate. It has been successfully cultivated for its fruit in a few places in this country.

Var. β, sulcàta (D. C. prod. 3. p. 328.) fruit furrowed transversely.

Cultivation of Granadilla (*P. quadrangulàris*). Mr. Mitcheson keeps a plant in a box 18 inches square, fixed on a level with the curb in one corner of a tan-pit. The sides of the box are perforated, to admit the roots to run among the tan, and the shoots are trained like vines, under the rafters. In autumn the shoots are pruned back to within two or three eyes of the old wood; and in March following, or just before the plant begins to break, it is taken out of the box, the root and ball reduced, and repotted in fresh compost. Abundance of water in the flowering season enables the plant to set its fruit without artificial impregnation. A strong plant will produce 40 fruits in a season in regular succession, from the end of June till Christmas. Half that number will grow to a larger size. Gard. mag. 2. p. 203. The *Pass. laurifòlia* and *Pass. edùlis* may be cultivated in the same way for their fruit.

Quadrangular-stemmed Passion-flower or Granadilla. Fl. Aug. Sept. Clt. 1768. Shrub cl.

75 P. Mauritia'na (Pet. Th. ann. mus. 6. p. 65.) leaves glabrous, cordate at the base, ovate, acuminated; petioles bearing 4-6 glands; bracteas lanceolate, acuminated, denticulated. ♄. ◡. S. Native of the Mauritius.

Mauritian Passion-flower. Shrub cl.

76 P. ala'ta (Ait. hort. kew. 3. p. 306.) leaves glabrous, somewhat cordate, ovate, acute; petioles bearing 4 glands; stipulas lanceolately falcate, somewhat serrated; pedicels terete; branches tetragonally winged; bracteas a little toothed. ♄. ◡. S. Native of Peru. Sims, bot. mag. t. 66. Sowerby in Lin. trans. 2. p. 23. t. 3. f. 6. Flowers very sweet-scented, the upper side of the calyx and petals deep crimson; rays variegated with purple, white, and crimson.

Winged-stemmed Passion-flower. Fl. April, Aug. Clt. 1772. Shrub cl.

77 P. latifòlia (D. C. prod. 3. p. 328.) leaves glabrous, broadly cordate, acuminated; lateral nerves approximate at the middle of the base; petioles glandular; stipulas and bracteas oval-oblong, entire; branches terete. ♄. ◡. S. Native of Peru. Flowers pale red.

Broad-leaved Passion-flower. Shrub cl.

78 P. a'lbida (Ker, bot. reg. 677.) leaves glabrous, roundish-cordate, entire; petioles biglandular in the middle; stipulas ovate-lanceolate, setosely apiculated; bracteas approximating the flowers, soon falling off; pedicels twice the length of the leaves. ♄. ◡. S. Native of Brazil, near Rio Janeiro. Flowers white, not pale red as in the preceding. Column inclined. Stamens secund. Crown yellowish.

Whitish-flowered Passion-flower. Fl. Aug, Sept. Clt. 1816. Shrub cl.

79 P. orna'ta (H. B. et Kunth, nov. gen. amer. 2. p. 129.) leaves glabrous, ovate-elliptic, acute, crenulated; petioles bi-

glandular; axils glandular; bracteas ovate, large, entire. ♄. ◡. S. Native of New Granada, in temperate places. Flowers whitish, with blue rays mingled with white.

Plumed Passion-flower. Shrub cl.

80 P. lo'ngipes (Juss. ann. mus. 6. t. 33. f. 1.) leaves glabrous, oval-lanceolate, somewhat cordate at the base, entire; petioles biglandular at the apex; stipulas and bracteas lanceolate; pedicels twice the length of the leaves. ♄. ◡. S. Native of New Granada, on Mount Quindiu. Flowers about the size of those of *P. cærùlea*, pale red.

Long-stalked Passion-flower. Shrub cl.

81 P. laurifòlia (Lin. l. c. p. 220. t. 10. f. 6.) leaves glabrous, ovate-oblong, entire; petioles biglandular at the apex; stipulas setaceous, length of petioles; bracteas obovate, glandularly serrated at the apex. ♄. ◡. S. Native of the West India Islands and South America. Plum. amer. t. 80. Ker, bot. reg. t. 13. Jacq. hort. schœnbr. 2. t. 162. amer. pict. 2. t. 219. Sowerby in Lin. trans. 2. t. 4. f. c. Marquiaas, Merian. sur. t. 21. The French call it *pomme de liane*, and the English *honeysuckle:* but in most parts of South America the fruit is known by the name of *murucuja* or *granadilla;* for which the plant is cultivated almost throughout South America, the fruit being agreeable to most palates. The *P. laurifòlia* is called also *water-lemon*. The flowers are red and violet and sweet-scented; the fruit about the size of a hen's-egg, but rather more elongated, and tapering equally at both ends; when ripe it is yellow, and dotted over with white spots. It contains a whitish watery pulp, which in the West Indies is usually sucked through a small hole made in the rind, which is tough, soft, and thin; the juice has a peculiar aromatic flavour, is delicately acid, and allays thirst agreeably.

Laurel-leaved Passion-flower or Granadilla. Fl. June, July. Clt. 1690. Shrub cl.

82 P. tinifòlia (Juss. l. c. t. 41. f. 2.) leaves glabrous, oblong, entire; petioles biglandular in the middle; stipulas setaceous; bracteas oblong, hardly crenated. ♄. ◡. S. Native of Cayenne, and about Essequibo. Very like *P. laurifòlia*.

Tinus-leaved Passion-flower. Fl. July. Clt. 1824. Sh. cl.

83 P. acumina'ta (D. C. prod. 3. p. 328.) leaves glabrous, ovate-lanceolate, acuminated, entire; petioles biglandular at the apex; bracteas oblong, obtuse, entire. ♄. ◡. S. Native of Brazil.

Acuminated-leaved Passion-flower. Shrub cl.

* * *Leaves lobed, parted, or cut to the base.*

84 P. indeco'ra (H. B. et Kunth, l. c. p. 134.) leaves puberulous beneath, rather glandular, semi-orbicular, lunate, subcordate; lobes ovate, divaricate; petioles glandless, pubescent; stipulas linear, pubescent; bracteas ovate. ♄. ◡. S. Native of New Granada, in temperate places. Perhaps belonging to the section *Decáloba*.

Indecorous Passion-flower. Shrub cl.

85 P. pulche'lla (H. B. et Kunth, l. c.) leaves glabrous, somewhat glandular, semiorbicular, truncately 2 or 3-lobed; petioles glandless; stipulas linear-subulate; bracteas oblong, large, entire. ♄. ◡. S. Native of South America, in the province of Caraccas. Flowers white, with yellow rays ringed with blue.

Neat Passion-flower. Shrub cl.

86 P. racemòsa (Brot. in Lin. trans. 12. t. 6.) leaves quite glabrous, rather peltate, glaucous beneath, for the most part 3-lobed; petioles usually bearing 4 glands; pedicels twin, forming terminal racemes, in consequence of the upper leaves being abortive. ♄. ◡. S. Native of Brazil. Sims, bot. mag. 2001. P. prínceps, Lodd. bot. cab. t. 84. Flowers of a deep red or scarlet colour. Racemes pendulous. There is a variety having the outer ray of the crown white.

Racemose Passion-flower. Fl. Mar. Oct. Clt. 1815, Sh. cl.

87 P. sanguínea (Colla. mem. acad. taur. ined. hort. ripul. append. t. 6.) leaves glabrous, cordate, glaucous beneath, 3-5-parted; lobes oblong, entire; petioles bearing 4 glands; stipulas auriculately falcate, apiculated, somewhat serrated; pedicels axillary, solitary, 1-flowered. ♄. ◡. S. Native country unknown. Probably a hybrid between *P. racemòsa* and *P. alàta*. Flowers large, of a deep scarlet or blood-red colour.

Blood-coloured-flowered Passion-flower. Fl. Ju. Oct. Clt.? Shrub cl.

88 P. cœru'leo-racemòsa (Sab. in hort. trans. 4. p. 758. t. 9.) leaves quite glabrous, rather coriaceous, 3-5-lobed; lobes undulated, somewhat toothed at the base; petioles bearing 4 glands; pedicels axillary, solitary, 1-flowered. ♄. ◡. S. A hybrid raised from the seed of *P. racemòsa*, impregnated by the pollen of *P. cærùlea*. Like the male parent, it will live throughout the winter in the open ground, with a little protection in severe weather. Lodd. bot. cab. t. 573. Flowers purple.

Blue-racemose Passion-flower. Fl. June, Oct. Hybrid 1820. Shrub cl.

89 P. ala'to-cœru'lea (Lindl. bot. reg. t. 848.) leaves glabrous, cordate, 3-lobed; lobes quite entire, ovate-lanceolate; petioles bearing 2-4 glands; stipulas auriculated, acuminately apiculated, entire; pedicels terete, much longer than the petioles; branches quadrangular. ♄. ◡. S. A hybrid, raised from the seeds of *P. alàta*, impregnated by the pollen of *P. cærùlea*. Lobes of calyx rose-coloured on the outside. Petals white inside. Crown triple; outer filamentous appendages variegated with black, blue, and white.

Winged-blue Passion-flower. Fl. June, Oct. Hybrid 1823. Shrub cl.

90 P. stipula'ta (Aubl. guian. 2. p. 325.) leaves glabrous, glaucous beneath, cordate at the base, 5-nerved, trifid; lobes ovate, entire; petioles bearing 2-4 glands; stipulas oblong, somewhat auricled, mucronate, and are as well as the bracteas entire; peduncles about equal in length to the petioles. ♄. ◡. S. Native of Cayenne and Brazil; and of Mexico, near Jalapa. P. glaúca, Ker. bot. reg. t. 88. but not of Humb. Flowers whitish; crown variegated with purple and white.

Stipulate Passion-flower. Fl. Aug. Sept. Clt. 1779. Sh. cl.

91 P. Raddia'na (D. C. prod. 3. p. 329.) leaves glabrous, somewhat cordate at the base, 5-nerved, trifid; lobes ovate, glandularly subserrated at the base; petioles bearing 2 glands in the middle; stipulas ovate, dimidiate, awned; peduncles 4-times longer than the petioles. ♄. ◡. S. Native of Brazil, where it was detected by Raddi.

Raddi's Passion-flower. Shrub cl.

92 P. a'lba (Link. et Otto. abhl. t. 33.) leaves glabrous, glaucescent beneath, somewhat cordate at the base, 5-nerved, 3-lobed; lobes oval, somewhat glandularly serrated at the base; petioles biglandular in the middle; stipulas cordate; superior peduncles longer than the petioles. ♄. ◡. S. Native of Brazil. Flowers white. Very nearly allied to *P. Raddiàna*.

White-flowered Passion-flower. Shrub cl.

93 P. seta'cea (D. C. l. c.) leaves velvety beneath, 3-nerved at the base, somewhat cordate, trifid; lobes ovate-oblong, acute, serrulated; petioles velvety, biglandular at the base; bracteas ovate, acuminated, ciliately serrated. ♄. ◡. S. Native of Brazil, near Rio Janeiro.

Setaceous-bractead Passion-flower. Shrub cl.

94 P. menispermifòlia (H. B. et Kunth, nov. gen. amer. 2. p. 137.) leaves hairy beneath, pubescent above, roundish-cordate, angularly 3-lobed, sharply toothed; petioles hairy, usually bearing 4 glands; stipulas large, dimidiately subcordate, awned,

hence toothed on one side. ♄ . ◡. S. Native of South America, near Jaen de Bracamoros. Flowers unknown.

Moon-seed-leaved Passion-flower. Shrub cl.

95 P. subpelta'ta (Ort. dec. 6. p. 78.) leaves glabrous, cordate, 3-lobed; lobes serrated: middle lobe more extended than the side ones; petioles bearing 2-4 glands in the middle; stipulas semi-cordate, mucronate; bracteas cordate. ♄ . ◡. S. Native of New Spain.

Subpeltate-leaved Passion-flower. Shrub cl.

96 P. punícea (Ruiz et Pav. ined. ex D. C. prod. 3. p. 329.) leaves velvety beneath, rather scabrous above, 5-nerved, broadly subcordate, trifid; lobes sharply serrated, acute; petioles velvety, glandless; stipulas setaceous; bracteas oval, serrated. ♄ . ◡. S. Native of South America, probably of Peru. Flowers scarlet. Agreeing in habit with *Tacsònia*.

Scarlet-flowered Passion-flower. Shrub cl.

97 P. incarna'ta (Lin. amœn. 1. p. 230. t. 10. f. 19. *a. e.*) leaves glabrous, somewhat cuneated at the base, 5-nerved, deeply trifid; lobes lanceolate, serrated; petioles biglandular at the apex; stipulas small; bracteas glandularly serrated; ovarium villous. ♄ . ◡. G. Native of South America and Virginia. Ald. hort. farn. t. 50. 52. 58. Mor. ox. 2. p. 6. sect. 1. t. 1. f. 9. Calycine lobes pale green. Petals white; crown with a double circle of purple rays. The *Flesh-coloured Granadilla*, or *May-apple*, is a perennial, sending up annually a number of herbaceous shoots. The flowers are sweet-scented, variegated with purple. The fruit, when ripe, is about the size of an apple, orange-coloured, with a sweetish yellow pulp.

Var. β, integriloba (D. C. prod. 3. p. 329.) lobes of leaves entire. Ker. bot. reg. t. 332. P. Kèrii, Spreng. syst. 3. p. 39. Flowers pink.

Flesh-coloured-flowered Passion-flower or Granadilla. Fl. July, Aug. Clt. 1629. Pl. cl.

98 P. edu'lis (Sims, bot. mag. t. 1989.) leaves glabrous, 3-lobed, serrated; petioles biglandular at the apex; bracteas glandularly serrated; crown about equal in length to the calycine lobes; ovarium glabrous. ♄ . ◡. S. Native of Brazil. Flowers whitish. Fruit purple, edible. Purple-fruiting Passiflòra, Sab. in hort. trans. 3. p. 99. t. 3. Purple-fruited Granadilla, Sab. The flowers are fragrant, of a white colour tinged with purple. The fruit changes to a dark livid purple on becoming ripe, and much resembles the fruit of the purple egg-plant. The shape is elliptic, an inch and a half in diameter, and 2 inches from the stalk to the top; the pulp is orange-coloured, and the seeds numerous; the taste acid, and the flavour somewhat like that of an orange. It produces fruit abundantly in stoves.

Edible-fruited Passion-flower or Granadilla. Fl. July, Aug. Clt.? Shrub cl.

99 P. serrula'ta (Jacq. obs. 2. t. 46. f. 2.) leaves glabrous, 3-lobed, finely serrulated; lobes oblong, middle one the longest; petioles biglandular in the middle; bracteas entire. ♄ . ◡. S. Native of South America, in the woods of Carthagena. Flowers variegated with crimson and white, sweet-scented, $2\frac{1}{2}$ inches wide.

Serrulated-leaved Passion-flower. Shrub cl.

100 P. cuneifòlia (Cav. diss. 10. t. 292.) leaves glabrous, 3-lobed, serrated; lobes ovate, acuminated: petioles biglandular; bracteas large, ovate, entire; crown 3 times longer than the calyx. ♄ . ◡. S. Native of South America.

Wedge-leaved Passion-flower. Fl. Jul. Aug. Clt. 1825. Sh. cl.

101 P. tríloba (Ruiz et Pav. ined. ex D. C. prod. 3. p. 330.) leaves glabrous, cordate, 3-lobed; lobes ovate-roundish, obtuse, somewhat denticulated; petioles biglandular at the apex; stipulas ovate-cordate, denticulated; bracteas large, ovate, mucronate. ♄ . ◡. S. Native of Peru.

Three-lobed-leaved Passion-flower. Shrub cl.

102 P. vitifòlia (H. B. et Kunth, nov. gen. amer. 2. p. 138.) leaves downy beneath, cordate, deeply 3-lobed; lobes ovate, acuminated, sharply toothed, with the sinuses biglandular; petioles biglandular at the base, pubescent; bracteas glandularly toothed. ♄ . ◡. S. Native of South America, on the banks of the rivers Magdalena and Cassiquiares. Flowers yellowish; outer crown orange-coloured; inner crown white.

Vine-leaved Passion-flower. Clt. 1823. Shrub cl.

103 P. pilòsa (Ruiz et Pav. ined. ex D. C. prod. 3. p. 330.) plant hispid from rigid hairs; leaves cuneated at the base and cordate, 3-lobed; lobes coarsely toothed, ovate-lanceolate; petioles biglandular; stipulas ovate-cordate; bracteas oblong, ciliated. ♄ . ◡. S. Native of Mexico. (v. s. in herb. Lamb.)

Pilose Passion-flower. Shrub cl.

104 P. adenópoda (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 3. p. 330.) leaves glabrous, cordate at the base, 5-nerved, 5-lobed; lobes ovate, acuminated, somewhat serrated; petioles bearing 2 pedicellate glands; bracteas deeply serrated. ♄ . ◡. S. Native of Mexico.

Stalked-glanded Passion-flower. Shrub cl.

105 P. filamentòsa (Cav. diss. 10. t. 294.) leaves glabrous, 5-parted, serrated; petioles biglandular in the middle; bracteas serrated; crown longer than the calyx or nearly equal to it. ♄ . ◡. S. Native of South America. Sims, bot. mag. 2023. Flowers with whitish petals and blue crown, coloured very like those of *P. cærùlea*.

Filamentous Passion-flower. Fl. Ju. Oct. Clt. 1817. Sh. cl.

106 P. palma'ta (Lod. bot. cab. no. 97. Link, enum. 2. p. 183.) leaves glabrous, palmately 5-parted, somewhat serrulated; serratures glandular; crown a little shorter than the calyx. ♄ . ◡. S. Native of Brazil. P. filamentòsa *β*, Ker. bot. reg. 584. Flowers the size of those of the following species, bluish; crown variegated with blue, purple, and white.

Palmate-leaved Passion-flower. Fl. Ju. Oct. Clt. 1817. Sh. cl.

107 P. cæru'lea (Lin. amœn. 1. p. 231. t. 10. f. 20.) leaves glabrous, 5-parted; lobes oblong, quite entire; petioles bearing 4 glands at the apex; stipulas falcate; bracteas ovate, entire; crown shorter than the calyx. ♄ . ◡. S. Native of Brazil and Peru. Curt. bot. mag. t. 28. Herb. amat. t. 102. Sowerby in Lin. trans. 2. p. 25. t. 4. f. 4. Calycine segments pale greenish white; the petals are nearly of the same shape and size. Styles purplish. Rays of the crown in two circles, purple at bottom, white in the middle, and blue at the ends. Fruit egg-shaped, size of a Mogul plum, yellow when ripe. The flowers have a faint scent, and continue but one day, like many other species of this genus. This is the only kind which can be considered truly hardy.

Var. β, angustifòlia; lobes of leaves narrow; plant flowering later than the species. A hybrid.

Var. γ, glaucophýlla; leaves glaucous beneath.

Var. δ, Colvíllei (Sweet, fl. gard. t. 126.) lobes of leaves oblong-lanceolate, serrulated; petioles biglandular at the apex; stipulas rather lunate, serrulately ciliated; bracteas ovate, obtuse, serrulated; threads of crown rather shorter than the corolla. ♄. H. A hybrid. Flowers whitish; petals tinged with blue; outer crown variegated with purple, white, and blue.

Blue-flowered or Common Passion-flower. Fl. June, Oct. Clt. 1699. Shrub cl.

108 P. serra'ta (Lin. amœn. 1. p. 232. t. 10. f. 21.) leaves glabrous, 7-parted, 7-nerved; lobes serrated; petioles bearing 4 glands; bracteas joined to the middle, acute, entire. ♄ . ◡. S. Native of Martinico. Plum. amer. t. 79. Petals violet-coloured. Crown variegated with purple, violet and white.

Var. β, digitàta (Ruiz et Pav. ined. ex herb. Lamb. D. C. prod. 3. p. 330.) lobes of leaves hardly serrated. ♄ . ◡. S. Native of Peru.

Serrated-leaved Passion-flower. Clt. 1800. Shrub cl.

109 P. Loureìrii; leaves glabrous, 5-parted; lobes quite entire; petioles biglandular. ♄. ◡. F. Native of China and Cochin-china. P. cœrùlea, Lour. coch. p. 527. but not of Lin. P. Chinénsis, Sweet? Flowers greenish yellow, with a blue crown.

Loureiro's Passion-flower. Fl. Ju. Oct. Clt.? Shrub cl.

110 P. peda`ta (Lin. amœn. 1. p. 233. t. 10. f. 22.) leaves pedate, in consequence of the petiole being branched at the top; petiole biglandular; segments of leaves oval, acuminated, serrated; bracteas dentately fringed. ♄. ◡. S. Native of St. Domingo and Trinidad. Plum. amer. t. 81. Calycine segments pale green, with abundance of little red spots on the upper surface. Petals or inner calycine segments blue. The rays of the crown are very close, deep red, with 2 or 3 white rings, very slender, violet at the ends; they are twisted so as to resemble the serpents about Medusa's head. Fruit the size of a middling apple, green, and dotted.

Pedate-leaved Passion-flower. Clt. 1781. Shrub cl.

Sect. VII. Tacsonioìdes (plants resembling *Tacsònia* in habit). D. C. prod. 3. p. 330. Tube of calyx rather elongated, nevertheless much shorter than the limb. The rest as in section *Granadílla*. Leaves 3-lobed, with the recesses and petioles glandular. An intermediate section between the genus *Papiflòra* and *Tacsònia*.

111 P. reflexiflòra (Cav. icon. 5. t. 425.) glabrous; leaves subpeltate, 3-lobed; lobes obtuse, quite entire, recesses and petioles bearing 6 glands; calycine lobes reflexed; crown very short or almost wanting. ♄. ◡. S. Native of Panamaide, and near Bodegas, in South America. Tacsònia reflexiflòra, Juss. ann. mus. 6. p. 393. Flowers scarlet.

Reflexed-flowered Passion-flower. Shrub cl.

112 P. pictura`ta (Ker. bot. reg. t. 673.) glabrous; leaves subpeltate, reddish beneath, 3-lobed; lobes quite entire, mucronate by a bristle; recesses and petioles bearing 4 glands; calycine lobes reflexed, twice the length of the filamentous crown. ♄. ◡. S. Native of Brazil. P. picturàta, Lodd. bot. cab. t. 1050. differs in the lobes of the leaves being glandless. Flowers red; outer crown beautifully variegated with blue and white.

Painted-leaved Passion-flower. Fl. Sept. Clt. 1820. Sh. cl.

Sect. VIII. Dysósmia (from δυσωδης, *dysodes*, fetid, and οσμη, *osme*, a smell; the species contained in this section have a bad smell). D. C. in mem. soc. gen. 1. pt. 2. p. 436. prod. 3. p. 331. Involucrum 3-leaved, under the flower; leaflets divided into many setaceous lobes, which are tipped with glands. Calyx 10-lobed, or the 5 inner ones are petals. Pedicels solitary. Fruit subcapsular.—Perhaps this section will form a proper genus.

113 P. hibiscifòlia (Lam. dict. 3. p. 39.) stem, petioles, and leaves clothed with soft velvety down on both surfaces; leaves truncate at the base, 5-nerved, trifid; lobes ovate-acuminated, somewhat dentate. ♄. ◡. S. Native of the West India Islands. P. fœ'tida, var. α, Lin. amœn. 1. p. 228. t. 10. f. 17. Plum. amer. t. 86. P. gossypifòlia, Desv. in Ham. prod. p. 48. ?—Giseck, icon. fasc. 1. t. 20. Flowers whitish. Plant fetid when bruised.

Hibiscus-leaved Passion-flower. Fl. July, Aug. Clt. 1731. Shrub cl.

114 P. fœ'tida (Cav. diss. 10. t. 289.) stems and petioles hispid; leaves villous on both surfaces, 5-nerved, cordate at the base, 3-lobed; lobes nearly entire, lateral ones very short, middle one acuminated. ♂. or ♃. ◡. S. Native of the Caribbee Islands and South America. Sims, bot. mag. 2619. Ker. bot. reg. 321. P. fœ'tida, var. β, Lin. amœn. P. variegàta, Mill. P. hirsùta, Lodd. bot. cab. 138. P. hircìna, Sweet, hort. brit. Flowers whitish; crown variegated with purple and blue. Plant fetid when bruised.

Fetid Passion-flower. Fl. May, Oct. Clt. 1731. Pl. cl.

115 P. acerifòlia (Schlecht. et Cham. in Linnæa. 5. p. 89.) the whole plant scabrous from hairs; leaves deeply cordate, pedately 5-7-nerved, cuneated within the recesses, 5 and sometimes 7-lobed; paler and glandless beneath; lobes acuminated, subserrated; teeth mucronate; petioles biglandular at the apex; glands stipitate, recurved at the apex; stipulas semiorbicular, sinuately toothed; teeth subulate; peduncles twin, involucrated in the middle; involucrum multifidly jagged, hardly glandular. ♄. ◡. S. Native of Mexico, in woods near Jalapa. Flowers a little larger than those of *P. fœ'tida*.

Sycamore-leaved Passion-flower. Shrub cl.

116 P. cilia`ta (Ait. hort. kew. 3. p. 310.) stem glabrous; petioles rather pilose; leaves glabrous, somewhat 5-nerved, cordate at the base, trifid; lobes acuminated, ciliated. ♃. ◡. S. Native of Jamaica. Curt. bot. mag. t. 288. Petals greenish on the outside and red within. Rays of crown variegated with white and purple. Stipe of ovarium deep purple, with darker spots.

Ciliated-leaved Passion-flower. Fl. Jul. Sept. Clt. 1783. Pl. cl.

† *Species not sufficiently known.*

* *Leaves entire.*

117 P. appendicula`ta (Meyer, esseq. p. 223.) leaves glabrous, glandular beneath, 3-nerved, rounded from the base, oblong, mucronate; petioles biglandular, puberulous; pedicels twin, shorter than the petioles; involucrum wanting. ♄. ◡. S. Native of Guiana, in shady sandy places. Perhaps belonging to either section *Cièca* or *Decáloba*. Flowers yellow.

Appendiculated Passion-flower. Shrub cl.

118 P. cyathóphora (Desv. in Ham. prod. p. 48.) leaves oblong-lanceolate, undivided, undulated and narrowed in the middle, mucronulate, 3-nerved, subcordate at the base, quite glabrous above and nerved, glaucescent beneath; petioles biglandular; glands large, lateral, hollow, cup-shaped, usually twin; involucrum wanting. ♄. ◡. S. Native of Guiana. Perhaps belonging to section *Cièca* or *Decáloba*.

Cup-bearing Passion-flower. Shrub cl.

119 P. pyrifórmis (D. C. prod. 3. p. 331.) leaves glabrous, ovate, acuminated, feather-nerved; petioles biglandular; pedicels solitary; fruit pear-shaped. ♄. ◡. S. Native of Brazil.

Pear-shaped-fruited Passion-flower. Shrub cl.

120 P. lanceola`ta (Desv. l. c.) branches compressed, angular, ciliated with down; leaves lanceolate, acute, mucronulate, rounded at the base, with the sides subauricled, pilose on both surfaces, quite entire; petioles biglandular; pedicels twin, capillary; fruit on a long pedicel. ♄. ◡. S. Native of the Antilles. Flowers scarlet. The rest unknown.

Lanceolate-leaved Passion-flower. Shrub cl.

121 P. tetrade`na (D. C. prod. 3. p. 331.) leaves ovate, quite entire? petioles bearing 4 glands; bracteas toothed; stem tetragonal, membranous. ♄. ◡. S. Native of Brazil. Vand. fl. lus. et bras. in Rœm. script. 148. Perhaps *P. alàta* or *P. quadrangulàris*.

Four-glanded Passion-flower. Shrub cl.

122 P. theobromæfòlia (D. C. prod. 4. p. 331.) stems erect; leaves cordate, ovate, acuminated, unequally serrated, rather puberulous; calyx double; petals? spatulate. ♄. S. Native country unknown. Flowered in the Botanic Garden at Schœnbrun. P. guazumæfòlia, Jacq. fragm. p. 13. but not of Juss. This plant perhaps belongs to a different genus, not belonging to this order.

Cacao-leaved Passion-flower. Shrub 4 to 6 feet.

123 P. Cochin-chine'nsis (Spreng. syst. app. p. 346.) leaves opposite, glabrous, ovate, undivided, quite entire; petioles biglandular; flowers axillary, twin, 5-cleft; berry ovate. ♄. ◡. G. Native of Cochin-china, among bushes. P. pállida, Lour. coch. p. 527. This species differs from all the other Passifloras in the opposite leaves; it is perhaps therefore a species of *Malpíghia*. Flowers large, pale.

Cochin-china Passion-flower. Shrub cl.

124 P. Singaporia'na (Wall. cat. no. 1232.) leaves glabrous, oblong; the rest of the plant unknown. ♄. ◡. S. Native of Singapore, in the East Indies. Like *P. laurifòlia*.

Singapore Passion-flower. Shrub cl.

125 P. Penangia'na (Wall. cat. no. 1233.) leaves ovate-oblong, entire, acuminated; tendrils trifid. ♄. ◡. S. Native of Penang. Flowers unknown.

Penang Passion-flower. Shrub cl.

* * *Leaves 2-lobed.*

126 P. luna'ta (Juss. herb. ex D. C. prod. 3. p. 331.) leaves rather downy beneath, glandular, 3-nerved, ovate at the base, lunately truncate at the apex; nerves ending each in a bristle; petioles glandless; pedicels twin; bracteas linear. ♄. ◡. S. Native of Peru. Perhaps belonging to the section *Cièca* or *Decáloba*.

Moon-shaped-leaved Passion-flower. Shrub cl.

127 P. contraye'rva (Smith, in Rees' cycl. no. 23.) leaves glabrous, deeply 2-lobed; lobes oblong, obtuse, hardly diverging; calyx multifid. ♄. ◡. S. Native of Mexico.—Hern. mex. p. 301. lower figure. Allied to *P. Mexicàna* and *P. Dictàmo*, but differs from them in the flowers being multifid, not 5-cleft. The root is famous for its medicinal virtues, being sweetish with some pungency and fragrance, and is considered a powerful counterpoison, deobstruent, cordial, &c.

Contrayerva Passion-flower. Shrub cl.

128 P. cunea'ta (Willd. enum. p. 696.) leaves glabrous, glandular beneath, cuneated at the base, somewhat 2-lobed at the apex, with a mucrone between the lobes; petioles glandless; pedicels twin; calyx 10-cleft, the 5 inner divisions are called petals. ♄. ◡. S. Native of Caraccas. Perhaps belonging to section *Decáloba* or section *Granadílla*.

Cuneate-leaved Passion-flower. Fl. Ju. Aug. Clt.? Sh. cl.

129 P. bicórnis (Mill. dict. no. 13.) leaves glabrous, stiff, 2-lobed; pedicels long, horizontal; fruit oval. ♄. ◡. S. Native of South America, at Carthagena. Flowers small, white.

Two-horned-leaved Passion-flower. Shrub cl.

130 P. clypea'ta (Smith, in Rees' cycl. no. 20.) leaves peltate, glandular beneath, 5-7-nerved, reticulately veined, 2-lobed, furnished with a mucrone between the lobes; petioles bearing 2 or 4 glands. ♄. ◡. S. Native of New Granada. Flowers unknown.

Buckler-leaved Passion-flower. Shrub cl.

* * * *Leaves 3-lobed.*

131 P. cephaleìma (Bory, ann. gen. 2. p. 152. t. 22. f. 2.) leaves glabrous, rather glandular beneath, somewhat 3-lobed, emarginate at the base; lobes divaricate, linear, obtuse, rounded; petioles very short, biglandular beneath the middle. ♄. ◡. S. Native country unknown, and has never flowered in the gardens of Europe.

Headed-flowered Passion-flower. Clt. 1826. Shrub cl.

132 P. multifórmis (Jacq. fragm. no. 169. t. 67. f. 1.) leaves glabrous, wrinkled beneath, cordate at the base, simple, 2 or 3-lobed, acuminated, very minutely serrated; petioles biglandular. ♄. ◡. S. Native of South America, at Caraccas. Willd. enum. 697. Flowers unknown. The plant agrees with *P. incarnàta* in the shape of the leaves.

Many-formed Passion-flower. Clt. 1820. Shrub cl.

133 P. heterophy'lla (Lam. dict. 3. p. 41.) leaves glabrous, acute, lower ones lanceolate, nearly sessile: middle ones on short petioles, 3-parted: upper ones pedate, in consequence of the petiole being branched at the apex; tendrils wanting; pedicels solitary, without an involucrum; calyx 10-lobed, or the 5 inner lobes, so called, are petals. ♄. ◡. S. Native of St. Domingo. Plum. ed. Burm. t. 139. f. 1. Perhaps belonging to section *Decáloba* or section *Astròphea?* Flowers yellowish.

Variable-leaved Passion-flower. Clt. 1817. Shrub cl.

134 P. Herma'nni (D. C. prod. 3. p. 332.) leaves velvety, 3-lobed; involucrum small, of 3 entire leaflets; calyx 10-parted. ♄. ◡. S. Native of Curassoa. Flowers whitish. Allied on one hand to *P. hirsùta* and on the other to *P. hibiscifòlia*.

Hermann's Passion-flower. Shrub cl.

135 P.? tubiflòra (H. B. et Kunth, nov. gen. amer. 2. p. 139.) leaves glabrous, coriaceous, rounded at the base, 3-lobed; lobes oblong-lanceolate, equal, entire; petioles biglandular in the middle; pedicels twin; tube of calyx about equal in length to the 5 lobes of the limb. ♄. ◡. S. Native of Mexico, in arid places near Acapulco and Etambo del Egido. Probably a species of *Tacsònia*. Flowers with a greenish calyx.

Tube-flowered Passion-flower. Shrub cl.

Cult. All the species of this elegant and curious genus, are well suited for climbers in conservatories and stoves, being free growers and of easy culture. They thrive well in very light rich soil, and the more room they are allowed, both for roots and stems, the freer they will grow and flower. They are all easily raised from cuttings planted in sand or mould, placed in heat; and the younger the cuttings are, the sooner they will strike root. Most of the species ripen fruit in our stoves, and consequently many fine varieties have been raised by impregnating the stigmas of one with the pollen of another. Several hybrids, raised from seeds set by the pollen of *P. cærùlea* are nearly hardy. Several of the species are marked greenhouse, in which they will grow and flower freely. *Passiflòra cærùlea* is the only species that can be considered quite hardy, and it requires a sheltered situation; it is therefore safest to plant against a wall, that it may be protected by a mat in severe weather: it thrives well in any soil, and cuttings of it are readily rooted, under a hand-glass.

Culture of the edible species of Granadílla.—All the species will fruit even in large pots; but it is best to plant them in an angle of a stove, which has been parted off, either by boards or brick-work, as low as the pit goes. At the bottom of the cavity formed by this division, should be laid some brick rubbish, over which may be thrown a little dead tan, and the whole be then filled with equal parts of very old tan, and a compost of leaf-mould and rotten dung; therein the roots will strike freely, and will even spread through the partition into the pit. They do not require the full heat of a pine-stove, for they flourish best in a temperature of from 65° to 70°; but they will not bring their fruit to perfection if kept in a common greenhouse or conservatory, though they will grow and flower in it. The shoots as they advance may be trained near to and under the inclined glass of the stove; the first flowers will appear in May, and the blooming will continue until September, the fruit setting the whole time; but if it does not set well it will be adviseable to impregnate the stigmas, by applying the pollen with a feather. As they grow, the very strong shoots should be cut out from their origin; for these do not bear fruit so abundantly as those which are less vigorous; but the fruiting-branches must not be shortened on any account. The temperature must be kept up equally during the time of flowering and fruiting; the crop will begin to come in August, and will continue until January, but the earlier produce is the best. When the crop is all off, which will be early in January,

the heat must be reduced to about 50°, so as to check and stop the growth. This being effected, the shoots must be well cut in. As little old wood as possible, besides the main stem, which rises from the pit to the glass, and a few pieces (about 2 or 3 feet of each) of the old branches should be retained; for all that is to be trained under the glass to bear in each year, ought to be the growth of the same season. It is found that the shoots break better and in greater quantity from the older wood than from that of two years' standing. In this dormant and reduced state it is to be kept during January and February, after which the necessary heat may be applied to cause it to resume its functions for the ensuing season.

IV. DISE'MMA (from δις, *dis*, two, and στεμμα, *stemma*, a crown; in reference to the crown of the flower being double, or in two). Lab. sert. caled. p. 78. D. C. prod. 3. p. 332.

Lin. syst. *Monadélphia, Pentándria.* Tube of calyx short, furrowed below. Crown of throat double; outer one composed of distinct filamentous threads; inner one tubular, with an entire or toothed border. The rest as in *Passiflòra.* All the species are either natives of New Holland or New Caledonia.

* *Petioles biglandular at the apex.*

1 D. aura'ntia (Labill. caled. t. 79.) leaves glabrous, ovate at the base, broadly 3-lobed; lobes obtuse, middle lobe the longest: lateral ones furnished with a kind of appendage each on the outside; bracteas bristle-formed, glandular at the apex, rather remote from the flower; petioles biglandular at the apex; threads of outer crown about equal in length to the inner lobes of the calyx or petals. ♄. ◡. G. Native of New Caledonia. Passiflòra aurántia. Forst. prod. p. 326. Cav. diss. 10. p. 457. Murucùja aurántia, Pers. ench. 2. p. 222. Flowers orange-coloured, with the tube of the inner crown green, longer than the simple upright rays that surround it.

Orange-flowered Disemma. Shrub cl.

2 D. Herbertia'na (D. C. prod. 3. p. 332.) leaves pubescent, cordate at the base, broadly 3-lobed; lobes ovate, acutish; petioles biglandular at the apex; pedicels twin, 1-flowered; bracteas bristle-formed, very remote from the flower; threads of outer crown 3 or 4-times shorter than the inner calycine lobes or petals. ♄. ◡. G. Native of New Holland, in the interior. Passiflòra Herbertiàna, Ker. bot. reg. 737. Murucùja Herbertiàna, Sweet. Flowers white and greenish, with the crown yellow.

Var. β, Caleyàna (D. C. prod. 3. p. 333.) leaves semiorbicular at the base, hardly subcordate; bracteoles situated in the middle of the pedicel. ♄. ◡. G. Native of New Holland. Passiflòra biglandulòsa, Caley. in herb. Lamb. Perhaps a proper species.

Herbert's Disemma. Fl. Jul. Sept. Clt. 1821. Shrub cl.

3 D. Baue'ri; leaves 3-lobed, sparingly glandular beneath; lobes oblong, retuse, middle one more prolonged; bracteas and stipulas setaceous; rays filiform, longer than the corolla, which is plicate; disk 5-lobed. ♄. ◡. G. Native of Norfolk Island. Fruit oval, blood-coloured. Flowers at first pale yellow, but at length orange-coloured, with the segments keeled and rather undulated, green on the outside. Murucùja Bauèri, Lindl. coll. t. 36.

Bauer's Disemma. Shrub cl.

4 D. coccínea (D. C. prod. 3. p. 333.) leaves glabrous, glandular beneath, cuneated at the base, 3-nerved, bluntly 3-lobed; petioles biglandular at the apex, longer than the pedicels; bracteas subulate, scattered, remote from the flower. ♄. ◡. S. Native of New Holland. Passiflòra coccínea, Banks, but not of Aubl. Flowers scarlet. Crown short, double. Fruit globose.

Scarlet-flowered Disemma. Shrub cl.

** *Petioles glandless.*

5 D. adiantifòlia (D. C. l. c.) leaves glabrous, glandular beneath, truncate at the base, 3-5-lobed; lobes obtuse, somewhat 3-lobed; petioles glandless, a little longer than the pedicels; bracteas subulate, scattered. ♄. ◡. G. Native of Norfolk Island. Passiflòra adiantifòlia, Ker. bot. reg. 233. Passiflòra aurántia, Andr. bot. rep. t. 295. but not of Forst. Passiflòra glàbra, Wendl. coll. 1. t. 17. Passiflòra Adiántum, Willd. enum. 698. Murucùja adiantifòlia, Sweet. Flowers yellow at first, fading to an orange-colour, with the inner crown green, longer than the purple rays that surround it.

Adiantum-leaved Disemma. Fl. Ju. Aug. Clt. 1792. Sh. cl.

Cult. See *Passiflòra*, p. 55. for culture and propagation. Splendid and curious climbing shrubs.

V. MURUCU'JA (a name given to many species of Passion-flower, especially those with edible fruit, by the natives of Brazil). Tourn. inst. t. 215. Juss. gen. p. 398. D. C. prod. 3. p. 333.

Lin. syst. *Monadélphia, Pentándria.* Tube of calyx furrowed below. Crown of throat simple, erect, tubularly-conical, truncate (f. 5. *b.* f. 6. *c.*); threads of crown not free, but joined together into a tube.—Habit of *Passiflòra.* Petioles glandless. —Species all natives of the West Indies.

Sect. I. Penta'ria (from πεντε, *pente*, five; calyx 5-lobed). D. C. prod. 3. p. 333. Calyx 5-lobed (f. 5. *a.*).

1 M. orbicula'ta (Pers. ench. 2. p. 222.) leaves glabrous, glandular beneath, 3-nerved, orbicular, somewhat 3-lobed; petioles glandless, twisted; tendrils few; bracteoles narrow, very acute. ♄. ◡. S. Native of St. Domingo. Passiflòra orbiculàta, Cav. diss. 10. t. 286. Flowers crimson.

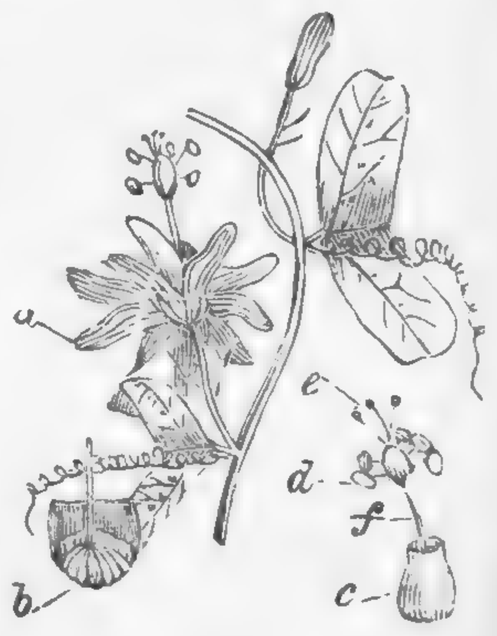
Orbicular-leaved Murucuja. Shrub cl.

FIG. 5.

Sect. II. Deca'ria (from δεκα, *deka*, ten; in reference to the calyx being 10-lobed). D. C. prod. 3. p. 333. Calyx 10-lobed (f. 6. *a.*); the 5 inner lobes probably petals.

2 M. ocella'ta (Pers. l. c.) leaves glabrous, glandular beneath, emarginate at the base, truncately 2-lobed at the apex; lobes obtuse, divaricate; petioles glandless, shorter than the pedicels; bracteas narrow, very acute. ♄. ◡. S. Native of the Antilles, in woods. Passiflòra Murucùja, Lin. amœn. 1. t. 10. f. 10. Cav. diss. 10. t. 287. Ker. bot. reg. t. 574.—Plum. amer. t. 87. Flowers deep red. Berry size of a pigeon's egg, flesh-coloured when ripe. Both the syrup and decoction of the plant is much used in the leeward parts of Jamaica, where it is frequent; and it is said to answer effectually all the purposes for which syrup of poppies and liquid laudanum are generally administered. The flowers are most in use; they are commonly infused in, or powdered and mixed immediately with

FIG. 6.



wine or spirits; and the composition is generally thought a very effectual and easy narcotic. Browne names it *bull-hoof* or *Dutchman's laudanum*, which are probably the vulgar names of the plant in Jamaica.

Var. β; leaves rounded at the base, somewhat 3-lobed. Cav. l. c.

Small-eyed Murucuja. Fl. July, Aug. Clt. 1730. Sh. cl.

Cult. Climbing shrubs, with the habit of *Passiflòra*, bearing beautiful flowers. Their culture and propagation are the same as that recommended for that genus, see p. 56.

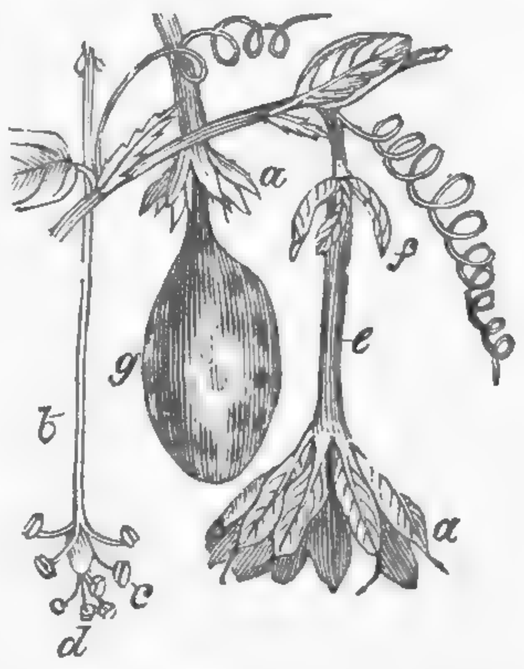
VI. TACSO'NIA (*Tacso*, the name of one of the species in Peru). Juss. gen. p. 398. ann. mus. 6. p. 388. D. C. prod. 3. p. 333.

Lin. syst. *Monadélphia*, *Pentándria*. Tube of calyx long (f. 7. *e.*), with a 10-cleft limb (f. 7. *a.*).; the 5 inner lobes probably petals; throat furnished with a scaly membrane. Habit of *Passiflòra*.

Sect. I. Eutacsònia (*eu*, well or good, and *Tacsònia*; this section contains the genuine species of the genus). D. C. prod. 3. p. 333. Involucrum large, 3-leaved (f. 6. *f.*); bracteas sometimes free, sometimes joined together.

* *Leaves undivided.*

FIG. 6.



1 T. adulterìna (Juss. ann. mus. 6. p. 393.) leaves woolly beneath, glabrous above, ovate, almost entire, with revolute edges; petioles glandless; stipulas toothed, linear-lanceolate. ♄. ◡. S. Native of New Granada. Passiflòra adulterìna, Lin. fil. suppl. p. 408. Smith, pl. ined. t. 24. Flowers purple. Berry ovate, spotted.

Adulterated Tacsonia. Sh. cl.

2 T. lana'ta (Juss. ann. mus. 6. t. 59. f. 1.) leaves woolly beneath, glabrous above, ovate-cordate, entire, with somewhat revolute edges; petioles glandless; stipulas narrow, hidden among the tomentum of the stem. ♄. ◡. S. Native of the Andes, about Quindiu. H. B. et Kunth, nov. gen. amer. 2. p. 141. Flowers white?

Woolly Tacsonia. Shrub cl.

** *Leaves 3-lobed.*

3 T. trifolia'ta (Juss. l. c. p. 393.) whole plant white from silky tomentum; leaves trifoliate; leaflets ovate-oblong, quite entire; petioles glandless; stipulas half stem-clasping, ciliated with glands. ♄. ◡. S. Native of Peru, in the valley of Canta.

Trifoliate Tacsonia. Shrub cl.

4 T. sanguínea (D. C. prod. 3. p. 334.) leaves tomentose beneath, reticulately veined, smooth above, deeply 3-lobed; lobes acute, serrated; petioles glandless; bracteas glandularly-toothed. ♄. ◡. S. Native of the West Indies. Passiflòra sanguínea, Smith, in Rees' cycl. no. 45. Flowers deep red.

Blood-coloured-flowered Tacsonia. Shrub cl.

5 T. pinnatistípula (Juss. l. c.) leaves white from velvety down beneath, trifid beyond the middle; lobes serrated; stipulas pinnate; petioles with 4-8 glands. ♄. ◡. S. Native of Chili. Sweet, fl. gard. new. ser. 2. t. 156. Passiflòra pinnatistípula, Cav. icon. 5. t. 428. Flowers rose-coloured or purplish; crown deep blue.

Var. β, *pénnipes* (Smith, in Rees' cycl. no. 48. under *Passiflòra*) stipulas palmately parted into subulate lobes, one of which is pinnate at the apex.

Pinnate-stipuled Tacsonia. Clt. 1828. Shrub cl.

6 T. micrade'na (D. C. prod. 3. p. 334.) clothed with velvety tomentum; leaves trifid, somewhat cordate, 3-5-nerved; lobes ovate-lanceolate, serrated; petioles bearing small glands, which are hidden among the tomentum; stipulas palmately parted into capillary lobes. ♄. ◡. S. Native of Peru.

Small-glanded Tacsonia. Shrub cl.

7 T. tomentòsa (Juss. l. c. p. 394.) leaves tomentose, trifid beyond the middle, 3-nerved; lobes ovate, serrated; petioles bearing 6 pedicellate glands; stipulas falcate, serrulated on the outside. ♄. ◡. S. Native of Peru. P. tomentòsa, Cav. diss. 10. t. 275, 276. Flowers rose-coloured.

Tomentose Tacsonia. Shrub cl.

8 T. manica'ta (Juss. l. c. t. 59. f. 2.) leaves somewhat tomentose beneath, trifid beyond the middle; lobes oval-oblong, serrated; petioles bearing 3-4 glands at the apex; stipulas roundish, spreading, crestedly toothed on the outside. ♄. ◡. S. Native of Peru, about Loxa. H. B. et Kunth, nov. gen. amer. 2. p. 139.

Var. β; lobes blunter and more tomentose beneath. Native of Villa de Ybarra.

Var. γ? petioles bearing many glands. On Mount Quindiu.

Var. δ; bracteas joined together at the base. On Mount Saraguru.

Manicated-stipuled Tacsonia. Shrub cl.

Sect. II. Bracteoga'ma (from βρακος, *brakys*, a cover, and γαμος, *gamos*, marriage; in reference to the bracteas of the involucrum being joined together). D. C. prod. 3. p. 334. Bracteas of involucrum 3, joined together into a tube.

9 T. trigòna (D. C. prod. 3. p. 334.) leaves clothed with hoary hairs beneath, pubescent above, deeply 3-lobed; lobes oblong, diverging, serrulated; petioles bearing 2-4 glands; stipulas manicated, denticulated, awned at the apex. ♄. ◡. S. Native of Peru. Passiflòra trigòna, Ruiz et Pav. ined. (v. s. in herb. Lamb.)

Trigonal Tacsonia. Shrub cl.

10 T. pedunncula'ris (Juss. l. c. p. 395.) leaves downy on the nerves beneath, cordate at the base, 3-nerved, trifid; lobes ovate, obtuse, serrated; petioles bearing 4 glands; stipulas ovate-lanceolate, acuminated, serrated. ♄. ◡. S. Native of Peru. Passiflòra pedunculàris, Cav. icon. 5. t. 426. Murucùja pedunculàris, Spreng. syst. 3. p. 43. Flowers purple or rose-coloured.

Var. β, *Dombeyàna* (D. C. prod. 334.) lobes of leaves acute; bracteas entire.

Peduncular Tacsonia. Clt.? Shrub cl.

11 T. mollíssima (H. B. et Kunth, nov. gen. amer. 2. p. 144.) leaves clothed with canescent tomentum beneath, and pubescence above, cordate at the base, 5-nerved, 3-lobed; lobes ovate, acute, sharply toothed; petioles bearing 12 glands; stipulas semi-ovate, acuminated, denticulated. ♄. ◡. S. Native of Santa Fe de Bogota. Murucùja mollíssima, Spreng. syst. 3. p. 43. Flowers rose-coloured.

Very soft Tacsonia. Shrub cl.

12 T. tripartìta (Juss. l. c. t. 60.) leaves rather tomentose beneath, smooth above, 3-parted; lobes lanceolate, serrated; petioles bearing 6-8 glands; stipulas manicated, crestedly toothed. ♄. ◡. S. Native of South America, in woods about Quito. H. B. et Kunth, l. c. 2. p. 142. Flowers rose-coloured.

Tripartite-leaved Tacsonia. Shrub cl.

13 T. míxta (Juss. l. c. 394.) leaves glabrous, 3-lobed; lobes oblong, serrated; petioles bearing 6 glands; stipulas oblong, acuminated, serrated on the outside. ♄. ◡. S. Native of New Granada. Passiflòra míxta, Lin. fil. suppl. 408. Smith, icon. ined. t. 25.

Var. β, *longiflòra* (D. C. prod. 3. p. 335.) leaves pubescent beneath; lateral lobes sometimes 2-lobed. ♄. ◡. S. Native of Peru. T. longiflòra and T. Tásco, Pers. ench. 2. p. 223. Flowers rose-coloured or purplish.

Mixed Tacsonia. Shrub cl.

14 T. speciòsa (H. B. et Kunth, nov. gen. amer. 2. p. 143.) leaves glabrous, cordate at the base, reticulately 5-nerved, deeply 3-lobed; lobes ovate-oblong, sharply serrated; petioles bearing 6-8 pedicellate glands; stipulas suborbicular, awned, denticulated. ♄. ◡. S. Native of Santa Fe de Bogota. Murucùja speciòsa, Spreng. syst. 3. p. 43. Flowers rose-coloured.

Showy Tacsonia. Shrub cl.

15 T. glabe'rrima (Juss. ann. mus. 6. p. 394.) leaves glabrous, coriaceous, 3-lobed; lobes oval-lanceolate, stiffly serrated; petioles biglandular at the apex; stipulas glove-formed, dentately crested. ♄. ◡. S. Native of Peru, on the Andes in shady places. Flowers purple.

Quite-glabrous Tacsonia. Shrub cl.

16 T. anastomòsans (Lamb. herb. ex D. C. prod. 3. p. 335.) leaves glabrous, coriaceous, cuneated at the base, 3-nerved, trifid; lobes ovate-lanceolate, callously serrated; petioles bearing 4 glands; stipulas ovate, awned, callously serrated. ♄. ◡. S. Native of Peru.

Anastomosing-veined Tacsonia. Shrub cl.

17 T. parvifòlia (D. C. prod. 3. p. 335.) leaves glabrous, glaucous beneath, 3-5-nerved, trifid; lobes ovate-lanceolate, acutely serrated; petioles bearing 4 glands; stipulas semi-cordate, acuminated, nearly entire. ♄. ◡. S. Native of Peru. Ruiz et Pav. (v. s. in herb. Lamb.)

Small-leaved Tacsonia. Shrub cl.

Sect. III. Distepha'na (from δις, *dis*, double, and στεφανος, *stephanos*, a crown; in reference to the double crown in the throat). Juss. l. c. D. C. prod. 3. p. 335.—Distèphia, Salisb. in litt. Involucrum small, 3-leaved; leaflets free, biglandular in the axils. Throat of calyx bearing a membranous tube, and a series of ligulæ.

18 T. glandulòsa (Juss. l. c. p. 391.) leaves glabrous, coriaceous, ovate, acuminated, quite entire, feather-nerved; petioles biglandular at the base, about equal in length to the pedicels; bracteas subulate, near the flower. ♄. ◡. S. Native of Cayenne. Passiflòra glandulòsa, Cav. diss. 10. t. 281.

Var. β, *canaliculàta* (D. C. l. c.) petioles thicker, and channelled at the base.

Glandular Tacsonia. Shrub cl.

19 T. Rohria'na (D. C. prod. 3. p. 335.) leaves glabrous, coriaceous, ovate-oblong, acuminated, quite entire, feather-nerved; petioles biglandular at the base, one-half shorter than the pedicels; bracteas subulate, remote from the flower. ♄. ◡. S. Native of Cayenne.

Rohr's Tacsonia. Shrub cl.

20 T. Stoupya'na (D. C. l. c.) leaves glabrous, coriaceous, ovate, acuminated, quite entire, feather-nerved; petioles biglandular at the base; bracteas oval, obtuse, foliaceous. ♄. ◡. S. Native of Cayenne. Cav. diss. 10. t. 281. lit. x.

Stoupy's Tacsonia. Shrub cl.

21 T. citrifòlia (Juss. l. c. p. 392. in a note,) leaves oval, coriaceous, quite entire, feather-nerved; petioles biglandular at the apex. ♄. ◡. S. Native of Cayenne. (v. s. herb. Juss.)

Citron-leaved Tacsonia. Shrub cl.

† *Species belonging to section Distephàna, but doubtful.*

22 T. quadriglandulòsa (D. C. l. c.) leaves glabrous, obtuse at the base, unequally serrated: superior ones oblong; inferior ones 3-lobed: recesses of the lobes of the leaves, petioles, and bracteas bearing 4 glands each. ♄. ◡. S. Native of Guiana, in woods, in the Island of Arowabisch. Passiflòra quadriglandulòsa, Meyer, esseq. p. 226.

Four-glanded Tacsonia. Shrub cl.

23 T. quadridenta'ta (D. C. l. c.) leaves glabrous, ovate-lanceolate, feather-nerved, with a few coarse acute teeth; petioles biglandular at the base; bracteas oblong, biglandular. ♄. ◡. S. Native of the West Indies.

Four-toothed-leaved Tacsonia. Shrub cl.

24 T. pube'scens (D. C. l. c.) leaves pubescent, ovate, lanceolate; petioles biglandular at the base; bracteas ovate-lanceolate, acuminated, glandularly serrated, and glandular on the back. ♄. ◡. S. Native of the East Indies.

Downy Tacsonia. Shrub cl.

Sect. IV. Psila'nthus (from ψιλος, *psilos*, naked, and ανθος, *anthos*, a flower; in reference to the flowers being naked, or without the involucrum). D. C. prod. 3. p. 335. Involucrum none under the flower.

25 T. trine'rvia (Juss. l. c. t. 58.) leaves tomentose beneath, oval, 3-nerved; nerves protruding so much as to form teeth; petioles glandless; calyx 10-lobed. ♄. ◡. S. Native of South America, in shady places at the river Cassiquiare. H. B. et Kunth, l. c. p. 142. Flowers rose-coloured?

Three-nerved-leaved Tacsonia. Shrub cl.

26 T.? viridiflòra (Juss. ann. mus. 6. p. 389.) leaves peltate, 3-lobed; calyx 5-lobed. ♄. ◡. S. Native of Mexico, in the vicinity of Acapulco. Passiflòra viridiflòra, Cav. icon. 5. t. 424. Intermediate between *Tacsònia*, *Passiflòra*, and *Murucùja*. Flowers green.

Green-flowered Tacsonia. Shrub cl.

Cult. The species have the habit of *Passiflòra*, and some of them are equally showy. Their culture and propagation are the same, see p. 56.

VII. PASCHA'NTHUS (from πασχω, *pascho*, to be in a passion, and ανθος, *anthos*, a flower; the same meaning as *Passiflòra*). Burch. trav. 1. p. 543. D. C. prod. 3. p. 336.

Lin. syst. *Polygàmia*, *Monoècia*. Flowers polygamous. Calyx permanent, tubular, 10-cleft; 5 outer lobes ovate: 5 inner ones oblong-linear, petaloid, or rather truly petals. Stamens 5, free. Anthers linear, inserted by the base. Ovarium stipitate. Stigmas 3, very short. Capsule subbaccate, 3-valved, 6-seeded. Seeds ornamented with red fleshy aril.—Habit of *Passiflòra*.

1 P. repa'ndus (Burch. l. c.) leaves glabrous, glaucous, oblong-linear, repand, 1-nerved, bearing 3 glands beneath; petioles very short, glandless; peduncles bearing a tendril, and two 1-flowered pedicels. ♄. ◡. G. Native of the Cape of Good Hope.

Repand-leaved Paschanthus. Shrub cl.

Cult. This very singular plant, being a native of the Cape of Good Hope, will thrive in a green-house, and will form an excellent climber for the rafters. Its culture and propagation are the same as that recommended for *Passiflòra*, see p. 56.

VIII. MODE'CCA (East Indian name of one of the species). Rheed. mal. 8. t. 20-23. Lam. dict. 4. p. 208. Blum. bijdr. p. 938. D. C. prod. 3. p. 336.

Lin. syst. *Dioècia*, *Monadélphia*. Flowers dioecious. Calyx permanent, campanulate, 10-cleft (f. 8. *b*.): 5 outer lobes oval acute: 5 inner lobes petaloid or probably petals (f. 8. *b*.). Scales 5-10 (f. 8. *c*.), rarely wanting, rising from the calyx. Stamens 5, inserted in the torus? monadelphous: anthers standing. Ovarium (f. 8. *d*.) on a short stipe. Stigmas 3, petaloid (f. 8. *e*.). Capsule bladdery, 1-celled, 3-valved, one or many-seeded. Seeds furrowed by rows of tubercles (f. 8. *f*.), arillate, fixed to 3 parietal placentas, which are adnate to the middle of the valves.—Habit of plants between *Passiflòra* and *Bryònia*.

1 M. palma'ta (Lam. dict. 4. p. 209.) leaves glabrous, variously palmately lobed, glandular beneath; stipulas spinescent; pedicels bractless. ♄. ◡. S. Native of Malabar. Flowers yellowish. Probably many species are confused under this name.

Var. α, *Naròla* (D. C. prod. 3. p. 336.) lobes of calyx acuminated; petaloid lobes or petals wanting; fruit globose.—Rheed. mal. 8. t. 20.

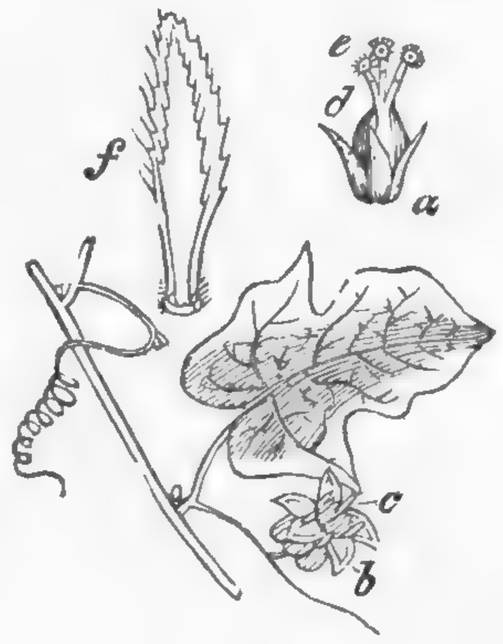
Var. β, *palmodécca* (D. C. l. c.) lobes of calyx acutish; petaloid lobes or petals feathered palmately; fruit globose. ♄. ◡. S. Rheed. l. c. t. 21.

Var. γ, *Mótta* (D. C. l. c.) lobes of calyx very much acuminated; petaloid lobes or petals wanting; fruit ovate.—Rheed. l. c. t. 22.

Palmate-leaved Modecca. Shrub cl.

2 M. loba'ta (Jacq. fragm. t. 131.) leaves glabrous, cordate at the base, 3-5-7-lobed, glandless; petioles biglandular at the apex; pedicels bractless. ♄. ◡. S. Native of Sierra Leone. Ker, bot. reg. t. 131. Flowers yellowish. (f. 8.)

FIG. 8.



Lobed-leaved Modecca. Fl. Aug. Clt. 1812. Shrub cl.

3 M. integrifòlia (Lam. dict. 4. p. 209.) leaves glabrous, ovate-lanceolate, usually entire, much acuminated; pedicels bractless, very short, few-flowered; fruit globose. ♄. ◡. S. Native of Malabar.—Rheed. mal. 8. t. 23.

Entire-leaved Modecca. Shrub cl.

4 M. Wightia'na (Wall. cat. no. 6764.) smooth; leaves cordate, triangularly ovate, entire; tendrils simple; capsule bladdery; seeds scrobiculate. ♄. ◡. S. Native of the East Indies, on the Gingee Hills. Like M. integrifòlia, Lam.

Wight's Modecca. Shrub cl.

5 M. alie'na (Wall. cat. no. 6766.) leaves deeply cordate at the base, oblong, acuminated; lobes at the base rounded; pedicels umbellate on the top of shortish peduncles; tendrils simple. ♄. ◡. S. Native of Silhet.

Alien Modecca. Shrub cl.

6 M. acumina'ta (Blum. bijdr. p. 940.) leaves ovate-oblong, acuminated, somewhat cordate at the base, and biauriculate; flowers racemose, rising from elongated axillary tendrils; fruit ovate, acuminated. ♄. ◡. S. Native of Java, on Mount Salak. Allied to M. integrifòlia according to Blume.

Acuminated-fruited Modecca. Shrub cl.

7 M. heterophy'lla (Blum. bijdr. p. 940.) leaves undivided or 3-lobed, acuminated, somewhat cordate at the base, and somewhat biauriculate; fruit oblong, acuminated at both ends. ♄. ◡. S. Native of Java, on Mount Gede.

Variable-leaved Modecca. Shrub cl.

8 M. diversifòlia (Wall. cat. no. 6763.) smooth; lower leaves triangularly ovate; upper ones 3-lobed, peltate at the base: lateral lobes sometimes bifid; pedicels 1-flowered, bractless; tendrils simple. ♄. ◡. S. Native of the East Indies. Fruit bladdery, 3-valved. Root tuberous. Momórdica heterophýlla, Wight, mss.

Diverse-leaved Modecca. Shrub cl.

9 M. cordifòlia (Blum. bijdr. p. 939.) leaves membranous, on short petioles, cordate, mucronulate, biauriculate at the base; flowers corymbose, dichotomous, rising from elongated axillary tendrils. ♄. ◡. S. Native of Java, on Mount Salak.

Heart-leaved Modecca. Shrub cl.

10 M. obtu'sa (Blum. bijdr. p. 939.) leaves coriaceous, oblong-cordate, obtuse, biauriculate at the base; flowers corymbose, dichotomous, rising from short axillary tendrils. ♄. ◡. S. Native of Java, on Mount Salak.

Obtuse-leaved Modecca. Shrub cl.

11 M. parviflòra; leaves oblong-lanceolate, entire, acuminated, glabrous; tendrils simple; peduncles axillary, dichotomous. ♄. ◡. S. Native of Sierra Leone. Flowers small, yellow.

Small-flowered Modecca. Shrub cl.

12 M. macrophy'lla (Blum. bijdr. p. 939.) leaves coriaceous, oval, bluntish at both ends, somewhat auriculated at the base; flowers corymbose, dichotomous, rising from axillary tendrils. ♄. ◡. S. Native of Java, on Mounts Salak, Parang, &c.

Long-leaved Modecca. Shrub cl.

13 M. austra'lis (R. Br. ined. ex D. C. prod. 3. p. 337.) leaves glabrous, somewhat peltate at the base, cordate, running down the petiole in an auriculated manner at the base, acute, entire, glandless. ♄. ◡. S. Native of New Holland, in the gulph of Carpentaria.

Southern Modecca. Shrub cl.

14 M.? bractea'ta (Lam. dict. p. 210.) leaves scabrous from tubercles on both surfaces, palmately lobed, emarginate at the base; pedicels bracteate, racemose; calyxes somewhat serrated. ♄. ◡. S. Native of the East Indies.

Bracteated Modecca. Shrub cl.

Cult. See *Passiflòra*, p. 56. for culture and propagation. The flowers of the species are by no means showy.

IX. DEIDA'MIA (a mythological name, daughter of Lycomedes, king of Scyros). Pet. Th. gen. pl. afr. 2. p. 61. t. 20. D. C. prod. 3. p. 337.

Lin. syst. *Monadélphia, Penta-Octándria.* Calyx 5-8-parted; lobes petaloid; crown a simple series of filamentose appendages, rising from the interior part of the calyx. Stamens equal in number to the lobes of the calyx; filaments joined at the base into a column. Ovarium ovate. Styles 3-4. Capsule pedicellate, 3-4-valved. Seeds arillate.—Climbing Madagascar shrubs, with axillary tendrils, impari-pinnate leaves, and glandular petioles.

1 D. Noronhia'na (D. C. prod. 3. p. 337.) leaflets obovate, somewhat cuneated at the base, emarginate at the apex; peduncles 2-3-flowered; flowers pentandrous. ♄. ◡. S. Native of Madagascar. D. alàta, Pet. Th. l. c. t. 20. Flowers brownish.

Noronh's Deidamia. Shrub cl.

2 D. Commersonia'na (D. C. l. c.) leaflets elliptic, mucronate at the apex; peduncles 5-7-flowered; flowers pentandrous. ♄. ◡. S. Native of Madagascar.

Commerson's Deidamia. Shrub cl.

3 D. Thompsonia'na (D. C. prod. 3. p. 337.) leaves elliptic, hardly mucronate, rather coriaceous; peduncles 5-7-flowered; flowers octandrous. ♄. ◡. S. Native of Madagascar. Passiflòra octándra, Thompson in herb. Lamb.

Thompson's Deidamia. Shrub cl.

Cult. See *Passiflòra*, p. 56. for culture and propagation.

X. VARE'CA (altered from *Walwareka*, the name of the fruit in Ceylon). Gærtn. fruct. 1. p. 219. t. 6. f. 6. D. C. prod. 3. p. 337.

Lin. syst. unknown. Flowers unknown. Berry 1-celled; pulp divided into numerous partial cells for the reception of the seeds. Placentas 3, parietal, many-seeded.

1 V. Zeyla'nica (Gærtn. l. c.) Native of Ceylon. Nothing but the fruit of this plant is known.

Ceylon Vareca. Shrub cl.?

Cult. See *Passiflòra*, p. 56. for culture and propagation.

ORDER CVI. MALESHERBIA'CEÆ (this order only contains the genus *Maleshérbia*). D. Don, in edinb. phil. journ. 1827. p. 321.—Passiflòreæ, Tribe III.—Malesherbièæ, D. C. prod. 3. p. 337.

Calyx tubular (f. 9. *h.*), membranous, inflated, 5-lobed (f. 9. *a.*); lobes imbricated in æstivation. Petals 5 (f. 9. *b.*), alternating with the segments of the calyx, permanent, convolute in æstivation, arising on the outside of the short membranous crown (f. 9. *e.*). Stamens 5-10, perigynous; filaments filiform, distinct, or connected with the stipe of the ovarium; anthers versatile. Ovarium superior (f. 9. *g.*), stipitate, 1-celled, with the placentas at the base, from which the ovules arise by the intervention of umbilical cords. Styles 3, filiform, very long, arising from distinct points at the apex of the ovarium (f.9. *d.*); stigmas clavate. Fruit capsular, 1-celled, 3-valved, membranous more or less, many-seeded. Seeds attached by umbilical cords to placentas, arising either from the axis of the valves, or from their base; testa crustaceous, brittle, with a fleshy crest, and no arillus. Embryo terete in the centre of fleshy albumen, with the radicle next the hylum.—Herbaceous or half shrubby plants, clothed with glandular pubescence. Leaves alternate, simple lobed, without stipulas. Flowers axillary or terminal, solitary, yellow or blue.

This order agrees with *Passiflòreæ* on the one hand, and *Turneràceæ* on the other. From the former they differ in the insertion of their styles, in their versatile anthers, in their short placentas, membranous fruit, terete embryo, want of arillus, and stipulas; and altogether in their habit. From *Turneràceæ*, to which their habit nearly allies them, they differ in the presence of a perigynous membrane, in the remarkable insertion of the styles, and in the want of all trace of an arillus; agreeing with that order in the æstivation of the corolla, and in the principal other points of their structure. The plants are unknown except as objects of great beauty.

I. MALESHE'RBIA (in memory of Christian William de Lamoignon Malesherbes, born at Paris in 1721, a great patron of the sciences). Ruiz et Pav. prod. p. 45. D. Don, l. c. D. C. prod. l. c.—Gynopleùra, Cav. icon. 4. p. 51.

LIN. SYST. *Pentándria, Monogýnia.* Character the same as that of the order.

1 M. THYRSIFLÒRA (Ruiz et Pav. prod. p. 457. et Hook. bot. misc. vol. 2. p. 220.) leaves linear-lanceolate, acute, sinuately toothed, tomentose; tube of calyx long, with a contracted throat; crown 10-cleft, with the segments 2-4-toothed. ♄. G. Native of Peru, in exposed argillaceous soil. Gynopleùra tubulòsa, Cav. icon. 4. t. 375. Flowers yellow.

Thyrse-flowered Malesherbia. Shrub 1 to 2 feet.

2 M. PANICULA'TA (D. Don in edinb. phil. journ. 1827. p. 321.) leaves oblong, obtuse, ciliated, pinnatifid: upper ones nearly entire; throat of calyx dilated; crown simple, acutely toothed. ♄. G. Native of the north of Chili. Flowers yellow?

Panicled-flowered Malesherbia. Shrub 1 to 2 feet.

3 M. LINEARIFÒLIA (D. Don in edinb. phil. journ. Jan. 1832.) villous; leaves linear, entire; throat of calyx dilated; crown 10-cleft, with toothed segments. ♄.? G. Native of Chili, especially in the tract of Portilla, near Mendoza. Gynopleùra linearifòlia, Cav. icon. 4. p. 52. t. 376. Flowers white.

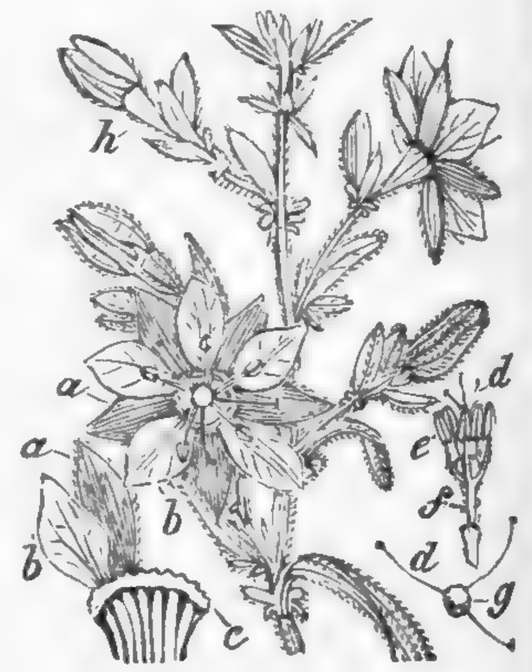
Linear-leaved Malesherbia. Pl. 2 to 3 feet.

4 M. HU'MILIS (D. Don, l. c.) plant very villous; leaves jagged; throat of calyx dilated; crown simple, erosely toothed; anthers roundish. ♄. G. Native of Chili about Coquimbo. Stems procumbent. Flowers white.

Dwarf Malesherbia. Fl. Aug. Clt. 1832. Pl. procumbent.

5 M. CORONA'TA (D. Don, l. c.) plant clothed with glandular pubescence; leaves linear, sinuately toothed; throat of calyx dilated; crown simple, toothed. ♄. G. Native of Chili, at Valparaiso. Flowers blue; crown white. Sweet, fl. gard. new. ser. t. 167. (f. 9.)

FIG. 9.



Crowned Malesherbia. Fl. Aug. Oct. Clt. 1832. Pl. 2 to 3 feet.

6 M. FASCICULA'TA (D. Don, l. c.) leaves lanceolate, acuminated, quite entire; flowers in fascicles; crown 10-cleft, with the segments tridentate. ♄. G. Native of Chili. A stiff erect shrub. Flowers small, in bundles at the tops of the branches.

Fascicled-flowered Malesherbia. Shrub 1 to 2 feet.

7 M. TENUIFÒLIA (D. Don in edinb. phil. journ. Oct. 1832.) leaves nearly pinnate; segments linear; calyx tubular; crown deeply lobed. ⊙. G. Native of the south of Peru, in the province of Tarapaca at Huataconda, where it is commonly called *Agi de Zorra*, i. e. Fox capsicum. Flowers reddish, according to the dried specimen.

Fine-leaved Malesherbia. Fl. Feb. Pl. ½ foot.

Cult. This genus is composed of curious plants, bearing very showy singular flowers, and are therefore worthy of culture as ornaments. A mixture of loam, peat, and sand, or any light rich earth is a good soil for them. The shrubby species may either be increased by seeds; or young cuttings will root if planted in light soil, under a hand-glass. The seeds of annual kinds require to be sown in a hot-bed, in order to forward the plants; and after they have grown an inch in height, they may be potted off into small pots, and afterwards shifted into pots of increasing size, as they grow. Some of them may be planted out into the open border, in a sheltered situation, where they will probably flower and seed freely.

ORDER CVII. LOA'SEÆ (plants agreeing with *Loàsa*, in important characters). Juss. ann. mus. 5. p. 18. dict. sc. nat. 27. p. 93. D. C. prod. 3. p. 339.—Loàseæ-veræ, H. B. et Kunth, nov. gen. amer. 6. p. 115.

Tube of calyx adhering to the ovarium, or girding it closely (f. 10. *a.* f. 12. *a.*); limb 5-parted (f. 11. *a.* f. 12. *a.*), rarely 4-parted, permanent. Petals equal in number to the lobes of the calyx (f. 12. *b.* f. 11. *b.*), with an inflexed valvate æstivation, or double that number (f. 10. *b.*), and disposed in 2 series; those of inner series, when present, usually much smaller (f. 10. *b.*) than those of the outer, scale-formed and truncate at the apex, inserted in the throat of the calyx. Stamens indefinite, arising from within the petals, disposed in several series, either distinct (f. 10. *c.*), or joined at the base in several parcels before each petal, within the cavity of which they lie in æstivation; filaments subulate (f. 10. *g.*), unequal, the outer ones frequently destitute of anthers. Ovarium adnate

to the calyx (f. 10. *a.* f. 11. *e.*), or inclosed within it, 1-celled, with several parietal placentas (f. 11.), or with 1 free central lobed one. Style 1, composed of 3-5-7-joined ones, crowned by as many lobes or stigmas. Capsule dry or succulent, crowned by the calyx (f. 10. *d.* f. 11. *g.* f. 12. *c.*), 1-celled, with several parietal placentas (f. 11.), originating at the sutures, and therefore may be called marginal, 3-4-7-valved; placentas equal in number to the valves, sometimes drawn out so far as to form dissepiments (f. 11. *f.*). Seeds numerous, without arillus. Embryo lying in the axis of a fleshy albumen; with the radicle pointing to the hilum, and flat small cotyledons.—American herbs more or less pilose or hispid, with the hairs or bristles usually stinging like those of the nettle, in consequence of their secreting an acrid juice. Leaves opposite or alternate, exstipulate, simple, but usually variously divided. Peduncles axillary, 1-flowered. Flowers elegant. This order is distinguished from *Onagrarièæ* by its unilocular ovaria, and indefinite stamens, part of which are sterile; and perhaps by the latter character, and the additional 5 petals, connected with *Passiflorèæ*, with which they sometimes also accord in habit. Their rigid stinging hairs, climbing habit, and lobed leaves resemble those of some *Urticeæ*. On the same account they may be compared with *Cucurbitàceæ*, with which they further agree in their inferior unilocular fruit, with parietal placentas, and in the very generally yellow colour of their flowers. This, indeed, is the order with which, upon the whole, *Loàseæ* must be considered to have the closest affinity.

Sýnopsis of the genera.

1 BARTÒNIA. Tube of calyx cylindrical (f. 10. *a.*); limb 5-parted (f. 10. *a.*). Petals 5-10 (f. 10. *b.*), about equal in shape. Stamens numerous (f. 10. *c.*). Capsule 3-7-valved; each placenta bearing 2 rows of seeds.

2 BLUMENBA'CHIA. Tube of calyx spirally twisted (f. 11. *e.*); limb 5-parted (f. 11. *g.*). Petals 10 (f. 11. *b.*); 5 outer ones cucullate, and the 5 inner ones scale-formed, each scale inclosing 2 sterile filaments. Fertile stamens disposed in 5 bundles (f. 11. *b.*). Fruit dividing into 10 parts at the base.

3 LOA'SA. Tube of calyx not twisted (f. 12. *a.*); limb 5-parted (f. 12. *c.*). Petals 10 (f. 12. *b.*); the 5 inner ones scale-formed, bearing 2 sterile filaments inside. Outer series of stamens sterile and free; inner ones disposed in 5 bundles, but distinct. Capsule 1-celled, 3-valved at the apex.

4 CAIÓPHORA. The fruit is oval, bursting into 3 valves from the base upwards; the placentas then separate from the sides of the capsule, and have the appearance of 3 arched columellæ. The rest as in *Loàsa*.

5 MENTZE'LIA. Tube of calyx cylindrical (f. 13. *b.*); limb 5-lobed (f. 13. *d.*). Petals 5 (f. 13. *a.*). Stamens free, usually disposed in bundles (f. 13. *e.*). Capsule turbinate, 3-valved, few-seeded (f. 13. *f.*).

6 KLAPRÒTHIA. Calyx with a turbinate tube, and a 5-parted limb. Petals 4. Stamens numerous, 4-5 sterile in front of each sepal, and 4-5 fertile in front of each petal. Fruit baccate, few-seeded.

I. BARTO'NIA (Benj. S. Barton, M. D., professor of botany at Philadelphia). Sims, bot. mag. t. 1487. Nutt. gen. amer. 1. p. 297. Pursh, fl. amer. sept. 1. p. 327. D. C. prod. 3. p. 339. but not of Willd.

LIN. SYST. *Icosándria, Monogýnia.* Tube of calyx cylindrical (f. 10. *a.*), closely girding the ovarium, but probably distinct from it; limb 5-parted (f. 10. *a.*), permanent. Petals 5-10 (f. 10. *b.*), unguiculate, the same shape, inserted in the calyx. Stamens indefinite (f. 10. *c.*), inserted with the petals, but shorter than them; filaments free (f. 10. *c.*); outer ones sometimes sterile; anthers oblong. Style filiform (f. 10. *e.*), marked with 3-7 spiral stripes (f. 10. *e.*). Capsule oblong, 1-celled, 3-7-valved; placentas bearing 2 rows of seeds each. Seeds compressed.—Herbs downy from stiff and bearded hairs. Leaves alternate, interruptedly pinnatifid. Flowers large, terminal, solitary, white or yellow, expanding in the evening, becoming reddish as they fade.

1 B. ORNA'TA (Nutt. gen. amer. 1. p. 297.) lobes of leaves acutish; capsule surrounded by bracteas, 5-7-valved; seeds somewhat emarginate. ♂. F. Native of Upper Louisiana, in argillaceous soil, on the banks of the river Missouri. B. decapétala, Sims, bot. mag. 1487. Petals 10, white.

Ornamental Bartonia. Fl. Jul. Sept. Clt. 1811. Pl. 1 to 2 ft.

2 B. NU'DA (Nutt. l. c.) lobes of leaves obtuse; capsule 3-valved, naked; seeds winged; outer stamens petaloid, usually sterile. ♂. F. Native on the banks of the Missouri, on gravelly hills. Petals 10.

Naked-fruited Bartonia. Fl. Jul. Sept. Clt. 1811. Pl. 1 to 2 ft.

3 B. LÆVICAU'LIS (Dougl. mss. ex Hook, fl. bor. amer. 1. p. 221. t. 69.) petals 5; petaloid stamens 5; bracteas wanting; stems very smooth; seeds winged. ⊙. H. Native of North America, on the gravelly islands and rocky shores of the Columbia, near the Great Falls. Flowers shining, yellow. An ornamental plant, not inferior to *B. ornàta*, but differs from it in the want of the large, jagged bracteas, as well as in its fewer petals and winged seeds.

FIG. 10.

Smooth-stemmed Bartonia. Pl. 2 to 3 feet.

4 B. PARVIFLÒRA (Dougl. mss. ex Hook. fl. bor. amer. 1. p. 221.) petals 5; petaloid stamens 5-7; bracteas wanting; stem scabrous; seeds winged. ♂. F. Native of North America; abundant in calcareous rocky situations, and micacious sandy banks of streams, in the interior parts of Columbia. Flowers smaller than those of the preceding species, but it is probably hardly more than a variety of that plant. It differs from *B. nùda*, Nutt. in the number of the petals. The name would be more applicable to the following species.

Small-flowered Bartonia. Pl. 1 to 2 feet.

5 B. ALBICAU'LIS (Dougl. mss. ex Hook. fl. bor. amer. 1. p. 222.) petals 5, obovate, small; petaloid stamens wanting; bracteas wanting; stems short, shining, white. ⊙. H. Native of North America, on arid sandy plains of the river Colombia, under the shade of *Púrshia tridentàta*. Mentzèlia albicaúlis, Dougl. mss. Acrolàsia bartonioìdes, Presl. reliq. Hænk. 2. p. 39. t. 55. Petals yellow.

White-stemmed Bartonia. Pl. decumbent.

6 B. ALBE'SCENS (Arnott, in Cheek, journ. 3. p. 273.) stem with a white shining epidermis; leaves sinuately toothed; capsule naked, 3-valved; seed broadly marginate; flowers dis-

posed in a leafy panicle. ♂. F. Native of Chili, in the Jarillal, or uncultivated grounds between Mendoza and the mountains; generally by the side of dry water courses, at about 3000 feet above the level of the sea. Sweet, fl. gard. new ser. t. 182. B. sinuàta, Presl. reliq. Hænk. 2. p. 38. Petals 10, pale yellow. Filaments all dilated. Stigmas 3-lobed. This species does not turn black on drying, as in the other species, and is readily distinguished from them by the beautiful white down on the stem.

Hoary Bartonia. Fl. July, Sept. Clt. 1831. Pl. 1 to 4 feet.

Cult. The seeds of the species should be raised in a gentle heat in spring; and when the plants are of a proper size, they should be potted separately in small pots, and shifted from size to size of pots as they grow; the pots should be well drained with sherds; and in the winter they should be placed on a dry shelf in a greenhouse or frame. The flowers are very showy, and the plants are therefore worth cultivating in every garden.

II. BLUMENBA'CHIA (in honour of John Freder. Blumenbach, M.D. professor of medicine at Göttingen, chiefly distinguished as a comparative anatomist). Schrad. in goett. anz. 1825. p. 1707. Comm. soc. goett. vol. 6. with a figure. D. C. prod. 3. p. 340. but not of Kœl.

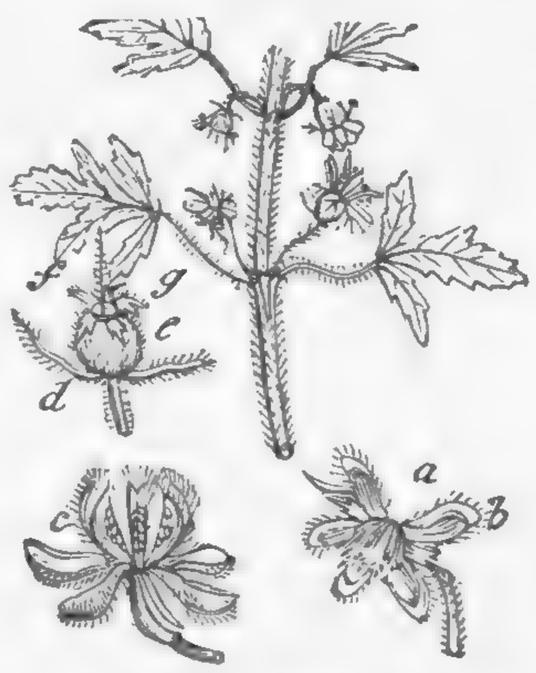
Lin. syst. *Polydélphia, Polyándria.* Calyx 5-parted (f. 11. *g.*), with the tube adhering to the ovarium. Petals 5 (f. 11. *b.*), inserted in the top of the calycine tube, cucullate, equal, spreading. Scales 5 (f. 11. *b.*), alternating with the petals, and inserted with them, furnished with 3 sterile filaments at the back of each, and clasping 2 subulate appendages inside. Stamens indefinite, inserted in the top of the calycine tube (f. 11. *b.*), disposed in 5 bundles, one opposite each petal; anthers 2-celled, bursting inwardly. Ovarium joined to the tube of the calyx. Style simple (f. 11. *f.*). Capsule marked with 10 spiral ribs, 1-celled, 10-valved; 5 of the valves thicker and broader than the other 5, with the placentas not reaching the axis; the other 5 narrower, with placentas almost reaching the axis (f. 11. *h.*), and bearing the seeds. Seeds rugged.—Branched, climbing, or trailing herbs, covered with stinging hairs. Leaves opposite, lobed. Flowers axillary, solitary, bracteate.

1 B. insígnis (Schrad. l. c.) lower leaves 7-5-lobed; upper ones deeply bipinnatifid. ⊙. H. Native of Chili and Brazil, in the provinces of Cisplatine and Rio Grande do Sul, and about Monte Video; also of Buenos Ayres. Reich. icon. exot. t. 121. Sweet, fl. gard. t. 170. B. parviflòra, Gill. mss. Loàsa palmàta, Spreng. syst. 3. p. 601. Trevir. in act. bot. 13. p. 181. t. 12. Loàsa pàtula, Graham, in edinb. phil. journ. Oct. 1827. Flowers with whitish petals and reddish-yellow scales.

Showy Blumenbachia. Fl. July, Nov. Clt. 1826. Pl. tr.

2 B. palma'ta (St. Hil. fl. bras. 2. p. 208.) leaves deeply and palmately 3-5-lobed; lobes pinnatifid. ⊙. H. Native of Brazil, on the confines of the province of Rio Grande de St. Pedro do Sul. Flowers with white petals; scales with ciliated edges, yellow at the base, lined with white, and red above it, tipped with vermilion colour.

FIG. 11.



Palmate-leaved Blumenbachia. Pl. tr.

3 B. latifòlia (St. Hil. fl. bras. 2. p. 209. t. 118.) leaves trifoliate; lateral segments 3-lobed, unequal-sided, terminal one equal-sided, 3-5-lobed. ⊙. H. Native of Brazil, in the province of St. Paul, between the towns of Rio Grande de St. Pedro do Sul and St. Francisco de Paulo. Flowers with white petals, and yellow scales tipped with orange colour. (f. 11.)

Broad-leaved Blumenbachia. Pl. tr.

4 B. punícea; plant very hispid; leaves opposite, pinnatifid, having the segments jagged; calycine lobes jagged, shorter than the petals, which are cucullate; bundles of stamens polyandrous. ⊙. H. Native of Peru. Loàsa punícea, Ruiz et Pav. fl. per. 5. t. 446. ined. (v. s. herb. Lamb.)

Scarlet Blumenbachia. Pl. 1 to 2 feet.

5 B. pterospe'rma; hispid; leaves opposite, pinnatifid, rather cordate at the base; segments toothed; peduncles long, 1-flowered, axillary; calycine segments toothed, shorter than the petals, which are cucullate; bundles of stamens polyandrous; stem climbing; seeds bordered by a wing. ⊙. H. Native of Peru. Loàsa pterospérma, Ruiz et Pav. fl. per. 5. t. 448. (v. s. herb. Lamb.)

Winged-seeded Blumenbachia. Pl. cl.

6 B. sepia'ria; stem climbing; leaves opposite, pinnatifid, with the segments pinnatifid or coarsely toothed; peduncles long, axillary, 1-flowered; calycine segments jagged, linear, longer than the petals, which are cucullate; bundles of stamens polyandrous. ⊙. H. Native of Peru. Loàsa sepiària, Ruiz et Pav. fl. per. 5. t. 449. ined.

Hedge Blumenbachia. Pl. cl.

7 B. micra'ntha; hispid; leaves opposite, ovate, serrated, petiolate; peduncles many-flowered, racemose, terminal, and rising from the forks of the stem; calycine lobes ovate, much shorter than the petals, which are cucullate, and holding 2 stamens each. ⊙. H. Native of Peru. Flowers very small. Loàsa micrántha, Ruiz et Pav. fl. per. 5. t. 442.

Small-flowered Blumenbachia. Pl. 1 foot.

8 B. grandiflòra; leaves opposite, petiolate, oblong, runcinate, acute, somewhat cordate at the base; pedicels 1-flowered, rising from the forks of them; stem climbing. ⊙. H. Native of Peru. Loàsa contórta, Lam. dict. 3. p. 579. D. C. prod. 3. p. 340. Juss. ann. mus. 5. p. 25. t. 3. f. 1. Loàsa physiopétala, Ruiz et Pav. fl. per. 5. t. 447. ined. Flowers yellow.

Great-flowered Blumenbachia. Pl. cl.

Cult. Elegant annual plants, with very showy flowers; their culture and propagation are the same as that recommended for the species of *Loàsa*, see p. 64.

III. LOA'SA (meaning unknown to us). Adan. fam. 2. p. 501. Jacq. obs. 2. p. 15. Schreb. gen. no. 908. Juss. gen. p. 322. ann. mus. 5. p. 24. Lam. ill. t. 426. D. C. prod. 3. p. 340.—Ortìga, Feuill. per. 2. p. 757. Neck. elem. no. 1221. Loòsa, Lin. præl. ed. gis. p. 334.

Lin. syst. *Polydélphia, Polyándria.* Calyx 5-cleft, with the tube adhering to the ovarium (f. 12. *a.*). Petals 5 (f. 12. *b.*), cucullate, equal, spreading, inserted in the top of the tube; scales 5, inserted with the petals, furnished with 3 sterile filaments on the back of each, and girding 2 subulate appendages inside. Stamens indefinite, inserted in the top of the calycine tube, disposed in 5 bundles (f. 12. *b.*), opposite the petals; anthers 2-celled, bursting inwardly. Ovarium joined to the calyx. Capsule crowned by the lobes of the calyx (f. 12. *a.*), 3-valved at the top, 1-celled; placentas linear, alternating with the valves. Seeds rugged.—Branched, decumbent, or climbing herbs, beset with stinging hairs. Leaves alternate, or opposite, toothed or lobed. Flowers axillary, extra-axillary, or opposite the leaves, solitary or racemose.

* *Leaves opposite.*

1 L. tríloba (Juss. ann. mus. 5. p. 24. t. 1. f. 3.) leaves cordate at the base, usually 3-lobed: lobes acute, toothed; middle lobe usually somewhat 3-lobed; pedicels axillary; caly-

cine lobes small, acute. ⊙. H. Native of Peru and Chili, about Valparaiso. Ruiz et Pav. fl. per. 5. t. 444. ined. Scales petaloid, equally and bluntly 3-lobed. Flowers small.

Three-lobed-leaved Loasa. Pl. 1 foot.

2 L. ACERIFÒLIA (Juss. l. c. p. 24. t. 1. f. 2.) leaves nearly opposite, cordate at the base, 5-7-lobed; lobes acute, toothed; pedicels shorter than the floral leaves; calycine lobes oblong, acuminated. ⊙? H. Native of Chili and Peru. Loàsa vitifòlia, Ruiz et Pav. fl. per. 5. t. 443. ined. L. trícolor, Ker. bot. reg. 667. Scales as in *L. tríloba*, but the calycine lobes are twice the length. Flowers with yellow petals and red scales.

Maple-leaved Loasa. Pl. tr.

3 L. BRYONIÆFÒLIA (Schrad. cat. hort. gœtt. 1823. pl. rar. hort. goett. with a figure) leaves cordate, lower ones 5-lobed, stalked, upper ones 3-lobed, almost sessile; all the lobes are sinuately lobed; pedicels exceeding the floral leaves; lobes of calyx a little toothed, acuminated. ⊙. H. Native of Chili. Stem erect, bristly. Flowers yellow, hardly smaller than those of *L. acerifòlia*. Stigma blunt. Seeds without aril; hylum lateral.

Bryony-leaved Loasa. Pl. 1 foot.

4 L. NITÍDA (Lam. dict. 3. p. 581.) leaves cordate at the base, many-lobed; lobes acute, toothed, lower ones usually pinnatifid; pedicels axillary; calycine lobes oblong, toothed, shorter than the petals; wings of the corona very small, toothed, and stalked; stamens much shorter than the petals; style straight, shorter than the stamens; sepals erect, much shorter than the pear-shaped fruit. ⊙. H. Native of Chili and Peru, on the mountains. Juss. ann. mus. 5. p. 25. t. 2. f. 2. Trat. tabl. 1. t. 23. Hook. exot. fl. t. 83. bot. mag. 2372. Ruiz et Pav. fl. per. 5. t. 445. Petals spreadingly reflexed, yellow, red at the base; scales red. Lobes of leaves bluntish. Stems prostrate.

Var. β; leaves more deeply lobed; lobes narrower.—Chili, about Valparaiso. L. trícolor, Lindl. bot. reg. 667.

Shining Loasa. Fl. June, Sept. Clt. 1822. Pl. tr.

5 L. SAGITTA'TA (Hook. et Arn. in bot. misc. 3. p. 238.) stems twining, pubescent; leaves all petiolate, opposite, cordately-sagittate, acuminated, with rather lobed margins: the lobes crenated; peduncles axillary and terminal, few-flowered; calycine lobes ovate-oblong. ⊙. ◠. H. Native of Chiloe. There has none of the stinging hairs, so peculiar to this genus, been observed on this species.

Sagittate-leaved Loasa. Pl. tw.

6 L. ELONGA'TA (Hook. et Arn. in bot. misc. 3. p. 239.) stems much elongated, nearly simple, shining; leaves remote, opposite, petiolate, cordate at the base, 5-7-lobed; peduncles axillary, few-flowered, twice the length of the leaves; calycine lobes broadly ovate, shorter than the petals, which are red; fruit hemispherical. ⊙. H. Native of Chili, about Coquimbo.

Elongated-stemmed Loasa. Pl. 2 to 3 feet.

7 L. PROSTRA'TA (Gill. mss. ex Arnott, in Cheek, edinb. journ. 3. p. 274.) stems prostrate, flexuous; leaves opposite, sessile, cordate, ovate, deeply angular; peduncles axillary, 1-flowered, about twice the length of the leaves; calycine lobes lanceolate, longer than the fruit, and about equal in length to the petals; valves of capsule closely beset by long, rigid hairs; seeds egg-shaped, large, with a smooth testa. ⊙. H. Native of Chili, on La Cuesta de los Manantiales, Cerro de San Pedro Nolasco, &c. Plant covered with long, rigid, stinging hairs.

Var. β, Cumingii (Hook. et Arnott, in bot. misc. 3. p. 239.) segments of leaves bipinnatifidly and sinuately toothed. About Valparaiso, and on the mountains near Aconcugua. In the species the segments of the leaves are simply and sinuately toothed.

Prostrate Loasa. Pl. prostrate.

8 L. PA'LLIDA (Gill. mss. ex Arn. in Cheek, edinb. journ. 3. p. 274.) epidermis of stem loose, and shining; leaves opposite, all petiolate, ovate, coarsely toothed; panicles opposite, axillary, much longer than the leaves; pedicels short, in the forks, about equal in length to the flowers; calycine lobes linear-oblong, one half shorter than the petals. ⊙. H. Native of Chili, among loose debris, on the banks of the El Rio del Yeso, near Arroyo de San Nicholas, at the elevation of about 5000 feet, &c., where it is called by the inhabitants *Cavalluna*. The plant is most nearly allied to *L. sclareæfòlia*, Juss. but that does not appear to have the loose epidermis on the stem, and the leaves are much larger. The pedicels in the forks of the panicle are elongated.

Pale Loasa. Pl. prostrate.

9 L. LATERÍTIA (Gill. mss. ex Arnott, in Cheek, edin. journ. 3. p. 275.) stems almost wanting; leaves opposite, on long petioles, pinnate; segments roundish, crenated, lobed; peduncles twin, 1-flowered, terminal, about equal in length to the leaves; calycine lobes oval, exceeding the tube, but one half shorter than the corolla. ⊙. H. Native of Chili, at Los Imposibles, near the foot of the descent from the Planchon towards Chili, and in El Valle de Tray Carlos, at the base of the volcano of Pateroa, at an elevation of 9000 feet. This species is readily distinguished by its large flowers of a brick red colour, and by its very short stems and radical branches, each of which bear 1 or 2 pairs of opposite leaves, and between the upper pair of which arise 2 1-flowered peduncles, terminating the branch. Seeds with a strongly reticulated testa like the next species; and as in it the hairs are short and not stinging.

Brick-coloured-flowered Loasa. Pl. prostrate.

10 L. PINNATÍFIDA (Gill. mss. ex Arnott in Cheek, edinb. journ. 3. p. 275.) stems nearly erect; leaves opposite, on long petioles: radical and lower ones pinnate: segments pinnatifid, with roundish approximate lobes; upper leaves pinnatifid; peduncles axillary, usually 1-flowered; calycine lobes ovate, much shorter than the corolla, and half the length of the fruit. ⊙. H. Native of Chili, at La Cuesta del Inga, at an elevation of about 9000 feet. Plant with short rigid, but not stinging hairs.

Pinnatifid-leaved Loasa. Pl. 1 foot.

11 L. DISSE'CTA (Hook. et Arn. in bot. misc. 3. p. 240.) stem erectish, strong, a little branched at the apex, with a loose white epidermis; petioles opposite, lower ones elongated, becoming gradually shorter to the top of the stem; leaves tripinnatifid, with the ultimate segments ovate-obtuse; pedicels short, rising from the forks of the stem; calycine lobes narrow-oblong, not half so long as the petals. ⊙. H. Native about Valparaiso, Los Ogos de Agua, and Aconcugua.

Dissected-leaved Loasa. Pl. 1 foot.

12 L. HETEROPHY'LLA (Hook. et Arn. in bot. misc. 3. p. 228.) stem prostrate, dichotomous; leaves opposite, on short petioles; lower ones small, hastately triangular, coarsely toothed: lower floral ones nearly reniform, 5-lobed, with the lobes nearly equal, and furnished with 1 or 2 teeth each; but the middle lobe of the uppermost leaves is rather lengthened; peduncles in the forks longer than the leaves; calycine lobes oblong-lanceolate, about equal in length to the petals; fruit conically hemispherical. ⊙. H. Native about Valparaiso? and at Los Ogos de Agua. The stem is rarely pubescent; but the branches, particularly in their upper part, and the turbinate tube of the calyx, are provided with long sharp spreading hairs.

Variable-leaved Loasa. Pl. prostrate.

13 L. ACANTHIFÒLIA (Lam. dict. 3. p. 579.) leaves cordate at the base, pinnatifid; lobes acuminated, sinuately toothed; pedicels axillary, and also from the forks, solitary, 1-flowered; lobes of calyx narrow, acuminated, reflexed, equal in length to the petals, which are bidentate. ⊙. H. Native of Chili. Juss. ann. mus. 5. p. 25. t. 3. f. 2. L. nitída, bot. mag. 2372? L. cymbæpétala, Ruiz et Pav. fl. per. 5. t. 442. b. ined. Ortìga

Chilénsis, Feuill. obs. 2. p. 757. t. 43. Petals yellow. Scales red. Herb erect, 4 feet high. The leaves are often alternate.

Acanthus-leaved Loasa. Pl. 4 to 5 feet.

14 L. Ruizi'ana; leaves opposite, ovate, coarsely serrated, hoary from down, petiolate; peduncles axillary and terminal, 1-flowered; calycine segments acute, much shorter than the petals, which are cucullate. ⊙. H. Native of Peru. L. incàna, Ruiz et Pav. fl. per. vol. 5. t. 441. ined. (v. s. herb. Lamb.)

Ruiz's Loasa. Pl. 1 foot.

15 L. sclareæfòlia (Juss. l. c. 5. p. 25. t. 1. f. 1.) leaves ovate-oblong, sinuately lobed; lobes acute, toothed; upper leaves sessile; pedicels solitary, 1-flowered in the forks of the stem; calycine lobes oblong, acuminated, shorter than the petals. ⊙. H. Native of Chili, where it is called Urtìca bràva, Tratt. t. 22. Scales emarginate at the apex.

Sclary-leoved Loasa. Pl. tr.

16 L. Pla'cei (Lindl. in hort. trans. 6. p. 97.) leaves cordate at the base, many lobed: upper ones sessile; pedicels axillary; sepals hardly toothed, reflexed, length of petals; the wings of the corona sessile, and quite entire; the longest of the stamens as long as the petals; style bent, longer than the stamens; capsule obovate, shorter than the reflexed sepals. ⊙. H. Native of Chili. L. acanthifòlia, Ker, bot. reg. t. 785. but not of Juss. Flowers yellow, with red scales.

Place's Loasa. Fl. June, Sept. Clt. 1822. Pl. 4 to 6 feet.

17 L. grandiflòra (Lam. dict. 3. p. 580.) lower leaves opposite; upper ones alternate, cordate at the base, 5-lobed; lobes deeply toothed; flowers axillary and terminal, on long pedicels; lobes of calyx acuminated, shorter than the petals. ⊙. H. Native of Peru. Juss. ann. mus. 5. p. 26. t. 4. f. 2. Tratt. tab. t. 29. Ruiz et Pav. fl. per. 5. t. 440. Lower leaves on long, and upper on short petioles. Flowers yellow. Scales oblong, 2-lobed, not appendiculate on the outside.

Great-flowered Loasa. Fl. Ju. Sept. Clt. 1825. Pl. 2 to 3 ft.

18 L. floribu'nda (Hook. et Arn. in bot. misc. 3. p. 239.) root simple, fusiform; stem short, with a loose epidermis, simple beneath the inflorescence, but much branched and panicled above; leaves oval-oblong, petiolate: cauline ones opposite, sinuately lobed, coarsely toothed, cordate at the base: lower floral ones alternate, sinuately lobed: upper floral ones smaller, cuneated at the base, toothed or quite entire; pedicels short, rising from the forks of the stems; calycine lobes elliptic, acute, attenuated at the base, shorter than the apiculated petals; scales furnished with 3 appendages each on the back above the middle. ⊙. H. Native about Valparaiso, and on the Cordillera of Chili.

Bundle-flowered Loasa. Pl. 1 foot.

** *Leaves alternate.*

19 L. Loxe'nsis (H. B. et Kunth, nov. gen. amer. 6. p. 116.) leaves alternate, and nearly opposite, ovate-oblong, 3-5-lobed; lobes irregularly toothed; middle lobe very large; flowers terminal and axillary, somewhat racemose; lobes of calyx ovate, acuminated, 3-nerved. ♄. S. Native of Peru, near Loxa. Leaves white beneath. Flowers yellow. Scales rounded at the apex, drawn out into a lobe at both ends. Herb suffruticose branched.

Loxa Loasa. Shrub.

20 L. argemonòides (Juss. ann. mus. 5. p. 26.) leaves cordate, sinuately lobed, tomentose on both surfaces, white beneath; flowers terminal and axillary, pedicellate; lobes of calyx lanceolate, one-half shorter than the petals. ♃. S. Native of South America, near Santa Fe de Bogota. Humb. et Bonpl. pl. equin. 1. p. 53. t. 15. H. B. et Kunth, nov. gen. amer. 6. p. 26. Tratt. tab. t. 30. Flowers nearly 3 inches in diameter. Scales bifid, furnished with 2 acute lobes, which are gibbous at the base.

Argemone-like Loasa. Pl. 6 to 10 feet.

21 L. ranunculifòlia (Humb. et Bonpl. pl. equin. 1. p. 50. t. 14.) leaves all alternate, somewhat orbicular, cordate, toothed, clothed with yellowish tomentum above, and silky white tomentum beneath; flowers terminal and axillary, somewhat racemose; lobes of calyx ovate-lanceolate, acute. ♃. S. Native of Peru, on the Andes near Caxamarca. H. B. et Kunth, nov. gen. amer. 6. p. 117. Tratt. tab. t. 27. Flowers large, yellow. Scales bifid, bigibbous at the base.

Crow-foot-leaved Loasa. Pl. 2 feet.

22 L. inca'na (Graham in edinb. phil. journ. Oct. 1830.) plant suffruticose, reddish, erectish; leaves scattered, petiolate, ovate-lanceolate, hoary, deeply serrated, scabrous; peduncles 1-flowered, opposite the leaves. ♄. G. Native of Peru, from Yazo to the valley of Canta. Corolla white. Whole plant covered densely with harsh barbed white hairs, intermixed by a few stinging ones. Cuticle papery, and pealing off.

Hoary Loasa. Fl. Oct. Nov. Clt. 1830. Pl. 2 feet.

23 L. Xanthiifòlia (Juss. l. c. t. 2. f. 1.) leaves petiolate, cordate, oblong, acute, coarsely toothed; pedicels extra-axillary; lobes of calyx oblong, hardly acute. ⊙. H. Native of Peru. Flowers small, yellow. Stems a foot and half high. Trat. tab. t. 26.

Xanthium-leaved Loasa. Pl. 1½ foot.

24 L. chenopodifòlia (Lam. dict. 3. p. 550.) leaves petiolate, somewhat ovate, deeply toothed; racemes loose, leafy, terminal; flowers drooping. ⊙. H. Native of Peru. Perhaps a mere variety of the preceding, according to Juss. ann. mus. 5. p. 26.

Goosefoot-leaved Loasa. Pl. 1 to 2 feet.

25 L. parviflòra (Schrad. pl. rar. bras. ined. ex D. C. prod. 3. p. 342.) leaves on long petioles, ovate-cordate, sinuately 3-7-lobed, hairy; flowers racemose; racemes extra axillary, few-flowered, shorter than the leaves; lobes of calyx acutish. ⊙. H. Native of Brazil, in the provinces of the Mines. Peduncles and calyxes bristly. Flowers with white petals and brown scales. Bristles or sterile stamens at back of scales white.

Small-flowered Loasa. Pl. trailing.

26 L. a'spera (Ruiz et Pav. fl. per. 5. t. 441. *b.*) hispid; leaves alternate, angularly lobed, and coarsely toothed; peduncles solitary, lateral; calyx long, very hispid; calycine segments ovate, longer than the petals. ⊙. H. Native of Peru.

Rough Loasa. Pl. 1 to 2 feet.

27 L. ambrosiæfòlia (Juss. l. c. t. 4. f. 1.) leaves petiolate, bipinnatifid; lobes and lobules bluntish; pedicels extra-axillary; lobes of calyx lanceolate-linear, acute, shorter than the petals. ⊙. H. Native of Peru. Stem a foot high, hardly branched. Herb beset with yellowish prickles. Flowers yellow, an inch in diameter. Tratt. tab. t. 31. Scales bifid, not appendiculate on the outside.

FIG. 12.

Var. β, hispida (D. C. prod. 3. p. 342.) lobes of leaves very numerous, broader and more crowded. Loàsa ùrens, Jacq. obs. 2. p. 15. t. 33. Lam. dict. 3. p. 578. Tratt. tab. t. 32. L. hìspida, Lin. syst. ed. 12. p. 364. L. bipinnatífida, Ruiz et Pav. fl. per. 5. t. 439. ined.

Ambrosia-leaved Loasa. Pl. 1 foot.

28 L. volu'bilis (Juss. l. c. t. 5. f. 1.) leaves alternate and opposite, bipinnatifid; lobes linear, obtuse; flowers terminal and axillary, pedicellate; lobes of calyx a little toothed, one half shorter than the petals; stem twining. ⊙. H. Native of Chili, near Conception, in sandy places; and of Peru. Tratt. tab.

t. 34. L. multífida, Ruiz et Pav. fl. per. 5. t. 443. *b*. Scales 2-lobed. Flowers small, yellow.

Twining Loasa. Pl. tw.

29 L. triphy'lla (Juss. l. c. p. 27. t. 5. f. 2.) leaves for the most part cut into 3 stalked, oblong, toothed segments: a few tripartite; pedicels extra-axillary; calycine lobes elliptic-oblong. ⊙. H. Native of Peru, on the Andes, in the high plains. Tratt. tab. 1. t. 21. H. B. et Kunth, nov. gen. amer. 6. p. 118. Stems ascending.

Three-leaved Loasa. Pl. ascending, 1 foot.

30 L. papaverifòlia (H. B. et Kunth, nov. gen. amer. 6. p. 118.) leaves trifoliate; segments or leaflets stalked, oblong, toothed: middle leaflet large, pinnatifid; flowers opposite the leaves, disposed in something like racemes; lobes of calyx elliptic, 3-nerved. ⊙. H. Native of the Andes, about Quindiu. Stem simple, ascending. Flowers white. There is a figure in the Flora Mexicana which agrees with this plant, except that the petals are drawn bifid at the apex.

Poppy-leaved Loasa. Pl. 1 foot.

Cult. All the species of *Loàsa* bear such beautiful flowers, that they are all worth cultivating for ornament, but they are so full of stings that it is impossible to handle them. The seeds of the annual species should be sown early in spring in the open ground, and the plants so raised will flower and produce seed the same season; or the seeds may be sown in pots, and reared in a hot-bed, and the plants may afterwards be planted out in the open border, in any convenient situation. All the species require a rich light soil and a warm situation. Some of the species are said to be perennial; we suppose all would be so if they were protected from frost.

IV. CAIO'PHORA (meaning not explained). Presl. in reliq. Hænk. 2. p. 43.

Lin. syst. *Polydélphia, Polyándria.* Calyx 5-parted; segments jagged. Petals 5, unguiculate, concave. Scales 5, petaloid, emarginate, or 4-toothed at the apex, each furnished with 4 sterile filaments inside. Stamens numerous, disposed in 5 bundles. Style trigonal, permanent; stigmas 3, conniving. Capsule ovate-oblong, with elevated spiral ribs, crowned by the reflexed calyx, 1-celled, many-seeded, opening at 3 of the sutures. Placentas marginal in the valves, but at length distinct from them. Seeds angular, echinated by bristles or reticulated. —Usually climbing plants, with the habit of *Loàsa*, beset with stinging hairs. Peduncles 1-flowered. Flowers yellow. This genus differs from *Loàsa* and *Blumenbàchia* in the dehiscence of the capsule, in the scales being furnished with 4 sterile filaments instead of 3, and in many other points. There are several plants now referred to the genus *Blumenbàchia* which belong to this genus; viz. B. grandiflòra, which is Caióphora contórta, Presl. reliq. Hænk. 2. p. 42. and B. punìcea, which is evidently the Caióphora circiifòlia, Presl. l. c. t. 54. and carduifòlia, Presl. l. c. p. 42.

1 C. corona'ta (Hook. et Arn. in bot. misc. 3. p. 238.) stems short; leaves opposite, petiolate, pinnate; segments bipinnatifid: lobules denticulated; peduncles axillary, 1-flowered, elongated; calycine lobes pinnatifid, with linear segments, longer than the ovarium. ⊙. H. Native of Chili, on both sides of the Cordillera of the Andes, between Mendoza and Chili, at an elevation of 8500 to 11,000 feet. The furrows of the fruit are nearly straight, or hardly spiral, so that this species partakes in some degree of the characters of *Loàsa*. Loàsa coronàta, Gill. mss. ex Arnott, in Cheek, in edinb. journ. 3. p. 274. C. absinthæfòlia, Presl. in reliq. Hænk. 2. p. 43.

Crowned Caiophora. Pl. prostrate, rising 1 to 2 feet.

Cult. See *Loàsa* for culture and propagation.

V. SCYPHA'NTHUS (*σκυφος, scyphos*, a cup, and *ανθος, anthos*, a flower; in reference to the form of the flower). Sweet, fl. gard. t. 238.

Lin. syst. *Polyadélphia, Polyándria.* Calyx deeply 5-parted, permanent, equal. Petals 5, inserted in the base of the calyx, on very short claws, concave, equal. Scales inserted with the petals, peltate at the apex, lobed, 3-horned. Stamens numerous, perigynous, the 10 exterior ones destitute of anthers; and these are placed by twos opposite the scales, and are longer than the rest, which are disposed in 5 fascicles opposite the petals; anthers 2-celled, erect. Ovarium prismatic, silique-formed; style one, erect, trigonal. Capsule prismatic, silique-formed, crowned by the tube of the calyx, 3-valved at the apex; seeds oval, wrinkled.—A twining herb, having its branches beset with retrograde strigæ. Leaves opposite, pinnatifid; superior ones bipinnatifid, hispid from hairs. Flowers sessile, erect, solitary, yellow.

1 S. e'legans (Sweet, l. c.). ⊙. H. Native of Chili. Stem dichotomous. Segments of leaves obtuse, ciliated. Grammatocárpus volúbilis, Presl. symb. bot. 1. p. 61. t. 38.

Elegant Scyphanthus. Fl. Aug. Sept. Clt. 1824. Pl. cl.

Cult. An elegant plant. For its culture and propagation, see *Loàsa*.

VI. MENTZE'LIA (in honour of Christian Mentzelius; physician to the Elector of Brandenburgh; published Centuria Plantarum Circa Gedanum, 4to. 1650. and Index nominum Plantarum Multilinguis, fol. 1682. 1696. and 1715.). Plum. nov. gen. 40. t. 6. Lin. gen. no. 670. Juss. ann. mus. 5. p. 24. Lam. ill. t. 425. H. B. et Kunth, nov. gen. amer. 6. p. 119. D. C. prod. 3. p. 343.—Onàgræ spec. Tour.

Lin. syst. *Icosándria, Monogýnia.* Calyx permanent, with a cylindrical, somewhat 5-furrowed tube, and 5 lanceolate or subulate, equal lobes (f. 13. *d.*). Petals 5 (f. 10. *a.*), equal, inserted in the upper part of the tube of the calyx. Stamens indefinite (f. 13. *e.*), multiple the number of the petals, and inserted with them; filaments free, usually disposed in 5 bundles; anthers erect, ovate, bilocular. Ovarium adnate to the calycine tube. Styles 3, connected to the middle or to the top, marked by 3 corresponding stripes. Capsule turbinately cylindrical, crowned by the calycine lobes (f. 13. *f.*), 1-celled, 3-valved at the apex. Seeds 3-6-9, or irregular in number in consequence of abortion, inserted in 3 parietal placentas.—Erect, branched, dichotomous herbs, rough from bearded or glochidate stiff hairs. Leaves alternate, or nearly opposite, coarsely toothed. Flowers of a deep orange colour, solitary, almost sessile in the forks of the stem, or pseudo-axillary from one of the branches being abortive, expanding in the height of the sun.

* *Stamens 20-25, all nearly equal. Seeds 3-6. Flowers smaller.*

1 M. a'spera (Lin. spec. ed. 1. p. 516.) petals roundish-oval, obtuse, hardly longer than the calycine limb, but much exceeding the stamens. ⊙. F. Native of the Antilles (Plum. ed. Burm. t. 174. f. 1.); Jamaica (P. Browne, jam. p. 249.); St. Domingo (Bertero). Seeds 5; parietal smooth, compressed. Hairs on plant glochidate at the apex.

Rough Mentzelia. Fl. July, Aug. Clt. 1733. Pl. 1 to 2 ft.

2 M. oligospe'rma (Nutt. in Sims, bot. mag. t. 1760.) petals oval, acuminated, longer than the calyx, but very little longer than the stamens. ↄ. G. Native of Louisiana, on the banks of the river Missouri, among rocks. M. aúrea, Nutt. gen. amer. 1. p. 300. Root tuberous, succulent. Seeds 3, smooth, linear-oblong. Hairs on plant bearded their whole length.

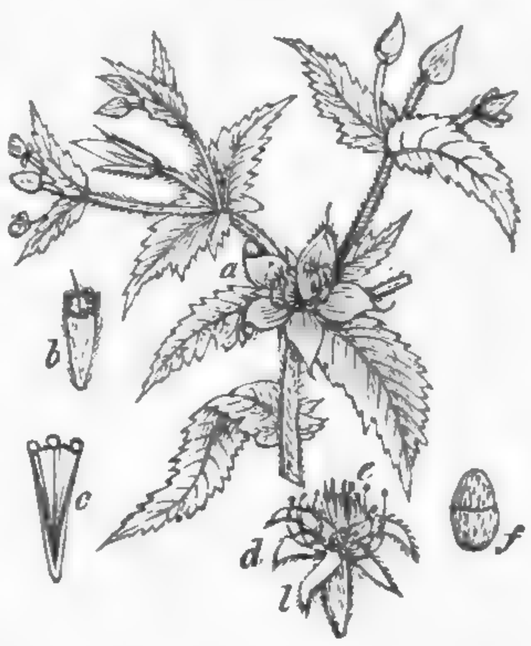
Few-seeded Mentzelia. Fl. May, Jul. Clt. 1812. Pl. 1 to 2 ft.

** *Stamens 30-100, the 10 exterior ones the longest. Seeds 6-9. Flowers larger than those of the last section.*

3 M. híspida (Willd. spec. 2. p. 1176.) petals obovate, mu-

cronately acuminated, longer than the calyx; stamens 30-35; leaves and flowers nearly sessile. ♃. G. Native of Mexico. Juss. ann. mus. 5. p. 24. M. áspera, Cav. icon. 1. p. 51. t. 70. exclusive of the synonyms. Flowers 15 lines in diameter. Seeds 6, ovate, compressed. Root violently purgative, and is used in the cure of syphilis. The Mexican name of the plant is *Zazale*.

FIG. 13.



Hispid Mentzelia. Fl. June, July. Clt. 1820. Pl. 3 feet.

4 M. STRIGÒSA (H. B. et Kunth, nov. gen. amer. 6. p. 120.) petals obovate, mucronately cuspidate, 2 or 3 times longer than the calyx; stamens about 50; leaves and flowers almost sessile; hairs on the branches retrograde. ♃. G. Native of Mexico, near Rio Sarco. Filaments of outer stamens dilated at the apex. Ovula 10.

Strigose Mentzelia. Pl. 1 to 2 feet.

5 M. SCA'BRA (H. B. et Kunth, l. c.) petals obovate, acute, a little longer than the calyx; stamens 100-110; flowers sessile in the forks of the stems; leaves petiolate. ♃. G. Native of New Granada, on the Andes about Pasto. Seeds scabrous, 6-9.

Scabrous-seeded Mentzelia. Pl. 1 to 2 feet.

6 M. GRANDIFLÒRA (Ruiz et Pav. fl. per. 5. t. 441. ined.) petals obovate, pointed, much longer than the calyx; calycine lobes ovate-lanceolate, acuminated, reflexed when the flowers are open; stamens numerous, from 30-40, unequal, outer ones the longest; leaves alternate, ovate, coarsely toothed, on short petioles. ♃. G. Native of Peru.

Great-flowered Mentzelia. Pl. 2 to 3 feet.

7 M. HÍRTA (Pav. in herb. Lamb.) calyx covered with long hairs; calycine segments lanceolate, much shorter than the petals; stamens numerous; leaves cordate, lobed, obtuse, alternate, clothed with soft pubescence; peduncles many-flowered. ♃. G. Native of Mexico. (v. s. in herb. Lamb.)

Hairy Mentzelia. Pl. 1 foot.

8 M. STIPITA'TA (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 3. p. 343.) petals oval, mucronately cuspidate, much longer than the calyx; stamens 30-40; flowers and leaves stipitate. ♃. G. Native of Mexico. Presl. in Hænk. reliq. 2. p. 40. Branches, pedicels, and ovaries scabrous from hairs. Leaves ovate, acuminated, 3-lobed, doubly toothed. Flowers lateral and terminal, solitary.

Stipitate-flowered Mentzelia. Pl. 1 to 2 feet.

Cult. The species grow well in any light rich soil; and cuttings will root readily in sand, under a hand-glass. They are also easily reared from seeds, which ripen in this country.

VII. KLAPRO'THIA (in honour of Martin Henry Klaproth, of Berlin, a celebrated chemist, and great friend of Humboldt). H. B. et Kunth, nov. gen. amer. 6. p. 121. t. 537. D. C. prod. 3. p. 343.

LIN. SYST. *Icosándria, Monogýnia.* Calyx permanent, with a turbinate tube and a 4-parted limb; lobes ovate, equal. Petals 4, on very short claws. Stamens numerous, especially 4-5 fertile ones in front of each petal; these are longer than the others, and 4-5 sterile ones in front of each sepal; these are pilose, and somewhat dilated at the apex into a 2-lobed membrane. Styles 4, connected together almost to the apex in one. Ovarium 1-celled, 8-nerved inside, and 4-ovulate; ovula pendulous, fixed to the nerves opposite the sepals. Fruit baccate. Herb twining; branches scabrous from retrograde hairs. Leaves oppo-

site, sharply toothed, stalked. Peduncles cymosely corymbose at the tops of the branches. Flowers white.

1 K. MENTZELIOÌDES (H. B. et Kunth, l. c.). ⊙. H. Native of the Andes, about Quindiu, near the volcanos.

Mentzelia-like Klaprothia. Pl. tw.

Cult. For culture and propagation see *Loàsa*, p. 65.

ORDER CVIII. TURNERA'CEÆ (plants agreeing with *Turnèra* in important characters). H. B. et Kunth, nov. gen. amer. 6. p. 123. D. C. prod. 3. p. 345.

Calyx free, usually coloured more or less, profoundly 5-cleft (f. 14. *a.*), deciduous; lobes equal, imbricate in æstivation. Petals 5, equal (f. 14. *b.*), inserted into the upper part of the tube of the calyx, and alternating with its lobes, narrow at the base, twisted in æstivation. Stamens 5, inserted in the upper part of the tube of the calyx below the petals, and alternating with them; filaments free, flat; anthers oblong, erect, 2-celled (f. 14. *c.*). Ovarium free, 1-celled (f. 14. *d.*), many-ovulate. Ovula ascending (f. 14. *f.*), fixed to 3 linear parietal placentas. Styles 3 (f. 14. *e.*) or 6, usually more or less deeply bifid, and cleft into many stigmas at the apex (f. 14. *e.*). Capsule 3-valved, 1-celled (f. 14. *f.*); valves bearing the seeds in their middle, along a longitudinal placenta, opening from the apex as far as the middle. Seeds subcylindrical, carved, crustaceous, reticulated, furnished with a thin, membranous arillus on one side. Hilum situated at the base of the seed. Embryo in the centre of a fleshy albumen, somewhat incurved, spatulate, with the radicle turned towards the hilum, and with plano-subconvex cotyledons.—Shrubs, subshrubs, and herbaceous plants, with a simple pubescence. Leaves alternate or scattered, simple, exstipulate, with occasionally 2 glands at the apex of the petioles, toothed, rarely pinnatifid. Flowers axillary, sessile, or pedunculate; the peduncles either distinct or connected with the petioles, simple and 1-flowered or branched and many-flowered, articulated in the middle or furnished with 2 small bracteoles. Petals yellow or yellowish, rarely blue. This order is placed by De Candolle between *Loàseæ* and *Fouquiràceæ*, chiefly it would seem on account of its manifest relation to the former, and its perigynous stamens. With *Malvàceæ* it agrees in the twisted æstivation of the corolla and habit. With *Loàseæ* and *Passiflòreæ*, they have also much in common. In the structure of the fruit it agrees with *Violarièæ* and *Cistìneæ*, but differs in the petals and stamens being inserted into the calyx, and the circumstance of their certain relationship to *Cistíneæ* gives great weight to the ingenious approximation, by M. Du Petit Thours, of *Passiflòreæ to Violarièæ*. The presence of glands upon the ends of the petioles of *Turneràceæ* is a confirmation of their affinity to the former. It is distinguished from *Loàseæ* by the fruit being superior and 1-celled, with parietal placentas, and by the definite stamens; the former character is, however, weakened by the nearly superior fruit of some *Loàseæ*.

Synopsis of the Genera.

1 TURNE'RA. Styles 3 (f. 14. *e.*), simple, divided at the apex into multifid stigmas (f. 14. *e.*). Capsule opening from the top to the middle.

2 Perique'ta. Styles 3, deeply 2-parted, crowned by 2 multifid stigmas each. Capsule opening from the top to the base.

I. TURNE'RA (so named by Linnæus in memory of William Turner, M.D., Prebendary of York, Canon of Windsor, and Dean of Wells; student of Pembroke Hall in Cambridge, 1538; died 1568. Author of a New Herbal, London, 1551. fol. Second part, Cologn, 1562. Second edition, Collen, 1566, with the addition of a third part, &c.). Plum. gen. p. 15. t. 12. Lin. gen. 376. Juss. gen. 313. Gærtn. fruct. 1. p. 366. t. 76. H. B. et Kunth, nov. gen. amer. 6. p. 123. St. Hil. fl. bras. 2. p. 212. —Turnèra, sect. 1. Lam. ill. t. 212. dict. 8. p. 141.

Lin. syst. *Pentándria, Trigýnia.* Calyx tubularly funnel-shaped (f. 14. *a.*). Styles 3 (f. 14. *e.*), simple, cleft at the apex into multifid stigmas (f. 14. *e.*). Capsule opening from the apex to the middle.

§ 1. *Peduncles joined with the petioles, bibracteate.*

* *Leaves biglandular at the base.*

1 T. ulmifòlia (Lin. spec. ed. 1. p. 965.) leaves oblong, acute, serrated, pubescent above, but clothed with white tomentum beneath, and biglandular at the base; flowers almost sessile; styles shorter than the stamens. ♂. S. Native of South America every where; common in Brazil. Lin. hort. cliff. 122. t. 10.—Sloan. hist. 1. t. 127. f. 4-5.—Mill. fig. t. 268. f. 2. Flowers yellow, about the size of those of *Lìnum trígynum.*

Var. β, angustifòlia (D. C. prod. 3. p. 346.) leaves oblong-lanceolate. ♄. S. Native along with the species. T. angustifòlia, Curt. bot. mag. t. 281. Link. enum. 1. p. 293. T. ulmifòlia *β*, Willd. spec. 1. p. 1503.

Elm-leaved Turnera. Fl. Ju. Sept. Clt. 1733. Sh. 2 to 4 ft.

2 T. cuneifórmis (Juss. in Poir. dict. 8. p. 142.) leaves cuneiformly obovate, coarsely serrated, pubescent above, but clothed with white tomentum beneath, and biglandular at the base; flowers nearly sessile. ♄. S. Native of Brazil, about Rio Janeiro. Spreng. nov. prov. 42. St. Hil. fl. bras. 2. p. 213. Otto, in hort. berol. 36. T. obtusifòlia, Smith, in Rees' cycl. vol. 36. no. 3. Petals yellow, with the claws brownish. Capsule globose.

Var. β; leaves and branches closely clothed with tomentum; stem dwarf. T. odoràta, Vahl. in herb. Juss.

Wedge-formed-leaved Turnera. Fl. June, July. Clt. 1821. Shrub 1 to 3 feet.

3 T. trioniflòra (Sims, bog. t. 2106.) leaves oblong-lanceolate, coarsely serrated, cuneated at the base, and quite entire, pubescent; flowers sessile; styles exceeding the stamens. ♄. S. Native of Brazil, island of Trinidad, and Mexico. T. élegans, Otto, l. c. Link, enum. 1. p. 293. Petals pale yellow, or sulphur-coloured, with purplish-brown claws. Bracteoles subulate. Flowers as large as those of *Bladder-ketmia.*

Ketmia-flowered Turnera. Fl. year. Clt. 1812. Pl. 1 to 2 ft.

4 T. lamiifòlia (St. Hil. fl. bras. 2. p. 213.) leaves roundish-obovate, unequally crenate-toothed, clothed with soft hairs above and woolly tomentum beneath, biglandular at the base; flowers on short peduncles; styles a little shorter than the stamens. ♄. S. Native of Brazil, in the southern part of the province of Goyaz. Petals yellow, rather truncate at the apex.

Dead-nettle-leaved Turnera. Shrub 1 foot.

5 T. lanceola'ta (St. Hil. fl. bras. 2. p. 214.) leaves linear-lanceolate, acute, nearly entire, hairy, biglandular at the base beneath; flowers almost sessile. ♄. S. Native of Brazil, in the provinces of Goyaz and Minas Geraes. Petals obovate-oblong, yellow. Styles exceeding the stamens a little.

Lanceolate-leaved Turnera. Shrub ½ foot.

6 T. oblongifòlia (St. Hil. fl. bras. 2. p. 215.) leaves oblong, acute, obsoletely and dentately serrated, beset with rufescent hairs, biglandular at the base beneath; flowers almost sessile; styles a little longer than the stamens. ♄. S. Native of Brazil, in the provinces of Minas Geraes and St. Paul, in grassy pastures and fields. Petals oblong, obovate, yellow.

Oblong-leaved Turnera. Shrub ½ to 1 foot.

7 T. cœrule'a (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 3. p. 346.) leaves oblong, coarsely serrated, but quite entire at the base, and hardly attenuated, clothed with adpressed villi beneath, biglandular at the top of the petiole; flowers sessile; styles longer than the stamens. ♃. S. Native of Mexico. This species is very like *T. trioniflòra*, but differs in the leaves being on shorter petioles, and in being hardly attenuated at the base, as well as in the hairs on the lower surface of the leaves being adpressed. Bulb subfuscous. Flowers blue.

Blue-flowered Turnera. Pl. ½ to 1 foot.

8 T. subula'ta (Smith, in Rees' cycl. vol. 36. no. 2.) leaves ovate, acute, serrated, clothed with white soft hairs; bracteoles linear-subulate; flowers sessile. ♃. S. Native of New Granada. Capsule pilose. Glands of leaves broad.

Subulate-bractead Turnera. Pl. 1 foot.

9 T. acu'ta (Spreng. syst. 1. p. 940.) leaves lanceolate, acuminated at both ends, crenately serrated, glabrous; flowers sessile. ♄. S. Native of Jamaica. Flowers yellow, about the size of those of *Lìnum trígynum.* Petioles 3-4 lines long. Bracteoles setaceous, adpressed to the calyx. Perhaps *T. acùta*, Willd. rel. in Rœm. et Schultes, syst. 5. p. 678. exclusive of the country.

Acute-leaved Turnera. Shrub 1 foot.

10 T. apífera (Mart. reis. bras. ex D. C. prod. 3. p. 346.) plant downy; leaves linear-lanceolate or lanceolate, acute, attenuated and biglandular at the base, remotely and acutely serrated, pubescent; stem suffruticose; branches twiggy; flowers petiolar; bracteas shorter than the calyx. ♄. S. Native of Brazil, at Rio Jaquitinhonha and Rio Verde Grande.

Bee-bearing Turnera. Shrub 1 foot.

11 T. serícea (H. B. et Kunth, nov. gen. amer. 6. p. 127.) leaves oblong, crenately serrated, soft, clothed with adpressed pubescence above, and white, silky down beneath; flowers sessile; styles exceeding the stamens. ♄. S. Native of South America, about Cumana and between Popayan and Almaguer. T. Peruviàna, Willd. in Rœm. et Schultes, syst. 6. p. 679. Petals yellow, violaceous at the base. Shrub branched, rather prostrate.

Silky Turnera. Shrub 1 to 2 feet.

12 T. móllis (H. B. et Kunth, l. c. p. 126.) leaves ovate-oblong, coarsely crenate-serrated, clothed with silky hairs on both surfaces, canescent beneath; flowers sessile; styles pilose. ♄. S. Native of New Granada, near Honda. Petals yellow, with violaceous claws. Capsule roundish-ovate.

Soft Turnera. Shrub 1 foot.

13 T. longiflòra (St. Hil. fl. bras. 2. p. 216.) leaves oblong, obtuse, crenately toothed, biglandular at the base beneath, woolly on both surfaces, but especially beneath; flowers sessile; styles 3-times longer than the stamens. ♄. S. Native of Brazil, in the province of Minas Geraes. Petals obovate-oblong, yellow, red at the base.

Long-flowered Turnera. Shrub 1 to 1½ foot.

14 T. lute'scens (St. Hil. fl. bras. 2. p. 217.) leaves lanceolate, acute, crenately toothed, lower ones glandless, upper biglandular at the base beneath, clothed with silky pubescence on the upper surfaces, and with yellowish tomentum beneath; flowers sessile in fascicles. ♄. S. Native of Brazil, in the province of Minas Geraes. Petals oblong-obovate, of a golden yellow colour.

Yellowish Turnera. Shrub 2 to 3 feet.

15 T. inca'na (St. Hil. fl. bras. 2. p. 217.) leaves oblong or

oblong-lanceolate, acutish, crenately-toothed, clothed with velvety pubescence above, and hoary tomentum beneath, and biglandular at the base; flowers sessile; styles one half shorter than the calyx. ♄. S. Native of Brazil, in the province of Goyaz. Petals yellow, obovate-oblong.

Hoary Turnera. Shrub 1 to 2 feet.

16 T. hermannioìdes (St. Hil. fl. bras. 2. p. 218.) leaves obovate-oblong, cuneated, unequally toothed, clothed with white tomentum on both surfaces, biglandular at the base beneath; flowers sessile; styles a little longer than the stamens. ♄. S. Native of Brazil, in that part of the province of Minas Geraes called Minas Novas. Petals oblong, marked with brown veins.

Hermannia-like Turnera. Shrub 1 to 1½ foot.

17 T. melochioìdes (St. Hil. fl. bras. 2. p. 219.) leaves oblong, obtuse, narrowed at the base, unequally crenate-toothed, rather roughish above, and clothed with rufescent tomentum beneath, biglandular at the base; flowers sessile; styles a little shorter than the stamens. ♄. S. Native of Brazil, in the province of Minas Geraes. Petals obovate, yellow.

Melochia-like Turnera. Shrub 1 to 2 feet.

18 T. na'na (St. Hil. fl. bras. 2. p. 219.) leaves obovate, rounded at the apex, crenated, pubescent on both surfaces, but especially beneath, biglandular at the base; flowers sessile; styles 3-times longer than the stamens. ♄. S. Native of Brazil, in the province of Minas Geraes. Petals obovate, yellow.

Dwarf Turnera. Pl. ¼ foot.

19 T. pinifòlia (St. Hil. fl. bras. 2. p. 220.) leaves linear, acute, almost quite entire, biglandular at the base beneath; flowers nearly sessile; styles shorter than the stamens. ♄. S. Native of Brazil, in the southern part of the province of Goyaz, on a mountain called Serra dos Pyreneos, near the town called Meia. Petals oblong, pale yellow.

Pine-leaved Turnera. Shrub 1 foot.

* * *Leaves glandless.*

20 T. genistoìdes (St. Hil. fl. bras. 2. p. 220.) leaves linear, acutish, glandless, hairy; flowers sessile; styles twice the length of the stamens. ♄. S. Native of Brazil, in the province of Minas Geraes, near Tejuco. Petals obovate-oblong, glabrous.

Genista-like Turnera. Shrub ½ to 1 foot.

21 T. chamædrifòlia (St. Hil. fl. bras. 2. p. 221.) leaves oblong, acute, deeply toothed, glandless, pubescent on both surfaces, but especially beneath; flowers on short peduncles; styles exceeding the stamens. ♄. S. Native of Brazil, in that part of the province of Minas Geraes called Minas Novas, on the banks of the river Jiquitinhonha. Petals rose-coloured?

Germander-leaved Turnera. Shrub ½ to 1 foot.

22 T. pinnatífida (Juss. in Poir. dict. 8. p. 144.) leaves obovate-oblong, cuneated, toothed, or pinnatifid, glandless, hairy or tomentose; flowers pedunculate; styles 3-times longer than the stamens, purple. ♄. S. Native of Brazil, in the province of Cisplatin, in pastures and fields. Petals scarlet, denticulated at the apex.

Var. β, angustíloba (D. C. prod. 3. p. 347.) stems diffuse; leaves hairy, pinnatifid: lobes narrow, acute; flowers of a dirty red or copper colour. ♄. S. Native of Brazil, about Monte Video, and in the province of Cisplatin.

Var. γ, cárnea (St. Hil. fl. bras. 2. p. 222.) stems ascending, 6 inches high; leaves hairy, oblong-lanceolate, cuneated, deeply toothed; petals pale red, usually marked at the base with a dark purple spot each; filaments puberulous. ♄. S. Native of Brazil, in the province of Cisplatin.

Pinnatifid leaved Turnera. Shrub ½ foot.

23 T. setòsa (Smith, in Rees' cycl. no. 6.) leaves obovate-wedge-shaped, serrated or pinnatifid, very hairy on both sides, without glands; peduncles axillary, partly combined with the footstalks; outer calyx linear. ♄. S. Native of Monte Video and Buenos Ayres. Flowers tawny, red.

Bristly Turnera. Pl. ¼ to ½ foot.

24 T. pumílea (Lin. amœn. 5. p. 395.) leaves broad-lanceolate, deeply serrated, hairy; flowers sessile, propped by 2 linear bracteas; styles and stamens length of petals. ☉. S. Native of Jamaica, in arid fields. Swartz, obs. 116.—Sloane, jam. hist. t. 127. f. 6.—Pumílea, no. 1. P. Browne, jam. 188. Stem hardly 3 inches long. Plum. icon. t. 150. f. 1. Flowers small, yellow.

Dwarf Turnera. Fl. July. Clt. 1796. Pl. ¼ foot.

25 T. microphy'lla (D. C. prod. 3. p. 347.) leaves oblong, attenuated at the base, crenated, wrinkled, clothed with white tomentum beneath; flowers sessile, bearing 2 linear, adpressed bracteoles at the base. ♄. S. Native of St. Domingo. T. pumílea, Poir. dict. 8. p. 143. but not of Swartz. Petiv. gaz. t. 38. f. 9. T. diffùsa, Willd. rel. in Rœm. et Schultes, syst. 6. p. 679. This plant differs from *T. pumílea* in the stem being suffrutescent, nearly a foot high, and much branched. Perhaps *T. microphýlla*, Desv. in Hamilt. prod. p. 33. is referrible to this plant.

Small-leaved Turnera. Shrub 1 foot.

§ 2. *Peduncles distinct from the petioles, axillary. Flowers bibracteolate.*

26 T. rupe'stris (Aubl. guian. 1. p. 289. t. 113. f. 1.) leaves linear, serrated, glabrous, glandless; flowers nearly sessile, bearing 2 setaceous bracteoles at the base. ♄. S. Native of Guiana, in the fissures of humid rocks, at the river Sinemari. Petals yellow, somewhat toothed at the apex, 3 lines long. Flowers small.

Rock Turnera. Fl. Ju. Sept. Clt. 1824. Shrub 2 to 3 ft.

27 T. frute'scens (Aubl. l. c. p. 290. t. 113. f. 2. but not of Mill.) leaves lanceolate, acuminated, equally serrated; flowers nearly sessile, bearing 2 sessile, lanceolate-linear bracteoles. ♄. S. Native of Guiana, in the fissures of rocks, on the banks of the river Sinemari. Very like *T. rupéstris*, but differs in the leaves being broader, and in the serratures being more crowded. Flowers small, yellow.

Var. β, latifòlia (D. C. prod. 3. p. 347.) leaves ovate, acute. ♄. S. Native of Cayenne.

Shrubby Turnera. Shrub 5 to 8 feet.

28 T. tomentòsa (H. B. et Kunth, nov. gen. amer. 6. p. 125. but not of Willd.) leaves oblong, irregularly crenate-serrated, pubescent above, but clothed with canescent tomentum beneath, glandless at the base; flowers sessile, with 6 stamens and 6 petals. ♄. S. Native of South America, in the province of Venezuela. Styles hairy, about equal in length to the stamens. Petals yellow.

Tomentose Turnera. Shrub 1 foot.

29 T. sidoìdes (Lin. mant. p. 58.) leaves obovate-cuneated, serrated, quite entire at the base, rather tomentose on both surfaces, pilose on the veins and margin beneath; flowers on very short pedicels; bracteoles linear, hairy. ♄.? S. Native of Brazil. Habit of *T. cistoìdes*. Petals obovate, yellow.

Sida-like Turnera. Shrub ½ foot.

30 T. carpinifòlia (H. B. et Kunth, l. c.) leaves oblong-lanceolate, doubly serrated, puberulous, biglandular at the base; flowers on short pedicels; bracteoles ovate, acuminated, serrated. ♄. S. Native on the humid banks of the river Orinoco, near Maypures. T. acùta, Willd. rel. in Rœm. et Schult. syst. 6. p. 678. ex Kunth. Flowers yellow. According to Willd. the flowers are petiolar; if such be the case, the plant belongs to the preceding section.

Hornebeam-leaved Turnera. Shrub 1 to 2 feet.

31 T. Duartea'na (St. Hil. fl. bras. 2. p. 223.) leaves ovate,

obtuse, crenated, glandless, pubescent above, hairy, tomentose beneath, white; peduncles simple. ♄. S. Native of Brazil, in the western part of the province of Minas Geraes. Styles shorter than the stamens. Petals 3-times longer than the calyx, erose, or rounded at the apex, rose-coloured when dry. Bracteas small, deciduous.

Var. β, rotundifòlia (St. Hil. l. c.) leaves smaller, ovate-roundish; flowers yellow. This variety will perhaps constitute a distinct species.

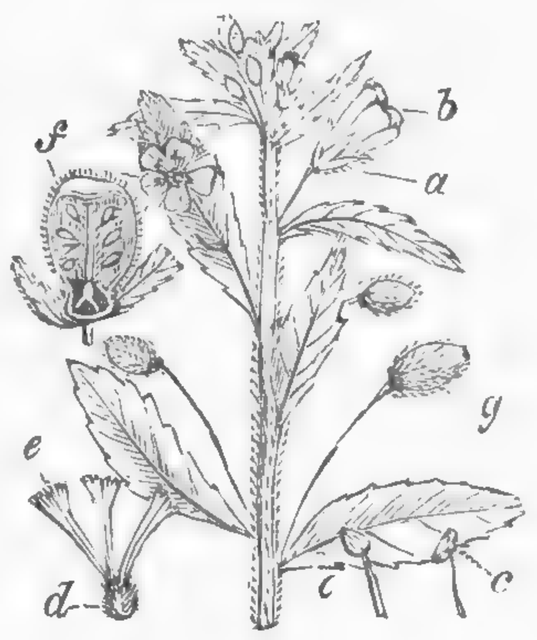
Duarte's Turnera. Shrub 1 foot.

32 T. HELIANTHEMOÌDES (St. Hil. l. c. p. 224.) leaves oblong or oblong-lanceolate, acutish, unequally denticulated, glandless, pubescent above, but clothed with white tomentum beneath; flowers axillary; peduncles simple; bracteas small, deciduous. ♄. S. Native of Brazil, in the southern part of the province of Goyaz, on the banks of the river Parahyba. Petals obovate. Styles about equal in length to the stamens.

Sun-rose-like Turnera. Pl. ½ to 1 foot.

33 T. RÒSEA (St. Hil. l. c. p. 225.) leaves linear-lanceolate, obtuse, obsoletely denticulated, glandless, rather pilose on both surfaces; pili rufescent; peduncles simple; bracteas small, deciduous. ♄. S. Native of Brazil, in the province of St. Paul, not far from the town called Franca. Petals rose-coloured, obovate, erose at the apex. Styles twice the length of the stamens.

FIG. 14.



Rose-coloured Turnera. Pl. ½ to 1 foot.

34 T. SIDÆFÒLIA (St. Hil. l. c. p. 227. t. 124.) leaves oblong, obtuse, crenated, glandless, rather scabrous above, but clothed with hoary tomentum beneath; peduncles axillary, 1-2-flowered; bracteas small, subulate, tomentose. ♄. S. Native of Brazil, in the province of Minas Geraes, at a place called Aldea da boa Vista. Petals obovate, obsoletely crenulated, yellow. Styles shorter than the stamens.

Sida-leaved Turnera. Shrub ½ to 1 foot.

35 T. AU'REA (St. Hil. l. c. p. 226.) leaves oblong, narrowed at the base, acute, or rounded at the apex, serrately toothed, glandless, beset with golden hairs; peduncles simple, articulated in the middle. ♄. S. Native of Brazil, in the province of Minas Geraes, near the town of St. Joao del Rey. Petals twice or thrice the length of the calyx, cuneated at the base and rounded at the apex, rose-coloured or flesh-coloured; each marked by a dark purple spot at the base. Styles shorter than the younger stamens.

Golden-haired Turnera. Shrub ¼ to 1 foot.

§ 3. *Flowers disposed in axillary and terminal racemes.*

36 T. RACEMÒSA (Jacq. hort. vind. 3. t. 94.) leaves oblong, or oblong-lanceolate, acutish, unequally denticulated, glandless, pubescent above, and clothed with white tomentum beneath; upper flowers leafless at the base, and therefore disposed in a terminal raceme; peduncles simple. ⊙. S. Native of Brazil, in the province of Minas Geraes, on the banks of the river Jiquitinhonha; and of St. Domingo. Stem and peduncles hispid. Petals ovate, yellow, furnished each with a small jagged appendage on the inside at the base. Styles longer than the stamens.

Racemose-flowered Turnera. Fl. July, Aug. Clt. 1789. Pl. 1 to 2 feet.

37 T. SALICIFÒLIA (St. Hil. l. c. p. 227.) leaves lanceolate, acuminated, serrated, glandless, smoothish; peduncles axillary, many-flowered. ♄. S. Native of Brazil, near Rio Janeiro. Petals obovate, striated, yellow, denticulated at the apex. Styles about equal in length to the calyx.

Willow-leaved Turnera. Shrub 2 to 3 feet.

38 T. CAPITA'TA (St. Hil. l. c. p. 215.) leaves elliptic-oblong, or oblong-lanceolate, acute, dentately serrated, nearly glandless, pubescent above, and clothed with yellowish tomentum beneath; flowers sessile, forming a many-flowered head at the tops of the branches. ♄. S. Native of Brazil, in the province of Minas Geraes, on the margins of woods near Poso Alto, not far from the confines of the province of St. Paul, and on the iron mountains near Nossa Snra da Concecao. Petals obovate-oblong, pale yellow. Styles much shorter than the stamens.

Capitate-flowered Turnera. Shrub 2 to 3 feet.

39 T. GUIANE'NSIS (Aubl. guian. 1. p. 291. t. 114.) leaves linear, acuminated, remotely serrated, biglandular at the base, glabrous on both surfaces; racemes terminal, few-flowered; pedicels leafless at the base, but bibracteolate under the calyx. ⊙. S. Native of Guiana, in moist meadows, and in the plains of Caraccas. H. B. et Kunth, nov. gen. amer. 6. p. 124. T. Humbóldtii, Spreng. syst. 1. p. 241. Glands small, sometimes 1-2, abortive. Bracteas glandular at the base. ex Aubl. Capsule ovate, trigonal, 3 or few-seeded. Flowers yellow. Perhaps Humboldt's plant is the same as that of Aublet.

Guiana Turnera. Fl. Ju. Jul. Clt. 1823. Pl. 1 to 2 feet.

40 T. GLA'BRA (D. C. prod. 3. p. 347.) leaves linear, obtuse, subserrated, narrowed at the base, glandless; racemes few-flowered; pedicels rising from the axils of small linear leaves and longer than them, articulated and bractless above the middle. ⊙. ? S. Native of St. Domingo. Stems erect, glabrous. Flowers yellow?

Glabrous Turnera. Pl. 1 to 2 feet.

41 T. CISTOÌDES (Lin. spec. 387.) leaves linear-lanceolate, serrated, pubescent above, tomentose beneath, glandless at the base; racemes terminal, leafy; pedicels rising from the axils of lanceolate leaves, and shorter than them, articulated and bractless above the middle. ⊙. S. Native of South America, in sterile places, Surinam, Jamaica, St. Domingo, Georgia, &c. Sloan. jam. hist. 1. p. 127. f. 7. Plum. ed Burm. t. 150. f. 1. Swartz. obs. 117. T. hirsùta, Bert. mss. Flowers small, yellow.

Rock-rose-like Turnera. Fl. June, Oct. Clt. 1774. Pl. ½ ft.

42 T. A'SPERA (Poir. dict. 8. p. 144.) leaves elliptic, sessile, a little toothed, pubescent above, and rather tomentose beneath, glandular; stem hardly pubescent, rough; racemes leafy, terminal; pedicels rising from the axils of the leaves, and shorter than them, articulated above the middle. ⊙. S. Native of French Guiana. Flowers yellow. Perhaps a variety of *T. cistoìdes* or of *Periquèta villòsa.*

Rough Turnera. Pl. ½ foot.

† *Species not sufficiently known.*

43 T. ODORA'TA (Rich. in act. soc. hist. nat. par. 1792. p. 107.) shrubby, much branched; flowers small; leaves ovate, acute, toothed, tomentose. ♄. S. Native of Cayenne. Flowers yellow?

Sweet-scented Turnera. Shrub.

44 T. HÍRTA (Willd. rel. in Rœm. et Schult. syst. 5. p. 678.) leaves linear-lanceolate, unequal, bluntly serrated, clothed with stellate tomentum on both surfaces; flowers axillary, solitary; stem branched, hairy. ⊙. S. Native of Brazil. Flowers yellow.

Hairy Turnera. Fl. June, July. Clt. 1818. Pl. ½ to 1 ft.

45 T. BRAZILIE'NSIS (Willd. rel. l. c.) leaves lanceolate, quite entire, clothed with hispid pubescence; flowers axillary, sessile, aggregate. ♄. S. Native of Brazil. Leaves biglandular at the base. ex Spreng.

Brazilian Turnera. Fl. Ju. Jul. Clt. 1810. Pl. ½ to 1 ft.

46 T. integrifòlia (Willd. rel. l. c.) peduncles 1-flowered, axillary; leaves linear-lanceolate, pubescent, glandless.—Native country unknown. Leaves revolute, sessile, strigose above, but clothed with stellate tomentum beneath. Peduncles branched, bractless. (ex Spreng. syst. 1. p. 942.)

Entire-leaved Turnera. Pl.?

47 T. virga'ta (Willd. rel. l. c.) leaves ovate, serrated, plicate, biglandular at the base; flowers bibracteate; bracteas linear-setaceous. ⊙. S. Native of Brazil.

Twiggy Turnera. Pl. ½ to 1 foot.

48 T. corchorifòlia (Willd. rel. l. c.) leaves oblong, doubly serrated, tomentose beneath. ⊙. S. Native of Brazil. The rest unknown.

Corchorus-leaved Turnera. Pl. ½ to 1 foot?

49 T. Desvau'xii (D.C. prod. 3. p. 348.) stem suffruticose, branched; branches assurgent, hairy; leaves ovate, obtuse, crenately toothed at the base, rather pilose beneath; flowers axillary, on long peduncles.—Native of Guiana. T. hírta, Desv. in Hamilt. prod. p. 33. but not of Willd.

Desvaux's Turnera. Pl. 1 foot.

Cult. All the species of *Turnèra* are elegant plants when in flower, and thrive well in any light rich soil. They seed freely in this country, and may be propagated by that means: cuttings also root freely, under a hand-glass, in heat. The seeds of annual species may be reared on a hot-bed in spring; and some of the plants may be planted out into the open border, in a warm sheltered situation, where they will probably flower and ripen their seeds, if the summer prove dry and warm.

II. PIRIQUE'TA (meaning not explained by Aublet). Aubl. guian. 1. p. 298. t. 117. Juss. gen. 294. H. B. et Kunth, nov. gen. amer. 6. p. 127. D. C. prod. 3. p. 348.—Burghártia, Neck. elem. no. 1186.—Burcárdia, Scop. ex Schreb. gen. no. 530. but not of Schmied. nor Duham. nor Neck. nor R. Br. —Turnèra species, Lam. and Willd.

Lin. syst. *Pentándria, Tri-Hexagýnia.* Calyx campanulate. Style 6, or 3 bipartite ones; stigmas multifid, flabellate. Capsule 3-valved from the apex to the base. Perhaps this genus is sufficiently distinct from the preceding. Habit of *Turnèra racemòsa*, but which plant is only furnished with 3 styles, not 6. Flowers pedicellate, in the axils of the upper leaves. Pedicels bractless, articulated above the middle.

1 P. villòsa (Aubl. l. c.) leaves ovate-oblong, erosely toothed, wrinkled, clothed with rufous villi. ⊙. S. Native of Guiana, in sand by the sea-side. Turnèra rugòsa, Willd. spec. 1. p. 1504. Poir. dict. 8. p. 145. Turnèra villòsa, Ræusch. Corolla yellow.

Villous Piriqueta. Pl. 2 feet.

2 P. tomentòsa (H. B. et Kunth, nov. gen. amer. 6. p. 128.) leaves oblong, acutish at both ends, irregularly crenate-serrated, pubescent above, clothed with soft hoary tomentum beneath. ⊙. S. Native of South America, between Atures and Maypures, on the Orinoco. Turnèra tomentòsa, Willd. rel. in Rœm. et Schultes, syst. 6. p. 678. but not of H. B. et Kunth, Corolla yellow.

Tomentose Piriqueta. Shrub 1 to 2 feet.

Cult. The culture and propagation of these plants are the same as for the annual species of *Turnèra*, see p. 70.

Order CIX. FOUQUIERA'CEÆ (plants agreeing with *Fouquièra* in important characters). D. C. prod. 3. p. 349.—Portulàceis affìnes, H. B. et Kunth, nov. gen. amer. 6. p. 81.

Calyx of 5 permanent sepals; sepals imbricated, ovate or roundish. Petals 5, combined into a tube, inserted in the bottom of the calyx or torus; limb of corolla 5-lobed, regular. Stamens 10-12, inserted with the corolla, exserted; anthers 2-celled. Ovarium free, sessile. Style filiform, trifid at the apex. Capsule trigonal, 3-celled; valves bearing dissepiments in their middle, which go as far as the centre of the fruit, and therefore the capsule is 3-celled. Seeds compressed, winged, fixed to the centre of the fruit or axis, few when the capsule is mature, but numerous when it is in a young state. Embryo straight, in the centre of a fleshy albumen, with flat cotyledons. —Trees or shrubs, natives of Mexico. Leaves in fascicles when young, in the axils of spines or cushions, quite entire, oblong, and rather fleshy. Flowers scarlet, disposed in a terminal spike or panicle.

This order is separated from *Portulàceæ* by De Candolle, as he tells us, (Mem. portul. p. 4.) for the following reasons: first, because their petals cohere into a long tube, of the same nature as that of gamopetalous *Crassulàceæ;* second, because their capsule consists of 3 loculicidal cells, that is to say, which separate through the middle, forming 3 septiferous valves; and thirdly, because their embryo is straight, with flat cotyledons, and stationed in the centre of a fleshy albumen. They approach the monopetalous *Crassulàceæ* in the structure of their flowers; and *Turneràceæ* and *Loàseæ* in the form of their fruit.

Synopsis of the genera.

1 Fouquie'ra. Sepals ovate, mucronate, free, 2 exterior and 3 interior. Limb of corolla spreadingly reflexed. Stamens 10-12, hypogynous.

2 Brónnia. Sepals roundish; limb of corolla erect. Stamens 10.

I. FOUQUIE'RA (in honour of Peter Edward Fouquiere, M. D. of Paris, and Professor of Medicine there). H. B. et Kunth, nov. gen. amer. 6. p. 81. t. 527. D. C. prod. 3. p. 349. —Echevèria species, Moc. et Sesse, icon. ined.

Lin. syst. *Decándria, Monogýnia.* Calyx coloured; sepals ovate, mucronate, 2 exterior and 3 interior, free. Corolla hypogynous; tube cylindrical, a little arched; limb spreadingly reflexed, nearly regular. Stamens 10-12, hypogynous, exserted; filaments ciliated below, and cohering together; anthers cordate. Ovulas 18, on each placenta, in 2 rows. Fruit unknown. A somewhat spinose shrub. Spikes terminal, erect. Flowers scarlet. Leaves oblong, rather fleshy.

1 F. formòsa (H. B. et Kunth, l. c.). ♄. S. Native of Mexico. Echevèria spicàta, Moc. et Sesse, fl. mex. icon. ined. Flowers flesh-coloured, an inch long. Leaves scattered, according to Kunth's figure; but according to the figure in the fl. mex. they are a little narrower and in fascicles: therefore the 2 figures mentioned are very unlike each other.

Showy Fouquiera. Shrub 6 to 10 feet.

Cult. A light rich soil will suit this very showy shrub; and young cuttings will root freely under a hand-glass, in heat.

II. BRO'NNIA (in honour of Henry George Bronn, a young botanist, who has written on the form of leguminous plants). H.B. et Kunth, nov. gen. amer. 6. p. 83. t. 528. D. C. prod. 3. p. 349.—Echevèria species, Moc. et Sesse, fl. mex. icon. ined.

Lin. syst. *Decándria, Monogýnia.* Calyx permanent; sepals 5, roundish. Tube of corolla cylindrical, straight; limb

erect. Stamens 10; filaments filiform, exserted; anthers ovate. Style exceeding the stamens. Cells of fruit 1-seeded when mature. A spinose shrub, with fascicles of obovate-oblong, membranous leaves in the axils of the spines. Flowers panicled, scarlet. It differs from the last genus in the placentas being drawn in more to the centre of the fruit.

1 B. spinòsa (H. B. et Kunth, l. c.). ♄. S. Native of Mexico. Echevèria paniculàta, Moc. et Sesse, fl. mex. icon. ined. Fouquièra spinòsa, H. B. et Kunth, nov. gen. amer. 3. p. 452. Cántua spinòsa, Willd. in Rœm. et Schultes, syst. 4. p. 369.

Spiny Bronnia. Tree 12 to 14 feet.

Cult. See *Fouquièra*, p. 70. for culture and propagation.

Order CX. PORTULA'CEÆ (plants agreeing in important characters with *Portulàca*). Juss. gen. p. 313. exclusive of some genera. D. C. fl. fr. ed. 3. vol. 4. p. 398. prod. 3. p. 351. St. Hil. pl. lib. p. 42.

Calyx free, or somewhat adnate to the very base of the ovarium (f. 15. *a. f.* f. 18. *a.*), usually of 2 sepals (f. 16. *a.* f. 18. *a.*), seldom of 3 or 5 (f. 20. *a.*), cohering at the base. Petals usually 5 (f. 15. *b.* f. 17. *b.*), but sometimes 3-4-6, very rarely wanting altogether, either distinct (f. 18. *b.*), or cohering into a short tube at the base (f. 15. *b.*), alternating with the sepals when the number is equal. Stamens inserted along with the petals, irregularly into the base of the calyx, and sometimes perhaps in the torus, variable in number in the species of the same genus, all fertile; filaments distinct, adnate to the base of the petals (f. 15. *g.*), and usually opposite them where the number is equal; anthers ovate, 2-celled, opening lengthwise, versatile (f. 18. *c.*). Ovarium one, usually roundish (f. 15. *e.*), 1-celled (f. 15. *f.*). Style sometimes single, filiform, cleft into numerous stigmas at the apex (f. 15. *c.*); sometimes wanting or nearly so; when this is the case the stigmas are distinct (f. 17. *c.*), and rise in numbers from the top of the ovarium. Capsule 1-celled, opening either transversely (f. 15. *f.*), or by the 3 valves from the base to the apex; but they are also occasionally 1-seeded and indehiscent. Seeds numerous when the fruit is dehiscent, attached to the central placenta (f. 15. *f.*). Albumen farinaceous. Embryo curved round the circumference of the albumen, with a long radicle, and oblong cotyledons.—Fleshy shrubs or herbs. Leaves alternate, rarely opposite, entire, usually succulent, without stipulas, or sometimes with membranous ones on each side of the petioles. Flowers axillary or terminal, usually expanding in the sun, and of short duration. The 1-seeded genera of this order agree in character with the order *Paronychièæ*, and the apetalous genera with the order *Ficoídeæ*. This order is related in nearly every point of view to *Caryophýlleæ*, from which they scarcely differ except in their perigynous stamens, which are opposite the petals when equal to them in number, and two sepals; the latter character is not, however, very constant. The presence of scarious stipulas in several *Portulàceæ*, although perhaps an anomaly in the order, indicates their affinity with *Paronychièæ*, from which the monospermous genera of *Portulàceæ* are distinguished by the want of symmetry in their flowers, and by the stamens being opposite the petals, instead of the sepals. So close is the relationship between these orders, that several of the genus *Gingínsia* in *Portulàceæ* have been referred to *Pharnàceum* in *Caryophýlleæ*, and several *Portulàceæ* have been described by authors as belonging to genera of *Paronychièæ*. De Candolle remarks, that his *Gingínsia brevicaúlis* resembles certain species of *Andrósace*, and that *Portulàceæ* have been more than once compared to *Primulàceæ* (mem. p. 14.), and the same author remarks in his prod. 3. p. 351. that the genera with definite stamens, and hairy axillæ approach *Cácteæ*, while the apetalous genera tend towards apetalous *Ficoídeæ*.

Insipidity, want of smell, and a dull green colour, are the usual qualities of this order, of which the only species of any known use are common *Parslane* and *Claytònia perfoliàta*, which resemble each other in properties.

Synopsis of the genera.

1 Tria'nthema. Sepals 5, concrete at the base, coloured. Petals wanting. Stamens 5, rarely 10 or more. Styles or stigmas 1-2, rarely 3. Capsule opening transversely.

2 Cypse'lea. Calyx campanulate, 5-parted, coloured. Petals none. Stamens 2-3. Style hardly any, bipartite, or probably 2 stigmas. Capsule opening transversely.

3 Portula'ca. Calyx bipartite (f. 15. *a.*), at length falling off. Petals 4-6, equal (f. 15. *b.*), free or concrete at the base. Stamens 8-15 (f. 15. *g.*). Style one, 3-6 cleft at the apex (f. 15. *c.*); or style wanting, and the stigmas 3-8 elongated. Capsule opening transversely (f. 15. *f.*).

4 Graha'mia. Calyx of 2 white permanent sepals, girded by 8-9 bracteas. Petals 5, obovate. Stamens numerous, united at the very base. Style 1; stigmas 4-5, revolute. Capsule 1-celled, 5-valved, many-seeded. Seeds compressed, winged.

5 Anaca'mpseros. Sepals 2 (f. 16. *a.*), cohering at the base. Petals 5 (f. 16. *b.*), very fugaceous. Stamens 15-20 (f. 16. *c.*). Style filiform, trifid at the apex (f. 16. *d.*). Capsule conical, 3-valved (f. 16. *c.*). Seeds winged.

6 Tali'num. Sepals 2 (f. 17. *a.*), deciduous. Petals 5 (f. 17. *b.*), free or somewhat concrete at the base. Stamens 10-20. Style filiform, 3-cleft at the apex (f. 17. *c.*). Capsule 3-valved. Seed wingless.

7 Lewísia. Calyx of 5 sepals. Petals 9-12. Stamens 12-16, hypogynous. Style deeply 6-parted, with the segments filiform, and the stigmas obtuse.

8 Calandri'nia. Calyx 2-parted (f. 18. *a.*). Petals 3-5 (f. 18. *b.*), free or rather connate at the base. Stamens 4-15 (f. 18. *c.*). Style one, very short, tripartite at the apex (f. 18. *c.*); lobes clavate. Capsule oblong-elliptic, 3-valved. Seeds wingless.

9 Portulaca'ria. Calyx of 2 sepals, membranous. Petals 5, permanent. Stamens 5, or probably 10, 5 of which are abortive. Style wanting; stigmas 3, spreading, glandular. Fruit triquetrous, winged, indehiscent, 1-seeded.

10 U'llucus. Sepals 2, coloured, deciduous. Petals 5, connected into a very short tube at the base. Stamens 5, short. Style filiform; stigma simple. Capsule 1-celled, 1-seeded.

11 Claytònia. Sepals 2 (f. 19. *a.* f. 20. *a.*), permanent. Petals 5, unguiculated (f. 19. *b.* f. 20. *b.*); claws connate at the base. Stamens 5 (f. 20. *d.*). Style one, trifid at the apex (f. 19. *c.* f. 20. *c.*); lobes stigmatose inside. Capsule 3-valved (f. 20. *c.*), 3-seeded.

12 Mo'ntia. Calyx of 2, rarely of 3 sepals. Petals 5, rather connate at the base, 3 of which are a little smaller than the rest. Stamens usually 3 in front of the smaller petals, making 9, very rarely 3-4. Capsule 3-valved, 3-seeded.

13 Leptri'na. Calyx 3-parted. Petals wanting. Stamens 3. Styles 3, short, acute. Capsule 3-valved, 3-seeded.

14 Coloba'nthus. Calyx 4-5-parted. Petals wanting. Stamens 4-6. Stigmas 4-5. Capsule 4-7-valved, many-seeded.

15 Gingi'nsia. Calyx 5-parted, permanent, petaloid on the margins and in the inside. Petals wanting. Stamens 5. Ovarium girded by a 5-lobed fleshy scale. Capsule 3-valved, many-seeded.

16 Aylme'ria. Calyx 2-parted, coloured. Petals 5. Stamens 10, membranous, connected into a hypogynous tube, the 5 inner ones abortive. Style one, crowned by a depressed capitate stigma. Capsule bladdery, membranous, valveless. Seeds numerous in the bottom of the cell.

17 Hydropy'xis. Calyx 5-parted, permanent. Corolla unequally 5-lobed. Stamens 4, 2 long and 2 short, inserted in the corolla. Ovarium superior. Style simple, crowned by a 3-lobed, capitate stigma. Capsule triangular, 1-celled, many-seeded, opening transversely.

I. TRIA'NTHEMA (from τρεις, *treis*, three, and ανθος, *anthos*, a flower; flowers are usually disposed by threes). Sauv. meth. fol. p. 127. Lin. gen. no. 537. D. C. prod. 3. p. 351.—Zalèya, Burm. fl. ind. p. 110.—Rocàma and Papulària, Forsk. desc. 69. et 71.

Lin. syst. *Pent-Decándria, Monogýnia.* Sepals 5, permanent, connected together at the base, rather coloured on the inside, and mucronated under the apex. Petals wanting. Stamens 5-10, rarely more, distinct, inserted in the bottom of the calyx; anthers kidney-shaped. Ovarium ovate. Styles or stigmas filiform, 1-2, rarely 3. Capsule opening transversely below the middle; the upper valve, which separates like a lid, is hollow, and contains a seminiferous cell; therefore both cells are either simple, or of two divisions, one or few-seeded.—More or less fleshy herbs, which are sometimes suffruticose at the base. Leaves opposite, quite entire, petiolate. Petioles dilated into a stipula-formed membrane on both sides. Flowers axillary, sessile, usually by threes.

Sect. I. Zale'ya (meaning not explained by Burmann). Burm. fl. ind. p. 110. D. C. prod. 3. p. 352. Stamens 10 or more.

1 T. polya'ndra (Blum. bijdr. p. 1137.) stems herbaceous, procumbent; branches terete; leaves linear, obtuse; flowers pedunculate, solitary, polyandrous, trigynous. ♃. S. Native of Batavia, in bogs.

Polyandrous Trianthema. Pl. cr.

2 T. govíndia (Ham. ex Wall. cat. no. 6838.) stems suffruticose, trailing; leaves opposite, elliptic, emarginate at the apex; those opposite each other of unequal size; flowers axillary, aggregate, sessile. ♄. S. Native of the East Indies, in Mungger. Plant glaucous. The number of stamens and styles unknown.

Govindia Trianthema. Shrub prostrate.

3 T. deca'ndra (Lin. mant. p. 70.) stem herbaceous, glabrous, diffuse, terete; leaves elliptic, acute. ⊙. F. Native of the East Indies. Zalèya decándra, Burm. l. c. t. 31. f. 3. Petioles furnished at the base on both sides with a broad membrane. Flowers on short pedicels, disposed in fascicles in the axils. Sepals mucronate at the apex. Stamens 10-12. Styles 2.

Decandrous Trianthema. Fl. July, Aug. Clt. 1762. Pl. tr.

4 T. tri'quetra (Rottl. et Willd. in nov. act. nat. berol. 4. p. 180.) stem herbaceous, dichotomous, branched; branches compressedly triquetrous; leaves somewhat spatulate, petiolate; flowers axillary, sessile.—Native on the coast of Coromandel. Structure of flower unknown.

Triquetrous Trianthema. Pl. diffuse.

5 T. humifu'sa (Thunb. fl. cap. p. 389.) stems frutescent, trailing, terete; leaves lanceolate, attenuated at both ends. ♄. G. Native of the Cape of Good Hope, in Konde Bokeveldt. Stamens 10, alternate ones shorter. Thunberg in his prodromus says the flowers are monogynous, but in his flora he says they are digynous.

Var. β; stamens 10, one-half shorter than the calyx, fixed by pairs to the base of the calycine segments.—Native of the Cape of Good Hope, at Hex River.

Trailing Trianthema. Shrub tr.

6 T. a'nceps (Thunb. fl. cap. p. 399.) stem frutescent, diffuse, 2-edged; leaves lanceolate, attenuated at both ends, acuminated. ♄. G. Native of the Cape of Good Hope. Stamens 10. Style 1, very short.

Two-edged-stemmed Trianthema. Shrub diffuse.

Sect. II. Roca'ma (*Rokama* is the Arabic name of *T. pentándra*). Forsk. descript. p. 71. D. C. prod. 3. p. 352. Stamens 5.

7 T. penta'ndra (Lin. mant. p. 70.) stem rough from velvety hairs; leaves elliptic, obtuse, flowers crowded in the axils of the leaves. ♃. (ex Forsk.) ♄. (ex Lin.) Native of Arabia. Rocàma dígyna, Forsk. l. c. Rocàma Arábica, Gmel. syst. 1. p. 455. Pluk. phyt. t. 120. f. 3. ex Lin. T. pentándra, Gærtn. fruct. 2. p. 213. t. 128. f. 5. Lam. ill. t. 375. f. 2. Stamens 5. Styles 2. Perhaps 2 species are here confused, the stems being, according to Linnæus, erect and shrubby, and according to Forskal annual and prostrate.

Var. β, *obcordàta* (D. C. prod. 3. p. 352.) leaves obovate, bluntly emarginate at the apex.—Native of the East Indies. T. obcordàta, Roxb. hort. beng. p. 34.

Pentandrous Trianthema. Fl. July, Aug. Clt. 1820. Pl. pr.

8 T. monógyna (Lin. mant. p. 69.) stem herbaceous, diffuse, dichotomous, branched, glabrous; leaves oval, obtuse, opposite, one of them smaller than the other; flowers axillary, sessile, bibracteolate. ⊙. S. Native of Jamaica, Curassoa, and Mexico. D. C. pl. grass. t. 109. Lam. ill. t. 375. f. 1. T. portulacástrum, Sauv. meth. p. 127. Lin. spec. 635. T. procúmbens, Mill.—Pluk. alm. t. 95. f. 4. Stamens usually 5, alternating with the sepals, but sometimes 10. Styles 1 or 2. Lower cell of capsule about 4-seeded: upper one 1-seeded.

Monogynous Trianthema. Fl. July, Aug. Clt. 1710. Pl. pr.

9 T. crysta'llina (Vahl. symb. 1. p. 32.) stem shrubby, diffuse, terete, glabrous, papulose; leaves linear or lanceolate, opposite, one of them smaller than the other; flowers crowded, axillary. ♄. G. Native of Arabia and the East Indies. Papulària crystállina, Forsk. desc. p. 69. Stamens alternating with the petals. Style 1.

Icy Trianthema. Shrub diffuse.

Cult. The seeds of the species of *Triánthema* require to be sown on a hot-bed in spring; and about the end of May they may be planted out in the open border in a warm sheltered situation, where they will probably flower and seed. Some are said

to be shrubby, these it will be requisite to treat as other stove plants ; and cuttings of them will be easily rooted.

II. CYPSE'LEA (from *κυψελη*, *kypsele*, a bee-hive ; in reference to the form of the capsule). Turp. in ann. mus. 7. p. 219. t. 121. f. 5. D. C. prod. 3. p. 353.—Radiàna, Rafin. speech. 1. p. 88.

Lin. syst. *Di-Triándria*, *Digýnia*. Calyx campanulate, permanent, coloured, 5-parted ; lobes obtuse, 2 of which are smaller than the other 3. Corolla wanting. Stamens 2-3, inserted in the calyx and alternating with its lobes (ex Turp.), or opposite the smaller lobes (ex Rafin.). Ovarium free, 1-celled Style hardly any, 2-parted, or stigmas 2. Capsule 1-celled, many-seeded, opening transversely. Seeds fixed to an oval, central placenta, very small, and very numerous.—Herbs, natives of St. Domingo, with the habit of *Móntia* or *Crýpta*, rather succulent, annual, and glabrous. Leaves opposite, obovate ; petioles widened into a stipule-formed, jagged membrane. Flowers axillary, small, greenish, solitary, on short pedicels.

1 C. humifu'sa (Turp. l. c.). ⊙. S. Native of St. Domingo. Tratt. obs. bot. 2. p. 41. t. 72. Radiàna petiolàta, Rafin. l. c. Millegràna Surian, in herb. Juss.

Trailing Cypselia. Pl. tr.

Cult. Sow the seeds thinly in a pot, and place them in a hot-bed, or in a stove, with a pan of water under the pot. Not worth growing, except in a botanic garden.

III. PORTULA'CA (from *porto*, to carry, and *lac*, milk ; plants milky). Tourn. inst. t. 118. Adans. fam. 2. p. 242. Juss. gen. p. 312.—Portulàca species of Lin.—Meridiàna, Lin. et Schrank.—Lèmia, Vand. in Rœm. script. p. 116. t. 7. f. 15. —Merìda, Neck.

Lin. syst. *Octo-Dodecándria*, *Monogýnia*. Calyx free from or adhering to the ovarium at the very base, bipartite (f. 15. *a*.), at length cut round about at the base, and falling off. Petals 4-6 (f. 15. *b*.), equal, distinct, or joined together at the very base, inserted in the calyx. Stamens 8 (f. 15. *g*.) -15 ; filaments free, sometimes adnate to the bottom of the corolla (f. 15. *g*.). Ovarium roundish. Style 1 (f. 15. *d*.), 3-6-cleft at the apex (f. 15. *c*.), or the style is wanting ; but in this case, the stigmas are 3-8 and elongated. Capsule sub-globose (f. 15. *f*.), 1-celled, opening transversely in the middle. Seeds numerous, fixed to a central placenta (f. 15. *f*.).—Humble fleshy herbs. Leaves scattered, quite entire, thick, usually bearing hairs in the axils, crowded, or somewhat verticillated about the flowers. Flowers expanding from 9 till 12 o'clock in the morning, if the sun shine, otherwise they remain closed.—This is a heterogeneous genus, and probably divisible, but easily distinguished by the capsule opening transversely.

* *Flowers yellow. Axils of leaves naked.*

1 P. olera'cea (Lin. spec. p. 638.) leaves wedge-shaped, fleshy ; axils and joints naked ; flowers sessile. ⊙. H. Native nearly throughout the whole world. D. C. pl. grass. t. 123. Schkuhr. handb. t. 130. Petals concrete at the base. Stamens 10-12, adnate to the corolla. Style wanting. Stigmas 5, elongated. Perhaps specifically distinct from the following varieties. —Blackw. icon. t. 287.

Var. α, sylvéstris (D. C. prod. 3. p. 353.) stem and branches prostrate and trailing. ⊙. H. Native of Europe, in cultivated fields ; and very common in Java (ex Blum.) ; in North America, about Norway House, and banks of the Hill river (Hook). Smith, fl. græc. 457. Lob. icon. t. 388. P. oleràcea, Haw. misc. p. 126. syn. p. 122.

Var. β, satìva (D.C. prod. 3. p. 353.) stems diffuse ; branches erectish. ⊙. H. Native of South America, and now cultivated in some parts of Europe. P. doméstica, Lob. icon. p. 388. P. satìva, Haw. misc. p. 136. syn. 122. P. latifòlia, Horn. hort. hafn. 2. p. 491. There is a variety of this with green leaves (P. víridis, Hortul.), and yellowish leaves (P. aúrea, Hortul.). The young shoots and succulent leaves are esteemed cooling, and are used in spring and summer as an ingredient in salads, and as pot-herbs and pickles. The plant was formerly in much more request than at present. Both the green and yellow-leaved sorts are raised from seed, and for a bed 4 feet by 4 feet, sown either broadcast or in drills, 9 inches apart, one-eighth of an ounce will suffice. " Each variety is somewhat tender ; the green, which is usually preferred, is perhaps rather the hardiest. An early crop may be sown in February or March, on a moderate hot-bed ; the plants will require the aid of a gentle heat till the middle of May, when the seed may be sown in a warm border. If a continued succession is required, sow every month during summer, till August, or while the plant can be raised ; generally in small drills, from 3-6 inches asunder. The plants will soon come up ; they should remain where sown. In very dry hot weather, water thrice a-week. The shoots may be gathered for use when they are from 2-5 inches in height, and are well furnished with leaves. Cut them off low, and the bottom part will soon sprout out again. When seed is required, leave some of the first open border plants to run ; they will give ripe seed in autumn."

Cultivated or Common Purslane. Fl. Aug. Sept. Clt. 1582. Pl. prostrate or erect.

2 P. parvifòlia (Haw. syn. p. 122.) leaves cuneiform, minute, fleshy ; stem much branched, prostrate ; flowers sessile, or on long peduncles. ⊙. H. Native of Jamaica. Probably only a variety of *P. satìva*, but the plant is much smaller, and the leaves are 10-times smaller.

Small-leaved Purslane. Fl. Aug. Clt. 1799. Pl. pr.

** *Flowers yellow. Axils of leaves or joints pilose.*

3 P. foliòsa (Ker. bot. reg. 793.) stem diffuse ; branches erect ; leaves subulate ; flowers solitary at the tops or in the forks of the branches, surrounded by white hairs and a many-leaved involucrum ; petals retuse or a little emarginate. ⊙. F. Native of Guinea, near Accra. P. Guineénsis, Spreng. There is a plant figured in fl. mex. of Moc. et Sesse, called by them *P. stellifórmis*, a native of Mexico, which is very like this species. Flowers small, yellow.

Leafy Purslane. Fl. June, July. Clt. 1822. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

4 P. suffruticòsa (Wight, ex Wall. cat. 6842.) shrubby, branched ; leaves linear, nearly terete, glabrous or downy ; flowers solitary at the tops of the branches. ♄. D. S. Native of the East Indies. Flowers surrounded by a whorl of leaves.

Suffruticose Purslane. Fl. Ju. Jul. Shrub 1 foot.

5 P. lanuginòsa (H. B. et Kunth, nov. gen. amer. 6. p. 74.) stems procumbent, branched ; leaves terete, obtuse, upper ones in whorles ; flowers in clusters of 2-5, surrounded by soft hairs ; petals obovate-spatulate, obtuse. ⊙. F. Native of South America, on the banks of the Amazon. Style 1 ; 3-5-cleft at the apex. Petals 4-5, yellow.

Woolly Purslane. Pl. pr.

6 P. margina'ta (H. B. et Kunth, l. c. p. 72.) stems rather dichotomous ; leaves cuneately spatulate, rounded at the apex, subverticillate, obsoletely veined, margined with red ; axils hairy ; flowers 5-7 in each head, involucrated. ⊙. F. Native near Caraccas, in Venezuela. Said to be allied to *P. oleràcea*. Flowers yellow.

Margined-leaved Purslane. Pl. pr.

7 P. Laruottea'na (St. Hil. fl. bras. 2. p. 190.) stem suffruticose at the base, pilose in the axils of the leaves ; leaves lanceolate, flattish, narrowed at the base, acute, longer than the hairs ; flowers crowded at the tops of the branches ; petals ob-

cordate, mucronulate, shorter than the calyx. ♄. S. Native of Brazil, in that part of the province of Minas Geraes called Minas Novas, near Nossa Snzra da Penha. Flowers yellow, surrounded by hairs and crowded leaves.

Laruotte's Purslane. Shrub $\frac{1}{2}$ to $\frac{3}{4}$ foot.

8 P. halimoìdes (Lin. spec. 639.) stem erect, diffuse, corymbose at the apex; leaves oblong, fleshy, crowded about the flowers at the tops of the branches; flowers surrounded by dense villi. ⊙. F. Native of Jamaica. Sloane, jam. hist. 1. p. 205. t. 129. f. 3. P. Browne, jam. p. 206. Lun. hort. jam. 2. p. 108. Petals connected at the base. Stamens 8-10. Style 3-5-parted.

Halimum-like Purslane. Fl. Ju. Jul. Clt. 1823. Pl. $\frac{1}{2}$ ft.

9 P. rubricau'lis (H. B. et Kunth, nov. gen. amer. 6. p. 73.) stems ascending, corymbosely branched above; leaves lanceolate, acute, nerveless; upper leaves in whorles; axils pilose; flowers 4-8, crowded into a head. ⊙. F. Native of South America, in sandy places and on dry mountains on the sea-shore near Laguna. Petals 5, obovate-oblong, emarginate, orange-coloured. Stamens 27-30. Style 6-8-cleft. Said to be allied to *P. halimoìdes*.

Red-stemmed Purslane. Pl. ascending $\frac{1}{2}$ foot.

10 P. hirsutíssima (St. Hil. fl. bras. 2. p. 121. t. 114.) stem suffruticose at the base, pilose at the axils of the leaves; leaves approximate, oblong-lanceolate, flattish, tapering to both ends, acute, shorter than the hairs; flowers crowded at the tops of the branches; petals obcordate, mucronulate, a little longer than the calyx. ♄. S. Native of Brazil, in that part of the province of Minas Geraes called Minas Novas, near Bom-Tim and Nossa Snra da Penha, and also near Tejuco. Flowers yellow, surrounded by a whorl of the upper leaves and axillary hairs.

FIG. 15.

Very hairy Purslane. Shrub $\frac{1}{4}$ to $\frac{1}{2}$ foot.

11 P. mucrona'ta (Link, enum. hort. berol. 2. p. 2.) stem erect; leaves obversely oblong, with a short taper point; floral leaves 8, constituting an involucrum; axils pilose; flowers terminal, sessile. ⊙. F. Native country unknown.

Mucronate-leaved Purslane. Fl. Ju. Clt. 1822. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

12 P. quadrífida (Lin. mant. p. 78.) stem prostrate; joints pilose; leaves elliptic-oblong, fleshy, flat; flowers terminal, sessile, quadrifid. ⊙. H. Native of Egypt, Arabia, and India. Jacq. coll. 2. p. 356. t. 17. f. 2. P. linifòlia, Forsk. descr. p. 92. Illécebrum verticillàtum, Burm. fl. ind. p. 66. Stems red. Flowers small, yellow. Petals 4, rarely 5, joined a little way at the base. Stamens 8, rarely more. Stigmas 4.

Var. β, Meridiàna (D. C. prod. 3. p. 354.) flowers usually tetrandrous. ⊙. H. Native of the East Indies. P. Meridiàna, Lin. fil. suppl. p. 248. Nelatsjìra, Rheed. mal. 10. t. 31. and Roxb. There is hardly any difference between this and *P. quadrífida*. Flowers surrounded by wool and 4 leaves, like those of *P. quadrífida*.

Quadrifid-flowered Purslane. Fl. Aug. Sept. Clt. 1773; β in 1791. Pl. prostrate.

* * * *Flowers purple; axils pilose, or perhaps sometimes naked.*

13 P. pilòsa (Lin. spec. 639.) stem diffuse; joints beset with long hairs; leaves alternate, linear-lanceolate, convex on the back, bluish, about equal in length to the axillary hairs; floral leaves in whorles; flowers crowded at the tops of the branches, sessile, surrounded by long hairs; petals ovate, acutish, a little longer than the calyx. ⊙. F. Native of South America, about Curassoa, in Brazil, Martinico, Jamaica, &c. in sandy places near the sea. Gærtn. fruct. 2. p. 212. t. 128. f. 4. Haw. misc. p. 137. Ker. bot. reg. 792.—Wolk. norib. 341. with a figure. Herm. par. 215. Comm. hort. amst. 1. t. 5. Flowers 5-parted, pale purple, expanding from 10-12 o'clock in the morning, if the sun is out. Stamens about 20. Root tuberous.

Var. β, setàcea (D. C. prod. 3. p. 354.) leaves subulate; stems erectish. ⊙. F. Native along with the species. P. setàcea, Haw. misc. 159. Herm. par. 214. with a figure. Pluk. phyt. t. 246. f. 6. and 105. f. 4. Flowers purple.

Pilose Purslane. Fl. Ju. Clt. 1690. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

14 P. lana'ta (Rich. act. soc. hist. nat. par. 1792. p. 109.) stems diffuse; leaves linear-sublanceolate, flat; hairs of the axillæ and joints longer than the leaves; flowers terminal, surrounded by hairs and a whorle of leaves. ⊙. F. Native of Cayenne. Petals red, obcordate. Stamens 15 and more. Perhaps only a variety of *P. pilòsa*.

Woolly Purslane. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

15 P. pilosíssima (Hook, bot. misc. 2. p. 221.) plant annual? small; stems branched, decumbent; leaves terete, oblong; fascicles of hairs twice or thrice longer than the leaves. ⊙. H. Native of Peru, at Yazo, in the valley of Canta. The flowers are concealed by long white solitary tufts of hairs. It comes nearest to the *P. lanàta*, Rich.

Very pilose Purslane. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

16 P. umbratícola (H. B. et Kunth, nov. gen. amer. 6. p. 72.) stems branched; axils sparingly pilose; leaves scattered, lanceolate, acute, veiny; flowers twin? on very short peduncles, terminal. ⊙. F. Native of New Andalusia, near Cumana and Bordones. Flowers 5-parted, rose-coloured. Stamens 12. Style 4-cleft.

Shaded Purslane. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

17 P. pusílla (H. B. et Kunth, l. c.) stems branched; axils naked? leaves scattered, elliptic, nerveless, rounded at both ends; flowers solitary? almost sessile. ⊙. F. Native on the Orinoco, among rocks near Maypures, and of Trinidad. Flowers rose-coloured, 4-5-petalled. Stamens 11-14. Style trifid.

Small Purslane. Fl. June, July. Clt. 1824. Pl. 1 to 2 in.

18 P. Hilairea'na; stem trailing, herbaceous, pilose in the axils of the leaves; leaves linear-lanceolate, convex on the back, flat in front, acute, longer than the axillary pili; flowers crowded on the tops of the branches; petals obcordate, much longer than the calyx. ⊙. F. Native of Brazil, in the province of St. Paul. P. grandiflòra, St. Hil. fl. bras. 2. p. 192. but not of Hook. Flowers purple, surrounded by crowded leaves and hairs.

St. Hilaire's Purslane. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot. trailing.

19 P. grandiflòra (Hook, in bot. mag. 2885.) stems diffuse, branched; leaves scattered, cylindrical, acute, with pilose axils; flowers 3-4 together, terminal, crowded, surrounded by a whorl of leaves and crowded hairs; petals longer than the calyx; style 8-9-cleft at the apex. ♃. F. Native of Chili. There are varieties of this plant with either purple or yellow large flowers. Root tuberous.

Var. α, màjor; (Hook, in bot. misc. 3. p. 241.) leaves an inch or an inch and a half long.—Bot. mag. t. 2885.

Var. β, microphýlla (Hook. et Arn. l. c.) leaves hardly half an inch long. P. Mendocinénsis, Gill. mss. Both varieties are found between Rio Saladillo and Mendoza.

Great-flowered Purslane. Fl. June, July. Clt. 1827. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

20 P. Gillie'sii (Hook. bot. mag. 3064.) stems erectish, branched at the base; leaves oblong-cylindrical, rather compressed, obtuse, dotted; axillary fascicles of hairs erect, adpressed; flowers terminal, usually solitary; petals longer than

the calyx, obovate-roundish. ♃. G. Native of Chili, in the plains near Mendoza. Plant stout, in proportion to its height. Flowers large, bright reddish purple.

Gillies's Purslane. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

21 P. teretifòlia (H. B. et Kunth, l. c.) stems creeping, corymbosely branched; axils rather pilose; leaves scattered, terete, acutish; flowers 3-5 in a heap, sessile, involucrated, and surrounded by hairs. ⊙. F. Native of South America, on the sandy banks of the river Orinoco and Rio Negro, near Carichana, Maypures, San Carlos, &c. Very like *P. rubicaúlis*, but differs in the flowers being purple. Stamens 18-24.

Terete-leaved Purslane. Pl. creeping.

22 P. axilliflòra (Pers. ench. 2. p. 6.) stems procumbent; leaves oblong, fleshy, in young plants they are opposite; flowers solitary, axillary. ⊙. F. Native country unknown. Meridiàna axilliflòra, Schrank. bot. zeit. 1804. p. 354. Corolla and stamens rose-coloured.

Axil-flowered Purslane. Pl. pr.

† *Species not sufficiently known.*

23 P. imbrica'ta (Forsk. descr. 92.) leaves crowded, ovate, acute, flat beneath, and convex above, opposite; joints hairy at the base; flowers sessile, terminal. ⊙. H. Native of Arabia. Flowers yellow, large. Surculi as if they were tetragonal, from the leaves being imbricated on them in 4 rows.

Imbricate-leaved Purslane. Pl. pr.

24 P. Ca'ffra (Thunb. fl. cap. p. 399.) stem weak, branched, glabrous; leaves linear-oblong, alternate; flowers axillary, pedicellate; pedicels bibracteate. ⊙. F. Native of the Cape of Good Hope. Corolla yellow, 6-petalled. Style trifid. Capsule probably 2-celled and 2-valved.

Caffrarian Purslane. Pl. pr.

25 P. Ara'bica (Forsk. descr. 92. no. 81.) calyx of 4 permanent sepals.—Native of Arabia. The rest unknown.

Arabian Purslane. Pl.?

26 P. fla'va (Forst. pl. esc. p. 72.). ⊙. F. Native on the shores of the Society Islands, where it is boiled and eaten by the natives, and called by them *Aturi*. This plant has not been described, and is probably nothing else but *P. oleràcea*.

Yellow-flowered Purslane. Pl. pr.

27 P. Wightia'na (Wall. cat. no. 6845.) plant diffuse; leaves small, intermixed with numerous soft leafy stipulas; flowers sessile, terminal, almost hidden by the white bracteas. ♄. S. Native of the East Indies, at Sadras, in moist sand. A singular species.

Wight's Purslane. Pl. $\frac{1}{4}$ foot.

Cult. Being mostly annual plants, growing naturally in sandy soil near the sea, the seeds should be sown in dry warm situations in spring: or it is perhaps better to sow them on a hotbed in spring, and plant them out towards the end of May into the open border; or they may be grown in pots and set in the greenhouse or in a frame.

IV. GRAHA'MIA (in honour of Mrs. Maria Graham, a great traveller in South America, particularly in Brazil, Peru, and Chili.) Gill. mss. ex Hook. et Arn. in bot. misc. 3. p. 241.

Lin. syst. *Icosándria, Monogýnia.* Calyx of 2 permanent, oblong-lanceolate, mucronate, concave, stiff sepals, propped by 8 or 9 imbricate bracteas, similar to the sepals. Petals 5, obovate, mucronulate. Stamens numerous, about 40; filaments filiform, monadelphous at the base; anthers erect, 2-celled. Ovarium oblong, 1-celled. Style filiform, thickened upwards; stigmas 4, but usually 5, linear. Capsule 1-celled, 5-valved. Seeds numerous, compressed, broadly winged, each fixed by a podosperm to the central axis.—A smooth branched shrub, with alternate, terete, oblong, obtuse, fleshy leaves, bearing hairs in the axils. Flowers solitary, terminating short or elongated branches, with white sepals and petals; and having the filaments purple at the base, and the anthers and stigmas yellow.

1 G. bractea'ta (Gill. mss. ex Hook. et Arn. l. c. p. 242.). ♄. D. G. Native of Chili, among bushes, in the Travèsia between San Louis and Mendoza, especially near the river Desaguadero, at the altitude of 1500 feet. Xeránthus salicòsus, Miers. chil. vol. 2. p. 529.

Bracteate-flowered Grahamia. Shrub 1 foot.

Cult. See *Portulacària* for culture and propagation.

V. ANACA'MPSEROS (from ανακαμπτω, *anacampto*, to cause return, and ερος, *eros*, love; supposed effects). Sims, bot. mag. (1811) no. 1357. D. C. cat. hort. monsp. p. 77. but not of Haw.—Telephiástrum, Dill. elth. p. 376.—Rulíngia, Haw. succ. pl. syn. (1812.) p. 124. but not of R. Br.—Portulàca species of Lin.—Rulíngia species of Ehrh.—Talìnum species of Willd.—Portulàcæ gíbbæ, Haw. misc. nat. p. 141.

Lin. syst. *Dodecándria, Monogýnia.* Calyx of 2 sepals (f. 16. *a.*); sepals opposite, oblong, rather concrete at the base. Petals 5 (f. 16. *b.*), very fugacious. Stamens 15-20 (f. 16. *d.*); filaments distinct, inserted in the bottom of the calyx along with the petals, and adhering a little to them. Style filiform, trifid at the apex (f. 16. *d.*). Capsule conical, 1-celled, 3-valved (f. 16. *c.*), with the valves cleft longitudinally in the middle, and therefore the capsule appears as if it was 6-valved (f. 16. *c.*). Seeds numerous, winged, fixed to a central placenta.—Very dwarf herbs or subshrubs, natives of the Cape of Good Hope. Leaves ovate, fleshy. Axils bearing filamentous subscarious stipulaceous hairs. Bracteas membranous, usually lobed into setaceous segments. Pedicels 1-flowered, elongated, disposed in racemes. Flowers of a rose-purple colour or white, expanding only in the heat of the sun.

1 A. telephia'strum (D. C. l. c.) leaves ovate, difformed, glabrous; axillary hairs filamentous, shorter than the leaves; racemes few-flowered, subpanicled. ♄. D. G. Native of the Cape of Good Hope.—Dill. hort. elth. t. 281. Comm. hort. amst. t. 89. Portulàca Anacámpseros, Lin. spec. 639. Haw. misc. p. 141. Talìnum Anacámpseros, Willd. spec. 2. p. 862. D. C. pl. grass. t. 3. Haw. syn. 124. Rulíngia vàrians, Haw. ex Spreng. Rulíngia Anacámpseros, Ehrh. beitr. 3. p. 133. Anacámpseros vàrians, Sweet. Flowers reddish. Seeds very much winged. Cotyledons in the germinating plant 2, thick, somewhat trigonal, convex beneath, with a very short caulicule.

Telephium-like Anacampseros. Fl. July, Aug. Clt. 1813. Pl. $\frac{1}{4}$ foot.

2 A. interme'dia; leaves very numerous and dense, expanded, flat, convex on the outside, retusely deltoid at the apex; axillary threads twisted, brown. ♄. D. G. Native of the Cape of Good Hope. Rulíngia intermèdia, Haw. in phil. mag. march 1828. Very like *A. polyphýlla*, but almost one half smaller, but taller; also like *A. filamentòsa*, but broader; the leaves more numerous, more crowded, paler; and the axillary threads are yellow, not white.

Intermediate Anacampseros. Fl. Ju. Jul. Clt. 1824. Pl. $\frac{1}{4}$ ft.

3 A. arachnoìdes (Sims, bot. mag. t. 1368.) leaves ovate, acuminated, difformed, green, shining, cobwebbed; axillary hairs filamentous, shorter than the leaves; racemes simple; petals lanceolate. ♄. D. G. Native of the Cape of Good Hope. Portulàca arachnoìdes, Haw. misc. p. 142. Rulíngia arachnoìdes, Haw. syn. p. 125. Talìnum arachnoìdes, Ait. hort. kew. ed. 2. vol. 3. p. 149. Flowers white, hardly with a tinge of purple. Bracteas scarious, jagged. Seeds with a short wing.

Cobwebbed Anacampseros. Fl. July, Aug. Clt. 1790. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

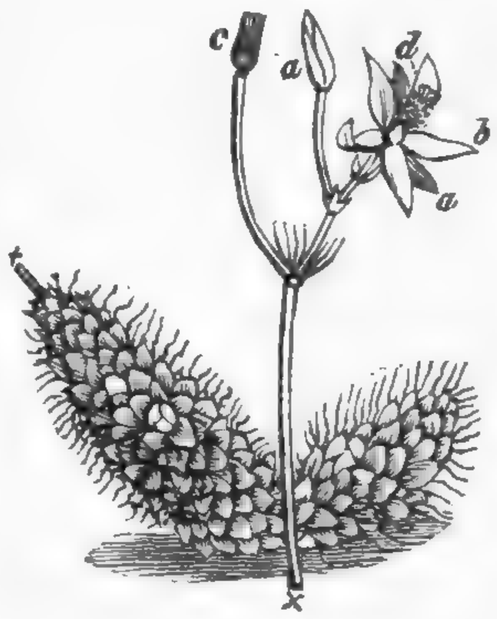
4 A. ru'bens (D. C. prod. 3. p. 356.) leaves ovate, acuminated, difformed, shining, dark green, somewhat reflexed at the

apex; axillary hairs shorter than the leaves; racemes simple. ♄. D. G. Native of the Cape of Good Hope. Portulàca rùbens, Haw. misc. p. 142. Rulíngia rùbens, Haw. syn. p. 125. Leaves and peduncles purplish. Flowers red.

Red Anacampseros. Fl. Jul. Sept. Clt. 1796. Pl. ½ to ¾ ft.

5 A. FILAMENTÒSA (Sims, bot. mag. t. 1367.) leaves ovate-globose, gibbous on both sides, and cobwebbed, rather rugged above; stipulas ramentaceous, longer than the leaves; petals oblong. ♄. D. G. Native of the Cape of Good Hope, in Carro near Hartiquos Kloof. Portulàca filamentòsa, Haw. misc. p. 142. Rulíngia filamentòsa, Haw. syn. p. 125. Talìnum filamentòsum, Ait. hort. kew. ed. 2. vol. 3. p. 149. Portulàca stipulàris, Dyandr. mss. Petals reddish or deep rose coloured.

FIG. 16.



Filamentose Anacampseros.
Fl. Aug. Sept. Clt. 1795. Pl. ½ to 1 foot.

6 A. LANCEOLA'TA (D. C. prod. 3. p. 356.) leaves lanceolate, fleshy, glabrous, convex beneath; axillary hairs very long; scape leafy, generally 1-flowered. ♄. D. G. Native of the Cape of Good Hope. Portulàca lanceolàta, Haw. syn. p. 126. Stems very short. Calyx reddish. Petals reddish. Seeds almost 3-winged.

Lanceolate-leaved Anacampseros. Fl. Aug. Sept. Clt. 1796. Pl. ½ foot.

7 A. ANGUSTIFÒLIA (D. C. prod. 3. p. 356.) leaves fleshy, narrow-lanceolate, expanded; stem short, branched. ♄. D. G. Native of the Cape of Good Hope. Rulíngia angustifòlia, Hav. rev. p. 60. Very like the preceding species, but smaller. Flowers red.

Narrow-leaved Anacampseros. Fl. July, Aug. Clt. 1820. Pl. ¼ foot.

8 A. RUFE'SCENS (D. C. l. c.) leaves crowded, expanded and recurved, ovate, acute or somewhat acuminated, thick, green, usually dark purple beneath. ♄. D. G. Native of the Cape of Good Hope. Rulíngia ruféscens, Haw. suppl. pl. succ. p. 64. syn. p. 60. This is the largest of all the species. Flowers like those of *A. Telephiástrum*.

Rufescent Anacampseros. Fl. July, Aug. Clt. 1818. Pl. ½ ft.

9 A. TRIGÒNA (D. C. l. c.) leaves ovate, trigonal, acute, erect, woolly in the axils and on the stem between the leaves. ♄. D. G. Native of the Cape of Good Hope, in Carro. Burm. afr. p. 79. t. 30. f. 2. Portulàca trigòna, Thunb. fl. cap. p. 399. Petals flesh-coloured, oblong, acute.

Trigonal-leaved Anacampseros. Pl. ¼ to ½ foot.

10 A. LANI'GERA (Burch. cat. geogr. pl. afr. austr. no. 2196.) leaves ovate, obtuse, small, very densely clothed with long wool. ♄. D. G. Native of the Cape of Good Hope. Very like the preceding species. Flowers unknown.

Wool-bearing Anacampseros. Pl. ¼ foot.

11 A. POLYPHY'LLA (D. C. l. c.) ♄. D. G. Native of the Cape of Good Hope. Rulíngia polyphýlla, Haw. suppl. 65. syn. 61.—Pluk. phyt. t. 41. f. 6.

Many-leaved Anacampseros. Fl. Jul. Aug. Clt. 1818. Pl. ¼ ft.

Cult. The species of this succulent genus of plants grow freely in sandy loam, mixed with some lime rubbish; they require but little water. Cuttings root freely if laid to dry a few days before planting. Leaves taken off close to the plants, and laid to dry a few days, and then planted, will take root and shoot out young plants at their base.

VI. TALI'NUM (probably from θαλια, *thalia*, a green branch; durable verdure). Sims, bot. mag. no. 1357. Haw. syn. p. 123. D. C. prod. 3. p. 356.—Talìnum species, Adans. fam. 2. p. 145. Juss. gen. p. 312.—Portulàca species, Lin.—Rulíngia species, Ehrh.

LIN. SYST. *Deca-Dodecándria, Monogýnia.* Calyx of 2 ovate sepals, deciduous. Petals 5 (f. 17. *b.*), hypogynous, or inserted in the bottom of the calyx, distinct or joined a little way at the base. Stamens 10-20, inserted along with the petals, and generally adhering a little to them, and joined together at the base. Style filiform, cleft at the apex into 3 spreading or close stigmas. Stigmas bearing papillæ inside. Capsule 3-valved, 1-celled, many-seeded. Seeds wingless, kidney-shaped, scabrous, fixed to the central placenta.—Fleshy herbaceous, or suffrutescent plants. Leaves alternate, quite entire, exstipulate. Flowers very fugaceous, expanding only in the heat of the sun, cymose or racemose. Cymes or racemes usually forming terminal panicles.

SECT. I. PHEMERA'NTHUS (from φημη, *pheme*, fame, and ανθος, *anthos*, a flower; in reference to the beauty of the flowers). Rafin. speech. 1. p. 86. D. C. prod. 3. p. 356.—Talìnum, Pursh, and Nutt. Stigmas 3, close together, and appearing like a simple stigma. Flowers disposed in dichotomous corymbose cymes.—Perennial herbs, natives of North America.

1 T. TERETIFÒLIUM (Pursh. fl. bor. amer. 2. p. 365.) root fibrous; cauline leaves terete, subulate, fleshy, cyme terminal, dichotomous, corymbose; stamens 20. ♃. F. Native of Virginia, Louisiana, and Delaware, among rocks exposed to the sun. Lodd. bot. cab. t. 819. Phemeránthus teretifòlius, Rafin. speech. p. 86. Talìnum trichótomum, Desf. hort. par.—Pluk. alm. t. 223. f. 2. Flowers of a rose purple-colour. Root tufted, fibrous.

Terete-leaved Talinum. Fl. Aug. Clt. 1823. Pl. ½ foot.

2 T. NAPIFÓRME (D. C. prod. 3. p. 357.) root tuberous; radical leaves terete, fleshy; cymes terminal, dichotomous, corymbose; stamens 5, alternating with the petals. ♃. F. Native of Mexico. Claytònia tuberòsa, Moc. et Sesse, fl. mex. icon. ined. Root tuberous, turnip-formed. Stems numerous from the neck of the tuber, almost leafless at the base, but cymose and dichotomous at the apex. Flowers white. This species from habit and inflorescence agrees with the preceding, but differs materially in having only 5 stamens, and a tuberous root. It is not a *Claytònia*, in consequence of the stamens alternating with the petals, not opposite them; nor a *Calandrínia* from the calyx not being deciduous.

Turnip-formed-rooted Talinum. Pl. ½ to 1 foot.

SECT. II. TALINA'STRUM (an alteration from *Talinum*). D. C. prod. 3. p. 357.—Talìnum, Sims and Haw. Style filiform. Stigmas 3, distinct, spreading. Ovarium globose (f. 17. *c.*). Leaves flat, rather fleshy. Stems suffrutescent, fleshy, erect.

3 T. CRASSIFÒLIUM (Willd. spec. 2. p. 862.) stem shrubby, erect; leaves flat, obovate-lanceolate, mucronate; flowers disposed in an elongated panicled corymb; peduncles triquetrous. ♄. D.S. Native country unknown, but probably of the West Indies. Haw. syn. p. 123. Portulàca crassifòlia, Jacq. hort. vind. 3. t. 52. Haw. misc. p. 140. T. paniculàtum, Mœnch. meth. p. 232. but not of Gærtn. nor Ruiz et Pav. Flowers red.

FIG. 17.

Var. β, albiflòrum (D. C. prod.

3. p. 357.) flowers white. ♄. D. G. Native of South America, by the sea side. Comm. hort. 1. p. 7. t. 4. Portulàca fruticòsa, Murr. syst. veg. but not of Thunb. Portulàca paniculàta, Lin. spec. 2. p. 640. Talìnum fruticòsum, Willd. spec. 2. p. 864. The calyx is said to be of 5 sepals, but this assertion we suspect to be erroneous.

Thick-leaved Talinum. Fl. Aug. Sept. Clt. 1800. Sh. 1 ft.

4 T. triangula're (Willd. spec. 2. p. 862.) stem shrubby, erect; leaves flat, channelled, wedge-shaped, emarginate, mucronate; racemes simple; rachis triquetrous. ♄. D. S. Native of the Antilles, on the sea shore. Plum. ed. Burm. t. 150. f. 2. Portulàca racemòsa, Lin. spec. 640. Haw. misc. p. 139. Portulàca triangulàris, Jacq. obs. 1. p. 35. t. 23. Rulíngia triangulàris, Ehrh. beitr. 3. p. 134. Flowers yellow, size of those of the preceding species.

Triangular Talinum. Fl. Aug. Sept. Clt. 1739. Pl. ¾ ft.

5 T. pa'tens (Willd. spec. 2. p. 863. var. α.) stem suffruticose, erect; leaves flat, glabrous, lower ones obovate, obtuse, upper ones lanceolate, acute; panicle terminal; peduncles alternate, dichotomous, bractless; petals oblong, acutish, 3 times longer than the calyx. ♄. D. S. Native of Martinico, St. Domingo, Mexico, New Granada, and Brazil, on rocks by the sea side; also of Buenos Ayres. Portulàca paniculàta, Jacq. amer. p. 148. Portul. pàtens, Jacq. hort. vind. 2. t. 151. Rulíngia pàtens, Ehrh. beitr. 3. p. 135. T. paniculàtum, Gærtn. fr. 2. p. 219. t. 128. but not of Mœnch. nor of Ruiz et Pav. Flowers small, red, 3 lines in diameter. The leaves of the plant are used in the same manner as common purslane in Brazil.

Spreading-panicled Talinum. Fl. Aug. Oct. Clt. 1776. Sh. 1 to 2 feet.

6 T. Andre'wsii (Sweet, hort. brit. p. 170.). stem suffruticose, erect; leaves glabrous, ovate-lanceolate, sessile; panicle branched, terminal; petals oblong, obtuse. ♄. D. S. Native of the West Indies. T. pàtens, Andr. bot. rep. t. 253. Flowers large, red.

Andrew's Talinum. Fl. Aug. Oct. Clt. 1800. Sh. 1 to 2 ft.

7 T. refle'xum (Cav. icon. 1. p. 1. t. 1.) stem suffruticose, erect; leaves flat, lanceolate or oval, obtuse, usually opposite; panicle terminal; peduncles usually opposite, dichotomous, bractless. ♂. D. S. Native of South America. Sims, bot. mag. t. 1543. Haw. syn. p. 124. Portulàca refléxa, Haw. misc. p. 141. T. pàtens β, Willd. spec. 2. p. 863. T. dichótomum, Ruiz et Pav. syst. fl. per. p. 118. This species is very nearly allied to *T. pàtens*, but differs in the flowers being yellow, not red or purple, as in that plant, and the plant is probably biennial.

Reflexed Talinum. Fl. Aug. Oct. Clt. 1800. Pl. 1 foot.

8 T. cuneifòlium (Willd. spec. 2. p. 864.) stem shrubby, erect; leaves flat, wedge-shaped, obtuse, mucronate; panicle terminal; lower peduncles 3-flowered. ♄. D. G. Native of Arabia Felix, about Surdud and Hadie; and also of the East Indies. Portulàca cuneifòlia, Vahl. symb. 1. p. 33. Orígia portulacifòlia, Forsk. descript. p. 103. Flowers of a reddish violet-colour.

Wedge-leaved Talinum. Fl. July, Aug. Clt. 1820. Sh. 1½ ft.

9 T. polygaloìdes (Gill. mss. ex Arnott, in Cheek, edinb. journ. vol. 3. p. 354.) stem shrubby, erect, branched a little; branches striated, angular; leaves flat, linear, mucronate (when dry very narrow, with revolute edges); peduncles bibracteate at the base, when bearing the fruit deflexed, axillary, emulating a simple raceme. ♄. D. G. Native of Chili, in the Jarillal, and along the foot of the mountains near Mendoza, at an elevation of 3000 to 4000 feet above the sea. Flowers about a fourth of an inch in diameter, yellow, fading to red. The stem appears not to be at all fleshy, according to the dried specimens.

Polygala-like Talinum. Pl. ¼ to ½ foot.

Sect. III. Taline'llum (a diminutive of *Talinum*). D. C. prod. 3. p. 358.—Talìnum, Ruiz et Pav. syst. fl. per. p. 65. Style thick. Stigmas 3, thick, flattish.—Generally annual herbs; and probably should have been joined with the genus *Calandrínia*.

10 T. revolu'tum (H. B. et Kunth, nov. gen. amer. 6. p. 76.) stem erect, simple; leaves glabrous, lanceolate, obtuse, narrowed at the base, with revolute margins; peduncles terminal, somewhat dichotomous, few-flowered; petals awned, glandular towards the base. ⊙. F. Native of South America, in shady places near Cumana. Flowers yellow. Stamens about 48. Fruit unknown.

Revolute-leaved Talinum. Pl. ½ foot.

11 T. mucrona'tum (H. B. et Kunth, l. c.) stems erectish: leaves glabrous, oblong or oblong-lanceolate, obtuse, somewhat mucronate, cuneated, and narrowed at the base; peduncles terminal, 2-3-cleft, many-flowered; flowers racemose; petals mucronate. ⊙. D. F. Native of New Andalusia, near Bordones, in shady humid places. Petals yellow, length of calyx. Stamens about 50.

Mucronate-leaved Talinum. Pl. ½ to ¾ foot.

12 T. polya'ndrum (Ruiz et Pav. syst. fl. per. p. 115.) leaves roundish-obovate, acuminated; flowers racemose, polyandrous; petals obcordate, quite entire. ⊙. F. Native of Peru, on the hills called Lomas towards Pongo. Herb a foot high, noxious to cattle. The rest unknown.

Polyandrous Talinum. Pl. 1 foot.

13 T. crena'tum (Ruiz et Pav. l. c.) leaves roundish-obovate, acuminated; flowers racemose; petals crenulated; stamens about 20.—Native of South America, on hills about Pongo in the province of Atiquipa. Herb a foot high, and is called by the natives *Langua de Vaca*, as well as the preceding plant. The rest unknown.

Crenated-petalled Talinum. Pl. 1 foot.

14 T. Menzie'sii (Hook. fl. amer. bor. 1. p. 223. t. 70.) caulescent; leaves linear-spatulate: lower ones on long petioles; margins naked: superior ones and sepals acutely keeled, glandularly ciliated on the back; flowers pedunculate, axillary. ⊙. H. Native of the north-west coast of America, south of Columbia. The habit is that of a species of *Talìnum*, without having seen the flowers; it may, however, when better examined turn out to be a species of *Calandrínia*. Root annual, rather fusiform.

Menzies's Talinum. Pl. ½ foot.

Cult. Pretty succulent plants, most of which require the heat of a stove; a mixture of loam, peat, and sand, or any light soil will suit them; and cuttings of them are very readily rooted. The seeds of the annual species may be reared on a hot-bed, and afterwards planted out in the open border about the end of May.

VII. LEWI'SIA (in honour of Captain M. Lewis, who accompanied Captain Clarke to the Rocky Mountains of North America). Pursh. fl. amer. sept. 2. p. 368. Hook. in bot. misc. 1. p. 345. t. 70. fl. bor. amer. 1. p. 223.

Lin. syst. *Dodecándria, Monogýnia.* Calyx of 5 sepals: sepals rather membranous. Petals 9-12, inner ones gradually the smallest. Stamens 12-16, hypogynous; anthers linear. Ovarium globose. Ovula many, fixed to a free central receptacle. Style deeply 6-parted: segments filiform; stigmas obtuse.—Plant herbaceous, stemless. Roots fascicled. Leaves terete, fleshy. Scapes 1-flowered.

1 L. redivìva (Pursh. l. c. Hook. l. c.) ♃. H. Native of North America.

Var. α; root blood-coloured; flowers white. Native on the banks of Clarke's river.

Var. β; root white; flowers rose-coloured. Native of the subalpine regions of the Rocky Mountains, on the west side, and abundant at the junction of the Spokan river with the Columbia, on dry stony rocks; also of the Flathead and Salmon rivers, in similar situations. The roots of this variety are gathered in great quantities by the Indians on the west side of the Rocky Mountains, and highly valued on account of their nutritive qualities. They are boiled and eaten as salep or arrow-root, and are admirably calculated for carrying on long journeys; two or three ounces a day being quite sufficient for a man, even while undergoing great fatigue. Perfect flowers of the plant have not yet been seen by any botanist, and therefore the genus is not well known; and probably may hereafter verge into *Talìnum*.

Revived Lewisia. Clt. 1826. Pl. $\frac{1}{2}$ foot.

Cult. A mixture of loam and brick-rubbish will be a good soil for this plant; and it may be propagated by dividing the plant at the root, by cuttings, or by seeds.

VIII. CALANDRI'NIA (in honour of L. Calandrini, an Italian botanist, who lived in the beginning of the 18th century). H. B. et Kunth, nov. gen. amer. 6. p. 77. D. C. prod. 3. p. 358.—Cósmia, Domb. mss. Juss. gen. 312.—Geúnsia, Moc. et Sesse, fl. mex. icon. ined.—Phacospérma, Haw. in phil. jour. 1827. p. 124.

Lin. syst. *Dodecándria, Monogýnia.* Calyx permanent, bipartite (f. 18. *a.*); sepals roundish-ovate. Petals 3-5 (f. 18. *b.*), hypogynous, or inserted in the bottom of the calyx, distinct or connected together at the very base, equal. Stamens 4-15, inserted in the torus or base of the petals, distinct, generally alternating with the petals. Style 1, very short, tripartite at the apex; lobes collected into a clavately capitate stigma (f. 18. *c.*). Capsule oblong-elliptic, 1-celled, 3-valved, many-seeded. Seeds adhering by capillary funicles to the central placenta.—Succulent or fleshy glabrous American herbs, having the habit of *Sámolus*. Leaves quite entire, radical or alternate. Pedicels 1-flowered, axillary or opposite the leaves. This genus hardly differs from *Talìnum*, as far as its characters are yet known.

* *Stamens* 10-15.

1 C. panicula'ta (D. C. prod. 3. p. 358.) plant caulescent, branched; leaves obovate-oblong, acuminated; flowers panicled; pedicels 5 times longer than the bracteas. ⊙. F. Native of Peru, in the province of Chancay, commonly called Lomas, on sandy hills; and in the province of Atiquipa, at Pango, where the plant grows a foot high, and is called there *Orejas de Perro* and *Castannuelas*. Talìnum paniculàtum, Ruiz et Pav. syst. fl. per. p. 115. Portulàca carnòsa, Domb. herb. Leaves glabrous, fleshy. Stem erect, paniculately branched at the apex. Sepals 2, ovate, permanent. Stamens 10-15. Capsule 3-valved, length of the calyx. Flowers purple.

Panicled Calandrinia. Fl. July, Aug. Clt. 1816. Pl. 1 foot.

2 C. lingula'ta (D. C. l. c.) plant caulescent, and branched from the base; leaves linear, tongue-shaped; flowers panicled. ⊙. F. Native of Peru, at Chancay near Jequan, in sandy places. Talìnum lingulàtum, Ruiz et Pav. fl. per. p. 115. Portulàca lineàris, Domb. Sepals 2, ovate, permanent. Stamens 10-15. Capsule 3-valved, shorter than the sepals.

Tongue-leaved Calandrinia. Pl. 1 foot.

3 C. cistiflòra (Gill. mss. ex Arnott, in Cheek, edinb. jour. 3. p. 355.) glabrous; stem ascending, suffruticose; branches leafy at the base, and nearly naked towards the apex; leaves linear-lanceolate, acutish; raceme terminal, few-flowered; pedicels elongated; bracteas minute, foliaceous: sepals ovate, acute; stamens numerous. ♄. D. G. Native on the Andes of Mendoza and Chili, in many places at an elevation above the sea, from 9,000 to 10,000 feet. The flowers are pretty large, and purple. It ranks near *C. lingulàta*.

Rock-rose-flowered Calandrinia. Pl. ascending.

4 C. affìnis (Gill. mss. ex Arnott, in Cheek, edinb. journ. 3. p. 355.) plant glabrous and stemless; leaves elongated, linear, obtuse, attenuated into the petiole; indurated bases of petioles imbricated and dilated; peduncles radical, 1-flowered, naked, one-half shorter than the leaves. ♃. D. G. Native on the Andes of Chili, at El Serro de San Pedro Nolasco. This species is closely allied to *C. acaúlis*, but differs in the flowers having numerous stamens.

Allied Calandrinia. Pl. $\frac{1}{4}$ foot.

5 C. capita'ta (Hook. et Arn. in bot. misc. 3. p. 244.) root annual; stems erectish, smooth, and nearly simple; leaves linear, smoothish, ciliated; racemes capitate, many flowered, terminal, and axillary, pedunculate; flowers nearly sessile; sepals roundish, tridentate at the apex, beset with long pili on the back. ⊙. F. Native on the Cordillera of Chili, and near Collina.

Capitate-flowered Calandrinia. Pl. $\frac{1}{2}$ foot.

6 C. ramosíssima (Hook. et Arn. in bot. misc. 3. p. 244.) root annual; stems many from the same neck, leafy, branched; axillary branches horizontal; leaves linear, pilose, ciliated with long hairs at the base; racemes short, few-flowered; sepals roundish, truncate, bluntly tridentate at the apex, and beset with long pili on the back. ⊙. F. Native of Chili, about Valparaiso.

Much-branched Calandrinia. Pl. $\frac{1}{2}$ to 1 foot.

7 C. Cumíngii (Hook. et Arn. in bot. misc. 3. p. 244.) root slender, annual; stems many from the same root, procumbent, leafy, dichotomously branched; leaves linear, attenuated at the base, beset with adpressed hairs; racemes few-flowered, terminal; sepals roundish, tridentate at the apex, pilose on the back. ⊙. F. Native of Chili, about Valparaiso; and on the Cordillera of Chili. The upper part of the stems, racemes, and calyxes are beset with glandular viscid hairs. The whole plant has a purplish hue. In character this species approaches near to *C. ramosíssima*, but in habit they are very distinct.

Cuming's Calandrinia. Pl. procumbent.

8 C. umbella'ta (D. C. prod. 3. p. 358.) stem erectish, nearly naked; leaves radical, linear, acute, pilose; corymb cymose, terminal, many-flowered; bracteas ciliated. ⊙. F. Native of Chili, at Conception in sandy places. Talìnum umbellàtum, Ruiz et Pav. syst. fl. per. p. 117. Portulàca prostràta, Domb. herb. Sepals nearly orbicular, permanent. Stamens 10-15. Ovarium prismatically conical, tapering a long way. Habit almost of a species of *Andrósace*.

Umbellate-flowered Calandrinia. Pl. $\frac{1}{2}$ foot.

9 C. pí'cta (Gill. mss. ex Arn. in Cheek, edinb. journ. 3. p. 356.) plant caulescent, sparingly branched, perennial, glabrous; leaves obovately spatulate, attenuated into the petiole at the base, glaucous; corymb cymose, terminal; pedicels much exceeding the bracteas, which are roundish, membranous, and edged with purple; sepals roundish, reticulated by purple; stamens numerous. ♃. D. G. Native on the Andes of Mendoza, in many places at the elevation of 10,000 feet above the sea. This is one of the most beautiful of the species; and according to habit comes near *C. glaúca*, but differs in the stamens being numerous.

Painted Calandrinia. Pl. 1 foot.

10 C. arena'ria (Cham. mss. ex Hook. et Arn. in bot. misc. 3. p. 246.) plant glaucous; stems numerous, prostrate, glabrous, leafy; leaves linear; common peduncle terminal, naked, simple or branched; racemes corymbose; pedicels a little longer than the bracteas; bracteas oval, membranous, painted by a dark purple branched middle nerve; seeds glabrous. ⊙. ? F. Native of Chili, about Valparaiso. Closely allied to C. pícta, Gill. but very distinct from it.

Sand Calandrinia. Pl. prostrate.

11 C. LINEARIFÒLIA (D. C. prod. 3. p. 359.) stem ascending, a little branched at the base; branches erect, radical and cauline leaves linear, glabrous, bluntish; corymb terminal, a little branched; calyx glandular. ♃. D. G. Native of South America. Perhaps the same as Talìnum lineàre, H. B. et Kunth, nov. gen. amer. 6. p. 77. which is found in the arid valleys of Mexico.

Linear-leaved Calandrinia. Pl. ascending.

12 C. PILOSIU'SCULA (D. C. l. c.) stems erectish, angular, rather pilose; leaves linear-spatulate, rather pilose; pedicels axillary, 1-flowered, rather adnate to the floral leaves, constituting a terminal or subterminal panicle. ⊙. F. Native of Chili, about Conception. Lindl. in hort. trans. 6. p. 291. T. ciliàtum, Hook. exot. fl. 1. t. 82. but not of Ruiz et Pav. Talìnum lineàre, Hoffm. verz. 1827. p. 217. Flowers rose-coloured. Stigmas 3, rose-coloured, nearly as in *Papàver*, having the styles radiating at the apex. Stamens 10-15, not 5, as in *Talìnum ciliàtum* of Ruiz et Pav.

Hairy Calandrinia. Fl. Aug. Clt. 1823. Pl. ½ to 1 foot.

13 C. SERI'CEA (Hook. et Arn. in bot. misc. 3. p. 244.) root perennial, woody, with a multiple neck; stems erectish, very leafy at the base; leaves linear, acute or subulate, clothed with silky hairs; raceme few-flowered, corymbose; upper pedicels hardly equal in length to the bracteas; sepals ovate, tridentate at the apex, clothed with long silky villi; stamens numerous. ♃. D. G. Native of Chili.

Var. α, *lóngipes* (Hook. et Arn. l. c.) lower pedicel elongated, slender, much longer than the rest and the bractea. On Sierra Bella Vista, and Acancugua; and on the Cordillera of Chili.

Var. β, *æ'quipes* (Hook. et Arn. l. c.) pedicels all nearly equal. Near Collina and Questa. In both varieties the leaves vary much in length, from 1 to 2 or even 3 inches.

Silky Calandrinia. Pl. 1 foot.

14 C. TENE'LLA (Hook. et Arn. in Beech. bot. p. 24.) stems ascending, branched at the base; leaves narrow-linear, glabrous; racemes terminal, branched; sepals glabrous, triangular, cordate, acuminated. ⊙.? G. Native of Chili, at Valparaiso. Very closely allied to *C. pilosiúscula*, but differs from it in being quite glabrous and in its smaller size. This is said to be only a variety of *C. pilosiúscula*. Hook. et Arn. in bot. misc. 3. p. 245.

Weak Calandrinia. Pl. ascending.

15 C. PHACOSPE'RMA (D. C. l. c.) stems weak, somewhat hexagonal; leaves linear-lanceolate, hispid on the margins; flowers racemose. ♂. F. Native of Peru. Phacospérma Peruviàna, Haw. in phil. journ. 1827. p. 124. Tetragònia Peruviàna, hort. Chelsea, ex Haw. Flowers reddish. Peduncles erect, shorter than the foliaceous bractea. Sepals quadrangular, curled. Stigma 6-lobed.

Lentil-seeded Calandrinia. Fl. June, July. Clt. 1820. Pl. 1 to 3 feet.

* * *Stamens from* 1 *to* 9.

16 C. CAULE'SCENS (H. B. et Kunth, nov. gen. amer. 6. p. 78. t. 526.) plant caulescent and branched; leaves alternate, spatulately lanceolate, acute; pedicels axillary and opposite the leaves, 1-flowered, bractless. ⊙. F. Native of Quito, near Chillo, and near the city of Mexico. Geúnsia ròsea, Moc. et Sesse, fl. mex. icon. ined. Talìnum caulèscens, Spreng. syst. 1. p. 453. Cósmia montàna, Domb. herb. Stem diffuse or procumbent. Flowers rose-coloured.

Caulescent Calandrinia. Pl. pr.

17 C. PROCU'MBENS (Moris. hort. taur. sem. 1831.) glabrous, caulescent, filiform, procumbent, branched; leaves succulent, linear, obtuse, alternate; pedicels axillary, and opposite the leaves; sepals triangular; flowers triandrous or hexandrous; capsule 3-celled. ⊙. H. Native of South America. This species differs from *C. compréssa* of Schrad. in being glabrous, in the stems being procumbent, in the stamens being 3-6, and in the sepals not being cordate at the base, &c.

Procumbent Calandrinia. Pl. pr.

18 C. COMPRE'SSA (Schrad. in litt. ex D. C. l. c.) plant caulescent and succulent; leaves linear, ciliated; flowers racemose; calyx compressed; sepals triangular, cordate, unequal, acuminated. ⊙. F. Native of Chili. Plant a span high, erect, simple, or somewhat divided, with short hairs on the peduncles and calyxes. Leaves obtuse, marked with a longitudinal line above, somewhat keeled beneath: radical ones 1½ or 2 inches long. Pedicels an inch and a half long. Flowers small, purple. Stamens 3-4. Capsule 3-4-valved. Schrad. mss.

Var. β, *adscéndens* (D. C. l. c.) plant smaller; stem ascending. Talìnum adscéndens, Hort. berol.

Compressed-calyxed Calandrinia. Pl. ½ foot.

19 C. DENTICULA'TA (Gill. mss. ex Hook. et Arn. in bot. misc. 3. p. 243.) plant glabrous; stem suffruticose, leafy; leaves lanceolate, acute, attenuated at the base; raceme terminal, 1-3 or few-flowered; pedicels elongated; sepals roundish-ovate, with denticulately-serrated margins. ♄. D. G. Native of Chili, along with *C. andícola*. The lower part of the stem is much branched.

Denticulated-calyxed Calandrinia. Shrub 1 foot?

20 C. ANDÍCOLA (Gill. mss. ex Hook. et Arn. in bot. misc. 3. p. 242.) plant wholly glabrous; stem suffruticose, leafy towards the apex: leaves cuneate-oblong, acute, attenuated at the base; raceme terminal, 1-3 or few-flowered; pedicels elongated; sepals roundish, hardly mucronulate at the apex, with quite entire margins; petals a little longer than the calyx; flowers with few stamens. ♄. D. G. Native of Chili, on the eastern side of the Cumbre, and at El Alto de la Laguna. Closely allied to *C. cistiflòra*, but apparently quite distinct. From *C. denticulàta* it can only be distinguished by the entire margins of the sepals.

Andes Calandrinia. Pl. ½ to 1 foot.

21 C. ACAU'LIS (H. B. et Kunth, l. c.) plant stemless; leaves elongated, linear, obtuse; peduncles radical, 1-flowered, bibracteate in the middle, one half shorter than the leaves. ♃. D. G. Native of Quito, on Mount Rucu-Pichincha, in humid places. Cósmia prostràta, Domb. herb.

Stemless Calandrinia. Pl. ¼ foot.

22 C. TRÍFIDA (Hook. et Arn. in bot. misc. 3. p. 243.) root annual, slender; stems erectish, simple, rather leafy, pilose; leaves linear, acute, pilose; radical ones elongated; upper cauline ones edged with long hairs, embracing a few flowers in their axils; raceme corymbose, dense, terminal; bracteas ciliated with long hairs: lower ones exceeding the racemes; sepals ovate, trifid at the apex, with a few hairs on the back, but more numerous on the margins; stamens 5. ⊙. H. Native of Chili, about Valparaiso. This and *C. Gillièsii* and *C. sericea* seem closely allied to *C. umbellàta*.

Trifid-bractead Calandrinia. Pl. ½ foot.

23 C. GILLIE'SII (Hook. et Arn. in bot. misc. 3. p. 243.) root perennial, woody, with a multiple neck; stems erectish, simple, very leafy at the base, but sparingly so at the apex; leaves oblong-linear, beset with adpressed hairs; raceme corymbose; lower bracteas hardly equal in length to the pedicels; sepals ovate, somewhat tridentate at the apex, and beset with long pili on the back; stamens 5. ♃. D. G. Native of the Andes, of Mendoza, and Chili; Cordillera of Chili; and Los Ojos de Aqua. C. umbellàta, Gill. mss.

Gillies's Calandrinia. Pl. ½ foot.

24 C. DIFFU'SA (Gill. mss. ex Arnott, in Cheek, edinb. journ.

3. p. 355.) plant caulescent, glabrous, diffuse; branches leafy at the base and nakedish at the top, 1-2-flowered; leaves spatulate-lanceolate, acute, quite entire; flowers terminal; sepals orbicular, quite entire. ♄. D. G. Native of the Andes of Chili, near El Paso de los Peuquenes, at an elevation above the sea of 10,000 feet. The number of stamens in the flowers of this species has not been determined.

Diffuse Calandrina. Pl. 1 foot.

25 C. glau'ca (Schrad. in litt. ex D. C. l. c.) plant caulescent, glabrous; leaves spatulate-lanceolate, acute, fleshy, glaucous; racemes few-flowered; fruit-bearing peduncles, 1½ inch long, reflexed; bracteas ovate, acute, membranous, and spotted with purple. ♃. D. G. Native of Chili. Stem a foot high. Leaves an inch and a half long, thick, tapering into the petioles. Flowers a little larger than those of *C. compréssa*. Sepals broadly ovate, purple, concave, reticulated with black. Capsule larger than the calyx, 3-valved. (Schrad. mss.)

Glaucous Calandrinia. Pl. 1 foot.

26 C. confe'rta (Gill. mss. ex Arnott, in Cheek, edinb. journ. 3. p. 356.) plant caulescent, perennial, glabrous; branches numerous from the neck of the root, simple, leafy at the base, nakedish towards the apex; leaves narrowly spatulate, glaucous; racemes crowded, terminal; pedicels hardly longer than the bracteas; sepals broadly ovate; flowers with few stamens, 3-4. ♃. D. G. Native on the Andes of Mendoza, at El Portezuela del Valle Hermosa.

Crowded racemed Calandrinia. Pl. 1 foot.

27 C. cæspitòsa (Gill. mss. ex Arnott, in Cheek, edinb. journ. 3. p. 356.) plant tufted, stemless; leaves linear-spatulate; peduncles radical, 1-flowered, naked, 3-times longer than the leaves; sepals broadly ovate; flowers with few stamens; stigmas 4-5; capsule 4-5-valved. ♃. D. G. Native on the Andes of Mendoza and Chili, and many places, at the elevation above the sea of from 9000 to 11,000 feet.

Tufted Calandrinia. Fl. Mar. April. Pl. tufted.

28 C. grandiflòra (Lindl. bot. reg. t. 1194.) plant glaucous; stem suffruticose; leaves fleshy, rhomboid, acute, petiolate; raceme simple, loose; calyx spotted; stamens numerous; petals obcordate. ♃. D. G. Native of Chili. Flower of a rose-purple colour. (f. 18.)

FIG. 18.

Great-flowered Calandrinia. Fl. Ju. Jul. Clt. 1826. Pl. 1 ft.

29 C. cilia'ta (D. C. l. c.) leaves linear-oblong, ciliated; flowers solitary, always pentandrous. ⊙. F. Native of Peru, at Huassa-Huassi, among rubbish and in cultivated fields. Talìnum ciliàtum, Ruiz et Pav. syst. p. 116. prod. p. 65. but not of Hook. Flowers purple.

Ciliated-leaved Calandrinia. Pl. ½ foot.

30 C. ? a'lba (D. C. prod. 3. p. 359.) leaves spatulate-lanceolate; flowers axillary, solitary, pentandrous. ⊙.? F. Native of Peru, about Chancay and Lima, among rocks. Herb a foot high. Talìnum álbum. Ruiz et Pav. l. c. Flowers white.

White-flowered Calandrinia. Pl. 1 foot.

31 C. nítida (D. C. l. c.) stems ascending, glabrous, leafy; leaves oblong-spatulate, acutish, glabrous, attenuated at the base; peduncles axillary, solitary, shorter than the leaves; sepals roundish, obtuse, pilose on the backs; stamens 1-9. ⊙. F. Native of Chili, in fields and waste places, at Conception, in the tract of Hualpen and Moquita; also about Valparaiso and Quillota. Herb half a foot high. Talìnum nítidum, Ruiz et Pav. l. c.

Nitid Calandrinia. Pl. ½ foot.

32 C. mona'ndra (D. C. l. c.) leaves spatulate-lanceolate; flowers in spikes, secund, monandrous. ⊙.? F. Native of Chili, on arid hills about Conception, near the river Andalien. Talìnum monándrum, Ruiz et Pav. l. c. Herb a hand and a half high.

Monandrous Calandrinia. Pl. ¾ foot.

Cult. Calandrínia is a fine genus of succulent plants; their culture and propagation are the same as that recommended for the species of *Talìnum*, p. 77. The seeds of annual species may be sown in a hot-bed in spring, and the plants planted out into the open border, in a dry sheltered situation, about the end of May.

IX. PORTULACA'RIA (altered from *Portulàca*). Jacq. coll. 1. p. 160. D. C. prod. 3. p. 360.—Hæ'nkea, Salisb. prod. p. 174.—Anacámpseros species, Lin. hort. cliff.

Lin. syst. *Pentándria, Monogýnia*. Calyx of 2 permanent membranous sepals. Petals 5, permanent, equal, obovate, hypogynous. Stamens 5, inserted with the petals, but disposed without any respect to the number of petals, hence there are probably 10, 5 of which are abortive; anthers short, usually barren. Ovarium ovate-triquetrous. Style wanting; stigmas 3, spreading, muricated with glands on the upper side. Fruit triquetrous, winged, indehiscent, 1-seeded.—A glabrous shrub, native of Africa. Leaves opposite, roundish-obovate, flat, fleshy. Peduncles opposite, denticulated, compressed; pedicels 1-flowered, 3 rising from each notch in the peduncle. Flowers small, rose-coloured. Fabric of seeds unknown.

1 P. A'fra (Jacq. l. c. t. 22.). ♄. G. Native of the South of Africa. D. C. pl. grass. t. 132. Claytònia Portulacària, Lin. mant. p. 211. Lam. ill. t. 144. f. 2. Crássula Portulacària, Lin. spec. p. 406. Hæ'nkea crassifòlia, Salisb. prod. 174. Portulàca fruticòsa, Thunb. fl. cap. p. 399. exclusive of the synonyms.—Dill. hort. elth. 1. t. 101. f. 120. The plant seldom flowers in the gardens: at Genoa in the garden of Grimaldi.

African Purslane-tree. Clt. 1732. Shrub 3 to 6 feet.

Cult. This plant will grow in any dry light soil; and young cuttings will root readily in sand under a hand-glass.

X. U'LLUCUS (*Ulluco* or *Melloco* is the name of the plant in Quito). Lozano, in senan. nuov. gran. 1809. p. 185. D. C. prod. 3. p. 360.

Lin. syst. *Pentándria, Monogýnia*. Calyx of 2 opposite, roundish, concave, pellucid, coloured, deciduous sepals. Petals 5, longer than the calyx, cordate, attenuated at the apex, connected at the base into a short tube. Stamens 5; filaments very short, erect; anthers 2-celled, erect. Ovarium sub-globose. Style filiform, length of stamens; stigma simple. Capsule 1-celled. Seed one, oblong.—Herb smooth. Root tuberous. Stem branched, angular. Leaves alternate, cordate, quite entire, thick, petiolate. Flowers disposed in a terminal, simple, drooping raceme. Pedicels furnished with very short bracteas.

1 U. tuberòsus (Loz. l. c.). ♃. D. G. Native of South America, in the province of Quito, growing in gardens, where it is called *Ulluco* or *Melloco*. The root is mucilaginous and eatable.

Tuberous-rooted Ullucus. Pl. 1 foot.

Cult. For the culture and propagation of this succulent plant see *Anacámpseros*, p. 76.

XI. CLAYTO'NIA (in honour of John Clayton, who collected plants, mostly in Virginia, and sent them to Gronovius, who published them in his Flora Virginica). Lin. gen. 287.

Juss. gen. 314. Lam. ill. t. 144. Gærtn. fr. 2. p. 220. t. 129. St. Hil. mem. mus. 2. p. 197. t. 4. f. 15.—Límnia, Lin. act. ups. 1746. p. 130.—Claytònia and Límnia, Haw. syn. p. 11.

Lin. syst. *Pentándria, Monogýnia.* Calyx of 2 oval, opposite, permanent sepals (f. 20. *a.* f. 19. *b.*). Petals 5, obcordate (f. 20. *b.*), or obovate (f. 19. *a.*), hypogynous, equal, unguiculate; claws connate at the base. Stamens 5 (f. 20. *b.*), inserted at the claws of the petals. Ovarium sessile. Style 1, trifid at the apex; lobes stigmatose inside. Capsule 1-celled, 3-valved, 3-seeded. Seeds sessile.—Herbs glabrous, rather succulent, usually perennial. Leaves quite entire: radical ones petiolate; upper usually opposite and sessile, and sometimes connate. Racemes terminal. Flowers white or rose-coloured.

§ 1. *Scape with 2 opposite leaves, which are sometimes connate.*

* *Roots fibrous, annual.*

1 C. perfolia'ta (Donn, hort. cant. p. 25.) leaves without nerves: upper ones connate or perfoliate, forming a roundish disk; radical leaves petiolate, oval-rhomboid; lower pedicels of raceme in bundles; petals entire or somewhat emarginate. ⊙. H. Native of Mexico, on the mountains of St. Augustin; and on the rocky mountains in North America; also of Cuba, if *C. Cubénsis*, Bonpl. ann. mus. 7. p. 82. t. 6. pl. equin. t. 26. be the same.—Sims, bot. mag. 1336. Límnia perfoliàta, Haw. syn. p. 12. Flowers small, white. Root fibrous. Leaves edible, and used like those of the *Purslane.*

Perfoliate Claytonia. Fl. May, Aug. Clt. 1794. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

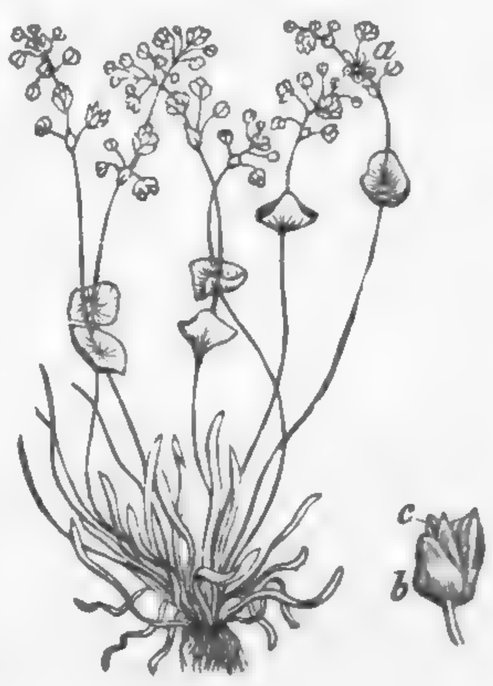
2 C. alsinòides (Sims, bot. mag. 1309.) root fibrous; leaves reticulately veined, rhomboid, acute; upper leaves opposite, sessile, ovate, mucronate: radical ones petiolate, ovate, acuminated; pedicels of raceme for the most part solitary, bractless; petals emarginate. ⊙. H. Native of the north-west coast of America, at the sources of the Columbia; particularly plentiful about Indian villages, where it seems to hold the place of chickweed in our country. Flowers white.

Var. β, *ròsea* (D. C. prod. 3. p. 361.) flowers rose-coloured; leaves almost nerveless. ⊙. H. Native of Nootka Sound. C. Sibírica, Sims, bot. mag. 2243. Sweet, br. fl. gard. t. 16. but not of Pall.

Chickweed-like Claytonia. Fl. Mar. June. Clt. 1794. Pl. $\frac{1}{2}$ foot.

3 C. Unalasche'nsis (Fisch. in Rœm. et Schultes, syst. 5. p. 434.) leaves nerved: upper ones opposite, sessile, rhomb-ovate: radical ones petiolate, ovate-lanceolate, acuminated; racemes twin; bracteas ovate; pedicels solitary, twice longer than the bracteas; petals emarginately bifid. ⊙. H. Native of the Island of Unalaschka, in humid sandy places. C. bífida, Willd. herb. The petals are said to be white in the dried state.

FIG. 19.



Unalaschka Claytonia. Fl. Mar. Jul. Clt. 1820. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

4 C. parviflòra (Dougl. mss. ex Hook. fl. bor. amer. 1. p. 225. t. 73.) root fibrous; radical leaves numerous, linear-spatulate, 3-nerved, with anastomosing veins, on long petioles; the 2 cauline ones joined into a perfoliate, ovate leaf, which is reticulately veined; racemes solitary, rather compound, unibracteate. ⊙. H. Native of North America, abundant along the course of the Columbia, in open parts of the forest, where wood has been burnt, or the ground turned up by deer. Flowers rose-coloured and white. This species differs from *C. perfoliàta* in its linear-spatulate radical leaves, ovate bracteas, and profusion of small flowers. (f. 19.)

Small-flowered Claytonia. Pl. $\frac{1}{4}$ foot.

5 C. spatula'ta (Dougl. mss. ex Hook. fl. amer. bor. 1. p. 226. t. 74.) plant minute; root fibrous; radical leaves numerous, narrow, linear-spatulate; the 2 cauline ones ovate, acute, and sessile; racemes solitary, unibracteate; petals entire. ⊙. H. Native of the north-west coast of America, in the valleys of the Rocky Mountains. Corolla longer than the calyx. Stems many from the same root. This is the smallest of all the species.

Spatulate-leaved Claytonia. Pl. $\frac{1}{8}$ foot.

6 C. sarmentòsa (Meyer. nov. pl. in mem. acad. de Mourou. vol. 17.) sarmentose; leaves nerved: radical ones oblong, obtuse, petiolate: cauline ones ovate, somewhat cordate, stem-clasping, but distinct: racemes terminal, solitary, bractless; petals emarginate.—Native of St. George, one of the Aleutian Islands.

Sarmentose Claytonia. Pl. sarmentose.

* * *Roots tuberous or fusiform.*

7 C. Virgi'nica (Lin. spec. 394.) leaves all narrow, linear, obsoletely 3-nerved, with anastomosing veins: radical ones very few; racemes solitary, nodding; pedicels elongated: lower ones bracteate; petals emarginate. ♃. H. Native of North America, in New England, Virginia, and Carolina, in humid woods; and of Kotzebue's Sound. The leaves of the plant, from the last-mentioned habitat, are remarkable for their broadness. Pluk. alm. t. 102. f. 3. Flowers white.

Virginian Claytonia, Fl. Mar. Aug. Clt. 1768. Pl. $\frac{1}{4}$ ft.

8 C. grandiflòra (Sweet, fl. gard. t. 216.) root tuberous: leaves linear-lanceolate, attenuated at both ends; racemes solitary, many-flowered; petals oval, obtuse, entire; sepals very blunt. ♃. H. Native of North America, near Montreal, and on the Saschatchawan. C. Virgínica, var. β, mèdia, D. C. prod. 3. p. 361. D. C. pl. grass. t. 131. Flowers pink or rose-coloured, with darker branched veins, and a yellow spot on the claw.

Great-flowered Claytonia. Fl. Mar. May. Clt.? Pl. $\frac{1}{4}$ foot.

9 C. acutiflòra (Sweet, hort. brit. edit. 2.) root tuberous; leaves all long, linear-lanceolate, 3-nerved, with anastomosing veins; racemes solitary, nodding: pedicels elongated: lower ones bracteate; petals elliptic, entire, acute at both ends; sepals acutish. ♃. H. Native of North America, in humid parts of woods. C. Virgínica, Sims. bot. mag. 941. C. Virgínica, var. *a*, acutiflòra, D. C. prod. 3. p. 361. Flowers white.

Acute-flowered Claytonia. Fl. Mar. May. Clt.? Pl. $\frac{1}{4}$ ft.

10 C. Carolinia'na (Mich. fl. bor. amer. 1. p. 175.) root tuberous; radical leaves subspatulate: cauline ones oblong; racemes solitary, nodding; pedicels elongated: lower ones bracteate; petals obovate, somewhat emarginate; sepals very blunt. ♃. H. Native of North America, in Carolina. C. spatulæfòlia, Salisb. prod. p. 71. C. Virgínica γ, spatulæfòlia, D. C. prod. 3. p. 361. Flowers pink or rose-coloured.

Carolina Claytonia. Fl. Mar. May. Clt. 1789. Pl. $\frac{1}{4}$ foot.

11 C. lanceola'ta (Pursh, fl. bor. amer. 1. p. 175. t. 3.) root tuberous; radical leaves very few, oblong, on long petioles: cauline ones elliptic, sessile, all 3-nerved, with anastomosing veins; racemes solitary, nodding; pedicels elongated: lower ones bracteate; petals deeply emarginate. ♃. H. Native of North America, in the valleys of the Rocky Mountains, in a rich soil; and perhaps in Eastern Siberia. Flowers large, white. It is very nearly allied to *C. Vestiàna* of Fisch.

Lanceolate-leaved Claytonia. Fl. Mar. May. Clt. 1812. Pl. $\frac{1}{4}$ foot.

12 C. A'rctica (Adams, act. mosc. 5. p. 94.) leaves nerve-

less, fleshy; cauline ones sessile, ovate; radical ones petiolate, subspatulate; racemes secund; petals obovate, somewhat emarginate. ♃. H. Native of Arctic Siberia, towards the mouth of the Lena. C. Chamissòi, Led. ex Spreng. syst. 1. p. 790. Flowers large, white, or pale yellow, with an orange throat.

Arctic Claytonia. Pl. $\frac{1}{4}$ foot.

13 C. Vestia'na (Fisch. in litt.) root tuberous; leaves veinless: radical ones oblong: cauline ones opposite, nearly sessile; stem dichotomous; peduncles long, somewhat corymbose; petals entire. ♃. H. Native of Siberia. C. Joanniàna, Rœm. et Schultes, syst. 5. p. 434. This species differs from the true *C. Sibírica* in the leaves being narrower, in the petals being white, and in the inflorescence. Flowers secund, at first nodding. Calycine lobes obtuse. Corolla appearing as if it were pedicellate.

Vest's Claytonia. Fl. Mar. Aug. Clt. 1827. Pl. $\frac{1}{4}$ foot.

14 C. acutifòlia (Pall. ex. Willd. rel. in Rœm. et Schultes, syst. 5. p. 436.) leaves oblong, nerved, acute; petals emarginate; branches numerous from the sides of the root. ♃. H. Native of Eastern Siberia. Flowers white. Stems 3-4 hands high.

Acute-leaved Claytonia. Fl. May, Ju. Clt. 1827. Pl. $1\frac{1}{2}$ ft.

15 C. tuberòsa (Pall. ex Willd. rel. in Rœm. et Schultes, 5. p. 436.) root tuberous; leaves linear-lanceolate, attenuated; petals retuse. ♃. H. Native of Kamtschatka and Eastern Siberia, among hypnums. Leaves 2, alternate. Tubers edible, like a potatoe.

Tuberous-rooted Claytonia. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

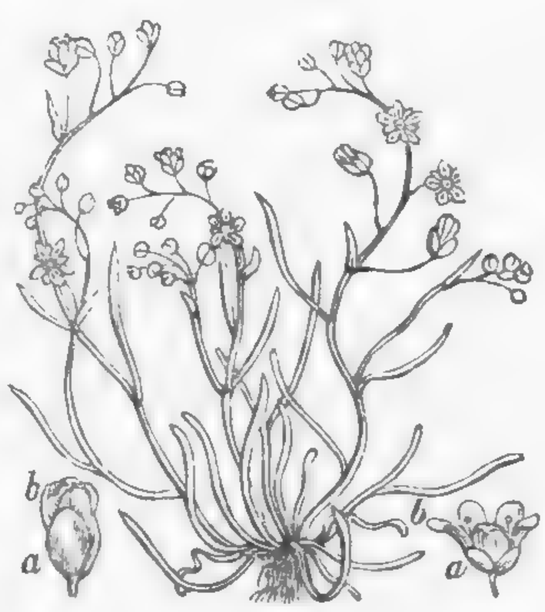
16 C. Sibírica (Lin. spec. 294.) root fusiform; leaves veined: radical and cauline ones oval; raceme secund; petals bifid. ♃. H. Native of Siberia, in boggy places. Limnia, Lin. act. holm. 1746. t. 5. Radical leaves quite glabrous, petiolate: cauline ones 2, opposite, sessile. Stamens inserted in the petals. Flowers rose-coloured.

Siberian Claytonia. Fl. Mar. Ju. Clt. 1768. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

§ 2. *Stem leafy. Leaves all alternate. Plants resembling Calandrínia in habit.*

17 C. linea'ris (Dougl. mss. ex Hook. fl. bor. amer. 1. p. 224. t. 71.) stems branched; leaves narrow-linear, obtuse, 3-nerved; racemes terminal, secund, bracteate at the base; petals entire. ⊙. H. Native of North-west America, in moist rocky places; on the Great and Little Falls of the Columbia, abundant. Stems filiform, leafy. Petals obovate. (f. 20.)

FIG. 20.



Linear-leaved Claytonia. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

18 C. filicau'lis (Dougl. mss. ex Hook. fl. bor. amer. 1. p. 224. t. 72.) stems branched at the base: lower leaves obovate, acute, reticulately veined, running into petioles; cauline leaves linear-spatulate; racemes terminal; flowers bracteate; petals entire. ⊙. H. Native of the north-west coast of America, on rocks in Nootka and Queen Charlotte's Sound; plentiful on moist rocks of the Columbia, near the ocean. Flowers largish.

Thread-stemmed Claytonia. Pl. $\frac{1}{4}$ foot.

19 C. stolonífera (Meyer. l. c.) stem erect, branched, bearing stolons at the base; leaves nearly sessile, oblong-spatulate, acute, a little nerved; racemes subcorymbose, lateral, bractless; petals entire. ♃. H. Native of Unalaschka.

Stoloniferous Claytonia. Pl. $\frac{1}{4}$ foot.

20 C. parvifòlia (Moc. icon. pl. nootk. ined. ex D. C. prod. 3. p. 361.) leaves nerveless; cauline ones alternate, elliptic, acute, attenuated at the base; radical ones like the cauline ones on short petioles; racemes few-flowered; pedicels solitary, bracteate; petals acutely emarginate. ⊙.? H. Native of North-west America, at Nootka Sound. Flowers rose-coloured.

Small-leaved Claytonia Pl. $\frac{1}{4}$ foot.

† *A very doubtful species.*

21 C. nemoròsa (Willd. rel. in Rœm. et Schultes, 5. p. 436.) leaves ovate: superior ones tern; racemes twin. ♃. S. Native of South America, in the shady woods of Javita. Perhaps this plant ought to be removed from the genus. ex H. B. et Kunth, nov. gen. amer. 6. p. 80. The plant, according to Bonpland, has a quadrangular stem; opposite petiolate leaves; terminal dichotomous spikes; a 5-parted calyx; a semi-5-cleft corolla; a short style, 2 stigmas, and a 1-celled, many-seeded capsule.

Grove Claytonia. Pl.?

Cult. The greater part of the species of *Claytònia* are very delicate little plants, especially those with tuberous roots: these grow best in a border of peat soil, and are increased by seeds, which sometimes ripen plentifully. The fibrous-rooted kinds, being all annual, the seeds of them only require to be sown in the open border, in a rather moist shaded situation; and if they are allowed to scatter their seeds, plants will rise every year in abundance.

XII. MO'NTIA (so named by Micheli, in honour of Joseph Monti, Ph. D. Professor of Botany, and Prefect of the Medical Garden at Bologna; author of Agri Bononiènsis stirpium Catalogi Prodromus, 1791, 4to.). Mich. gen. 17. t. 13. Gærtn. fr. 2. p. 220. t. 129. Lin. gen. no. 101. Juss. gen. 313.—Camerària, Dill. nov. gen. p. 114. t. 6. but not of Lin.—Alsinoìdes, Vaill.

Lin. syst. *Triándria, Trigýnia.* Calyx of 2, rarely of 3 sepals. Petals 5, connected a little way at the base, 3 of which are smaller than the other 2. Stamens inserted in the claws of the petals, usually 3 in front of each of the smaller petals, very rarely more. Ovarium sessile. Style very short, 3-parted; divisions spreadingly reflexed. Capsule 1-celled, 3-valved, 3-seeded.—European, glabrous, aquatic, or bog herbs. Leaves opposite. Flowers axillary, small. This genus is hardly distinct from *Claytònia*.

1 M. fonta'na (Lin. spec. p. 129.). ⊙. W. H. Native of Europe and North America; also of South America, in bogs, ponds and ditches.

Var. α, mìnor (Willd. spec. 1. p. 415.) stem erectish, divaricate; leaves rather connate. ⊙. B. H. Native of humid sandy woods and springs.—Mich. gen. t. 13. f. 2.—Fl. dan. t. 131. Smith, engl. bot. t. 1206.—Schkuhr. handb. t. 20. M. fontàna β, erécta, Pers. ench. 1. p. 111. M. mìnor, Gmel. fl. bad. 1. p. 301.

Var. β, màjor (Willd. spec. l. c.) stems weak, creeping, dichotomous; leaves sessile. ⊙. B. H. Native of rivulets. Mich. gen. t. 13. f. 1. M. rèpens, Gmel. fl. bad. 1. p. 302. M. fontàna β, rèpens, Pers. ench. 1. p. 111. M. rivulàris, Gmel.

Fountain or Water-chickweed. Fl. April, May. Brit. Pl. $\frac{1}{8}$ to $\frac{1}{4}$ foot.

Cult. This plant will grow in any moist soil, or in water.

XIII. LEPTRI'NA (meaning unknown to us). Rafin. journ. phys. 1819. aug. p. 95. D. C. prod. 3. p. 362.

Lin. syst. *Triándria, Trigýnia.* Calyx 3-parted; lobes elliptic, obtuse. Petals wanting. Stamens 3, alternating with the parts of the calyx, and hypogynous. Ovarium 1, oval. Styles 3, short, acute. Capsule 1-celled, 3-valved, 3-seeded.

Seeds fixed to the central placenta.—A small smooth herb, native of North America. Radical leaves 3, entire, linear-lanceolate, acute. Scape 1-flowered, length of leaves. This genus is hardly known, but it only appears to differ from *Móntia* in the want of petals.

1 L. AUTUMNA'LIS (Rafin. l. c.). ⊙. B. H. Native of North America, on the banks of the Ohio.

Autumnal Leptrina. Pl. $\frac{1}{8}$ to $\frac{1}{4}$ foot.

Cult. The seeds of this plant only require to be sown in the open ground, in a moist situation; and if the plant is allowed to scatter its seeds, there will be plenty of plants each year.

XIV. COLOBA'NTHUS (from *κολοβος, kolobos,* maimed, and *ανθος, anthos,* a flower; in reference to the want of petals). Presl. in reliq. Hænk. 2. p. 13. t. 49. f. 2.

Lin. syst. *Tetra-Hexándria, Tetra-Pentagýnia.* Calyx 4-5-parted. Petals wanting. Stamens 4-6, alternating with the segments of the calyx. Stigmas 4-5. Capsule 4-7-valved, many-seeded. Both Bartling and Kunth insert this genus in the order *Caryophýlleæ,* while the stamens are decidedly perigynous, and therefore ought to come among the *Portulàceæ.*

1 C. ARETIOÌDES (Gill. mss. ex Hook. et Arn. in bot. misc. 3. p. 246.) root perennial, with a multiple neck; calyx 5-parted; segments ovate; capsule 5-valved. ♃. F. Native of Chili, at Los Hornillos, El Paramillo San Isedro, and on the Andes of Mendoza.

Aretia-like Colobanthus. Pl. $\frac{1}{4}$ foot.

2 C. QUITE'NSIS (Bartling, in Presl. reliq. Hænk. 2. p. 13. t. 49. f. 2.) root annual, with a multiple neck; calyx 5-parted; segments lanceolate; capsule 5-valved, ⊙. H. Native about Quito, and on the Cordillera of Chili. Sagìna Quiténsis, H. B. et Kunth, nov. gen. amer. 6. p. 19.

Quito Colobanthus. Pl. $\frac{1}{8}$ foot.

3 C. SAGINOÌDES (Bartl. in Presl. reliq. Hænk. 2. p. 13. t. 49. f. 1.) root annual, with a multiple neck; calyx 4-parted; segments ovate; capsule 4-valved. ⊙. H. Native of Chili.

Sagina-like Colobanthus. Pl. $\frac{1}{8}$ foot.

Cult. See *Portulàca* for culture and propagation, p. 75.

XV. GINGI'NSIA (in honour of M. Gingins, who has written upon the genera *Vìola* and *Lavándula*). D. C. prod. 3. p. 362.—Pharnàceum species of authors.

Lin. syst. *Pentándria, Trigýnia.* Calyx 5-parted; lobes oval, permanent, petaloid on the inside and at the margins. Petals wanting. Stamens 5, inserted in the bottom of the calyx, and alternating with its lobes; anthers 2-celled, inserted by the base. Ovarium surrounded at the base by a 5-lobed fleshy scale. Style wanting. Stigmas 3, crest-formed. Capsule 3-valved, 1-celled. Seeds numerous, fixed to the central placenta.—Cape subshrubs. Leaves irregularly verticillate, opposite or alternate, filiform or linear, furnished with scarious stipulas at the base. Peduncles axillary, elongated, bearing umbels of pedicellate flowers at the apex; branches of umbels numerous, divided, many-flowered. This genus differs from *Pharnàceum* and all the other Caryophyllaceous genera in the stamens being perigynous, and in the leaves being usually alternate; and from all the genera in the order *Paronychièæ* in the stamens alternating with the sepals, not opposite them.

§ 1. *Leaves linear.*

1 G. BREVICAU'LIS (D. C. in mem. soc. hist. nat. par. vol. 4. with a figure. D. C. prod. 3. p. 362.) plant almost stemless; leaves linear, mucronate, crowded in whorls, almost radical; stipulas membranous, ciliately jagged at the apex. ♄. G. Native of the Cape of Good Hope. Pharnàceum lineàre, Thunb. fl. cap. 274. but not of others. Stems very short. Leaves rather spreading, unequal.

Short-stemmed Ginginsia. Pl. $\frac{1}{4}$ foot.

2 G. ELONGA'TA (D. C. l. c. with a figure; prod. l. c.) leaves alternate, linear, crowded at the tops of the branches; stipulas linear-elongated, ciliately jagged; peduncles more than 3-times longer than the stem. ♄. G. Native of the Cape of Good Hope. Pharnàceum incànum, Lin. mant. p. 358. but not of others. Pharnàceum lineàre, Andr. bot. rep. t. 329. Flowers whitish.

Elongated Ginginsia. Fl. May, June. Clt. 1795. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

3 G. AURA'NTIA (D. C. prod. 3. p. 363.) caulescent; leaves linear, crowded in whorls; whorls distant; stipulas small. ♄. G. Native of the Cape of Good Hope. Pharnàceum lineàre, Andr. bot. rep. t. 326. Ait. hort. kew. ed. 2. vol. 2. p. 174. Flowers of an orange-copper colour. Branches shrubby, white. This species differs from *Pharn. lineàre* of Thunb. in the stems being suffruticose, not herbaceous, and elongated, not short.

Orange-flowered Ginginsia. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

§ 2. *Leaves filiform.*

4 G. A'LBENS (D. C. l. c.) plant caulescent; leaves filiform, mucronate, irregularly whorled or alternate; stipulas small. ♄. G. Native of the Cape of Good Hope. Pharnàceum álbens, Thunb. fl. cap. p. 274.? Pharn. lineàre flòre álbo, Andr. bot. rep. t. 329.? but the leaves are linear in Andrews's plant, not filiform. Flowers greenish on the outside, but yellowish inside and on the edges.

Whitish Ginginsia. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

5 G. CONFE'RTA (D. C. l. c.) plant caulescent; leaves opposite, crowded, terete, mucronate; stipulas cut into many setaceous hairs, one half shorter than the leaves. ♄. G. Native of the Cape of Good Hope. Lam. ill. t. 214. f. 3. Pharnàceum incànum, Thunb. fl. cap. 273.? Sims, bot. mag. 1883. but not of Lour.

Crowded Ginginsia. Fl. May, Oct. Clt. 1782. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

6 G. PRUINÒSA; stems branched, thickish; branches pale from membranous stipulas; leaves crowded, filiform, acute, terete, fleshy, mealy or pruinose. ♄. G. Native of the Cape of Good Hope. Pharnàceum pruinòsum, Haw. pl. succ. p. 15.

Pruinose Ginginsia. Fl. Ju. Aug. Clt. 1817. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

7 G. MICROPHY'LLA (D. C. l. c.) plant caulescent; leaves terete, obtuse, in fascicles at the nodes, the rest scattered; stipulas woolly; branches scattered, divaricate. ♄. G. Native of the Cape of Good Hope. Pharnàceum microphýllum, Lin. fil. suppl. 185. Thunb. fl. cap. p. 272. Mollùgo microphýlla, Ser. in D. C. prod. 1. p. 329. Said to be very like *G. conférta.*

Small-leaved Ginginsia. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

8 G. TERETIFÒLIA (D. C. l. c.) plant caulescent; leaves filiform, mucronate, whorled on the branches; stipulas unknown; branches opposite, divaricate. ♄. G. Native of the Cape of Good Hope. Pharnàceum teretifòlium, Thunb. fl. cap. p. 274. Mollùgo teretifòlia, Ser. in D. C. prod. 1. p. 393. Stem a foot high. Leaves half a line long. Peduncles shorter than the leaves.

Terete-leaved Ginginsia. Shrub 1 foot.

Cult. A mixture of loam, peat, and sand will answer the species of this genus; and the pots in which they are grown should be well drained with sherds. The best way of propagating them is by seeds.

XVI. AYLME'RIA (in honour of Aylmer Bourke Lambert, F.R.S. F.S.A. and V.P.L.S. the celebrated botanist, to whom we owe many obligations in the prosecution of the present work).

Mart. amaranth. p. 68. nov. act. bonn. 13. p. 276. D.C. prod. 3. p. 263.

Lin. syst. *Monadélphia, Pentándria.* Calyx 2-parted, coloured. Petals 5. Stamens 10, joined into a membranous hypogynous tube; the 5 outer ones abortive; and the 5 inner ones opposite the petals, bearing 2-celled anthers. Style 1; stigma depressed, capitate. Utriculus membranous, valveless. Seeds numerous, lentiform, in the bottom of the cell.—Australian perennial herbs. Stems terete, jointed, dichotomous upwards. Leaves linear, opposite, or in whorls. Stipulas scarious. Flowers beautifully coloured, in terminal corymbs. According to Martius, the genus is related to *Paronychièæ*, but this is doubtful, in consequence of the stamens being hypogynous, and also particularly so in their being opposite the sepals. The calyx is of 2 sepals, as in *Portulàca*, and the petals are 5, as in most of the order, and the stamens are 10, as in *Triánthema*.

1 A. ròsea (Mart. l. c.) stems straightish, and are, as well as the leaves, glabrous; stipulas ciliately serrulated; corymb compact. ♃. G. Native of New Holland, on the western coast. Flowers rose-coloured.

Rose-coloured-flowered Aylmeria. Pl. 1 foot.

2 A. viola'cea (Mart. l. c.) stems diffusely dichotomous, and are as well as the leaves glabrous; stipulas quite entire; corymb loose. ♃. G. Native of New Holland, on the west coast. Flowers violaceous.

Violaceous-flowered Aylmeria. Pl. 1 foot.

Cult. See *Ginginsia* for culture and propagation, p. 83.

XVII. HYDROPY'XIS (from *ὑδωρ, hydor*, water, and *πυξις, pyxis*, a box; the plant is an inhabitant of water, and the capsule resembles a box, from its opening transversely). Rafin. fl. lud. p. 94. D. C. prod. 3. p. 364.

Lin. syst. *Tetrándria, Monogýnia.* Calyx permanent, 5-parted, bibracteate on the outside; the two inner lobes the smallest. Corolla peripetalous (perhaps inserted in the calyx), crateriform, unequally 5-lobed. Stamens 4, didynamous, inserted in the corolla; anthers hastate. Ovarium superior. Style simple, crowned by a capitate 3-lobed stigma. Capsule 1-celled, many-seeded, triangular, opening transversely. Central placenta free. This genus is likely to be nearer related to *Utricularia* than to any other.

1 H. palu'stris (Rafin. l. c.) Native of Louisiana, in ditches and marshes. *Pourpier des marais*, Robin. voy. p. 488. Stems creeping, prostrate. Flowers axillary, pedunculate, solitary, white.

Marsh Hydropyxis. Pl. creeping.

Cult. This plant should be grown in a pot filled with peat, and placed in a deep pan of water. It is easily propagated by separating the runners.

Order CXI. PARONYCHIE'Æ (plants agreeing with *Paronỳchia* in important characters). St. Hil. plac. lib. p. 56. Juss. mem. mus. 1. p. 387.—Herniàriæ, Cat. hort. par. (1777.). Illecébreæ, R. Br. prod. p. 413. Lindl. intr. nat. ord. p. 164.

Calyx of 5 sepals (f. 21. *a.* f. 22. *a.*), seldom of 3-4; sepals sometimes separate to the base, sometimes joined to the middle (f. 22. *a.*), and sometimes nearly to the apex (f. 24. *a.*). Petals small, scale-formed (f. 22. *a.*), emulating sterile stamens, inserted upon the calyx between the lobes, occasionally wanting (f. 23. *a.*), or converted into superabundant stamina. Stamens perigynous, exactly opposite the sepals (f. 22. *a.*), if equal to them in number, but sometimes fewer by abortion; filaments distinct; anthers 2-celled (f. 21. *c.*). Ovarium free. Styles 2-3, either distinct (f. 24. *a.*), or partially combined (f. 22. *d.*). Fruit small, dry, 1-celled, usually membranous, either valveless and indehiscent, or opening with 3 valves. Seeds either numerous, fixed to a free central placenta, or solitary and pendulous, upon a funicle, arising from the base of the cavity of the fruit. Albumen farinaceous. Embryo cylindrical, lying on one side of the albumen, curved more or less, with the radicle always pointing towards the hylum. Cotyledons small.—Herbaceous or half-shrubby branching plants, with opposite or alternate, often fascicled, entire, sessile leaves and scarious stipulas. Flowers small, usually whitish green, sometimes sessile and axillary, and sometimes variously disposed in terminal cymes. Bracteas scarious, analogous to the stipulas.

This order comes very near *Portulàceæ*, *Amarantàceæ*, and *Caryophýlleæ*, from which it is distinguished with difficulty. By excluding the section *Scleránthеæ*, their scarious stipula will distinguish them from the two last-mentioned orders, and there is scarcely any other character that will; for there are *Caryophýlleæ* that have perigynous stamens, as *Lárbrea* and *Adenàrium*; and *Paronychièæ* which have hypogynous ones, as *Polycarpæ'a*, *Stipulácida*, and *Ortègia*. From *Portulàceæ* it is scarcely to be known with absolute certainty, except by the position of the stamens before the sepals instead of the petals. With *Crassulàceæ*, particularly *Tillæ'a*, they agree very much in habit, but their concrete carpella will always distinguish them. De Candolle comprehends in the order various plants without stipulas; but as the latter organs seem to be an essential part of their character, the tribes *Queriàceæ* and *Minuartièæ* are excluded, and will be found elsewhere.

Synopsis of the genera.

Tribe I.

Telephie'æ. *Calyx 5-parted* (f. 21. *a.*). *Petals and stamens 5, inserted in the bottom of the calyx* (f. 21. *b.*). *Styles 3* (f. 21. *e.*) *free, or connected together a little at the base. Leaves alternate, stipulaceous.*

1 Tele'phium. Styles 3, spreadingly reflexed, concrete at the base. Capsule pyramidal, trigonal, 3-valved, 3-celled at the base, and 1-celled at the apex. Seeds numerous, fixed to the central placenta, in 6 rows.

2 Corrigìola. Style short; stigmas 3 (f. 21. *e.*). Capsule 1-seeded, indehiscent, covered by the calyx. Seed suspended by a funicle, originating at the bottom of the capsule.

Tribe II.

Illece'breæ. *Calyx 5-parted* (f. 22. *a.*). *Petals 5 or wanting. Stamens 2-3, inserted in the bottom of the calyx* (f. 22. *a.*). *Styles free or somewhat concrete at the base* (f. 22. *d.*). *Capsule indehiscent, 1-seeded. Funicle long, rising from the bottom of the capsule, bearing a subpendulous seed at the apex.—Herbs, rarely subshrubs. Leaves opposite, acute, with scarious stipulas.*

3 Hernia'ria. Calyx almost 5-parted. Scales or petals 5, filiform, entire, but sometimes wanting or very small. Stamens 5, or only 2-3 from abortion. Styles 2, short, distinct, or concrete at the base. Capsule covered by the calyx.

4 GYMNOCA'RPUM. Calyx almost 3-parted. Petals 5, emulating sterile filaments. Stamens 5. Style 1; stigma simple. Capsule valveless, covered by the indurated calyx.

5 ANY'CHIA. Calyx 5-parted. Petals and scales wanting. Stamens 3-5, distinct. Style none; stigmas 2, subcapitate. Capsule covered by the calyx.

6 ILLE'CEBRUM. Calyx 5-parted, or nearly 3-sepalled, ending on the back at the apex, in an awned horn. Petals wanting, but there are 5 subulate scales in place. Stamens 2-5. Style hardly any; stigmas 2, capitate. Capsule covered by the calyx, divisible into 5 at the stripes.

7 PARONY'CHIA. Calyx 5-parted (f. 22. *a.*). Petals or scales 5, linear. Stamens 5 (f. 22. *a.*). Style 1; stigmas 2 (f. 22. *d.*). Capsule indehiscent or 5-valved, covered by the calyx.

8 PENTACÆ'NA. Calyx 4-parted; segments very unequal, outer 3 spiny at the apex, inner 3 navicular, armed on the back. Stamens 5. Stigmas 2, short. Capsule 1-seeded.

9 CARDIONE'MA. Calyx 5-parted; lobes drawn out on the back at the apex into a straight horn. Petals wanting. Stamens 5, 2 sterile ones obcordate, flat, 3 fertile ones obcordate at the base, bearing each an antheriferous filament in the recess. Styles 2, hardly concrete at the base, long, revolute. Fruit oval-oblong.

TRIBE III.

POLYCARPÆ'Æ. *Calyx 5-parted* (f. 23. *a.*). *Petals 5, or wanting. Stamens* 1-5, *inserted in the bottom of the calyx. Styles* 2-3, *sometimes distinct, sometimes concrete. Capsule* 1-*celled, many-seeded. Seeds fixed to the central placenta.—Herbs or subshrubs. Leaves opposite. Stipulas scarious. The stamens in this tribe are almost hypogynous, and truly so in some genera, as in Polycarpœ'a, Stipulácida, and Ortègia, and therefore verge closely on the order Caryophýlleæ.*

10 POLYCARPÆ'A. Lobes of calyx with membranous edges (f. 20. *a.*). Petals 5. Stamens 5, nearly hypogynous (f. 23. *a.*). Styles 3, concrete at the base. Capsule 1-celled, 3-valved, many-seeded.

11 STIPULI'CIDA. Lobes of calyx with membranous edges. Petals 5. Stamens 3, inserted in the torus. Style short, crowned by 3 stigmas. Capsule 1-celled, 3-valved, few-seeded.

12 BALA'RDIA. Lobes of calyx flattish. Petals 5. Stamens 2-3-4, inserted in the receptacle. Styles 3, very short, papilliferous inside. Capsule 1-celled, 3-valved, many-seeded.

13 AVE'RSIA. Lobes of calyx thickened in the middle, keeled. Petals 5, or only 3 from abortion. Stamens 3, inserted in the bottom of the calyx. Style 1, trifid at the apex. Capsule 1-celled, 3-valved, many-seeded.

14 ORTE'GIA. Lobes of calyx keeled a little. Stamens 5, 3 fertile, inserted in the torus, the other 2 scale-formed and sterile. Style 1, capitate at the apex or bifid. Capsule 3-valved, many-seeded.

15 POLYCA'RPON. Lobes of calyx with membranous edges, concave, keeled, and mucronate. Petals 5, emarginate. Stamens 3-5. Styles 3, very short. Capsule 1-celled, 3-valved, many-seeded.

16 CE'RDIA. Lobes of calyx petaloid inside, ending in a bristle each at the apex. Petals wanting. Stamen one, in front of one of the sepals. Style filiform, bifid at the apex. Capsule 1-celled, many-seeded.

TRIBE IV.

POLLICHIE'Æ. *Calyx 5-toothed; tube urceolate. Stamens* 1-2, *inserted in the throat of the calyx. Petals wanting. Stigma bifid. Utriculus or fruit valveless,* 1-*seeded. Bracteas and calyx increasing after flowering, and becoming fleshy, so as to form something like a berry.—Suffruticose herbs, with opposite or subverticillate stipulaceous leaves.*

17 POLLI'CHIA. Character the same as that of the tribe.

† *Genera belonging to Paronychièæ, but are not sufficiently known.*

18 LITHÓPHILA. Calyx 3-parted, acute. Petals 3. Scales or abortive stamens 2, opposite the sepals. Stamens 2, placed at one side of the ovarium. Style thick, bluntly emarginate at the apex. Fruit unknown. A very minute glabrous herb.

19 SELLÒWIA. Calyx urceolate, 5-cleft, membranous, 10-ribbed. Petals 5, alternating with the lobes of the calyx. Stamens fixed in the middle of the segments of the calyx, and shorter than them; anthers didymous. Style 1; stigma obtuse. Capsule 3-valved, 1-celled, 1-seeded. A smooth herb, with the habit of *Illécebrum verticillàtum.*

Tribe I.

TELEPHIE'Æ (plants agreeing with the genus *Telephium* in important characters). D. C. prod. 3. p. 366. Calyx 5-parted (f. 21. *a.*). Petals and stamens 5 (f. 21. *b.*), inserted into the bottom of the calyx. Styles 3 (f. 21. *e.*), distinct, or somewhat concrete at the base.—Leaves alternate, stipulaceous.

I. TELE'PHIUM (so named from Telephus, son of Hercules by Auge, and according to some king of Mysia). Tourn. inst. t. 128. Lin. gen. 377. Gærtn. fr. 2. p. 221. t. 129. Lam. ill. t. 213. Juss. mem. mus. 1. p. 389. St. Hil. plac. lib. p. 44.

LIN. SYST. *Pentándria, Monogýnia.* Calyx 5-parted, permanent; lobes oblong, concave. Petals 5, inserted in the bottom of the calyx, and alternating with its lobes, and about equal in length to them. Stamens 5, opposite the sepals, and inserted in their bases. Styles 3, spreadingly reflexed, concrete at the base. Capsule pyramidal, trigonal, 3-valved, 3-celled at the base, and 1-celled at the top from the dissepiments not being extended so far. Seeds numerous, disposed in 6 rows on the central placenta. Embryo lateral, curved, but not annular. Albumen mealy.—Subshrubby, procumbent, many-stemmed, glabrous, glaucous herbs. Leaves alternate, rarely opposite, stipulaceous. Flowers white or greenish white.

1 T. IMPERA'TI (Lin. spec. 388.) leaves alternate; flowers in racemose corymbs, rather crowded. ♃. H. Native of the south of Europe, particularly in the south of France, Italy, Spain, Switzerland, &c. D. C. fl. fr. 4. p. 400. Lam. ill. t. 213. Schkuhr. handb. 1. t. 85. T. rèpens, Lam. fl. fr. 3. p. 71. T. alternifòlium, Mœnch, meth. 231. Flowers white, sometimes tinged with red.

Imperati's Orpine. Fl. June, Aug. Clt. 1658. Pl. tr.

2 T. OPPOSITIFÒLIUM (Lin. spec. 388.) leaves opposite; flowers in racemose corymbs, crowded. ♃. H. Native of Barbary.

Shaw, spec. p. 572. with a figure. Flowers white. Perhaps only a variety of the preceding.

Opposite-leaved Orpine. Pl. tr.

3 T. laxiflòrum (D. C. prod. 3. p. 366.) leaves alternate; peduncles opposite the leaves, trifid at the apex; middle pedicel 1-flowered, lateral ones elongated, and usually 3-flowered. ♃. G. Native of the Cape of Good Hope. Herb glaucous. Leaves alternate, distant, obovate, mucronate; petiole short, margined, with a membrane. Capsule subglobose, 3-celled nearly to the apex. Perhaps a proper genus, but the habit is truly that of *Telèphium*.

Loose-flowered Orpine. Pl. tr.

Cult. All the hardy species of *Orpine* grow well in any light soil; and may either be increased by cuttings or parting at the root; they are well adapted for ornamenting rock-work. The last species being a native of the Cape of Good Hope, requires the protection of a green-house in winter.

II. CORRIGI'OLA (a diminutive of *corrigia*, a shoe string; trailing flexible plants). Lin. gen. no. 378. Juss. mem. mus. 1. p. 389. Lam. ill. t. 213. D. C. prod. 3. p. 366. Polygonifòlia, Vaill. Adans. Dill.

Lin. syst. *Pentándria, Trigýnia.* Calyx 5-parted (f. 21.*a*.), permanent. Petals 5 (f. 21. *b*.), equal to the calyx and inserted in it, and alternating with its lobes. Stamens 5, opposite the sepals. Style short; stigmas 3 (f. 21. *e*.). Capsule 1-seeded, indehiscent, covered by the calyx. Seed suspended by a funicle, which rises from the bottom of the capsule.—Procumbent glaucous herbs, with alternate stipulaceous leaves, and terminal racemose corymbs of small flowers. Habit of *Telèphium*.

1 C. telephiifòlia (Pourr. chl. narb. 20. act. tol. 3. p. 316.) stems naked in the floriferous part. ♃. H. Native about Perpignon and about Madrid, in sandy places; also of Chili about Valparaiso. D. C. fl. fr. suppl. p. 527. Flowers white.

Var. β, imbricàta (Lapeyr. abr. p. 169.) stems short; lower leaves rather imbricated. ♃. H. Native about Vinca and Nyer.

Orpine-leaved Strap-wort. Fl. July, Aug. Clt. 1822. Pl. procumbent.

2 C. littora'lis (Lin. spec. p. 388.) stems leafy in the floriferous part. ⊙. H. Native throughout Europe, on sandy shores. Found by Hudson in England on the Slapham Sands beyond Dartmouth, and near Star-point. Œed. fl. dan. t. 334. Smith, engl. bot. 668. fl. græc. t. 292. Polygonifòlia, Dill. giss. append. t. 3. Lind. als. t. 2. Flowers white.

FIG. 21.

Shore Strap-wort. Fl. June, Aug. Britain. Pl. tr.

3 C. deltoídea (Hook. et Arnott, in Beech, bot. p. 24.) stems prostrate; leaves deltoid, long, spatulate; racemes lateral, furnished at the base by a spatulate bractea. ♃.? G. Native of Chili, about Conception and Valparaiso. This plant bears a strong resemblance to *C. littoràlis*. Flowers white.

Deltoid-leaved Corryiola. Pl. prostrate.

4 C. squamòsa (Hook. et Arn. in bot. misc. 3. p. 247.) caudex perennial, a little branched, very scaly at the apex, from which many stems issue; stems prostrate; leaves linear, oblong; racemes corymbose, leafless. ♃. G. Native of Chili, about Valparaiso, Vina de la Mar, and Playa Ancha. The lower part of the stem, which is here called a caudex, from its resemblance to that part of ferns, is to be seen in no other species of the genus; the scaly appearance at its summit is obviously caused by a congeries of stipulas. Flowers white.

Scaly Strap-wort. Pl. prostrate.

5 C. Cape'nsis (Willd. spec. 1. p. 507.) flowers sessile; calyx hardly with membranous margins. ⊙. H. Native of the Cape of Good Hope. Thunb. fl. cap. p. 272. C. littoràlis, Thunb. prod. p. 55. Perhaps sufficiently distinct from *C. littoràlis*.

Cape Strap-wort. Fl. June, Aug. Clt. 1819. Pl. tr.

Cult. The seeds of the annual kinds should be sown in dry light soil. The culture of the perennial kind is the same as that recommended for the hardy species of *Telèphium*.

Tribe II.

ILLECE'BREÆ (this tribe contains plants agreeing with *Illécebrum* in some particular characters). D. C. prod. 3. p. 367. Calyx 5-parted (f. 22. *a*.). Petals 5, or wanting. Stamens 2-5, inserted in the bottom of the calyx. Styles distinct, or somewhat concrete at the base. Capsule indehiscent, 1-seeded. Funicle long, rising from the bottom of the capsule, bearing a somewhat pendulous seed at the top.—Herbs, rarely subshrubs. Leaves opposite, acute, with scarious stipulas.

III. HERNIA'RIA (from *hernia*, a rupture; supposed effect in curing). Tourn. inst. t. 288. Lin. gen. no. 308. Lam. ill. t. 180. Juss. mem. mus. 1. p. 389. D. C. prod. 3. p. 367.

Lin. syst. *Pentándria, Digýnia.* Calyx nearly 5-parted, somewhat coloured inside. Scales or petals 5, filiform, quite entire, alternating with the sepals, sometimes wanting or very small. Stamens 5, or only 2-3 from abortion, opposite the sepals. Styles 2, short, distinct, or concrete at the base. Capsule 1-seeded, indehiscent, covered by the calyx.—Prostrate suffruticose small herbs, with branched stems. Leaves opposite, stipulaceous: stipulas solitary between the leaves, broad at the base. Flowers glomerate in the axils of the leaves. Bracteas small.

§ 1. *Herniariæ veræ* (true species of *Herniària*). *Stems prostrate, small; flowers glomerate in the axils of the leaves, puberulous or hairy on the outside.*

1 H. cine'rea (D. C. fl. fr. suppl. p. 375. mem. par. t. 3.) plant of many stems, herbaceous, clothed with cinereous hairs; branches ascending; leaves oval, acute at both ends; flowers crowded, axillary. ⊙. H. Native about Montpelier, Narbonne, plentiful in Spain in dry gravelly or sandy places. In Spain the plant is called *Quebrantapiedras*. H. ánnua, Lag. gen. et spec. p. 12. and perhaps H. latifòlia, Lapeyr. abr. p. 127.

Cinereous Rupture-wort. Fl. June, Aug. Clt. 1823. Pl. tr.

2 H. vire'scens (Salzm. pl. exsic. ex D. C. prod. 3. p. 367.) herb ascending, many stemmed, smoothish; leaves oval, ciliated; bundles axillary, few-flowered; calyx rather pilose. ⊙. H. Native of Mauritania, about Tangiers. It differs from *H. cinèrea* in the greenish habit, nearly as *H. hirsùta* does from *H. glàbra*, or as *H. alpìna* does from *H. incàna*.

Greenish Rupture-wort. Pl. tr.

3 H. gla'bra (Lin. spec. p. 317.) plant herbaceous, glabrous, prostrate; leaves oval; bundles many-flowered. ♃. H. Native of Europe and Siberia, in exposed gravelly places. In England, at the Lizard-point, and near Newmarket. Oed. fl. dan. t. 529. Smith, engl. bot. t. 206. Schkuhr, handb. t. 56. Blackw. herb. t. 320. H. alpéstris, Aubr. H. fruticòsa, Gouan, This and the two following species are confounded by Spreng. in his syst. 1. p. 929. under the name of *H. vulgàris*.

Glabrous Rupture-wort. Fl. July, Aug. England. Pl. tr.

4 H. hirsu'ta (Lin. spec. p. 317.) plant herbaceous, prostrate, hairy; leaves oval-oblong; bundles sessile, few-flowered.

♃. H. Native throughout Europe, in gravelly places. In England, near Barnet; and in Cornwall. Smith, engl. bot. 1379. Mor. hist. sect. 5. t. 29. f. 2. Petiv. brit. t. 10. Tandich, icon. t. 284. This plant is in every respect the same as *H. glàbra*, except in the hairiness.

Var. β, pubéscens (D. C. prod. 3. p. 368.) leaves ciliated, smoothish; stipulas larger. Paronỳchia pubéscens, D. C. fl. fr. 3. p. 403.

Hairy Rupture-wort. Fl. July, Aug. England. Pl. tr.

5 H. inca'na (Lam. dict. 3. p. 124.) suffruticose, prostrate, hoary from villi; leaves ovate-oblong; flowers somewhat pedicellate, in loose clusters. ♃. H. Native of Italy, Provence, Dauphiny, &c. in barren places. D. C. fl. fr. suppl. 375. H. lenticulàta, Lin. spec. p. 317. exclusive of the synonymes. H. alpìna, Lois. but not of Vaill.

Hoary Rupture-wort. Pl. tr.

6 H. Besse'ri (Fisch. ex Horn. suppl. p. 127.) stems shrubby at the base, somewhat ascending; branches elongated; leaves oblong-lanceolate, pubescent; bundles axillary, many flowered, rather loose. ♃. H. Native of Tauria and Podolia. H. incàna, Bieb. suppl. p. 173. H. hirsùta, D'Urv. enum. p. 28. H. Millegràna, Pall. ex Spreng. and perhaps H. microcárpa of Presl. del. prag. which was collected on the mountains of Sicily.

Besser's Rupture-wort. Fl. June, Aug. Clt. 1822. Pl. tr.

7 H. macroca'rpa (Sibth. et Smith, fl. græc. t. 252.) stems fruticulose at the base, ascending; branches setosely pubescent; leaves obovate-lanceolate, hairy on both surfaces, as well as on the calyxes; bundles few-flowered. ♃. H. Native of Laconia, and by the way side between Smyrna and Bursa; also in the Balearic Islands.

Large-fruited Rupture-wort. Pl. tr.

8 H. alpìna (Vill. dauph. 2. p. 556. exclusive of the synonyme,) root becoming woody at length; stems prostrate, tufted, densely leafy, suffruticose; leaves oval, rather villous, ciliated; flowers few towards the tops of the branches, somewhat glomerate. ♃. H. Native of Provence, Dauphiny, and Savoy on the Alps. D. C. fl. fr. suppl. p. 375. H. alpéstris, Lam. dict. 3. p. 125. This plant is distinguished from *H. incàna* at first sight by its greenish habit, not hoary.

Alpine Rupture-wort. Fl. May, Aug. Clt. 1822. Pl. tr.

9 H. America'na (Nutt. in Sillim. amer. journ. 5. p. 822. p. 291.) smoothish, procumbent; leaves linear-oblong, much shorter than the internodes; stipulas minute; bundles many-flowered. ♃. H. Native of Eastern Florida. Anýchia herniarioìdes, Ell. sketch. 1. p. 308. but not of Michx. ex Nutt. Camphorósma glàbra of authors. Stem clothed with retrograde down. Racemes 3-5-flowered. Lobes of calyx obtuse, coarctate, white inside.

American Rupture-wort. Pl. pr.

10 H. seti'gera (Gill. mss. ex Hook. et Arn. in bot. misc. 3. p. 247.) plant perennial, herbaceous, puberulous, many-stemmed, prostrate; leaves oblong-lanceolate, furnished with spiny bristles at the apex; flowers almost sessile, axillary, and usually solitary, puberulous on the outside; stamens 3; styles united at the base. ♃. F. Native of Chili, at El Aquadita, near La Punta de San Luis. This species has no scales or abortive petals, and but only one style, and stigmas have been perceived.

Bristle-bearing Rupture-wort. Pl. prostrate.

11 H. fruticòsa (Lin. amœn. 4. p. 269.) stem shrubby, very humble, much branched, tufted; branches short, villous; leaves small, obovate, thickish, crowded; flowers glomerate, hairy, 4-cleft. ♄. H. Native of Spain, in dry exposed places; and of Mauritania, near Mascar. Desf. fl. atl. 1. p. 213.—Lob. icon. t. 85.—Barrel. icon. t. 713.

Shrubby Rupture-wort. Fl. May, Aug. Clt. 1814. Pl. proc.

§ 2. *Polygonoìdeæ* (plants with the habit of *Polýgonum*). *Stems erect, dichotomous at the apex. Flowers glabrous, disposed in loose cymes. Perhaps a proper genus.*

12 H. polygonoìdes (Cav. icon. 2. t. 137.) erect, glabrous, shrubby; branches dichotomous at the apex; leaves ovate, cuspidate, distant. ♄. H. Native of Mauritania, near Mascar; and on the hills of Spain, in Valentia, as well as in Provence. Illécebrum suffruticòsum, Lin. spec. p. 298. Paronỳchia suffruticosa, Lam. fl. fr. 3. p. 230. Herniària érecta, Desf. alt. 1. p. 214. H. Joanneàna, Rœm. et Schultes, syst. 6. p. 297. This species differs from *Paronýchia*, in the fruit being indehiscent. The habit is very dissimilar from the other species of *Herniària*, but emulates *Anýchia* and *Paronýchia*.

Polygonum-like Rupture-wort. Fl. May, Aug. Clt. 1752. Pl. ½ foot.

† *Species not sufficiently known.*

13 H. dicho'toma (D. C. prod. 3. p. 368.) stems erect, numerous, dichotomous, herbaceous; leaves distant, oblong, mutic, and are, as well as the branches, powdery from short down; flowers cymose. ♃. ? H. Native country unknown. Paronýchia dichótoma, D. C. in Lam. dict. ency. 5. p. 25. Illécebrum dichótomum, Pers. ench. 1. p. 261. "Calyx glumaceous, striated at the base and pubescent, profoundly 5-cleft; segments bluntish, with scarious margins; sterile threads 5, alternating with the sepals, and 5 antheriferous ones opposite them, hardly shorter than the sterile ones. Style bidentate at the apex. Ovarium attenuated at the base. Ovulum one, pendulous, suspended from the top of a thread, which arises from the bottom of the capsule." Adr. Juss. in litt. 1827.

Dichotomous Rupture-wort. Pl. ¼ to ½ foot.

14 H. lenticula'ta (Thunb. fl. cap. p. 245.) suffruticose, hairy, decumbent, clothed with cinereous villi; leaves ovate, fleshy. ♄. G. Native of the Cape of Good Hope. H. incàna Capénsis, Pers. This is a very obscure species. The Linnean plant under this name, according to Vahl and Smith, is *Créssa Crética;* but we know not what Thunberg's plant is.

Lenticular Rupture-wort. Pl. procumbent.

Cult. All the species are weedy looking plants, most of them with the habit of wild-thyme, and therefore are only worth cultivating in botanic gardens. The plants grow best in dry light sandy soil, and are increased by seeds.

IV. GYMNOCA'RPUM (from γυμνος, *gymnos*, naked, and καρπος, *karpos*, a fruit).

Forsk. descr. p. 65. icon. t. 10. Desf. atl. 1. p. 203. St. Hil. plac. lib. p. 73. Juss. mem. mus. 2. p. 388. D. C. prod. 3. p. 369.

Lin. syst. *Pentándria, Monogýnia.* Calyx almost 3-parted, permanent; segments coloured inside. Petals 5, emulating sterile filaments. Stamens 5, inserted in the bottom of the calyx. Style one, crowned by a simple stigma. Capsule valveless, 1-seeded, covered by the indurated calyx.—Diffuse subshrubs, with opposite stipulaceous leaves, usually bearing fascicles of rameal leaves in the axils. Pedicels axillary, solitary, opposite, appearing crowded at the tops of the branches, from the internodes being short. The name of this genus is spelt variously by authors, viz. *Gymnocarpos* (Forsk.), *Gymnocarpus* (Viv.), *Gymnocarpon* (Pers.), *Gymnocarpum* (Steud.).

1 G. fruticòsum (Pers. ench. 1. p. 636.). ♄. F. Native of the deserts of Barbary, Egypt, &c. G. decándrum, Forsk. l. c. Viv. fl. lib. 13. t. 10. f. 1. Desf. l. c. Triánthema fruticòsa, Vahl. symb. 1. p. 32. Lobes of calyx violaceous inside, somewhat cucullate at the apex, and furnished with an awn on the back.

Shrubby Gymnocarpum. Shrub 1 foot.

Cult. This shrub will require to be protected from frost in

winter, and for this purpose it should be grown in a pot. A mixture of sand and loam will suit the plant very well, and it may either be increased by seeds or cuttings.

V. ANY'CHIA (so named from its affinity to *Paronýchia*). Michx. fl. bor. amer. 1. p. 113. Juss. mem. mus. 2. p. 389. Torr. fl. unit. stat. 1. p. 272. D. C. prod. 3. p. 369.—Quèria, Gært. fr. 2. t. 128. Nutt. gen. amer. p. 158.

LIN. SYST. *Tri-Pentándria, Digýnia.* Calyx 5-parted; sepals conniving, somewhat saccate, and callous at the apex. Petals and scales none. Stamens 3-5; filaments distinct. Style none. Stigmas 3, subcapitate. Capsule indehiscent, 1-seeded, covered by the calyx.—North American, erect, dichotomous, annual herbs, with the habit of *Lìnum cathárticum*. Leaves opposite, furnished with scarious stipulas at the base. Flowers solitary in the axils of the branches, and in fascicles at the tops of the short branches, green.

1 A. DICHÓTOMA (Michx. l. c.) stem covered with retrograde pubescence; leaves cuneate-oblong; stipulas longer than the flowers; flowers in fascicles. ⊙. H. Native of Virginia, New York, Kentucky, and Canada, in dry woods and on hills. Quèria Canadénsis, Lin. spec. Ort. dec. t. 15. f. 2. Nutt. l. c. Anýchia dichótoma var. *α*. Torr. fl. unit. stat. 1. p. 273. A. Canadénsis, Elliott. car. 1. p. 307.

Dichotomous Anychia. Fl. May, Aug. Clt. 1806. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

2 A. CAPILLA'CEA (D. C. prod. 3. p. 369.) stem quite glabrous, smooth; leaves ovate; stipulas shorter than the flowers; flowers remote. ⊙. H. Native of New Jersey and New England, in pine barrens. Quèria capillàcea, Nutt. gen. amer. 1. p. 159. Anýchia dichótoma *β*, Torr. l. c. According to Torrey, this is only a smooth variety of the last.

Capillaceous Anychia. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

Cult. The seeds of these plants only require to be sown in the open border in a dry warm situation in a light soil.

VI. ILLE'CEBRUM (from *Illecebra* of Pliny, which is from *illicio*, to allure; pretty enticing plants). Gærtn. fil. carp. p. 36. t. 184. Juss. mem. mus. 2. p. 386. R. Br. prod. p. 416. in a note.—Paronýchia species, Tourn. Juss. Lam. and D. C.—Illécebrum species of Lin.

LIN. SYST. *Di-Pentándria, Digýnia.* Calyx 5-parted, nearly 3-sepalled; sepals subcucullate, thickened, ending in an awn-like horn at the apex on the back. Petals wanting, or 5 subulate scales in place of the petals, alternating with the lobes of the calyx. Stamens 2-5, opposite the sepals, and inserted in their base. Style hardly any; stigmas 2, capitate. Capsule covered by the calyx, 5-valved, or divisable into 5 at the stripes. Seed solitary from abortion, inserted in the side of the capsule. Embryo hardly curved, placed on one side of the albumen, which is farinaceous.—A small trailing herb, with opposite leaves, furnished with scarious stipulas at the base. Flowers axillary or cymose. Bracteas scarious, smaller than the flowers.

1 I. VERTICILLA'TUM (Lin. spec. p. 280.) stems trailing, filiform, glabrous; leaves roundish; flowers crowded in the axils of the leaves, verticillate. ♃. H. Native of Europe, in bogs and wet meadows. In England in the western part of Cornwall, about Penzance, and in Devonshire, in marshy boggy ground. Schkuhr, handb. t. 50. Vill. in Schrad. journ. 1801. p. 409. t. 4. Smith, engl. bot. t. 895. Fl. dan. t. 335.—Vaill. bot. par. t. 15. f. 2. Flowers snow white, furnished with scarious bracteas at the base. Calyxes cartilaginous. Stamens 2 ex Juss., the rest abortive, 5 ex Schkuhr. Root creeping.

Whorled Knot-grass. Fl. July, Aug. England. Pl. tr.

Cult. The seeds of this plant should be sown in a moist situation, where the plants will thrive and flower freely; and if the seeds be allowed to scatter themselves, the plants will rise regularly every season. It is worth cultivating, being a small delicate beautiful plant.

VII. PARONY'CHIA (from *παρα, para*, near, and *ονυξ, onyx*, a claw; supposed to cure a tumour which rises near the nail). Juss. mem. mus. 1. p. 388. D. C. prod. 3. p. 370. St. Hil. fl. bras. 2. p. 185.—Paronýchia species of Tourn. Juss. gen. —Illécebrum species of Lin.

LIN. SYST. *Pentándria, Monogýnia.* Calyx 5-parted (f. 22. *f.*); lobes concave, cucullate, generally mucronate at the apex (f. 22. *b.*). Petals or scales 5, subulate, alternating with the lobes of the calyx. Stamens 5 (f. 22. *a.*). Style one, entire or bifid (f. 22. *d.*); lobes papilliferous inside. Capsule 1-seeded (f. 22. *e.*), membranaceous, indehiscent or 5-valved, covered by the calyx.—Herbaceous or suffrutescent much branched plants. Leaves opposite, stipulate; stipulas scabrous, twin on both sides between the leaves. Young leaves frequently in fascicles in the axils of the old leaves. Flowers cymose or glomerate, but usually crowded in the axils of the leaves.

SECT. I. CHÆTONY'CHIA (from *χαιτη, chaite*, a head of hair, and *ονυξ, onyx*, a claw; in reference to the lobes of the calyx ending in a bristle each). D. C. prod. 3. p. 370. Lobes of calyx equal, dilated at the apex, membranous, ending in an awn on the back. Scales or petals, or abortive stamens perhaps wanting. Flowers cymose.

1 P.? CYMÒSA (D. C. in Lam. dict. 5. p. 26. fl. fr. 3. p. 402.) stems erect, branched, divaricate, puberulous; leaves linear, nearly terete, glabrous, awned; flowers cymose, ultimate ones in fascicles. ⊙. H. Native of Spain, Greece, Mauritania, in sandy places. Illécebrum cymòsum, Lin. spec. 299. exclusive of Bocc. syn. Vill. in Schrad. journ. 1801. p. 408. t. 4. Flowers greenish. This plant is allied to *Illécebrum*, but is probably a distinct genus.

Cymose Paronychia. Fl. July. Clt. 1820. Pl. $\frac{1}{4}$ foot.

SECT. II. EUNY'CHIA (altered from *Paronýchia*. This section is supposed to contain the genuine species of the genus). D. C. prod. 3. p. 370. Lobes of calyx equal, awned, mucronate or nearly unarmed, not dilated at the apex. Flowers crowded in the axils of the leaves.

2 P. ECHINA'TA (Lam. fl. fr. 3. p. 232. exclusive of Lin. syn.) stems branched, prostrate, smoothish; leaves oval, glabrous; flowers subsecund, crowded in the axils of the leaves, puberulous; lobes of calyx drawn out into somewhat divaricate awns. ⊙. H. Native of Mauritania, Portugal, Corsica, Sicily, Provence, in sand by the sea side. Illécebrum echinàtum, Desf. atl. 1. p. 204. Vill. in Schrad. journ. 1801. p. 409. t. 4. Smith, fl. græc. t. 245.—Bocc. sic. t. 20. f. 3. Flowers greenish.

Echinated-flowered Paronychia. Fl. July. Clt. 1821. Pl. prostrate.

3 P. BRASILIA'NA (D. C. in Lam. dict. 5. p. 23.) stems trailing, puberulous; leaves oblong-lanceolate, narrowed both at the base and apex, mucronate, pubescent on both surfaces; flowers crowded in the axils of the leaves; calyx glabrous, deeply 5-parted: lobes ending in a long mucrone each. ♄. G. Native of Buenos Ayres and Monte Video, by road sides. P. Bonariénsis, D. C. prod. 3. p. 370. Flowers white.

Brazilian Paronychia. Fl. May, July. Clt. 1820. Pl. tr.

4 P. COMMU'NIS (St. Hil. fl. bras. 2. p. 186.) stems trailing, puberulous; leaves oblong-lanceolate, narrow at the base and the apex, mucronate, pubescent on both surfaces; flowers crowded in the axils of the leaves; calyx turbinate, pubescent; lobes equal, ending in short points. ♃. G. Native of Brazil, in pastures in that part of the province of St. Paul called Cam-

pos Geraes, and by the sea side in the province of St. Catharine. Flowers deep brown.

Common Paronychia. Pl. tr.

5 P. Chile'nsis (D. C. prod. 3. p. 370.) stems diffuse, tufted; leaves crowded, oblong-linear, mucronate, smoothish; flowers crowded in the axils of the leaves; lobes of calyx hardly mucronate at the apex. ♃. F. Native of Chili, about Conception and Valparaiso. Leaves of the younger branches subspinose at the apex, of the adult ones acute. Stipulas oblong, scarious.

Chili Paronychia. Pl. $\frac{1}{4}$ foot.

6 P. camphorosmoìdes (St. Hil. fl. bras. 2. p. 187.) stems diffuse, pubescent; leaves linear-subulate, keeled, mucronate, puberulous; flowers crowded in the axils of the leaves; calyx turbinate, smoothish: lobes equal, acutish. ⊙. H. Native of Brazil, in that part of the province of St. Paul called Campos Geraes, near Egreja Velha.

Camphorosma-like Paronychia. Pl. $\frac{1}{2}$ to 1 foot.

7 P. Ara'bica (D. C. cat. hort. monsp. 1813. p. 130.) stems diffuse, branched; leaves oblong-linear, glabrous, awnedly mucronate; flowers sessile, rather crowded: lobes of calyx ending in a long awn each. ⊙. H. Native of Arabia and Egypt. Corrigìola albélla, Forsk. descr. p. 207. Illécebrum Arábicum, Lin. mant. p. 51. Pers. ench. 1. p. 261. Bracteas silvery, awned at the apex.

Arabian Paronychia. Pl. diffuse.

8 P. polygonifòlia (D. C. fl. fr. ed. 3. vol. 3. p. 403.) stems trailing, branched; leaves oblong-linear, smoothish, acute, not mucronate; flowers rather crowded in the axils of the leaves; lobes of calyx ending in a short mucrone each. ♃. H. Native of Dauphiny, Spain, and Balearic Islands. Illécebrum polygonifòlium, Vill. in Schrad. journ. 1801. p. 410. t. 4. Illécebrum verticillàtum β, Willd. spec. 1. p. 1205. Illécebrum alpìnum, Vill. dauph. 1. p. 296. This plant hardly differs from *P. argéntea*, unless in the leaves being narrower.

Knot-grass-leaved Paronychia. Pl. tr.

9 P. argen'tea (Lam. fl. fr. 3. p. 230.) stems trailing, branched; leaves ovate, smoothish, acutish; flowers axillary and terminal, crowded; lobes of calyx ending in a short mucrone each. ♃. H. Native of the south of Europe, in dry exposed places. D. C. fl. fr. ed. 3. vol. 3. p. 404. Illécebrum Paronýchia, Lin. spec. p. 299. Smith, fl. græc. t. 246.—Barrel. icon. t. 726. P. argéntea and P. Hispánica, D. C. dict. ency. 5. p. 24. There is a variety with rounder glabrous leaves. Bracteas white, shining, acuminated. Perhaps the same as Illécebrum Itálicum and Ill. Narbonénse, Vill. in Schrad. journ. 1801. p. 411.

Var. β, Mauritánica (D. C. prod. 3. p. 371.) leaves broader; heads large, distant. ♃. H. Native of Mauritania and the Archipelago. Illécebrum Mauritánicum, Willd. rel. in Rœm. et Schultes, syst. 5. p. 516.

Silvery Paronychia. Pl. tr.

10 P. capita'ta (Lam. fl. fr. 3. p. 229.) stems erectish; leaves oblong, keeled, ciliated, pubescent; bracteas acuminated; heads of flowers terminal; lobes of calyx linear, unequal. ♃. H. Native of the south of Europe, in arid places. D. C. fl. fr. ed. 3. vol. 3. p. 404. P. rígida, Mœnch. meth. p. 315. Illécebrum capitàtum, Lin. spec. 1. p. 299. Smith, fl. græc. t. 247—Lob. icon. 420. f. 1. Flowers white. Perhaps the same as Illécebrum Lugdunénse, Vill. in Schrad. journ. 1801. t. 4.?

Capitate-flowered Paronychia. Fl. June, Aug. Clt. 1683. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

11 P. serpyllifòlia (D. C. in Lam. dict. 5. p. 24. fl. fr. ed. 3. vol. 3. p. 404.) stems prostrate, creeping, knotted, branched; leaves obovate, flat, rather fleshy, with ciliated margins; flowers terminal; bracteas acuminated; lobes of calyx awnless. ♃. H. Native of the south of Europe, in arid places. Illécebrum serpyllifòlium, Vill. in Schrad. journ. 1801. t. 4. Flowers white.

Var. β, herniarioìdes (Pourr. chl. narb. p. 321.) leaves subcordate.

Wild-thyme-leaved Paronychia. Fl. June, Aug. Clt. 1818. Pl. prostrate.

12 P. nívea (D. C. dict. ency. 5. p. 25.) stems erectish, much branched; leaves oblong, acute, flattish, pubescent; bracteas large, short-acuminated; heads of flowers terminal; lobes of calyx awnless. ♃.? H. Native of Spain, Italy, the Levant, &c. in arid places.—Barrel. icon. t. 687. and 725.? Illécebrum níveum, Pers. ench. 1. p. 261. Illécebrum cephalòtes, Bieb. fl. taur. suppl. p. 169. Perhaps the same as Ill. marítimum, Vill. l. c. P. Arragónica, Schultes, syst. 5. p. 520.? Flowers snow white.

Snowy Paronychia. Fl. June, Aug. Clt. 1812. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

13 P. aretioìdes (D. C. prod. 3. p. 371.) stems fruticulose, ascending, much branched; branchlets hairy; leaves clothed with silky pubescence, oval-oblong, obtuse, not exceeding the stipulas; bracteas obtuse; heads of flowers terminal. ♃. H. Native of Spain, in the province of Valentia. Illécebrum aretioìdes, Pourr. ined. ex L. Dufl. in litt.

Aretia-like Paronychia. Pl. $\frac{1}{8}$ to $\frac{1}{4}$ foot.

14 P. Canarie'nse (Juss. mem. mus. 1. p. 389.) stem shrubby, erect, branched at the apex; branches rather hoary from short white hairs; leaves ovate, acute, downy; cymes panicled, branched, loose; bracteas mucronately awned at the apex, but not hiding the flowers. ♄. G. Native of Teneriffe. Habit of *Polycarpæ'a Canariénsis*, but differs in the ovarium being 1-seeded.

Canary Paronychia. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

15 P. Smi'thii (Choisy, mss. ex D. C. prod. 3. p. 371.) stem shrubby, erect, branched; leaves linear-oblong, acuminated, nerveless, and are, as well as the branches, glabrous; cymes few-flowered, loose: lobes of calyx mucronately awned. ♄. G. Native of the Canary Islands.

Smith's Paronychia. Shrub $\frac{1}{4}$ to $\frac{1}{2}$ foot.

16 P. herniarioìdes (Nutt. gen. amer. 1. p. 159.) plant herbaceous, trailing, crowded, downy all over; leaves oblong-oval, ciliated, terminated by a bristle; lobes of calyx subulate, ending each in a spreading setaceous acumen. ♃. H. Native of South Carolina, in arid sandy places. Anýchia herniarioìdes, Michx. fl. bor. amer. 1. p. 113. Anýchia Herniàriæ, Pers. ench. 1. p. 261.

Rupture-wort-like Paronychia. Pl. tr.

17 P. dicho'toma (Nutt. gen. amer. 1. p. 159.) plant rather herbaceous, tufted, procumbent, glabrous; leaves linear, acerose, acute, marked by a double line on the back; stipulas bifid; cymes dichotomous; bracteas shorter than the flowers; lobes of calyx ending in a short mucrone each. ♃. H. Native of Virginia, on rocks at the river Shenondoah. Achyránthes dichótoma, Lin. mant. p. 51.

Dichotomous Paronychia. Pl. procumbent.

18 P. argyro'coma (Nutt. l. c. p. 160.) plant herbaceous, tufted, procumbent, pubescent; leaves linear, acutely pungent, villous, nerveless; stipulas entire; cymes dichotomous; bracteas about equal in length to the flowers; lobes of calyx mucronate. ♃. H. Native of Lower Carolina and of Tennessee, among rocks on the mountains. Anýchia argyrócoma, Michx. fl. bor. amer. 1. p. 114. In habit this plant approaches the preceding. Stipulas elongated. Bracteas acuminated. Flowers white.

Silvery-tufted Paronychia. Pl. procumbent.

19 P. sessiliflòra (Nutt. l. c. p. 160.) plant densely tufted, much branched, glabrous; leaves linear-subulate, acute: superior ones longer, recurved; stipulas about equal in length to the leaves, bifid; flowers terminal, sessile; lobes of calyx arched on the inside at the apex, and ending in a long awn each on the

outside. ♃. H. Native of North America, on the more elevated hills about the Missouri, near Fort Mandan; on the dry banks of the north branch of the Saskatchawan, between Carlton House and Edmonton House. Hook. fl. bor. amer. 1. p. 227. t. 75. (f. 22.)

Sessile-*flowered* Paronychia. Pl. ¼ foot.

FIG. 22.

Sect. III. Acanthony'chia (from *ακανθος, acanthos*, a spine, and *ονυξ, onyx*, a claw; in reference to the 3 outer lobes of the calyx, being each furnished with an awn-like spine at the apex). D. C. prod. 3. p. 372. Lobes o calyx unequal, 3 outer ones furnished each with an awn-like spine at the apex, 2 inner ones small, and nearly unarmed. Stigmas 2, sessile.

20 P. Rose'tta (St. Hil. fl. bras. 2. p. 188. t. 113.) stems trailing, woolly; leaves linear-subulate, mucronate, smoothish; lobes of calyx unequal, 3 outer ones the largest, and furnished with a long mucrone each: 2 inner ones smaller, and nearly awnless. Flowers crowded in the axils of the leaves. ♃. G. Native of Brazil, in the province of St. Catharine, in sand by the sea side, where it is called by the inhabitants *Rosetta*. Probably a species of *Pentacæ'na*.

Rosetta Paronychia. Pl. tr.

† *Species not sufficiently known.*

21 P. tenuifòlia (D. C. prod. 3. p. 372.) stem branched, diffuse, hairy; leaves linear-lanceolate, somewhat ciliated; flowers axillary, longer than the stipulas. ⊙. H. Native country unknown. Illécebrum tenuifòlium, Willd. enum. suppl. p. 12.

Fine-leaved Paronychia. Fl. June, July. Clt. 1820. Pl. procumbent.

22 P. sedifòlia (Salt. itin. abyss. ed germ. 1. p. 476. ex Rœm. et Schultes, syst. 5. p. 523.) This species is not described.

Stone-crop-leaved Paronychia. Pl.

† *Plants referred by authors to the genus Paronýchia, which are to be excluded.*

1 *P. lanuginòsa* (Poir. suppl. 4. p. 302.) is probably a species of Gomphrèna.

2 *P. Bengalénsis* (Rœm. et Schultes, syst. 5. p. 521. but not of Juss.) is probably a species of Achyránthes.

3 *P. tenélla* (Hortul. or Illécebrum tenéllum of Desf.) is perhaps a species of Alternanthèra.

4 *P. dichótoma* (D. C. in Lam. dict. but not of Nutt.) is Herniària dichótoma.

5 *P. subulàta* is Polycarpæ'a spadícea.

6 *P. linearifòlia* is now Polycarpæ'a linearifòlia.

Cult. All the species of this genus are well adapted for ornamenting rock-work, from their dwarf stature, and generally trailing habit. Most of them, however, grow best in small pots in sand and loam, filling the pots half way with sherds; and they are easily increased by dividing the plants at the root, or by cuttings under a hand-glass, or by seeds. The seeds of the annual species only require to be sown in the open border or on rock-work. Some of the species are marked green-house and frame; these require to be protected from frost in winter.

VIII. PENTACÆ'NA (from *πεντε, pente*, five, and *ακαινα, akaina*, a thorn; in reference to the 5 spiny lobes of the calyx). Bartling in reliq. Hœnk. 2. p. 5. t. 49. f. 1.

Lin. syst. *Pentándria, Digýnia.* Calyx 5-parted; segments very unequal: 3 outer ones spiny at the apex, and woolly on the margins: 2 inner ones much shorter, boat-shaped, and armed on the back. Stamens 5, without any sterile filaments; anthers 2-celled. Stigmas 2, short. Fruit 1-seeded.

1 P. ramosi'ssima (Hook. et Arn. in bot. misc. 3. p. 248.) stems trailing, woolly; leaves linear-subulate, mucronate; lobes of calyx unequal, all linear and hood-formed, ending each in a very long point on the back; flowers sessile, axillary, crowded. ♃. G. Native of Brazil, on the confines of the province of Rio Grande de St. Pedro do Sul, and of the province of Cisplatin; and among rocks about Monte Video; of Chili, in Las Achiras, province of Cordova, Valparaiso, and Buenos Ayres; also of Mexico, at the foot of Mount Orizaba. Paronýchia ramosíssima, D. C. prod. 3. p. 372. mem. paron. p. 12. t. 4. Loeflíngia ramosíssima, Weinm. in bot. zeit. p. 608. Pent. polychnemonoìdes, Bartl. in Presl. reliq. Hænk. 2. p. 5. t. 49. f. 1. Stipulas scarious, woolly.

Much-branched Pentacæna. Pl. tr.

Cult. See *Paronýchia* for culture and propagation.

IX. CARDIONE'MA (from *καρδια, cardia*, the heart, and *νημα, nema*, a filament; in reference to the sterile filaments being obcordate). D. C. prod. 3. p. 372.—Bivonæ'a, Moc. et Sesse, fl. mex. ined. but not of D. C. nor Spreng.

Lin. syst. *Pentándria, Digýnia.* Calyx 5-parted; lobes conniving, rather coloured inside, and rather concave, drawn out on the back at the apex into a long straight conical horn each. Petals wanting. Stamens 5, opposite the lobes of the calyx, and inserted in their base; 2 of which are sterile, obcordate, and flat: and 3 fertile, obcordate at the base, bearing each a slender antheriferous filament in the recess; anthers roundish, 2-celled. Styles 2, hardly concrete at the base, long, revolute. Fruit 1-seeded, ovate-oblong.—A small many-stemmed herb. Leaves opposite, crowded, rather distich, linear, acute. Flowers sessile, axillary, small, greenish white, each furnished with 5 bracteas, 4 of the bracteas linear and entire, the fifth larger and serrulated.

1 C. multicau'le (D. C. prod. 3. p. 373. mem. par. t. 1.) ♃. G. Native of Mexico. Bivonæ'a multicaúlis, Moc. et Sesse, fl. mex. icon. ined.

Many-stemmed Cardionema. Pl. small.

Cult. This plant is to be cultivated and propagated in the same manner as that recommended for the species of *Paronýchia*. It will require protection in winter, by placing it in a frame or green-house.

Tribe III.

POLYCARPÆ'Æ (this tribe contains plants agreeing with *Polycarpæ'a* in important characters). D. C. prod. 3. p. 373. Calyx 5-parted (f. 23. *a*.). Petals 5 (f. 23. *d*.) or wanting. Stamens 1-5, inserted in the bottom of the calyx. Styles 2-3, sometimes distinct from the base, and sometimes connected. Capsule 1-celled (f. 23. *e*.), many-seeded. Seeds fixed to the central placenta.—Herbs or subshrubs. Leaves opposite. Stipulas scarious. The stamens in some of the genera are nearly hypogynous, as in *Polycárpon*, and altogether so in *Polycarpæ'a, Stipulícida*, and *Ortègia*, and therefore these genera verge very closely on the order *Caryophýlleæ*, but are distinguished from them in the presence of stipulas, and number of stamens: the habit agrees with *Paronychièæ*.

X. POLYCARPÆ'A (from *πολυ, poly*, many, and *καρπος, carpos*, a fruit; a name, however, only indicating its affinity with *Polycarpon*). Lam. journ. hist. nat. 2. p. 8. t. 25. D. C. prod. 3. p. 373. St. Hil. fl. bras. 2. p. 182.—Hagæ'a, Vent. tabl. 2.

p. 240.—Móllia, Willd. hort. berol. 1. p. 11.—Lahàya, Rœm. et Schultes, syst. 5. p. 402.—Hyàla, Lher. mss.—Anthýllis species, Adans.—Pòlia, Lour.

Lin. syst. *Pentándria, Monogýnia.* Calyx more or less deeply 5-parted, permanent; lobes membranous, flattish, neither keeled nor mucronate. Petals 5, inserted in the bottom of the calyx, and opposite its lobes. Style one, 3-furrowed at the apex. Capsule 1-celled, trigonal, 3-valved, many-seeded. Seeds rather reniform.—Branched dichotomous herbs. Leaves opposite, stipulate, young ones disposed in fascicles in the axils of the old leaves. Flowers cymose; cymes usually forming a terminal corymb.

1 P. gnaphalòdes (Poir. suppl. 4. p. 473.) stems suffruticose, prostrate; leaves oblong, clothed with hoary tomentum; flowers crowded into terminal subcapitate cymes. ♃. F. Native about Mogodor, on the coast of Africa, in sandy places; and of the Grand Canary Island and Teneriffe. Illécebrum gnaphalòdes, Schousb. mar. 1. p. 117. Polycarpæ'a microphýlla, Cav. anal. scienc. no. 7. p. 25. Hàgea gnaphalòdes, Pers. ench. 1. p. 262. Lahàya gnaphalòdes, Schultes, syst. 5. p. 405. Móllia gnaphalòdes, Spreng. syst. 1. p. 794. Flowers white.

Cottony Polycarpæa. Fl. June, July. Clt. 1818. Pl. pros.

2 P. latifòlia (Poir. l. c.) stems suffruticose, diffuse; leaves obovate, mucronate by an awn; cauline leaves usually 6 in a whorl, those of the branches opposite; cymes terminal, corymbosely capitate; stipulas, bracteas, and calyxes scarious, and acuminated. ♄. F. Native of Teneriffe, among rocks in woods. Móllia latifòlia, Willd. enum. 1. p. 269. Schrank, pl. rar. hort. mon. t. 29. Lahàya latifòlia, Schultes, syst. 5. p. 403. Flowers white.

Broad-leaved Polycarpæa. Fl. June, Aug. Clt. 1810. Pl. $\frac{1}{4}$ foot.

3 P. Teneríffæ (Lam. journ. hist. nat. 2. p. 8. t. 25.) stem branched, diffuse; cauline leaves petiolate, ovate, usually 6 in a whorl; cymes dichotomous, corymbose, many-flowered; lobes of calyx with membranous margins. ⊙. H. Native of Teneriffe, by way sides. Illécebrum divaricàtum, Ait. hort. kew. ed. 1. vol. 1. p. 291. Hàgea Teneríffæ, Pers. ench. 1. p. 262. Móllia diffùsa, Willd. hort. berol. 1. t. 11. Lahàya diffùsa, Schult. syst. 5. p. 402. Flowers white.

Teneriffe Polycarpæa. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

4 P. arista'ta (Chr. Smith in litt. ex D. C. prod. 3. p. 373.) stems branched, suffruticulose; leaves usually 6 in a whorl, lanceolate-linear: young ones silky, mucronated by an awn: old ones nearly glabrous, and almost awnless; cymes corymbose, terminal; calyxes with membranous margins. ♄. F. Native of the Canary Islands, on the Pico de Teyde. Illécebrum aristàtum, Ait. hort. kew. ed. 1. vol. 1. p. 290. Móllia aristàta, Ait. hort. kew. ed. 2. vol. 2. p. 62. Lahàya aristàta, Schult. syst. 5. p. 403. Stems erect or diffuse. Flowers white.

Awned-leaved Polycarpæa. Fl. June, July. Clt. 1780. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

5 P. Memphítica (Delil. fl. egypt. p. 67. t. 24. f. 2.) stems herbaceous, diffuse, branched, villous; leaves usually 6 in a whorl, oval-oblong, narrowed into the petiole; cymes terminal, few-flowered; calyx pubescent, with membranous margins. ⊙. H. Native of fields about Cairo, and along the banks of the Nile, and in its islands. Style very short; stigmas 3, nearly sessile. Petals quite entire. This plant, although very distinct, is joined with *P. gnaphalòdes* by Spreng.

Memphitic Polycarpæa. Pl. diffuse.

6 P. fra'gilis (Delisle, fl. egypt. p. 65. t. 24. f. 1.) stems herbaceous, prostrate, brittle; leaves opposite, aggregate, lanceolate, mucronate, with replicate edges; cymes corymbose, terminal, many-flowered. ♃. F. Native of Egypt, in the deserts about the pyramids, &c. Móllia frágilis, Spreng. syst. 1. p. 795. Style filiform, length of petals. Seeds 8-10. Flowers white.

Var. a, incàna (D. C. prod. 3. p. 374.) stem and leaves clothed with grey tomentum.

Var. β, vìrens (D. C. l. c.) leaves glabrous.—Corrigìola rèpens, Forsk. descr. p. 207. ex Delisle.

Brittle Polycarpæa. Pl. prostrate.

7 P. stella'ta (D. C. prod. 3. p. 374.) stems diffuse, much branched, suffruticulose; leaves usually 6 in a whorl, linear, flat, and are, as well as the branches, rather pilose; cymes terminal, many-flowered, corymbose; calyxes scarious. ⊙. F. Native of Guinea. Achyránthes stellàta, Willd. spec. 1. p. 1195. Móllia stellàta, Willd. hort. berol. Lahàya stellàta, Schultes, syst. 5. p. 403 Root perpendicular, simple. Habit of *P. Teneríffæ*, but differs in the leaves being linear.

Stellate-leaved Polycarpæa. Fl. June, Aug. Clt. 1820. Pl. $\frac{1}{4}$ foot.

8 P. corymbòsa (Lam. ill. no. 2798.) stems erect, herbaceous, tomentose; branches divaricate; leaves usually 6 in a whorl, linear, awned; cymes corymbose, loosish; calyxes scarious, acuminated. ♃.? F. or ⊙. Native of Ceylon. Achyránthes corymbòsa, Lin. spec. p. 296. (exclusive of the synonyme of Plukenet, which is referrible to *Celòsia Monsòniæ*). Willd. spec. 1. p. 1196. (exclusive of the synonyme of Loureiro, which is referrible to *Polycarpæ'a spadícea*). Lahàya corymbòsa, Schultes, syst. 5. p. 404. Pol. I'ndica, Lam. journ. hist. nat. 2. p. 8. Celòsia corymbòsa, Roxb. fl. ind. 1. p. 310.?—Bocc. mus. 44. t. 39. good.—Burm. zeyl. t. 65. f. 2. Flowers white.

Corymbose-flowered Polycarpæa. Fl. July, Aug. Clt. 1823. Pl. 1 foot.

9 P. spadi'cea (Lam. l. c. no. 2799.) stems ascending, diffuse, branched, suffruticose at the base; branches tomentose; leaves linear, bluntish, when young rather tomentose; cymes terminal, corymbose; calyxes scarious. ♃.? ♄.? S. Native of the East Indies, on the coasts of Malabar and Tranquebar.—Rheed. mal. 10. t. 66. Celòsia corymbòsa, Willd. spec. 1. p. 1200. exclusive of the synonyme of Retz. Móllia spadícea, Willd. hort. berol. Lahàya spadícea, Schultes, syst. 5. p. 405. Pòlia arenària, Lour. coch. p. 164. Allied to *P. corymbòsa*, but is more diffuse in habit; leaves broader and shorter, in more distant whorls; lobes of calyx less acuminated. Perhaps Paronýchia subulàta, D. C. in Lam. dict. 5. p. 25. or Illécebrum subulàtum, Pers. ench. 1. p. 261. is referrible to this species.

Chestnut-brown Polycarpæa. Pl. 1 foot, diffuse.

10 P. Brasilie'nsis (St. Hil. fl. bras. 2. p. 183.) stems erect, puberulous; leaves linear-subulate, with revolute margins, mucronate, puberulous; cymes corymb-formed; calycine lobes very acute, puberulous; petals ovate-orbicular, one-half shorter than the calyx. ♃. S. Native of Brazil, in that part of the province of St. Paul called Campos Geraes, near Fazenda de Jaquariahiba. Flowers densely clothed with white tomentum. Petals at first white, but at length of a dirty yellow-colour. Root fusiform, with many stems rising from the neck.

Var. β, ramosíssima (St. Hil. l. c.) stems much branched; leaves setaceous; cymes branched; flowers a little smaller than those of the species. Native of Brazil, in the province of Goyaz, on the sandy Mountain called Serra dos Pyreneos; also on the road to Campo Allegre, in the province of Minas Geraes.

Brazilian Polycarpæa. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

11 P. tenuifòlia (D. C. prod. 3. p. 374.) stems erect, branched; leaves opposite, linear-subulate, keeled below; cymes terminal, dichotomous, corymbose; calyxes scarious, length of capsule. ♄. S. Native of Sierra Leone. Achyránthes tenuifòlia, Willd. spec. 1. p. 1196. Móllia tenuifòlia, Willd. hort. berol. Lahàya tenuifòlia, Schult. syst. 1. p. 404. Leaves with revolute margins. Stipulas minute, diaphanous.

Fine-leaved Polycarpæa. Fl. June, Aug. Clt. 1817. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

12 P. glabrifòlia (D. C. l. c. and mem. par. t. 5.) stems erect, branched, suffruticose; branches pubescent; leaves glabrous, oblong-linear, bluntish, twice the length of the stipulas; cymes terminal, dense, many-flowered, in crowded heads. ♄.? ♃.? S. Native of Sierra Leone. This species differs from *P. tenuifòlia* in the leaves not being subulate, nor keeled, nor with revolute edges; in the stipulas being large, and in the flowers being capitate.

Glabrous-leaved Polycarpæa. Pl. 1 foot.

13 P. linearifòlia (D. C. l. c. and mem. par. t. 6.) stems erect, or somewhat ascending at the base, branched; branches pubescently hairy; leaves linear, elongated, pubescent, 3 times longer than the stipulas; cymes crowded into a dense terminal roundish head. ⊙. F. Native of Senegal. Paronýchia linearifòlia, D. C. in Lam. dict. 5. p. 26. Illécebrum linearifòlium, Pers. ench. 1. p. 261. Alternanthèra erécta, Rchb. in Sieb. pl. exsic. seneg. no. 60. Habit of *Celòsia*, but the characters are those of *Polycarpæ'a*.

Linear-leaved Polycarpæa. Pl. 1 foot.

14 P. frankenioìdes (Presl. in Hœnk. reliq. 2. p. 6.) stems much branched, diffuse, procumbent, roughish; branches opposite; leaves opposite, oblong, obtuse, clothed with rough pubescence; flowers in dichotomous corymbose panicles; sepals bluntish, pilose. ⊙. H. Native of the Island of Luzon.

Frankenia-like Polycarpæa. Pl. procumbent.

† *Species not sufficiently known.*

15 P. carnòsa (Chr. Smith in Buch. can. p. 142.) stem shrubby; leaves 6 in a whorl, fleshy: lower ones spatulate: upper ones lanceolate; stipulas very short, jagged. ♄. G. Native of the Canary Islands.

Fleshy Polycarpæa. Shrub ¼ foot.

16 P. Smi'thii (Link in Buch. can. p. 142.) leaves 6 in a whorl, linear, glabrous, obtuse; stipulas very short; panicle dichotomous; branchlets divaricate; bracteas ovate, shorter than the calyx. ♄. G. Native of the Canaries, in the island of Palma, at Cumbre de Caldera. Very nearly allied to *P. stellàta* but differs in the panicle.

Smith's Polycarpæa. Pl. ¼ to ½ foot.

17 P.? minuartioìdes (D. C. prod. 3. p. 375.) stem shrubby, branched; branches tomentose; leaves subulate, crowded; cymes axillary, few-flowered. ♄. F. Native of the south of Spain. Móllia minuartioìdes, Spreng. mant. 1. p. 37. ex Schultes. Lahàya minuartioìdes, Schultes, syst. 5. p. 406. This is a very doubtful species, being omitted in Spreng. syst.

Minuartia-like Polycarpæa. Fl. Ju. Aug. Clt. 1826. Pl. ¼ ft.

18 P.? depre'ssa (D. C. l. c.) stems herbaceous, depressed, diffuse; leaves opposite, crowded into something like whorles, wedge-shaped; stipulas 4-cleft? flowers terminal, triandrous; calyx fleshy; petals linear, 4-toothed at the apex. ⊙. F. Native of the East Indies. Pharnàceum depréssum, Lin. mant. p. 564. Lœflíngia I'ndica, Retz, ind. p. 48. Roxb. fl. ind. 1. p. 169. This plant is certainly neither a *Lœflingia* nor a *Pharnàceum*; from the stipulas and many-seeded capsule, it agrees more nearly with *Polycarpæ'a*, but differs in the fleshy calyx, and triandrous flowers: perhaps it is more nearly allied to *Pollíchia*, but the calyx in this plant is said to be 5-parted.

Depressed Polycarpæa. Pl. depressed.

Cult. The seeds of the annual species of *Polycarpæ'a* should be reared on a hot-bed early in spring. The perennial and shrubby species being either green-house, or frame plants, require to be kept in their respective places: they are easily increased by cuttings under a hand-glass, those of the stove species in heat.

XI. STIPULI'CIDA (from *stipula*, a stipula, and *cædo*, to cut; stipulas cut or jagged). Michx. fl. bor. amer. 1. p. 26. t. 6. Ell. sketch. p. 51. Nutt. gen. amer. 1. p. 29. D. C. prod. 3. p. 375.—Polycárpon species, Pers. Rœm. and Spreng.

Lin. syst. *Triándria*, *Monogýnia*. Calyx 5-parted; lobes oval, with membranous margins. Petals 5, cuneate-oblong, entire. Stamens 3, inserted with the petals into the disk or torus. Style short; stigmas 3. Capsule 1-celled, 3-valved. Seeds few, fixed by funicles to the central placenta.—Small perennial dichotomous herbs, native of North America. Radical leaves almost like those of *Polycarpæ'a Teneríffæ*, ovate, petiolate; cauline leaves sessile, opposite, small. Stipulas jagged. Flowers small, tern, terminal. An intermediate genus between *Polycárpon* and *Polycarpæ'a*, from the sepals being flattish as in *Polycarpæ'a*, and in the stamens being 3, as in *Polycárpon*; but differs from both in the petals and stamens being expressly hypogynous according to Richard in Michx. l. c.; the genus therefore perhaps ought to have been placed in *Caryophyllææ*.

1 S. seta'cea (Michx. l. c.) ♃. F. Native of Lower Carolina, in sandy arid places. Polycárpum stipulífidum, Pers. ench. 1. p. 111. Pursh, fl. amer. sept. 1. p. 90. Plant glabrous, setaceous, erect, many times dichotomous.

Setaceous Stipulicida. Pl. ¼ foot.

Cult. See *Ortègia*, p. 93. for culture and propagation.

XII. BALA'RDIA (in honour of M. Balard, of Montpelier, who was the first to detect a new chemical principle called brome). St. Hil. fl. bras. 2. p. 180.

Lin. syst. *Di-Tetrándria*, *Trigýnia*. Calyx 5-parted almost to the base, permanent; segments flattish. Petals none. Stamens 2-3-4, inserted in the receptacle. Styles 3, very short, papilliferous inside. Capsule 3-valved, many-seeded; valves membranous. Seed subovoid, fixed to the central placenta.—An annual, branched, dichotomous herb, with opposite, stipulate leaves, and cymose flowers.

1 B. Plate'nsis (St. Hil. fl. bras. 2. p. 181. t. 111.) leaves linear, about equal in length to the internodes, mucronulate; cymes branched, many-flowered. ⊙. H. Native of Brazil, in the southern part of the province of Cisplatine, near Povo de Canelones; and in the western part near Pueblo de las Viboras; also of Buenos Ayres.

Plate Balardia. Pl. ½ foot.

Cult. The seeds of this plant should be sown on a hot-bed in spring, and the plants may be planted out in the open border in the month of May, in any warm dry situation. Not worth cultivating, excepting in a botanic garden.

XIII. AVE'RSIA (in honour of M. Avers, D. M. P., who has written a dissertation on the *Nicotiàna Tabácum*, in which he treats of its various qualities). St. Hil. fl. bras. 2. p. 184.

Lin. syst. *Triándria*, *Monogýnia*. Calyx deeply 5-parted, permanent; lobes thickened in the middle, keeled. Petals 5, inserted in the bottom of the calyx. Stamens 3, inserted with the petals; filaments dilated at the base, joined to the petals and together at the base. Style 1, trifid; lobes papilliferous inside. Capsule 3-valved, many-seeded; valves membranous. Seeds fixed to the central placenta, cylindrical. Embryo in the middle of fleshy albumen, not at one side as in *Polycarpæ'a*.—A trailing branched herb, with opposite stipulate leaves; young leaves or abortive branches in fascicles in the axils of the older leaves. Cymes branched, many-flowered.

1 A. frankenioìdes (St. Hil. l. c. t. 112.) stems trailing, branched; leaves lanceolate, bluntish, narrowed into the petiole, pubescent; cymes many-flowered; segments of calyx obtuse, pubescent; petals and stamens one half shorter than the calyx. ⊙. H. Native of Brazil, on the sandy banks of the rivers Parahyba, Rio Doce, Jiquitinhonha, Rio de St. Francisco, &c. Flowers white.

Frankenia-like Aversia. Pl. trailing, ½ foot.

Cult. See *Balárdia* above for culture and propagation.

XIV. ORTE'GIA (in honour of Joseph E. de Ortega, a Spanish botanist, companion of Lœfling in his travels. See *Lœflíngia*). Lœfl. itin. p. 112. Lin. gen. no. 51. Gærtn. fr. 2. p. 224. t. 129. f. 8. Ser. in D. C. prod. 1. p. 388. and 3. p. 375.—Ortèga, Lin. spec. ed. 1.—Juncària, Clus.

Lin. syst. *Triándria, Monogýnia.* Calyx of 5 sepals, or 5-parted; sepals erect, oblong, a little keeled. Petals wanting. Stamens 5, 3 of which are fertile, inserted in the torus in front of 3 of the sepals; the other 2 almost vanished, or small, sterile, and scale-formed. Ovarium ovate. Style 1, capitate at the apex, or bifid. Capsule 3-valved. Seeds numerous, fixed to the central placenta. Embryo straight, placed on the back of the albumen.—Erect, much-branched herbs. Leaves opposite, linear, with 2 black dots at the sides, from which the stipulas have fallen. Cymes dichotomous, many-flowered. Flowers greenish-white. Stamens hypogynous, as in *Stipulícida* and *Polycarpæ'a*.

1 O. Hispa'nica (Lin. spec. ed. 1. p. 560.) stigma capitate. ♃. H. Native of Spain, about Madrid and many other places. Cav. icon. 1. t. 47.—Clus. hist. 2. p. 174. f. 2. Vahl. enum. 2. p. 25.

Spanish Ortegia. Fl. Ju. Jul. Clt. 1768. Pl. ½ foot.

2 O. dichótoma (Lin. mant. p. 175.) stigma trifid. ♃. H. Native of Italy and Piedmont, about Giavena. All. act. taur. 3. p. 176. t. 4. f. 1. D. C. fl. fr. ed. 3. vol. 4. p. 726. Vahl. symb. 2. p. 25. Cyme more loose than that of the first species, and therefore it is more distinctly dichotomous, but divided in a similar way.

Dichotomous Ortegia. Fl. Aug. Sept. Cl. 1781. Pl. ½ foot.

Cult. The species thrive best in light soil; and are increased by cuttings or seeds. They are well fitted for rock work, or to be grown in small pots among other alpine plants.

XV. POLYCA'RPON (from πολυ, *poly*, many, and καρπος, *karpos*, a seed; seeds numerous). Lœfl. in Lin. gen. no. 105. Gærtn. fr. 2. t. 129. Lam. ill. t. 51. Juss. mem. mus. 2. p. 390. D. C. prod. 3. p. 376.—Trichlis, Hall. gœtt.—Anthýllis species, Adans.

Lin. syst. *Tri-Pentándria, Trigýnia.* Calyx deeply 5-cleft (f. 23. *a.*), permanent; segments concave, keeled, mucronate at the apex. Petals 5 (f. 23. *b.*), emarginate, inserted in the tube of the calyx. Stamens 3-5, inserted in the tube of the calyx. Style trifid; lobes papilliferous inside. Capsule 1-celled, 3-valved (f. 23. *e.*), many-seeded. Seeds nearly ovoid, a little curved, fixed to the central placenta.—Annual, branched, dichotomous herbs. Leaves opposite, or 4 in a whorl; young ones usually disposed in fascicles in the axils of the old leaves. Flowers in cymose corymbs. Stipulas and bracteas small, scarious.—This genus agrees with *Adenàrium*, but differs in the stamens being equal in number to the petals, not as in *Caryophýlleæ*, double that number.

* *Flowers triandrous.*

1 P. Apure'nse (H. B. et Kunth, nov. gen. amer. 6. p. 40.) flowers triandrous; petals emarginate? leaves 5-10 in a whorl. ⊙. H. Native of South America, on the banks of the river Apures, in the province of de Varinas. Stems diffuse, pubescent. Leaves linear-spatulate. Cymes dichotomous. Lobes of calyx obtuse. Stamens and styles 3.

Apures All-seed. Pl. ⅛ to ¼ foot.

2 P. tetraphy'llum (Lin. fil. suppl. 116.) flowers triandrous; petals emarginate; lower leaves 4 in a whorl; rameal ones opposite, obovate-oblong, rounded at the apex, mucronulate, shorter than the internodes. ⊙. H. Native of Europe, Canary Islands; Brazil on walls, about the town of St. Paul. In England, on the west coast; on various parts of the coast of Devonshire, Somersetshire, and Portland Island.—Smith, engl. bot. t. 1031. Krock. fl. siles. t. 42. Mollùgo tetraphýlla, Lin. spec. 1. p. 89.

FIG. 23.

Var. β, diphýllum (D. C. prod. 3. p. 376.) leaves all opposite. ⊙. H. Polycárpon diphýllum, Cav. icon. 2. p. 40. t. 151. f. 1. Paronýchia striàta, D. C. in Lam. dict. 5. p. 25.? Illécebrum striàtum, Pers. ench. 1. p. 261.

Four-leaved All-seed. Fl. Ju. Jul. Engl. Pl. ¼ foot.

** *Flowers pentandrous.*

3 P. alsinefòlium (D. C. prod. 3. p. 376.) flowers pentandrous; petals nearly entire: leaves oval, rather fleshy; flowers crowded into terminal cymes. ⊙. H. Native of Sicily, France, between Cetta and Narbonne, and also of the Cape of Good Hope and New Holland, on the sandy sea-coast. Bocc. sic. p. 71. t. 38. Hàgea alsinefòlia, Biv. manip. 3. p. 7. Lahàya alsinefòlia, Schultes, syst. 5. p. 405. Móllia alsinefòlia, Schultes, syst. 1. p. 795. Holósteum tetraphýllum, Thunb. fl. cap. p. 120. Polycárpon spec. Sieb. fl. nov. holl. no. 570. Illécebrum alsinefòlium, Lin. mant. 51.? Very like *P. tetraphýllum*, but differs in the leaves being smooth and oval; and in the flowers being pentandrous, larger, fewer, and more crowded.

Chickweed-leaved All-seed. Fl. Ju. Aug. Clt. 1817. Pl. ¼ ft.

4 P. peploìdes (D. C. prod. 3. p. 376.) flowers pentandrous; petals quite entire; leaves opposite, obovate; flowers crowded into terminal cymes. ♃. F. Native of Sicily; France about Perpignon. Hàgea polycarpoìdes, Biv. manip. 2. no. 3. Móllia Polycárpon, Spreng. nov. prod. p. 28. Lahàya polycarpoìdes, Schultes, syst. 5. p. 404. Arenària peploìdes, Lapeyr. abr. p. 251. but not of Lin. Very like *P. tetraphýllum*, and, as in it, the leaves are sometimes 4 in a whorl; but besides these characters, it differs in the leaves being rounder; cymes denser; flowers a little larger, and pentandrous, &c.

Water Purslane-like Polycarpon. Pl. ¼ foot.

Cult. The seeds of the annual species of the genus only require to be sown in the open border in spring. The last species being perennial, should be grown in a small pot, and placed among other alpine plants.

XVI. CE'RDIA (in honour of Juan de Dios Nizente de la Cerda, an artist attached to the Mexican expedition). Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 3. p. 377.

Lin. syst. *Monándria, Monogýnia.* Calyx 5-parted; lobes oblong; petaloid inside, drawn out each into a long mucrone at the apex. Petals wanting. Stamen 1, in front of one of the calycine segments. Ovarium ovate-globose. Style filiform, bifid at the apex. Capsule 1-celled, many-seeded,—Dwarf Mexican herbs, intermediate between *Herniària* and *Pollíchia*. Roots perennial, simple. Stems spreading. Leaves opposite, or in something like whorls, linear, cuspidate. Stipulas membranous, solitary between the opposite leaves. Flowers small, axillary, subpedicellate; pedicels furnished with 1-2 bracteas.

1 C. vire'scens (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 3. p. 377.) leaves opposite. ♃. G. Native of Mexico. D. C. mem. par. t. 2. Flowers greenish-white inside.

Greenish-flowered Cerdia. Pl. pr.

2 C. purpura'scens (Moc. et Sesse, l. c.) leaves 4 together in

a kind of whorl. ♃. G. Native of Mexico. Flowers purplish inside.

Purplish Cerdia. Pl. pr.

Cult. These plants will grow well in a mixture of loam and sand, and are easily increased by dividing at the root, by cuttings, or by seeds.

Tribe IV.

POLLICHIE'Æ (this tribe only contains the genus *Pollíchia*). D. C. prod. 3. p. 377. Calyx 5-toothed; tube urceolate. Stamens 1-2, inserted in the throat of the calyx. Petals wanting. Stigma bifid. Fruit or utriculus valveless, 1-seeded. Bracteas and calyx becoming large and fleshy after flowering, and forming something like a berry.—Suffruticose herbs, with opposite, subverticillate stipulaceous leaves.

XVII. POLLI'CHIA (in honour of John Adam Pollich, M.D., author of a History of the native plants of the Palatinate of the Rhine). Sol. in Ait. hort. kew. (1789) 1. p. 5.; 3. p. 505. Juss. mem. mus. 2. p. 388. but not of Med. nor Roth. nor Willd.—Neckèria, Gmel. syst. (1796) 1. p. 16. but not of Hedw. nor Scop.—Meerbúrgia, Mœnch, suppl. (1802) p. 116.

Lin. syst. *Monándria, Monogýnia.* Calyx campanulately urceolate, 5-toothed, permanent. Petals wanting, unless the scales at the throat are to be taken for them. Stamen 1 (ex Mœnch. rarely 2) inserted in the throat of the calyx. Style filiform; stigma bifid. Capsule valveless, 1-seeded, inclosed in the thickened tube of the calyx.—A suffruticose branched herb. Leaves linear, opposite, but at first sight appear verticillate, in consequence of 2 rameal leaves rising in each axil, furnished with scarious acute stipulas. Flowers small, aggregate, sessile, bracteate.

1 P. campe'stris (Ait. l. c. Smith. spicil. 1. t. 1.). ♄.? ♃.? F. Native of the Cape of Good Hope. Neckèria campéstris, Gmel. l. c. Meerbúrgia glomeràta, Mœnch. l. c. Flowers greenish. Bracteas mixed with the flowers, ciliated; scales full of sweet juice.

Field Pollichia. Fl. Sept. Clt. 1780. Pl. ½ foot.

Cult. The seeds of *Pollíchia* must be raised on a hot-bed; and when the plants are 2 inches high, they may be planted out singly into pots, placed among the greenhouse plants, and afterwards treated like them.

† *Genera placed in Paronychièæ, but are not sufficiently known.*

XVIII. LITHO'PHILA (from λιθος, *lithos*, a stone, and φιλεω, *phileo*, to love; this plant delights to grow among stones). Swartz, fl. ind. occ. 1. p. 47. t. 1. D. C. prod. 3. p. 380.

Lin. syst. *Diándria, Monogýnia.* Calyx profoundly 3-parted, acute. Petals 3, ovate-lanceolate. Scales, nectaries, or abortive stamens 2, opposite the segments of the calyx. Stamens 2, at one side of the ovarium. Style thick, bluntly emarginate at the apex. Fruit unknown.—A very minute glabrous herb. Leaves stem-clasping, linear, obtuse. Flowers white, crowded.

1 L. muscoìdes (Swartz, l. c. p. 48.).—Native of the desert island of Navaza, among rocks.

Moss-like Lithophila. Pl. 1 inch.

Cult. This plant is not worth cultivating, unless in botanic gardens. Should it ever be introduced to our gardens, we would recommend its being grown in a pot filled with broken stones, having the crevices filled with vegetable mould. It may probably be propagated by seeds.

XIX. SELLO'WIA (in honour of Frederick Sello, a German botanist, who was lately drowned in some creek of the Amazon; and who has sent home many fine collections of Brasilian plants). Roth. nov. spec. p. 162. D. C. prod. 3. p. 380.

Lin. syst. *Pentándria, Monogýnia.* Calyx urceolate, 5-cleft, membranous, 10-ribbed; lobes short, lanceolate; ribs bearing alternately a petal and a stamen. Petals 5, oval, alternating with the calycine lobes. Stamens 5, fixed in the middle of the calycine lobes, and shorter than them; anthers didymous. Style 1; stigma obtuse. Capsule 3-valved, 1-celled, 1-seeded.—A quite glabrous herb, with the habit of *Illécebrum verticillàtum*. Leaves opposite, oblong-oval. Flowers 1-2 in the axils of the leaves, small, white, and somewhat pedicellate. It is not known whether the leaves are stipulaceous or naked.

1 S. uliginòsa (Roth. l. c. p. 163.). Native of the East Indies, in bogs.

Bog Sellowia. Pl. proc.

Cult. Place a pan of water under the pot in which this plant is grown.

Order CXII. SCLERA'NTHEÆ (plants agreeing in important characters with *Scleránthus*). Link. enum. p. 417. Bartl. ex Mart. amarant, p. 67.—Paryonychièæ, Tribe V. Sclerántheæ, D. C. prod. 3. p. 377, &c.

Flowers hermaphrodite. Calyx 4-5-parted (f. 24. *a.*). Stamens from 1 to 10, inserted in the orifice of the tube (f. 24. *a.*). Ovarium simple, 1-seeded. Styles 2 (f. 24. *e.*) or 1, emarginate at the apex. Fruit a membranous utricle, inclosed within a hardened calyx. Seed hanging from the apex of a funicle, which arises from the bottom of the cell. Embryo cylindrical, curved round farinaceous albumen.—Small herbs. Leaves opposite, without stipulas. Flowers axillary, sessile. This order has been referred by De Candolle to *Paronychièæ*, from which it differs in the absence of petals and stipulas, and therefore appears to constitute a distinct order, more nearly related to *Chenopòdeæ* than *Paronychièæ*, from which the plants chiefly differ in the indurated tube of the calyx, from the orifice of which the stamens proceed, and in the number of the latter exceeding that of the divisions of the calyx. The tribe *Minuartièæ* is probably not distinguishable from *Scleránthea*, notwithstanding the supposed presence of petals, which would perhaps be more properly called abortive stamens. All the plants contained in this order are uninteresting weeds, of no known use.

Synopsis of the genera.

Tribe I.

Sclera'nthea. *Calyx 4-5-toothed* (f. 24. *a.*), *with an urceolate tube. Petals none. Stamens* 1-10, *inserted in the throat of the calyx* (f. 24. *a.*). *Styles* 2 (f. 24. *e.*) *or* 1, *emarginate at the apex* (f. 24. *b.*). *Fruit an utricle, covered by the indurated tube of the calyx,* 1-*seeded. Seed hanging by a funicle, which arises from the bottom of the capsule.*

1 Mnia'rum. Calyx 4-cleft, with an urceolate tube. Stamens 1. Styles 2.

2 Sclera'nthus. Calyx 5-cleft (f. 24. *a.*), with an urceolate tube. Stamens from 2 to 10. Styles 2 (f. 24. *e.*).

3 Guillemi'nea. Calyx 5-cleft, with a campanulate tube. Stamens 5. Style 1, emarginate at the apex.

Tribe II.

Queria'ceæ. *Calyx 5-parted. Petals none. Stamens* 10,

inserted in the bottom of the calyx. Capsule 3-valved. Seed hanging from a long funicle, which arises from the centre of the cell.

4 Que'ria. The character is the same as that of the tribe.

Tribe III.

Minuartie'æ. *Calyx 5-parted. Petals wanting or very minute. Stamens* 3-10, *inserted in the bottom of the calyx. Styles* 3. *Capsule* 1-*celled*, 3-*valved. Seeds numerous, fixed to the central placenta.*

5 Minua'rtia. Lobes of calyx quite entire. Styles 3.

6 Lœfli'ngia. The 3 outer lobes of calyx bisetose at the base. Style 1, trifid at the apex.

Tribe I.

SCLERA'NTHEÆ (plants agreeing with *Scleránthus* in important characters). Paronychièæ, Tribe V. Scleránthеæ, D. C. prod. 3. p. 377. Calyx 4-5-cleft, with an urceolate tube. Petals wanting. Stamens 1-10, inserted in the throat of the calyx. Styles 2 or 1, emarginate at the apex. Fruit a 1-seeded membranous utricle, covered by the indurated tube of the calyx. Seed hanging from a long funicle, which arises from the bottom of the cell, and which is recurved at the apex.—Herbs, with opposite exstipulate leaves.

I. MNIA'RUM (from *μνιαρος*, *mniaros*, mossy; in reference to the moss-like habit of the plants). Forst. gen. 1. t. 1. Lin. fil. suppl. 18. R. Br. prod. p. 412. St. Hil. plac. lib. p. 58. Juss. mem. mus. 2. p. 387. D. C. prod. 3. p. 378.—Ditòca, Banks ex Gærtn. fr. 2. p. 196. t. 126.

Lin. syst. *Monándria, Digýnia.* Calyx 4-cleft, permanent, with an urceolate tube. Petals wanting. Stamen one, inserted in the throat of the calyx. Ovarium free, 1-seeded. Styles 2. Capsule valveless, membranous, covered by the indurated tube of the calyx. Seed one, as in *Scleránthus*.—Australian herbs. Leaves opposite, subulate. Peduncles axillary, bearing 4 bracteas and 2 flowers at the apex, becoming after flowering elongated and stiff. The ovarium, according to Forster, is sometimes 2-seeded.

1 M. biflòrum (Forst. l. c.) stems tufted; branches quite glabrous; leaves denticulated at the base, the rest quite entire. ♃. G. Native of Van Diemen's Land, Maria Island in New Holland, New Zealand, and of the Straits of Magellan. R. Br. prod. p. 412. Forst. comm. gœtt. 1789. t. 1. M. pedunculàtum, Labill. nov. holl. 1. t. 2. Ditòca muscòsa, Gærtn. l. c.

Two-flowered Mniarum. Fl. June, July. Clt. 1823. Pl. ¼ ft.

2 M. fasciculà'tum (R. Br. prod. p. 412.) stems many from the same neck, procumbent, branched; branches clothed with fine pubescence; leaves denticulated their whole length. ♃. G. Native of Van Diemen's Land.

Fascicled Mniarum. Pl. procumbent.

Cult. A mixture of loam, peat, and sand, will suit the species of *Mniàrum*, and they may be propagated either by seeds or cuttings.

II. SCLERA'NTHUS (from *σκληρος*, *scleros*, hard, and *ανθος*, *anthos*, a flower; in reference to the dry juiceless calyx). Lin. gen. no. 562. Gærtn. fruct. t. 126. R. Br. prod. 1. p. 412. St. Hil. pl. libr. p. 58. Juss. mem. mus. 2. p. 387.

Lin. syst. *Penta-Decándria, Digýnia.* Calyx 5-cleft (f. 24. *a.*), permanent, with an urceolate tube. Petals wanting. Stamens inserted in the throat of the calyx, 10 (f. 24. *a.*), rarely 5 or 2. Ovarium free, 2-seeded. Styles 2 (f. 24. *e.*). Capsule very thin, valveless, covered by the indurated tube of the calyx. Seed one, hanging from a long funicle, which arises from the bottom of the capsule, and is recurved at the apex.—Small herbs, with opposite linear leaves, which are rather connate at the base. Flowers small, greenish white, sessile in the axils of the forks of the branches.

1 S. pere'nnis (Lin. spec. 580.) flowers decandrous; lobes of fructiferous calyx closed, obtuse, with white and membranous edges. ♃. H. Native of Europe and the Levant, in dry sandy fields. In England, on high open sandy fields, rare; as about Eldon, Suffolk, and plentifully near Snettingham, Norfolk; near Bury St. Edmunds; and Scotland, on a gravelly bank near Forfar. Schkuhr, handb. t. 120. Fl. dan. t. 563. Smith, engl. bot. t. 352.—Ray, syn. p. 160. t. 5. f. 1. The Polish cochineal (*Cóccus Polónicus*) is found upon the roots in the summer months.

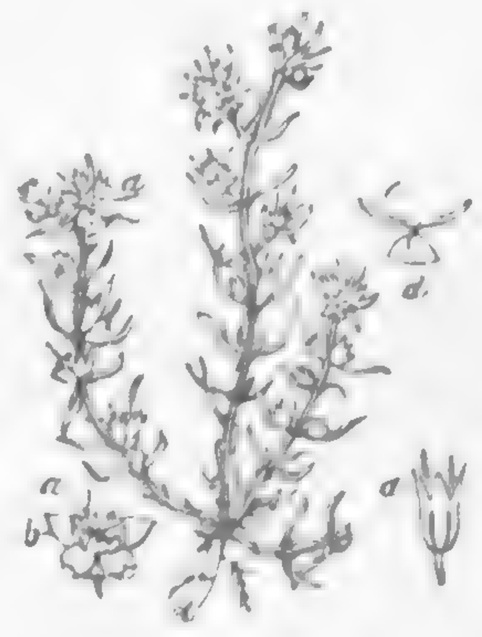
Perennial Knawel. Fl. July, Aug. England. Pl. prostrate.

2 S. polyca'rpus (Lin. spec. p. 581.) flowers subdecandrous; lobes of the calyx when in fruit rather spreading, and without any margin, acute, shorter than the tube. ⊙. H. Native in sandy fields about Montpelier, but never gathered elsewhere in France; also of Italy, according to Linnæus.—Column. ecphr. 1. t. 294. It differs from *S. ánnuus* at first sight, in the flowers being one-half smaller; but it is probably merely a variety of it.

Many-fruited Knawel. Pl. procumbent.

3 S. a'nnuus (Lin. spec. p. 580.) flowers subdecandrous; lobes of fructiferous calyx spreading, immarginate, acutish, about equal in length to the tube. ⊙. H. Native of Europe, the Levant, also of North America, in dry sandy cultivated fields; plentiful in some parts of Britain. Fl. dan. 504. Smith, engl. bot. t. 351. Knawel ánnuum, Scop. carp. p. 501. There is a variety, according to Leers. which has only 5 or 7 stamens to each flower. The Swedes and Germans receive the vapour arising from a decoction of it into their mouths to cure the tooth-ache.

FIG. 24.



Annual Knawel. Fl. July, Aug. Britain. Pl. ¼ foot.

4 S. hirsu'tus (Presl. del. p. 65.) flowers with 5 petals and 5 stamens; calyxes conniving, obtuse; stamens equalling the calyx in length; anthers hairy; stems pubescent. ⊙. H. Native on Mount Etna, in the open regions. Leaves subulate, glabrous. Flowers capitate.

Hairy Knawel. Pl. prostrate.

5 S. pu'ngens (R. Br. prod. p. 412.) flowers pentandrous, particularly having 5 fertile and 5 sterile stamens; lobes of fructiferous calyx spreading; leaves subulate, triquetrous, mucronate, pungent, rough on the keel and margins. ⊙. ? H. Native of New Holland, on the south coast.

Pungent-leaved Knawel. Fl. July, Aug. Clt. 1826. Pl. procumbent.

6 S. dia'nder (Rr. Br. prod. p. 412.) flowers diandrous; stamens mixed with scales; lobes of fructiferous calyx erect; leaves subulate, keeled, mucronulate, almost naked on the keel and margins. ⊙. H. Native of Van Diemen's Land.

Diandrous Knawel. Pl. procumbent.

Cult. The seeds of these plants only require to be sown in the open border. None of the species are worth cultivating except in botanic gardens.

III. GUILLEMI'NEA (in honour of John Anthony Guillemin, an acute French botanist, who has written on the family of plants called *Gentiàneæ*, &c.). H. B. et Kunth, nov. gen. amer. 6. p. 41. t. 518. D. C. prod. 3. p. 378.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft, with a campanulate tube; lobes equal. Petals wanting. Stamens 5, inserted in the top of the tube, opposite the calycine lobes, short: anthers 1-celled. Style 1, somewhat emarginate at the apex. Fruit an indehiscent 1-seeded utricle, covered by the calyx. Seed hanging by a funicle, which arises from the bottom of the capsule.—A South American trailing herb, with opposite branches. Stems woolly. Leaves glabrous, oblong, opposite, exstipulate, but the petioles are connate at the base. Flowers capitate, axillary. Bracteas under each flower.

1 G. illecebrioìdes (H. B. et Kunth, l. c.) ♃. G. Native of South America, near Quito, in the valley of St. Jago.

Illecebrum-like Guilleminea. Pl. tr.

Cult. Any common light soil will suit this plant, and it may be propagated from cuttings or seeds.

Tribe II.

QUERIA'CEÆ (this tribe contains nothing but the genus *Quèria*). Calyx 5-parted. Petals wanting. Stamens 10, inserted in the bottom of the calyx. Capsule 3-valved. Seed 1, on a long funicle, which rises from the centre of the capsule.—Herbs, with opposite exstipulate leaves.

IV. QUE'RIA (in honour of Joseph Quer y Martinez, M.D. professor of botany at Madrid; author of Flora Espanola, 1762). Lœfl. itin. p. 48. Lin. gen. no. 108. Lam. ill. t. 52. St. Hil. plac. lib. p. 58. Juss. mem. mus. 2. p. 387. D. C. prod. 3. p. 379.

Lin. syst. *Decándria, Trigýnia.* Stamens 10, slender, unequal, sometimes 5 of which are sterile. Styles 3, very slender. Capsule membranous, 1-celled, 3-valved. Seed reniform when mature.—Small stiff annual herbs. Leaves opposite, crowded, setaceous, connate, recurved at the apex. Flowers in the axils of the upper branches and superior leaves, sessile, solitary. This genus is hardly distinct from *Minuártia*, unless in the styles being 3; in the valves being 3, and form of the seeds, which are evidently solitary from abortion.

1 Q. Hispa'nica (Lin. spec. p. 132.) ⊙. H. Native of Spain, in dry exposed places. Quer, fl. esp. 6. t. 15. f. 2. Ort. cent. t. 15. f. 1.

Spanish Queria. Fl. Aug. July. Clt. 1800. Pl. 1 to 2 inches.

† *A doubtful species.*

2 Q. trichótoma (Thunb. in Lin. soc. trans. 2. p. 529.) ⊙. H. Native of Japan. Rùbia, Thunb. fl. jap. p. 357. Stem trichotomous. Flowers racemose. Corolla cylindrical, below the fruit, Thunb. This plant does not probably belong to the order.

Trichotomous Queria. Pl. $\frac{1}{4}$ foot.

Cult. The seeds only require to be sown in the open ground in any dry situation.

Tribe III.

MINUARTIE'Æ (plants agreeing with *Minuártia* in important characters). Paronychièæ, Tribe VII. Minuartièæ, D. C. prod. 3. p. 379. Calyx 5-parted. Petals wanting or very small. Stamens 3-10, inserted in the bottom of the calyx. Styles 3. Capsule 1-celled, 3-valved. Seeds numerous, fixed to the central placenta.—Annual herbs, natives of the south of Europe, with opposite exstipulate leaves.

V. MINUA'RTIA (so named from John Minuart, a Spanish apothecary, restorer of botany in Spain; he constituted the genus *Cerviàna*, now *Pharnàceum*, and is commended by Lœfling). Lœf. itin. p. 48. Lin. gen. no. 107. Lam. ill. t. 52. St. Hil. mem. plac. p. 59. Juss. mem. mus. 2. p. 386. D. C. prod. 3. p. 379.

Lin. syst. *Pentándria, Trigýnia.* Sepals 5, hardly joined at the very base, quite entire. Petals or abortive stamens 5, small, alternating with the sepals. Stamens 5, opposite the sepals, and longer than the petals. Styles 3, filiform. Capsule 1-celled, 3-valved. Seeds few, fixed to the central axis.—Small annual herbs. Leaves opposite, setaceous, 3-5-nerved at the base, quite entire. Flowers in the forks of the branches, and in the axils of the upper leaves, solitary, small, sessile, or on short pedicels; constituting a leafy, dense, dichotomous cyme. Petals bifid, or rather nectaries. (ex Lœfl.) Stamens 10, 5 abortive. (Steven.) Petals and stamens 10. (St. Hil.) According to several specimens examined, the stamens are 10, and the 5 alternate ones are sometimes converted into petals. The genus differs from *Lœflíngia* in the sepals being quite entire, and from *Quèria* in the fruit being many-seeded.

1 M. campe'stris (Lœfl. itin. p. 122.) flowers distinctly pedicellate, equal in length, or a little longer than the floral leaves; sepals very unequal, 3 large and 2 smaller. ⊙. H. Native of Spain, in dry sandy fields. Habit almost of *Bufònia*. Act. holm. 1758. t. 1. f. 3.

Field Minuartia. Fl. Ju. Jul. Clt. 1806. Pl. $\frac{1}{8}$ to $\frac{1}{4}$ foot.

2 M. dichótoma (Lœfl. l. c. p. 121. t. 1. f. 3.) flowers almost sessile, in fascicles, shorter than the floral leaves; sepals nearly equal; mucrone of leaves oblique. ⊙. H. Native of Spain, on hills. Act. holm. 1758. t. 1. f. 5. Plant stiff, dusky.

Dichotomous Minuartia. Fl. Ju. Jul. Clt. 1771. Pl. $\frac{1}{8}$ to $\frac{1}{4}$ ft.

3 M. monta'na (Lœfl. l. c. p. 122. t. 1. f. 4.) bundles of flowers about equal in length to the bracteas; sepals nearly equal; mucrone of leaves straight. ⊙. H. Native of Spain, Tauria, and Iberia, on dry hills.—Bieb. fl. taur. 1. p. 90.

Mountain Minuartia. Fl. Ju. Jul. Clt. 1806. Pl. $\frac{1}{8}$ to $\frac{1}{4}$ ft.

Cult. The seeds only require to be sown in the open ground, in any dry situation, in a light soil.

VI. LŒFLI'NGIA (so named in honour of Peter Lœfling, one of the disciples of Linnæus, who travelled in Spain and America, and died on his travels in 1756.). Lin. act. holm. 1758. p. 15. t. 1. f. 1. gen. p. 52. Lam. ill. t. 19. St. Hil. mem. plac. lib. p. 59. Juss. mem. mus. 2. p. 386. D. C. prod. 3. p. 380.

Lin. syst. *Pentándria, Monogýnia.* Sepals 5, connected at the base, 3 outer ones bisetose at the base. Petals 5, small, conniving, inserted in the bottom of the calyx. Stamens 5, alternating with the petals, or 3, 2 of them being abortive? Style 1, trifid at the apex, or divided into 3 from the base. Capsule 1-celled, 3-valved. Seeds numerous, fixed to the central placenta.—Small, annual herbs. Leaves opposite, exstipulate, margined on both sides at the base, and appendiculated, these appendages probably supply the place of stipulas. Flowers in the forks of the branches, and in the axils of the upper leaves, solitary, sessile.

1 L. Hispa'nica (Lin. spec. p. 50.) flowers triandrous; style 1, trifid at the apex. ⊙. H. Native of Spain, Mauritania, and South of France, in dry sandy places. Lœfl. itin. t. 1. f. 1. Cav. icon. 1. t. 94. L. prostràta, Mœnch. Herb clammy, pubescent. Corolla white; petals obovate, emarginate.

Spanish Lœflingia. Fl. Ju. Jul. Clt. 1770. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

2 L. penta'ndra (Cav. icon. 2. t. 148. f. 2.) flowers pentandrous; styles 3, distinct from the base. ⊙. H. Native along

the Mediterranean Sea, in the sand; and of Spain, near Valentia. Perhaps sufficiently distinct from the first.

Pentandrous Lœflingia. Fl. Ju. Jul. Clt. 1820. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

† *Species not sufficiently known.*

3 L. Ca'spica (Gmel. syst. 1. p. 105.) plant smooth in every part. Found on the shores of the Caspian Sea, by Gmelin. Gmel. itin. 3. p. 310. t. 35. f. 1.

Caspian Lœflingia. Pl. $\frac{1}{4}$ foot.

4 L.? renifòlia (Lag. gen. et spec. p. 2.) flowers pentandrous; leaves orbicularly reniform. ⊙. H. Native of Mexico.

Kidney-leaved Lœflingia. Pl. $\frac{1}{4}$ foot.

Cult. The seeds only require to be sown in the open border in any dry lightish soil.

Order CXIII. CRASSULA'CEÆ (plants agreeing with *Crássula* in important characters). D. C. bull. philom. 1801. no. 49. p. 1. fl. fr. ed. 3. vol. 4. p. 382. prod. 3. p. 381.—Sempervivæ, Juss. gen. p. 237.—Succuléntæ, Vent. tabl. vol. 3. p. 271.—Succuléntæ β, Lin. ord. nat.—Crássulæ, Juss. dict. 11. p. 369.

Sepals from 3 (f. 25. *e.*) -20 (f. 30. *a.*), more or less united at the base, and therefore the calyx is many-parted (f. 26. *b.*). Petals equal in number with the sepals (f. 25. *b.* f. 26. *a.*), and alternating with them, either distinct (f. 27. *b.*) or united into a gamopetalous corolla (f. 26. *a.*), inserted in the bottom of the calyx. Stamens inserted with the petals, either equal to them in number (f. 25. *c.*) and alternating with them, or twice as many (f. 27. *c.*); those opposite the petals being shortest, and arriving at perfection after the others; filaments distinct, subulate; anthers oval, 2-celled, bursting lengthwise. Nectariferous scales several, one at the base of each ovarium sometimes obsolete. Ovaria of the same number as the petals, opposite to which they are placed around an imaginary axis, usually distinct, but in some of the anomalous genera rather concrete, all 1-celled, and tapering into 1 stigma each, opening when ripe by a longitudinal chink in front, but in the genus *Dimórpha* on the back. Seeds attached to the margins of the suture, in 2 rows, variable in number. Albumen thin, fleshy. Embryo straight in the axis of the albumen, having the radicle directed to the hilum.—Fleshy herbs or shrubs. Leaves entire or pinnatifid, without stipulas. Flowers usually in cymes, sometimes rising in the forks, often arranged unilaterally along the divisions of the cymes.

The plants contained in this order are all remarkable for the succulent nature of their stems and leaves, in which they resemble *Cácteæ*, *Portulàceæ*, and certain genera of *Euphorbiàceæ*, &c. but this analogy goes no farther. Their real affinity is probably with *Saxifràgeæ*, through *Penthòrum*, which is not succulent, like the rest of the genera; and with *Paronychièæ*, through *Tillæ'a*, as De Candolle has remarked. In both those orders, the nectariferous scales of *Crassulàceæ* are wanting. De Candolle observes (mem. crass. p. 5.) that there is no instance of a double flower in the order, although this might have been expected from their analogy in structure with *Caryophýlleæ*. *Sempervìvum tectòrum* almost constantly exhibits the singular phenomenon of anthers bearing ovules instead of pollen.

These plants are found in the driest situations, where not a blade of grass nor a particle of moss can grow, on naked rocks, old walls, sandy hot plains, alternately exposed to the heaviest dews of night, and the fiercest rays of the noon-day sun. Soil is to them a something to keep them stationary, rather than a source of nutriment, which in these plants is conveyed by myriads of mouths, invisible to the naked eye, but covering all their surface, to the juicy beds of cellular tissue which lie beneath them.

Refrigerent and abstergent properties, mixed sometimes with a good deal of acridity, distinguish them. The fishermen of Madeira rub their nets with the fresh leaves of *Sempervivum glutinòsum*, by which they are rendered as durable as if tanned, provided they are steeped in some alkaline liquor. Malic acid exists in *Sempervìvum tectòrum*, combined with lime.—Turner, p. 634.

Synopsis of the genera.

Tribe I.

Crassula'ceæ legi'timæ. *Carpella distinct, opening when mature by a longitudinal fissure in front* (f. 26, *b.*).

1 Tillæ'a. Divisions of calyx, petals, and stamens 3-4 (f. 25. *a. b. c.*). Nectariferous scales none or very small. Carpels 3-4 (f. 25. *d.*), constricted in the middle, 2-seeded.

2 Bullia'rda. Divisions of calyx, petals and stamens 4. Nectariferous scales 4, linear. Carpels 4, many-seeded.

3 Dasyste'mon. Sepals 3-7, filiform, unequal, hardly joined at the base. Petals 3-7, often 5, hardly joined at the base, rather revolute at the apex. Stamens 3-7; filaments thick. Carpels 3-5.

4 Se'ptas. Calyx 5-9-parted. Petals 5-9, stellately spreading. Stamens 5-9; filaments slender. Scales 5-9, small, roundish. Carpels 5-9, many-seeded.

5 Cra'ssula. Calyx 5-parted. Petals 5, distinct. Stamens 5; filaments subulate. Scales 5. Carpels 5, many-seeded.

6 Purgòsia. Calyx 5-parted. Petals 5, imbricating at the base. Stamens 5; scales 5, emarginate. Carpels 5, gibbous on the outside, and flat inside, many-seeded.

7 Globu'lea. Calyx 5-parted. Petals 5, bearing a waxy globule each at the apex. Stamens 5. Scales 5. Carpels 5.

8 Curto'gyne. Calyx 5-parted. Petals united into a 5-parted corolla. Stamens 5. Scales 5. Ovaria 5, gibbous at the apex, ending each in a long sublateral style.

9 Gramma'nthes. Calyx 5-cleft. Corolla gamopetalous; lobes 5, rarely 6, expanded. Stamens 5-6, inserted in the tube of the corolla. Scales none. Carpels 5.

10 Ròchea. Calyx 5-lobed. Petals 5, united into a gamopetalous corolla, with a spreading 5-lobed limb. Stamens 5. Glands and carpels 5.

11 Kalosa'nthes. Calyx 5-lobed (f. 26. *b.*). Petals united into a 5-parted corolla (f. 26. *a.*), with the tube cylindrical, 2 or 3 times longer than the spreading limb. Stamens 5, inserted in the tube of the corolla. Glands and carpels 5.

12 Kalanchòe. Calyx 4-parted; sepals hardly united at the base. Corolla gamopetalous, with a 4-parted, spreading

border. Stamens 8, adnate to the base of the tube of the corolla. Scales 4, linear. Carpels 4; styles filiform.

13 BRYOPHY'LLUM. Calyx inflated before flowering, hardly 4-cleft to the middle. Corolla gamopetalous, hypogynous; lobes 4, acute. Stamens 8, adnate to the base of the tube of the corolla. Glands 4.

14 COTYLE'DON. Calyx 4-parted. Corolla gamopetalous, with a 5-lobed, spreadingly reflexed limb. Stamens 10, adnate at the base to the tube of the corolla. Scales oval. Carpels 5, each drawn out into a subulate style.

15 PISTORI'NIA. Calyx 5-parted. Corolla gamopetalous, with a 5-parted spreading border. Stamens 10, adnate their whole length to the tube of the corolla. Scales 5. Carpels 5, ending each in a long filiform style.

16 UMBI'LICUS. Calyx 5-parted. Corolla campanulate, 5-cleft; lobes acute. Stamens 10, inserted in the corolla. Scales 5. Carpels 5; styles subulate.

17 ECHEVE'RIA. Calyx 5-parted (f. 27. *a.*); sepals erect. Petals 5, united at the base (f. 27. *b.*), thick, and erect. Stamens 10 (f. 27. *c.*), united to the petals at the base. Scales 5. Carpels 5, each ending in a subulate style.

18 SE'DUM. Calyx 5-parted (f. 29. *a.*); sepals turgid, leaf-formed. Petals 5 (f. 29. *b.*), usually spreading. Stamens 10 (f. 29. *c.*). Scales 5. Carpels 5.

19 SEMPERVÌVUM. Calyx 6-20-parted (f. 30. *a.*). Petals 6-20 (f. 30. *b.*). Stamens twice the number of the petals (f. 30. *c.*). Scales toothed or jagged. Carpels equal in number to the petals.

TRIBE II.

CRASSULA'CEÆ ANÓMALÆ. *Carpels united at the base into a many-celled capsule.*

20 DIAMÓRPHA. Calyx 4-lobed. Petals 4. Stamens 8. Carpels 4, united at the base, opening longitudinally on the back or outside.

21 PENTHÒRUM. Calyx 5-parted. Petals 5. Stamens 10. Scales wanting? Carpels 5, united at the base into a 5-beaked, 5-celled capsule, which is pentagonal at the apex, and opening under the beaks. Seeds small, numerous.

Tribe I.

CRASSU'LEÆ or CRASSULA'CEÆ LEGI'TIMÆ (this tribe contains the legitimate plants of the order). Carpels distinct; when mature opening on the inside by a longitudinal fissure.

I. TILLÆ'A (so named in honour of Michael Angelo Tilli, M. D. F. R. S., born 1653. Professor of Botany at Pisa; author of Horti Pisani Catalogus, 1723, fol. with 50 plates. It contains a few rare plants, observed by him in his voyages to Constantinople and Tunis). Mich. gen. 22. t. 20. D. C. bull. philom. no. 49. p. 2. prod. 3. p. 381.—Tillæ'a species of Lin.

LIN. SYST. *Tri-Tetrándria, Tri-Tetragýnia.* Calyx 3-4-parted (f. 25. *a.*). Petals 3-4 (f. 25. *b.*), oblong, acuminated. Scales none, or very small. Carpels 3-4, somewhat constricted in the middle, 2-seeded.—Small, glabrous, annual herbs, inhabitants of exposed sub-humid places. Leaves opposite. Flowers small, white, for the most part axillary.—Many of the exotic species may probably belong to *Bulliárda.*

1 T. MUSCÒSA (Lin. spec. 186.) stems branched at the base, decumbent; leaves connate; flowers axillary, sessile, trifid. ⊙. H. Native of Europe in many places, in dry, barren, sandy, and gravelly soil; plentiful in Britain, on the most barren sandy heaths; frequent in Norfolk and Suffolk. It is a troublesome weed in the gravel walks of Holkham. Bocc. mus. t. 22. Mich. gen. t. 20. Lam. ill. t. 90. D. C. pl. grass. t. 73. Smith, engl. bot. 116. Reich. icon. t. 191. Bocc. sic, t. 29. In exposed situations. this plant becomes reddish; but in that state it is not the *T. rùbra* of Gouan.

FIG. 25.

Mossy Tillæa. Fl. June, Oct. Britain. Pl. trail.

2 T. SÍMPLEX (Nutt. gen. amer. append. et journ. acad. philad. 1. p. 114.) stem erect, simple; leaves connate, oblong-linear, acute; flowers alternate, sessile; petals 4, erect, twice the length of the calyx. ⊙. H. Native of North America, in humid gravelly places.

Simple-stemmed Tillæa. Pl. $\frac{1}{8}$ foot.

3 T. MOSCHA'TA (D. C. prod. 3. p. 382.) stem prostrate at the base; branches ascending; leaves connate, oval-oblong; flowers 4-cleft, sessile in the axils of the superior leaves. ⊙. H. Native of the Straits of Magellan, on the mountains; and of the Maclovè Islands. Crássula moschàta, Forst. in act. soc. gœtt. 9. p. 26. Bulliárda Magellánica, D. C. bull. philom. no. 49.

Musk Tillæa. Pl. prostrate.

4 T. MÍNIMA (Miers, chil. 2. p. 530.) stems diffuse, branched; leaves minute, connate at the base, oval-oblong; flowers 4-cleft, crowded into whorls in the axils of the leaves, on short pedicels; petals 4, acuminated, shorter than the calyx; carpels 1-2-seeded.—Native of Chili, about Conception and Coquimbo. T. erécta, Hook et Arnott, in Beech. voy. bot. 1. p. 24. Allied to *T. moschàta* and *verticillàris.*

Least Tillæa. Pl. $\frac{1}{4}$ foot.

5 T. VERTICILLA'RIS (D. C. l. c.) stems prostrate at the base, rooting; branches aseending; leaves opposite, oblong-linear; flowers 4-cleft, crowded in whorls in the axils, some of which are sessile and others pedicellate. ⊙. H. Native of New Holland. Tillæ'a pedunculàta, Sieb. pl. exsic. nov. holl. no. 173. but not of Smith. Petals acuminated, longer than the calyx. Habit almost of *Illécebrum verticillàtum.*

Verticillate-flowered Tillæa. Pl. pr.

6 T. PEDUNCULA'RIS (Smith, in Rees' cycl. vol. 35. no. 4.) stem erect, simple; leaves rather connate, lanceolate, acute; pedicels axillary, solitary, twice or thrice longer than the leaves; carpels truncate at the apex. ⊙. H. Native about Monte Video and Buenos Ayres, in humid places. Bulliárda Bonariénsis, D. C. bull. philom.

Peduncled-flowered Tillæa. Pl. $\frac{1}{8}$ foot.

7 T. RUBE'SCENS (H. B. et Kunth, nov. gen. amer. 6. p. 43.) stems branched, prostrate; leaves oblong-lanceolate, ovate, mucronate, rather fleshy, connate at the base; flowers 4-cleft, on long pedicels; petals shorter than the calyx. ⊙. H. Native about Quito, near Alansi. Flowers white. Carpels 2-seeded. T. connàta, Ruiz et Pav. fl. per. 1. p. 70. t. 106. f. *a.*, which was found in Peru, about Chancay, on humid hills, appears to differ from Kunth's plant in the stems being rather erect.

Reddish Tillæa. Pl. pr.

Cult. Sow the seeds among gravel, and keep it moist, either in pots or in the open ground.

II. BULLIA'RDA (in memory of — Bulliard, author of Herbier de la France, 600 planches in fol. 1780, and other botanical works). D. C. bull. philom. no. 49. p. 1. prod. 3. p. 382.—Tillæ'a species, Lin.

Lin. syst. *Tetrándria, Tetragýnia.* Calyx 4-parted. Petals 4, oval or oblong, acute. Stamens 4. Scales 4, linear. Carpels 4, many-seeded.—Small, glabrous, annual, subaquatic herbs. Leaves opposite. Flowers small, white, axillary, sessile, or pedicellate. The parts of the flower are sometimes quinary, and therefore differ from *Crássula* in the form of the scales, and from *Tillæ'a* in the many-seeded carpels, as well as in the number of the parts of the flower.

1 B. Vaillá'ntii (D. C. pl. grass. t. 74.) stem erect, dichotomous; leaves oblong, acute; pedicels longer than the leaves. ⊙. H. Native of France, at Fontainbleau, in humid shady places, &c. Vaill. bot. t. 10. f. 2. Tillæ'a aquática, Lam. ill. t. 90. but not of Lin. Tillæ'a Vaillántii, Willd. spec. 1. p. 720. Corolla pale flesh-coloured. Stems sometimes erect and sometimes prostrate, generally rooting at the lower nodes. T. prostràta β, Poir. dict. 7. p. 674. is perhaps referrible to this plant.

Vaillant's Bulliarda. Fl. June, Aug. Clt. 1825. Pl. erect or prostrate.

2 B. aqua'tica (D. C. bull. phil. no. 49.) stem erect, rather dichotomous; leaves linear-lanceolate; flowers sessile, or on very short pedicels. ⊙. H. Native of Sweden, Norway, and Germany, in places where water stagnates. Tillæ'a aquática, Lin. fl. suec. no. 156. Wahl. fl. suec. no. 210. Stuck. p. 6. t. 1.

Var. β, *prostràta* (D. C. prod. 3. p. 382.) stems procumbent. Tillæ'a prostràta, Schkuhr, in Ust. ann. 2. p. 21. t. 3. Horn. fl. dan. t. 1510. Stuck, p. 21. t. 3. In Hornemann's plant the flowers are either sessile or on short pedicels.

Aquatic Bulliarda. Fl. Ju. Aug. Clt. 1816. Pl. pr.

Cult. See *Tillæ'a* for the manner of growing these plants.

III. DASYSTE'MON (from δασυς, *dasys*, thick, and στημων, *stemon*, a stamen; in allusion to the thick filaments). D. C. prod. 3. p. 382.

Lin. syst. *Tri-Heptándria, Tri-Pentagýnia.* Sepals 3-7, leaf-formed, unequal, hardly united at the base, equalling the corolla in length. Petals 3-7, but generally 5, erect, hardly united at the base, and revolutely spreading at the apex. Stamens 3-7, alternating with the petals, and longer than them; filaments thick; anthers erect. Carpels 3-5.—An Australian herb, covered all over with scaly papulæ. Root fibrous. Stem branched at the apex. Leaves opposite, connate, linear.

1 D. calyci'num (D. C. l. c. mem. crass. t. 3.). ⊙. H. Native of New Holland. Crássula calycìna, Desf. cat. hort. par. 1815. p. 187. Herb 3-4 inches long, rather ascending at the base, dichotomously branched at the apex. Leaves thick, flattish, rather convex below. Flowers greenish-white.

Large-calyxed Dasystemon. Pl. ¼ foot.

Cult. Sow the seeds of this plant thinly in pots, in gravelly soil.

IV. SE'PTAS (from *septem*, seven; the number 7 prevailing in the fructification). Lin. gen. 465. Haw. syn. 61. D. C. prod. 3. p. 383.—Crássula species of Thunb. and Willd.

Lin. syst. *Penta-Enneándria, Penta-Enneagýnia.* Calyx 5-9-parted, shorter than the corolla. Petals 5-9, stellately spreading. Stamens 5-9; filaments slender, acuminated; scales 5-9, small, roundish. Carpels 5-9, many-seeded.—Herbs, native of the Cape of Good Hope. Roots tuberous, quiescent in winter; tubers roundish; fibres capillary. Stems simple, terete. Leaves of 2 opposite pairs, and the pairs sometimes approximate so near as to make the leaves appear in whorls. Flowers white, disposed in something like umbels. The habit of the plants is referrible to some *Saxifràgeæ*.

1 S. Cape'nsis (Lin. amœn. 6. p. 87.) leaves roundish, broadly crenated, tapering into the petioles; and the base of the petioles is rather connate; petals spreading. ♃. D. G. Native of the Cape of Good Hope. Andr. bot. rep. 90.—Pluk. alm. 340. f. 9. bad. Lam. ill. t. 276. Crássula Séptas, Thunb. fl. cap. p. 291. There are varieties of this plant, differing in the number of the floral parts from 5-9, but generally 7; and with few-flowered or many-flowered umbels; and with leaves more or less stalked, having the crenatures either simple or subcrenated. Flowers white or red.

Var. β, *globífera* (D. C. prod. 3. p. 383.) umbels many-flowered, compound; leaves revolute at the apex, doubly crenated. ♃. D. G. Native of the Cape of Good Hope. Séptas globífera, Sims, bot. mag. t. 1472. Stems red. Flowers white.

Cape Septas. Fl. Mar. Aug. Clt. 1774; β in 1809, Pl. ½ ft.

2 S. umbe'lla (Haw. syn. p. 62.) leaves 2, united together into an orbicular disk, broadly sub-crenated; petals reflexed. ♃. D. G. Native of the Cape of Good Hope. Crássula umbélla, Jacq. coll. 4. p. 172. icon. rar. t. 352. Tratt. tab. t. 253. Leaves red beneath. Flowers 5-6-cleft, reddish.

Umbelled Septas. Fl. July. Clt. 1800. Pl. ¾ foot.

Cult. A mixture of sand, loam, and peat suit the species of this genus; and they should be watered but sparingly when not in a growing state. They are readily increased by separating the tubers of the roots.

V. CRA'SSULA (a diminutive of *crassus*, thick; in reference to the fleshy leaves and stems). Haw. syn. p. 51. D. C. prod. 3. p. 383. mem. crass. t. 1. f. 2.—Crássula species of Lin. —Crássula, Haw. rev. p. 8-9.—Gomàra, Adans. farn. 2. p. 248.

Lin. syst. *Pentándria, Pentagýnia.* Calyx 5-parted, much shorter than the corolla; sepals flattish. Petals 5, stellately spreading, distinct. Stamens 5; filaments subulate. Scales 5, ovate, short. Carpels 5, many-seeded.—Fleshy shrubs or herbs, generally natives of the Cape of Good Hope. Leaves opposite, quite entire, or sub-crenated. Flowers white, rarely rose-coloured.

§ 1. *Latifòlia* (from *latus*, broad, and *folium*, a leaf; leaves broad). *Shrubby. Leaves broader, flat, with the surface and margins smooth.*

1 C. arbore'scens (Willd. spec. 1. p. 1554.) stem shrubby, erect, terete; leaves opposite, roundish, mucronate, fleshy, flat, glaucous, dotted above, glabrous; cymes trichotomous. ♄. D. G. Native of the Cape of Good Hope. C. Cotylèdon, Curt. bot. mag. t. 384. Jacq. misc. bot. 2. p. 295. t. 19. Cotylèdon arboréscens, Mill. dict. ed. 6. Flowers large, rose-coloured, spreading stellately. Shrub, with the leaves and habit very similar to those of *Cotylèdon orbiculàta*.

Arborescent Crassula. Fl. May, June. Clt. 1739. Shrub 2 to 3 feet.

2 C. Portula'cea (Lam. dict. 2. (1786.) p. 172.) stem erect, fleshy, thick; leaves opposite, oblique, acute, distinct, glabrous, shining, dotted; cymes trichotomous. ♄. D. G. Native of the Cape of Good Hope. D. C. pl. grass. t. 79. C. oblìqua, Ait. hort. kew. ed. 1. (1789.) vol. 1. p. 393. Cotylèdon ovàta, Mill. dict. no. 8. C. portulàcea and C. oblìqua, Pers. ench. 1. p. 337. C. articulàta, Zucca, curt. no. 59. Flowers rose-coloured. Like *C. Cotylèdon*.

Portulaca-like Crassula. Fl. April, May. Clt. 1759. Shrub 3 to 4 feet.

3 C. LA'CTEA (Ait. hort. kew. ed. 1. p. 496.) stem shrubby, terete, branched, twisted below; leaves ovate, attenuated at the base, and connate, glabrous, dotted within the margin; cymes many-flowered, panicle-formed. ♄. D. G. Native of the Cape of Good Hope. D. C. pl. grass. t. 37. Smith, exot. bot. t. 33. Sims, bot. mag. t. 1771. Jacq. schœnbr. t. 430. Thunb. fl. cap. p. 289. no. 45. Leaves pale green. Flowers snow white, stellately spreading.

Milk-coloured-flowered Crassula. Fl. Sept. Oct. Clt. 1774. Shrub ¾ to 1 foot.

4 C. ARGE'NTEA (Lin. fil. suppl. p. 188.) leaves connate, ovate, entire, fleshy, glabrous, silvery; stem shrubby; corymbs supradecompound. ♄. D. G. Native of the Cape of Good Hope. Thunb. fl. cap. p. 289. Flowers white; anthers black. Stem a foot or more in height. Leaves obtuse, with an acumen.

Silvery Crassula. Shrub 1½ foot.

5 C. TELEPHIOÌDES (Haw. rev. succ. p. 9.) stems herbaceous? erect; leaves obovate-oblong, stem-clasping, minutely and punctately crenated below; flowers cymose. ♄. D. G. Native of the Cape of Good Hope. Leaves 3 inches long and 18 lines broad. Petals pale rose-coloured. Scales square. Habit almost of *Sèdum Telèphium*, but smaller and more humble; and differs in the stamens being 5. D. C. Perhaps *Anacámpseros*, Burm. afr. t. 25. f. 2. is referrible to this plant.

Orpine-like Crassula. Fl. July. Clt. 1818. Shrub 1 foot.

§ 2. *Subulàres* (from *subula*, an awl; form of leaves). *Shrubby. Leaves subulate. Haw. syn. p.* 51.

6 C. RAMÒSA (Ait. hort. kew. 1. p. 390.) shrubby, glabrous, branched at the base; leaves subulate, flat above, connately perfoliate, smooth, much spreading; peduncles elongated, cymosely corymbose. ♄. D. G. Native of the Cape of Good Hope. Thunb. fl. cap. p. 284. Haw. syn. p. 51. according to whom it is nearly allied to *C. perfoliàta*. C. dichótoma, Lin. fil. suppl. p. 188. ex Willd. Flowers pink.

Branched Crassula. Fl. July, Aug. Clt. 1774. Sh. 2 to 3 ft.

7 C. FRUTICULÒSA (Lin. mant. p. 61.) stem shrubby, smooth; leaves opposite, subulate, acute, much spreading, and a little recurved; peduncles solitary, subumbellate. ♄. D. G. Native of the Cape of Good Hope. Flowers small, white, campanulate; anthers purple. Very like *C. perfoliàta*, according to Thunberg; but it differs in the leaves being reflexed.

Var. β, Càfra (Lin. mant. p. 222.) stem suffruticose.

Shrubby Crassula. Shrub 2 to 3 feet.

8 C. REVO'LVENS (Haw. phil. mag. 1824. p. 188.) stem suffruticose, slender, a little branched; branches erect; leaves linear, lean, acute, revolutely reflexed, and arched, rather distant. ♄. D. G. Native of the Cape of Good Hope. Flowers small, white, in dense terminal heads. Perhaps not distinct from *C. fruticulòsa*.

Revolving-leaved Crassula. Fl. Aug, Sept. Clt. 1820. Shrub 1 foot.

9 C. TETRAGÒNA (Lin. spec. 404.) stem erect, shrubby, terete, leaves decussately opposite, depressed above, subulate, somewhat tetragonal, incurved, spreading, glabrous. ♄. D. G. Native of the Cape of Good Hope. Bradl. succ. pl. dec. 5. t. 41. D. C. pl. grass. t. 19. Flowers small, white, nearly urceolate, disposed in a pedunculate fastigiate cyme. Stems sometimes rooting.

Tetragonal Crassula. Fl. Aug. Clt. 1711. Shrub 2 feet.

10 C. BIPLANA'TA (Haw. phil. mag. 1824. p. 186.) stem suffruticose, erect, with spreading branches; leaves erectish, smooth, subulate, acute, flat on both surfaces, channelled beneath. ♄. D. G. Native of the Cape of Good Hope. Very like the following. Bracteas larger. Flowers white; anthers reddish.

Biplanate-leaved Crassula. Fl. Sept. Clt. 1823. Sh. 1 ft.

11 C. ACUTIFÒLIA (Lam. dict. 2. p. 175.) stem suffruticose, decumbent, branched, terete; leaves opposite, fleshy, terete, subulate, spreading, glabrous; cymes small, pedunculate. ♄. D. G. Native of the Cape of Good Hope. D. C. pl. grass. t. 2. Allied to *C. tetragòna*, but is rather more herbaceous, decumbent, and rooting. Leaves usually reflexed. Flowers white.

Acute-leaved Crassula. Fl. Sept. Nov. Clt. 1795. Pl. decumbent.

12 C. BIBRACTEA'TA (Haw. in phil. mag. 1824. p. 187.) plant effuse, decumbent, rooting; leaves subulate, expanded, flat or furrowed above; bracteas two on each peduncle. ♄. D. G. Native of the Cape of Good Hope. Flowers white; anthers sulphur-coloured, but at length becoming brown. Allied to *C. acutifòlia*.

Var. α, mìnor (Haw. l. c.) plant usually rufescent; leaves less furrowed above or flat, full of rufous dots beneath.

Var. β, màjor (Haw. l. c.) greenish; leaves usually furrowed above, and often dotted with brown; branches longer than in var. *α*.

Bibracteate Crassula. Fl. Aug. Sept. Clt. 1823. Pl. ½ foot.

13 C. FILICAU'LIS (Haw. in phil. mag. 1824. p. 188.) plant effusely dichotomous; leaves spreadingly recurved, lanceolate-subulate, smooth, convex beneath; branches rooting, filiform. ♂.? ♄.? D. G. Native of the Cape of Good Hope. Flowers white, disposed in a kind of cyme; anthers yellow. Allied to the two preceding species.

Thread-stemmed Crassula. Fl. Aug. Sept. Clt. 1820. Pl. pr.

§ 3. *Squamulòsæ* (from *squamulosus*, covered with little scales). *Frutescent. Leaves linear-lanceolate, rough from scaly papulæ. Haw. rev. succ. p.* 11.

14 C. SCA'BRA (Lin. spec. p. 405.) stem suffruticose, erect, terete, branched, covered with retrograde rugosities; leaves opposite, spreading, connate, linear-lanceolate, acute, scabrous, ciliated; flowers corymbose, terminal. ♄. D. G. Native of the Cape of Good Hope. Dill. hort. elth. t. 99. f. 117. Mart. cent. t. 24. Segments of flowers spreading, or a little revolute, white at first, but becoming at length brownish.

Scabrous Crassula. Fl. June, July. Clt. 1730. Pl. 1½ foot.

15 C. SCABRE'LLA (Haw. rev. succ. p. 11.) leaves linear-lanceolate, acuminated, expanded, and are, as well as the stems, rough from scales. ♄. D. G. Native of the Cape of Good Hope. Allied to *C. scàbra* and *C. squamulòsa*. Flowers white?

Roughish Crassula. Fl. Ju. July. Clt. 1810. Pl. ½ to 1 ft.

16 C. SQUAMULÒSA (Willd. enum. suppl. p. 15.) the whole plant scaly from diaphanous papulæ; leaves lanceolate; flowers capitate. ♄. D. G. Native of the Cape of Good Hope. Haw. rev. succ. p. 11. Flowers white. Said to be nearly allied to *C. scàbra*.

Scaly Crassula. Fl. June, July. Clt. 1817. Pl. ½ foot.

17 C. BULLULA'TA (Haw. rev. succ. p. 11.) leaves lorate-lanceolate, and are, as well as the stems, roughish from whitish blisters; flowers cymose. ♄. D. G. Native of the Cape of Good Hope. Cotylèdon, &c. Mart. cent. t. 24. Flowers said to be yellow. Allied to *C. scàbra*, according to Haworth.

Little-blistered Crassula. Fl. Aug. Sept. Clt. 1800. Shrub 1 foot.

18 C. PRUINÒSA (Lin. mant. p. 60.) stem shrubby, dichotomous; branchlets and leaves subulate, scabrous from papulæ; flowers corymbose. ♄. D. G. Native of the Cape of Good Hope. Flowers white. Leaves opposite, linear, rather connate at the base. Thunb. prod. p. 55. fl. cap. p. 283.

Pruinose Crassula. Shrub 1 foot.

19 C. murica'ta (Thunb. prod. p. 55. fl. cap. p. 283.) stem frutescent, erect; branches tetragonal; leaves connate, trigonal, scabrously ciliated, obtuse; flowers subumbellate. ♄. D. G. Native of the Cape of Good Hope. It differs from *C. tetragòna* in the stem being erect, and in the leaves being scabrous.

Muricated Crassula. Shrub 1 foot.

§ 4. *Columnàres* (from *columna*, a column; disposition of leaves on the branches). *Frutescent. Leaves broader, densely imbricated along the stems and branches. Haw. syn. p. 54.*

20 C. columna'ris (Lin. fil. suppl. p. 191.) stem erect, simple, an inch high; leaves connate, roundish, glabrous, very closely imbricated; flowers disposed in a roundish terminal fascicle. ♄. D. G. Native of the Cape of Good Hope. Burm. afr. p. 19. t. 9. f. 2. Flowers white, small, very copious.

Columnar Crassula. Clt. 1789. Pl. $\frac{1}{8}$ foot.

21 C. lycopodioi'des (Lam. dict. 2. p. 173.) stem shrubby, branched, covered with leaves on all sides; leaves decussate, ovate, acute, smooth, imbricating in 4 rows; flowers axillary, sessile, bracteolate. ♄. D. G. Native of the Cape of Good Hope. C. imbricàta, Ait. hort. kew. 1. p. 393. C. muscòsa, Lin. spec. p. 405. Thunb. fl. cap. p. 281. ex Thunb. in litt. Corolla small, purple at the base. There is a variety of this plant having the stems naked at the base, according to Thunberg.

Club-moss-like Crassula. Shrub tr.

22 C. ericoi'des (Haw. in phil. mag. 1825. July, p. 30.) plant between erect and decumbent; branchlets distant; leaves ovate-oblong, small, flat, closely imbricated in 4 rows; flowers 5-10, disposed in an umbellate cyme. ♄. D. G. Native of the Cape of Good Hope. An elegant species, not allied to any unless perhaps to *C. pyramidàlis*. Flowers small, snow white. Leaves 3 to 4 lines long.

Heath-like Crassula. Fl. Sept. Clt. 1820. Shrub $\frac{1}{2}$ foot.

23 C. vesti'ta (Lin. fil. suppl. p. 188.) leaves connate, deltoid, obtuse, quite entire, covered with white powder, more frequent on the upper ones; flowers terminal, capitate. ♄. D. G. Native of the Cape of Good Hope. Thunb. fl. cap. p. 290. Stem a hand high, erectish, branched, naked at the base. Flowers yellow, aggregate and sessile on the branches.

Clothed Crassula. Shrub $\frac{1}{2}$ foot.

§ 5. *Perfilàtæ* (from *per*, through, and *filum*, a thread; in reference to the thread-like stems). *Frutescent or nearly herbaceous. Leaves flat, broader, glabrous, connate, usually glaucous. Haw. syn. p. 54.*

24 C. perfo'ssa (Lam. dict. (1786) 2. p. 173.) stem suffruticose, decumbent, slender, a little branched; leaves connately perfoliate, roundish, and rather acute, glabrous, dotted above, but not ciliated; thyrse elongated, composed of cymose pedunculate opposite branchlets. ♄. D. G. Native of the Cape of Good Hope. D. C. pl. grass. t. 25. Jacq. hort. schœnbr. t. 432. C. perfilàta, Scop. del. insub. (1788) 3. p. 12. t. 6. C. punctàta, Mill. C. coronàta, Donn, hort. cant. Flowers yellow.

Deep-pitted Crassula. Fl. Sept. Clt. 1785. Pl. decumbent.

25 C. perfora'ta (Lin. fil. suppl. p. 190. Thunb. fl. cap. p. 287.) stem shrubby, erect; leaves green, connately perfoliate, ovate, remote, glabrous, with cartilaginously ciliated margins; thyrse interrupted. ♄. D. G. Native of the Cape of Good Hope.

Perforated Crassula. Shrub 1 foot.

26 C. margina'lis (Ait. hort. kew. 1. p. 306.) stem perennial, herbaceous, glabrous, pellucid; leaves connately perfoliate, roundish-ovate, ending in a recurved mucrone, flat, spreading, glabrous, dotted within the margin; flowers disposed in umbellate corymbs. ♃. D. G. Native of the Cape of Good Hope. Jacq. schœnbr. 4. t. 471. C. marginàta, Thunb. prod. p. 56. fl. cap. 287. Stems prostrate, jointed, rooting. Leaves reddish beneath, quite entire, with cartilaginous margins, which are at first reddish, but at length becoming white from farina. Peduncles terminal, with two lateral ones, rising from the axils of the upper leaves. Flowers white; petals lanceolate, acute. The characters and synonymes are taken from the manuscript of the Prince de Salm-Dyck.

Marginal-leaved Crassula. Fl. July, Aug. Clt. 1774. Pl. cr.

27 C. pellu'cida (Lin. spec. p. 406.) stems nearly herbaceous, flaccid, creeping; leaves opposite, obovate, attenuated at the base, glabrous, glandularly toothed, crowded at the tops of the branches; cymes subumbellate. ♄. D. G. Native of the Cape of Good Hope.—Dill. hort. elth. t. 100. f. 119. Jacq. fragm. t. 44. f. 3.? Thunb. fl. cap. p. 283. Very like *C. spatulàta*, but differs in being more herbaceous, in the leaves not being petiolate, in the flowers being a little larger, and more crowded; the rest similar, according to the figure of Jacquin. Flowers pink.

Pellucid Crassula. Fl. June, Sept. Clt. 1732. Pl. tr.

28 C. prostra'ta (Thunb. prod. p. 54. fl. cap. p. 282.) stems herbaceous, decumbent, pellucid, glabrous; leaves lanceolate, acute; flowers subumbellate. ♃. D. G. Native of the Cape of Good Hope. Like *C. pellùcida*, but differs in the form of the leaves.

Prostrate Crassula. Pl. prostrate.

29 C. centaurioi'des (Lin. spec. p. 404.) stems herbaceous, dichotomous, prostrate; leaves opposite, sessile, flat, oblong-ovate, glabrous, punctately toothed on the margins; peduncles axillary, 1-flowered. ☉. D. G. Native of the Cape of Good Hope. Sims, bot. mag. t. 1765. C. pellùcida, Jacq. fragm. t. 44. f. 3.? Flowers rose-coloured, nearly like those of *C. spatulàta*; the ultimate ones somewhat corymbose.

Centuary-like Crassula. Pl. prostrate.

§ 6. *Petiolàres* (from *petiolus*, a leaf-stalk; in reference to the leaves being stalked). *Frutescent. Leaves flat, broader, petiolate. Haw. syn. p. 55.*

30 C. corda'ta (Ait. hort. kew. ed. 1. vol. 1. p. 396.) stem shrubby; leaves opposite, petiolate, cordate, obtuse, quite entire, dotted above, glabrous; cymes panicle-formed. ♄. D. G. Native of the Cape of Good Hope. D. C. pl. grass. 2. t. 121. Jacq. schœnbr. t. 431. Flowers reddish. Allied to *C. perforàta*. C. cordàta, Willd. spec. 1. p. 153. but the C. cordàta of Thunb. appears to be a distinct plant, who says that his plant is annual, and that the flowers are solitary. Plant glaucous.

Cordate-leaved Crassula. Fl. May, Aug. Clt. 1774. Pl. prostrate.

31 C. spatula'ta (Thunb. prod. 58. fl. cap. p. 293.) stems suffruticose, decumbent, branched; leaves petiolate, roundish, crenated, glabrous, shining above; corymbs panicle-formed. ♄. D. G. Native of the Cape of Good Hope. D. C. pl. grass. t. 49. C. lùcida, Lam. dict. 2. p. 173. C. cordàta, Lodd. bot. cab. t. 359. Flowers rose-coloured; petals acute. Herb very smooth.

Spatulate-leaved Crassula. Fl. July, Sept. Clt. 1774. Pl. prostrate.

§ 7. *Deltoídeæ* (leaves resembling in figure the Greek delta). *Plants suffrutescent. Leaves deltoid, sessile.*

32 C. deltoi'dea (Lin. fil. suppl. p. 189.) leaves connate, deltoid, spreading, approximate, glabrous, powdery, glaucous; flowers corymbose, subfastigiate. ♃.? D. G. Native of the Cape of Good Hope. Thunb. fl. cap. p. 288. Stem erect, branched, naked at the base, fleshy, half a finger in length.

Leaves almost like those of *Mesembryánthemum deltoídeum*. Corymbs few-flowered; pedicels angular. Root fusiform.

Deltoid-leaved Crassula. Pl. ¼ foot.

33 C. CORA'LLINA (Lin. fil. suppl. p. 188.) leaves opposite, deltoid, obtuse, approximate, dotted; flowers in umbellate corymbs; stems erect, dichotomously branched. ♄. Lin. ♃. Thunb. D. G. Native of the Cape of Good Hope. Thunb. fl. cap. p. 290. Stem an inch high. Leaves nearly orbicular, white, and powdery at the apex, 1-2 lines long, longer than the internodes.

Coralline Crassula. Pl. 1 inch.

34 C. PUBE'SCENS (Lin. fil. suppl. p. 190.) leaves connate, ovate, acute, fleshy, villous, spreading; stem erect, branched, glabrous; flowers corymbose. ♃. D. G. Native of the Cape of Good Hope. Thunb. fl. cap. p. 285. Flowers small, white, according to the dried specimen. Calyx puberulous.

Pubescent Crassula. Pl. ¼ foot.

§ 8. *Rosulàres* (from *rosa*, a rose; leaves spread like the petals in a double rose). *Plants herbaceous, perennial. Radical leaves opposite, flat, disposed in a dense expanded disk, formed like the flower of a rose. Scapes nearly naked. Flowers small, glomerate; bundles of flowers opposite. Haw. rev. succ. p.* 13.

35 C. ORBICULA'RIS (Lin. mant. p. 361.) radical leaves oblong, obtuse, cartilaginously ciliated, flat, rosulate; runners or twigs rising from the root; scape nearly naked; bundles of flowers opposite, pedunculate. ♃. D. G. Native of the Cape of Good Hope.—Dill. elth. t. 100. f. 118. D. C. pl. grass. t. 43. C. sedioìdes, Mill. dict. no. 9. Herb 4-5 inches high. Petals greenish white, rose-coloured at the apex. Stigmas purple.

Orbicular Crassula. Fl. July, Sept. Clt. 1731. Pl. ¼ to ½ ft.

36 C. ROSULA'RIS (Haw. rev. succ. p. 13.) leaves radical, obtuse, minutely ciliated, flat, rosulate; runners or twigs none; scape nearly naked; bundles of flowers opposite, pedunculate. ♃. D. G. Native of the Cape of Good Hope. Very like *C. orbiculàris*, but differs in the plant being 3 times the size, destitute of runners, and in the flowers being 4-5-cleft and white; it is, however, probably only a variety of it.

Rosulate Crassula. Fl. July. Clt. 1819. Pl. ½ foot.

§ 9. *Glomeràtæ* (from *glomero*, to heap up in a lump; ultimate flowers). *Plants herbaceous, dichotomous, annual. Leaves opposite. Flowers small: lower ones solitary in the forks of the stems, the rest glomerate. Haw. revis. succ. p.* 12.

37 C. GLOMERA'TA (Lin. mant. p. 60.) stems herbaceous, scabrous, dichotomous; leaves linear-lanceolate; flowers solitary in the forks of the stems, ultimate ones glomerate. ⊙. D. G. Native of the Cape of Good Hope. D. C. pl. grass. t. 57. C. scleranthoìdes, N. L. Burm. prod. p. 8. Habit of *Scleránthus* or *Valerianélla*. Herb hardly a finger in length. Flowers white.

Glomerated Crassula. Fl. Aug. Oct. Clt. 1774. Pl. ½ ft.

38 C. GLA'BRA (Haw. syn. p. 58. rev. p. 12.) stem herbaceous, glabrous or rather pubescent, dichotomous; leaves linear-lanceolate; flowers solitary in the forks, ultimate ones glomerate. ⊙. D. G. Native of the Cape of Good Hope. C. glomeràta β, Ait. hort. kew. 1. p. 392. Flowers white.

Glabrous Crassula. Fl. June, Oct. Clt. 1774. Pl. ¼ foot.

39 C. STRIGÒSA (Lin. amœn. 6. p. 86.) stems herbaceous, erect, rather hispid, dichotomous; leaves obovate, obtuse, strigose; pedicels 1-flowered. ⊙. D. G. Native of the Cape of Good Hope. Lam. dict. 2. p. 174. Petals ovate, length of the calyx.

Strigose Crassula. Pl. ½ foot.

§ 10. *Tillæoìdeæ* (plants with the habit of *Tillæ'a*). *Small subaquatic glabrous herbaceous plants, having 4-cleft flowers.*

40 C. NA'TANS (Thunb. prod. p. 54. fl. cap. p. 281.) stems erect, dichotomous; leaves connate, linear-oblong, obtuse; pedicels axillary, opposite, shorter than the leaves; petals obovate, a little longer than the calyx. ⊙. B. G. Native about Cape Town, in ditches and other watery places. Tillæ'a Capénsis, Lin. fil. suppl.

Floating Crassula. Pl. fl.

41 C. INA'NIS (Thunb. l. c.) stem erect, simple, branched at the apex; leaves perfoliate, ovate, obtuse; flowers corymbose; petals ovate-lanceolate, twice the length of the calyx. ⊙. D. G. Native of the Cape of Good Hope. Tillæ'a perfoliàta, Lin. fil. l. c.

Dwarf Crassula. Pl. ¼ foot.

42 C. UMBELLA'TA (Thunb. l. c.) stem simple, erect; leaves on short petioles, ovate, obtuse; flowers umbellate. ⊙. D. G. Native of the Cape of Good Hope. Tillæ'a umbellàta, Willd. spec. 1. p. 721.

Umbellate-flowered Crassula. Pl.

43 C. DECU'MBENS (Thunb. l. c.) stem erect or decumbent; leaves connate, terete, subulate; flowers pedicellate, fastigiate at the tops of the branches. ⊙. D. G. Native of the Cape of Good Hope. C. Thunbergiàna, Schultes, syst. 6. p. 733. The stems are said to be decumbent in the diagnosis, but in the description erect. Scales very short, red.

Decumbent Crassula. Pl. decumbent.

† *Species not sufficiently known.*

* *Leaves opposite.*

44 C. NEGLE'CTA (Schultes, syst. 6. p. 722.) stems herbaceous; leaves petiolate, cordate, and are as well as the branches glabrous; flowers solitary. ⊙. G. Native of the Cape of Good Hope. C. cordàta, Thunb. nov. act. nat. cur. 6. p. 330. fl. cap. p. 293. but not of others.

Neglected Crassula. Pl. ½ foot.

45 C. EXPA'NSA (Ait. hort. kew. 1. p. 390.) stems herbaceous, dichotomous; leaves semicylindrical, subulate, channelled above, spreading; peduncles axillary, solitary, 1-flowered. ⊙. G. Native of the Cape of Good Hope. It is not known whether the leaves are opposite or alternate.

Expanded Crassula. Fl. June, July. Clt. 1774. Pl. ½ foot.

46 C. DIFFU'SA (Ait. hort. kew. ed. 1. vol. 1. p. 395.) stems herbaceous; leaves oblong, attenuated at the base, crenated; peduncles opposite the leaves and axillary, solitary. ⊙. G. Native of the Cape of Good Hope. Flowers pink? The rest unknown.

Diffuse Crassula. Fl. June, July. Clt. 1774. Pl. ¼ foot.

47 C. SUBULA'TA (Lin. mant. p. 360.) stem herbaceous, branched; leaves opposite, terete, spreading; flowers capitate. ⊙. G. Native of the Cape of Good Hope. Herm. lugd. bat. 552. with a figure. Flowers white, ex Herm. and Petiv. gaz. t. 89. f. 8.

Subulate-leaved Crassula. Fl. June, July. Clt. 1800. Pl ½ ft.

48 C. SYLVA'TICA (Licht. in Schultes, syst. 6. p. 726.) stem herbaceous, dichotomous, beset with strigose hairs; leaves obovate-oblong, with the margin and base beset with strigose hairs; flowers terminal and axillary, solitary.—Native of the Cape of Good Hope. The rest unknown.

Wood Crassula. Pl. ?

49 C. ADSCE'NDENS (Thunb. nov. act. nat. cur. 6. p. 341.) stem suffrutescent, decumbent; branches erect, filiform above,

and naked; leaves connate, triquetrous, entire, spreading, glabrous; corymb compound. ♄. D. G. Native of the Cape of Good Hope. This plant is omitted in Thunberg's flora, cap. and prod. and is therefore doubtful.

Ascending Crassula. Pl. decumbent.

50 C.? A'LBA (Forsk. descr. 60. but not of Hortul.) stem simple; leaves opposite, crowded, sheathing, lanceolate, cartilaginously ciliated; peduncles dichotomous; flowers corymbose.—Native of Arabia, on the mountains of Hadie and Boka. Flowers white, 5-parted.

White-flowered Crassula. Pl. ½ foot.

51 C.? LINEOLA'TA (D. C. prod. 3. p. 390.) stem herbaceous; leaves cordate, sessile; peduncles nearly terminal, axillary, approximate, umbel-formed. ♂. D. G. Native of the Cape of Good Hope. Sims, bot. mag. 1765. Flowers yellow. Mr. Haworth has placed this species between *C. retroflèxa* and *C. centaurioìdes;* but *C. retroflèxa* is now referrible to *Grammánthes,* and therefore this species is probably a species of that genus.

Lined-leaved Crassula. Fl. June, Aug. Clt. 1774. Pl. ½ ft.

52 C.? AGARDHIA'NA (Schultes, syst. 6. p. 718.) stem suffrutescent, twisted, branched; branches naked; radical leaves ovate, imbricated; cauline ones remote, alternate. ♄. D. G. Native of the south of Spain. According to the description this is a species of *Sèdum* or *Sempervìvum.*

Agardh's Crassula. Pl. ½ foot.

** *Alternifòliæ. The leaves being alternate in the following plants, they are probably species of Sèdum.*

53 C.? MICROCA'RPA (Sibth et Smith, fl. græc. prod. 1. p. 217.) leaves oblong; stem thickened; capsule angular, dotted, mutic. ⊙. H. Native of the island of Cyprus, among rocks.

Small-fruited Crassula. Pl. ½ foot.

54 C.? PULCHE'LLA (Ait. hort. kew. ed. 1. vol. 1. p. 392.) leaves ovate-oblong, fleshy, reflexed; stem herbaceous, dichotomous; flowers pedunculate in the forks; peduncles turbinate. ⊙. G. Native of the Cape of Good Hope. Haw. succ. p. 12. Lobes of calyx leaf-formed, spreading, 2 short, and 3 about equal in length to the petals, which are ovate and acute. Flowers pink.

Neat Crassula. Fl. July. Clt. 1810. Pl. ½ foot.

55 C.? SPA'RSA (Ait. l. c. p. 395.) stems herbaceous; leaves alternate, rather spatulate, acute, quite entire; racemes compound. ♂. D. G. Native of the Cape of Good Hope. Flowers white?

Scattered Crassula. Fl. June, July. Clt. 1774. Pl. ½ foot.

N. B. *Plants formerly included in the genus Crássula, but are now to be excluded from the order.*

1 C.? ALTERNIFÒLIA (Lin. hort. cliff. p. 497. according to the figure in Burm. afr. p. 58. t. 24. f. 1.) is probably a species of *Borragínea,* and perhaps *B. ciliàta.*

2 C.? PINNA'TA (Lour. coch. p. 185.) is a plant far separated from *Crássula,* and most probably belonging to the order *Terebinthàceæ.* C. pinnàta of Dum. Cours. is a species of *Bryophýllum* or *Kalanchòe.* The C. pinnàta of Lin. fil. suppl. 191. is probably the same plant as Loureiro's.

Cult. *Crássula* is an extensive genus of rather ornamental plants, and some of which are rather grotesque. A mixture of loam, sand, and brick rubbish, is the best soil for them. Cuttings root very readily if dried for a few days, after being cut off from the plants before being planted. The seeds of the annual species should be sown in pots, and when the plants have grown a little may be separated, and planted into other pots. All the species are well fitted for a dry stove, or to be placed on shelves erected in a green-house.

VI. PURGO'SIA (from πυργος, *pyrgos,* a tower; in reference to the disposition of the clusters of flowers). Haw. in phil. mag. 1828. p. 184. Turgòsia, Haw. rev. succ. p. 14.

Lin. syst. *Pentándria, Pentagýnia.* Calyx 5-parted, much shorter than the corolla. Petals 5, imbricating at the base, mucronulate beneath the apex. Stamens 5; filaments subulate. Scales 5, emarginate. Carpels 5, flat inside, and gibbous on the outside.—Herbaceous half naked plants. Leaves for the most part radical. Inflorescence spicately thyrsoid. Flowers in whorles, almost sessile. The species are probably all biennial.

§ 1. *Linguæfòliæ* (from *lingua,* a tongue, and *folium,* a leaf; form of leaves). *Leaves lorately tongue-formed, thick, acutish. Haw. l. c.*

1 P. LINGUÆFÒLIA (Haw. rev. succ. p. 14.) lower leaves distinct, opposite, tongue-formed, ciliated, pubescent; stem leafy; flowers verticillate, crowded, sessile. ♃. or ♂. D. G. Native of the Cape of Good Hope. Crássula linguæfòlia, Haw. misc. nat. p. 175. Stem simple, a foot high. Corolla ampullæform, from green to white. Perhaps only a variety of *P. tomentòsa.*

Tongue-leaved Purgosia. Fl. Aug. Clt. 1803. Pl. 1 foot.

2 P. TOMENTÒSA (Haw. rev. succ. p. 14.) radical leaves oblong-lanceolate, imbricated, bluntish, villous, ciliated; stem nearly naked; flowers verticillate. ♃. or ♂. D. G. Native of the Cape of Good Hope. Crássula tomentòsa, Lin. fil. suppl. p. 190. Stem erect, angular, villous, a foot high. Flowers white.

Tomentose Purgosia. Fl. April, May. Clt. 1790. Pl. 1 ft.

3 P. PERTU'SA (Haw. rev. succ. p. 14. in phil. mag. 1828. p. 185.) leaves lorate, acuminated, incurved, semicylindrical; superior bracteas ovate-lanceolate, cartilaginously serrulated, ascending; scape thyrsoid. ♂. D. G. Native of the Cape of Good Hope. Crássula corymbulòsa, Link, enum. 1. p. 301. Link et Otto, abbild. p. 39. t. 16. A'loe pertùsa, Haw. rev. succ. 15 and 201. Flowers white; petals erect, about equal in length to the stamens.

Pertuse-leaved Purgosia. Fl. Nov. Clt. 1818. Pl. 1 foot.

4 P. PERTU'SULA (Haw. in phil. mag. 1828. p. 184.) leaves lanceolate, recurved, beset with impressed dots on both surfaces; upper bracteas cordate, entire; scape panicled. ♂. D. G. Native of the Cape of Good Hope. Corolla snow white.

Impressed-dotted-leaved Purgosia. Fl. Oct. Nov. Clt. 1824. Pl. 1 foot.

5 P. HI'RTA; radical leaves lanceolate, hairy; stem herbaceous, erect, nearly naked, rather pubescent; heads of flowers verticillate. ♂. D. G. Native of the Cape of Good Hope. Crássula hírta, Thunb. fl. cap. 284. Like *P. spicàta.* Leaves fleshy, white, erect, acute. Flowers white.

Hairy Purgosia. Pl. ½ to 1 foot.

6 P. CEPHALO'PHORA; radical leaves connate, linear-oblong, obtuse, entire; stem nearly naked, erect; heads of flowers opposite, pedunculate. ♂.? D. G. Native of the Cape of Good Hope. Crássula cephalóphora, Lin. fil. suppl. p. 190. Thunb. fl. cap. p. 287. Flowers white. Leaves long.

Head-bearing Purgosia. Pl. ½ foot.

7 P. CRENULA'TA; leaves connate, lanceolate, obtuse, punctately crenulated, glabrous; stem herbaceous, erect, glabrous, terete; corymb decompound. ♂. D. G. Native of the Cape of Good Hope. Crássula crenulàta, Lin. fil. suppl. p. 189. Thunb. fl. cap. p. 287. Flowers white.

Crenulated Purgosia. Pl. 1 foot.

§ 2. *Ovatifòliæ* (from *ovatus*, ovate, and *folium*, a leaf). *Leaves ovate, oval, or obovate.*

8 P.? CILIA'TA; stem suffruticose, sparingly branched, terete; leaves oval, obtuse, flattish, distinct, ciliated; corymbs terminal. ♃. D. G. Native of the Cape of Good Hope. Crássula ciliàta, Lin. spec. p. 405. D. C. pl. grass. t. 7.—Dill. elth. t. 98. f.116. Cilia of leaves white, cartilaginous, usually retrograde. Flowers cream-coloured.

Ciliated Purgosia. Fl. July, Aug. Clt. 1732. Pl. ½ foot.

9 P. CONCI'NNA; leaves obovate, ciliated, rather imbricated. ♃. D. G. Native of the Cape of Good Hope. Crássula concínna, Haw. rev. succ. This is a much larger plant than the following, to which it is nearly allied. Flowers white.

Neat Purgosia. Fl. July, Aug. Clt. 1818. Pl. ½ foot.

10 P. CONCINNE'LLA; leaves obovate, with densely ciliated silvery margins. ♃. D. G. Native of the Cape of Good Hope. Crássula concinnélla, Haw. in phil. mag. 1823. p. 381. Allied to *P. concínna*, but weaker, and 4 or 5 times smaller in every part, densely ciliated. Leaves rather imbricated, and appearing as if they were disposed in 2 compressed rows. The rest unknown.

Small-neat Purgosia. Fl. July. Clt. 1823. Pl. ½ foot.

11 P. COTYLE'DONIS; radical leaves connate, oblong, obtuse, tomentose, ciliated; stem nearly naked, herbaceous, somewhat tetragonal; flowers disposed in a corymb composed of fascicles. ♃. D. G. Native of the Cape of Good Hope. Crássula cotylèdonis, Lin. fil. suppl. 190. Crássula Cotylèdon, Haw. syn. p. 56. but not of Jacq. Stem simple, erect, a foot high. Leaves an inch broad, and a finger in length, erect. Flowers white.

Cotyledon Purgosia. Pl. 1 foot.

12 P. CAPITELLA'TA (Haw. rev. p. 17.) leaves connate, oblong, glabrous, cartilaginously ciliated, spreading, longer than the internodes; flowers in whorled heads. ☉. D. G. Native of the Cape of Good Hope. Crássula capitellàta, Lin. fil. suppl. p. 190. Thunb. fl. cap. 286. Stem glabrous, terete, erect. Flowers white, approximate, sessile.

Headed Purgosia. Fl. July, Aug. Clt. 1774. Pl. ½ foot.

13 P. ALPE'STRIS; leaves connate, ovate, acute, imbricating in 4 rows; heads pedunculated; stem leafy, glabrous. ♃. D. G. Native of the Cape of Good Hope. Crássula alpéstris, Lin. fil. suppl. p. 190. Thunb. fl. cap. 286. nov. act. nat. cur. 6. p. 336. t. 56. f. 4. Allied to *Crássula montàna*, but differs in the leaves being more acuminated, not ciliated, in the stem being thicker, and clothed with leaves, and in the flowers being larger.

Alp Purgosia. Pl. ½ foot.

14 P. HEMISPHÆ'RICA; lower leaves connate, roundish, imbricated into a round heap, cartilaginously ciliated; stem nearly naked; flowers rising in fascicles from the axils, forming a panicled spike. ☉. G. Native of the Cape of Good Hope. Crássula hemisphæ'rica, Thunb. prod. p. 57. fl. cap. p. 292. Floral leaves very short. Flowers small, white.

Hemispherical Purgosia. Pl. ½ foot.

15 P. THYRSIFLÒRA (Haw. rev. succ. 17.) leaves perfoliate, ovate, obtuse, ciliated, glabrous, erectly spreading; thyrse branched, spicate. ♂. D. G. Native of the Cape of Good Hope. Crássula thyrsiflòra, Lin. fil. suppl. 190. Thunb. fl. cap. 283. Stems herbaceous, terete, erect, a span high. Flowers white.

Thyrse-flowered Purgosia. Pl. ½ foot.

16 P. OBOVA'TA (Haw. rev. succ. p. 16.) leaves opposite, decussate, obovate, ciliated, full of minute impressed dots; stem rather hispid; flowers axillary, in a thyrsoid spike. ♂. D. G. Native of the Cape of Good Hope. Crássula obovàta, Haw. suppl. p. 17. Flowers white. Allied to *P. aloìdes*.

Obovate-leaved Purgosia. Fl. June, July. Clt. 1818. Pl. 1 ft.

17 P. ALOÌDES (Haw. rev. succ. p. 16.) stem simple, rather pilose; leaves ovate or spatulately lanceolate, distinct, ciliated, full of impressed dots; heads of flowers axillary, constituting a thyrsoid spike. ♂. D. G. Native of the Cape of Good Hope. Crássula aloìdes, Ait. hort. kew. 1. p. 394. Petals mucronulate, white, with a red rib. Stem half a foot high.

Aloe-like Purgosia. Fl. June, Aug. Clt. 1774. Pl. ½ foot.

18 P. PUNCTA'TA; stems simple, smooth; leaves opposite, ovate, dotted, ciliated: lower ones oblong; corymbs axillary, very short. ♄. D. G. Native of the Cape of Good Hope. Crássula punctàta, Lin. spec. p. 406. Ait. hort. kew. ed. 2. vol. 2. p. 193. exclusive of the synonyme of Miller, ex Haw. syn. p. 154. Corolla campanulate, white; limb reflexed; anthers purple.

Dotted-leaved Purgosia. Fl. April, Aug. Clt. 1759. Pl. 1 ft.

19 P. RAMULIFLÒRA; stem fruticulose, beset with retrograde hairs; leaves opposite, obovate, acute, rather connate, ciliated; branches axillary, few-flowered; petals lanceolate, erect, shining at the apex. ♄. D. G. Native of the Cape of Good Hope. Crássula ramuliflòra, Link. enum. 1. p. 301. Otto. et Link. abbild. p. 41. t. 17. Flowers white. Calyx and leaves usually reddish at the apex.

Branch-flowered Purgosia. Fl. Ju. Jul. Clt. 1822. Sh. ½ ft.

20 P. TURRÌTA (Haw. rev. succ. p. 16.) radical leaves opposite, connate, ovate-oblong, acute, imbricating in 4 rows, villously ciliated; stem leafy at the base; flowers in whorls. ♂. D. G. Native of the Cape of Good Hope. Crássula turrìta, Thunb. prod. 3. p. 55. fl. cap. p. 283. Jacq. schœnbr. 1. t. 52. Stem simple, a foot high. Corolla pale, reddish at the apex.

Var. β, *ròsea* (Haw. l. c.) flowers red.

Tower Purgosia. Fl. Feb. Mar. Clt. 1818. Pl. 1 foot.

21 P. BARBA'TA; radical leaves opposite, connate, crowded, imbricated into a round heap, reticulated, bearded; stem nearly naked; flowers in whorls. ♂. D. G. Native of the Cape of Good Hope. Crássula barbàta, Thunb. prod. p. 57. fl. cap. p. 292. Lin. fil. suppl. 188. Floral leaves not exceeding the flowers. Stem glabrous, a span high.

Bearded Purgosia. Pl. ½ foot.

22 P. MONTA'NA; leaves connate, ovate, acute: radical ones approximate: cauline ones distant; flowers in whorls, in the axils of the upper leaves: ultimate ones capitate. ♃. D. G. Native of the Cape of Good Hope. Crássula montàna, Lin. fil. suppl. p. 189. Thunb. fl. cap. p. 285. Stem filiform, simple. Calyxes ciliated.

Mountain Purgosia. Pl. ½ foot.

23 P. DENTA'TA; plant glabrous, nearly leafless; leaves almost radical, petiolate, toothed, roundish-cordate; flowers subumbellate. ♂? D. G. Native of the Cape of Good Hope, among rocks on the mountain called Ribekcasteel. Crássula dentàta, Thunb. prod. p. 57. fl. cap. p. 293. Umbels of flowers radical. Peduncles shorter than the leaves.

Toothed-leaved Purgosia. Pl. ¼ foot.

24 P. PYRAMIDA'LIS; leaves connate, imbricating in 4 rows, ovate, obtuse, entire, glabrous; heads terminal, sessile, globose. ♃. D. G. Native of the Cape of Good Hope. Crássula pyramidàlis, Lin. fil. suppl. p. 189. Thunb. fl. cap. p. 287. nov. act. cur. 6. p. 336. t. 5. b. f. 3. Stems flexuous, erect, covered over with leaves. Leaves a line long. Said to be allied to *Crássula muscòsa*.

Pyramidal Purgosia. Pl. ½ foot.

25 P.? DE'BILIS; stem herbaceous, dichotomous, straightish; leaves opposite, glabrous, crowded, nearly terete, concave, papulose; flowers pedicellate; petals linear. ♂? D. G. Native of the Cape of Good Hope. Crássula dèbilis, Thunb. fl. cap. p. 280.

Weak Purgosia. Pl. ½ foot.

26 P. RUPE'STRIS; leaves connate, ovate, quite entire, glabrous, approximate, convex and carinated beneath; corymbs trichotomous, fastigiate, supra-decompound. ♃. D. G. Native of the Cape of Good Hope. Crássula rupéstris, Lin. fil. suppl. p. 189. Thunb. fl. cap. 288. Pedicels glabrous, of a purplish colour. Petals white. Stem erect, a hand high or more.

Rock Purgosia. Pl. ½ foot.

27 P. TE'CTA; leaves almost radical, connate, ovate, obtuse, imbricated, cartilaginously ciliated, and clothed with greyish powder; scape nearly naked, filiform; flowers sessile, capitate. ♂. D. G. Native of the Cape of Good Hope. Crássula técta, Lin. fil. suppl. p. 190. Thunb. fl. cap. 290. Flowers small, white. Scape an inch high.

Clothed Purgosia. Pl. 1 to 2 inches.

28 P.? MÍNIMA; glabrous, nearly stemless; leaves petiolate, roundish, entire; peduncles nearly radical, 1-flowered. ♂. D. G. Native of the Cape of Good Hope. Crássula mínima, Thunb. prod. p. 57. fl. cap. p. 292.

Least Purgosia. Pl. ⅛ foot.

29 P. SPICA'TA; radical leaves glabrous, connate, linear-subulate; stem erect, herbaceous, nearly naked; heads of flowers verticillated. ♂? D. G. Native of the Cape of Good Hope. Crássula spicàta, Lin. fil. suppl. p. 189. Thunb. fl. cap. p. 284. Whorls of flowers sessile, many-flowered, approximate.

Spike-flowered Purgosia. Pl. ½ to 1 foot.

Cult. The greater part of this genus of succulent plants being biennial, the seeds of them should be sown in spring or summer, in pots filled with gravelly sand and loam, well drained in the bottom. Cuttings of them are also easily rooted, if laid to dry a few days after they are cut, before being planted, especially of those species which are permanent. Brick rubbish, mixed with loam, is a good soil for the grown up plants.

VII. GLOBU'LEA (from *globulus*, a globule or small globe; in reference to the waxy globules with which the petals are tipped). Haw. syn. p. 60. rev. succ. p. 17. phil. mag. 1824. sept. p. 189.—Crássula species of Lin. and others.

LIN. SYST. *Pentándria, Pentagýnia.* Calyx 5-parted. Petals 5, erect, bearing each a waxy globule at the apex. Stamens 5, shorter than the petals. Scales 5, short, broad, obtuse. Carpels 5.—Herbs, natives of the Cape of Good Hope. Leaves flat, rather cultrate: cauline ones few: radical ones crowded, opposite, not always decussate, but more or less disposed by pairs, in a spiral manner, about the base of the stem. Flowers in dense corymbs, subcapitate, small, of a pale cream colour or white.

§ 1. *Cultràtæ* (from *cultratus*, made like a knife; form of leaves like a pruning knife). *Leaves cuneately-obovate, cultrate. Stem suffruticose. Haw. in phil. mag.* 1824. *p.* 190.

1 G. CULTRA'TA (Haw. syn. p. 60.) erect; leaves obovate-elliptic, acutish, obliquely subreflexed, connate, flattish, shining. ♄. D. G. Native of the Cape of Good Hope. Crássula cultràta, Lin. spec. 2. p. 405. Sims, bot. mag. t. 1940.—Dill. hort. elth. p. 115. t. 97. f. 114. Flowers cream-coloured.

Cultrate-leaved Globulea. Fl. Jul. Aug. Clt. 1732. Sh. 1 ft.

2 G. RADI'CANS (Haw. in phil. mag. 1824. p. 27.) plant erect, bushy; branches crowded, rooting downwards; leaves lanceolate-ovate, cultrate; flowers in dense heads. ♄. D. G. Native of the Cape of Good Hope. It differs from the preceding in the sepals being obtuse, in the heads of flowers being more dense, and in the flowers being smaller. Flowers white.

Rooting Globulea. Fl. Ju. Oct. Clt. 1823. Sh. 1 foot.

3 G. ATROPURPU'REA (Haw. in phil. mag. 1824. p. 189.) leaves obliquely cuneate-obovate, dark purple; scape or flower bearing stem, very long, and panicled. ♄. D. G. Native of the Cape of Good Hope. Crássula obliqua *β*, Haw. rev. succ. p. 204. It approaches very near *G. cultràta*, but differs in the inflorescence. Flowers white.

Dark purple-leaved Globulea. Fl. Aug. Clt. 1823. Shrub ½ to 1 foot.

§ 2. *Linguàtæ* (from *lingua*, a tongue; form of leaves). *Leaves lorate, obtuse, convex beneath, or narrow tongue-formed, imbricating exactly in 4 rows. Stem very short or herbaceous. Scapes or floriferous stems naked. Haw. in phil. mag.* 1824. *p.* 191.

4 G. LI'NGUA (Haw. in phil. mag. 1824. p. 28.) leaves elongated, lorate, ventricosely semi-lanceolate, cultrate, and are as well as the calyxes ciliated. ♃. D. G. Native of the Cape of Good Hope. Leaves without dots. Flowers panicled, white; anthers yellow.

Tongue-leaved Globulea. Fl. Ju. Jul. Clt. 1823. Pl. 1 ft.

5 G. LÍNGULA (Haw. l. c. p. 29.) leaves rather elongated, ventricosely semi-lanceolate, cultrate, thin, flaccid. ♃. D. G. Native of the Cape of Good Hope. Very like the preceding, but much smaller.

Small-tongue-leaved Globulea. Fl. June, July. Clt. 1823. Pl. ½ foot.

6 G. CAPITA'TA (Haw. rev. succ. p. 17.) leaves ventricosely lanceolate, cultrate, rather convex beneath, imbricately decussate, when young hoary. ♃. D. G. Native of the Cape of Good Hope. Crássula capitàta, Salm-Dyck, cat. 1820. p. 14. but not of Lam. Very like *G. obvallàta*, but larger, and the leaves are more acinaciform, usually an inch and a half broad.

Capitate-flowered Globulea. Fl. June, Jul. Clt. 1819. Pl. ½ to 1 foot.

7 G. OBVALLA'TA (Haw. syn. p. 60.) leaves opposite, connate, sublanceolate, cultrate, with cartilaginously ciliated edges: radical ones approximate; panicle elongated; peduncles opposite, cymose. ♄. or ♃. D. G. Native of the Cape of Good Hope. Trew. pl. rar. 1. t. 11. Crássula obvallàta, Lin. mant. p. 61. D. C. pl. grass. t. 61. Crássula obfalcàta and obvallàris, Hortul. Flowers white.

Guarded-leaved Globulea. Fl. Jul. Aug. Clt. 1795. Pl. ½ ft.

8 G. CANE'SCENS (Haw. syn. p. 61.) leaves all radical, decussately imbricated, ciliated, lorately lanceolate, bent, cultrate, canescent. ♃. D. G. Native of the Cape of Good Hope. Crássula canéscens, Schultes, syst. 6. p. 734. An intermediate species between *G. obvallàta* and *G. nudicaúlis*.

Canescent Globulea. Fl. Jul. Aug. Clt. 1800. Pl. ½ foot.

§ 3. *Angustàtæ* (from *angustus*, narrow; leaves). *Leaves linear, semi-terete, furrowed, or terete. Stems herbaceous, tufted. Scapes leafless. Haw. in phil. mag.* 1824. *p.* 191.

9 G. NUDICAU'LIS (Haw. syn. p. 61.) stemless; leaves radical, crowded, rosulate, semi-terete, subulate, acute, rather pubescent; scape nearly naked; heads of flowers somewhat verticillate, glomerated at the apex of the scape. ♃. D. G. Native of the Cape of Good Hope. Crássula nudicaúlis, Lin. spec. p. 405. D. C. pl. grass. t. 132.—Dill. hort. elth. p. 116. t. 99. f. 115. Flowers white.

Naked-stemmed Globulea. Fl. May, Sept. Clt. 1732. Pl. ¼ to ½ foot.

10 G. SULCA'TA (Haw. rev. p. 18.) stemless; leaves incurved, subulate, semi-terete, deep green, shining, broadly channelled. ♃. D. G. Native of the Cape of Good Hope. Very like *G. nudicaúlis*, but differs in being glabrous, and in the leaves being broadly furrowed above.

Furrowed-leaved Globulea. Fl. Ju. Sept. Clt. 1818. Pl. ¼ ft.

§ 4. *Loràtæ* (from *loratus*, lorate; shape of leaves). *Leaves lorate, narrowest at the apex, convex beneath, tufted, imbricating in 4 rows. Stems herbaceous. Scapes leafy.*

11 G. impre'ssa (Haw. in phil. mag. 1824. p. 189.) plant stemless; leaves lorately-lanceolate, green, full of impressed dots; dots large, scattered, numerous. ♃. D. G. Native of the Cape of Good Hope. Leaves cæspitose, decussate, rather ciliated at the base. Flowers small, pale.

Var. β, mìnor (Haw. l. c.) smaller; dots on leaves more obsolete.

Impressed-dotted Globulea. Fl. Aug. Sept. Clt. 1820. Pl. ¼ ft.

12 G. paniculà'ta (Haw. in phil. mag. 1825. p. 29.) leaves lorate, acuminated, green, beset with minute impressed dots; branches of panicle spike-formed. ♃. D. G. Native of the Cape of Good Hope. Plant stemless, smooth. Leaves convex beneath and channelled above, with cartilaginously sub-ciliated margins. Flowers snow white; anthers yellow.

Panicled-flowered Globulea. Fl. Jul. Clt. 1823. Pl. ¼ to ½ ft.

13 G. hí'spida (Haw. l. c. p. 30.) leaves crowded, lorate, acuminated, convex beneath, hispid; stem suffruticose, hispid. ♄. D. G. Native of the Cape of Good Hope. Flowers white.

Hispid Globulea. Fl. Nov. Clt. 1823. Pl. ½ foot.

§ 5. *Subulàtæ* (from *subula*, an awl; shape of leaves). *Leaves subulate, fleshy, flattish above. Stems suffruticose, branched. Flowers disposed in dense, cymose, terminal heads. Haw. in phil. mag. 1824. p. 191.*

14 G. mesembryanthemoìdes (Haw. l. c. p. 190.) stems suffruticose, bushy, erect; leaves subulate, and are as well as the branches, branchlets, and calyxes hispid. ♄. D. G. Native of the Cape of Good Hope. Flowers glomerate, in dense fascicles, cream-coloured.

Var. β; plant a little taller; flowers not so crowded.

Fig-marigold-like Globulea. Fl. Aug. Sept. Clt. 1820. Pl. ¼ to ½ foot.

15 G. subinca'na (Haw. l. c.) stem suffruticose, erectly decumbent; leaves semiterete, subulate, acute, a little incurved, and are as well as the branchlets covered with soft hoary down. ♄. D. G. Native of the Cape of Good Hope. Flowers white. There are decumbent and erect varieties of this plant.

Hoaryish Globulea. Fl. Aug. Clt. 1823. Pl. ½ foot.

16 G. mo'llis (Haw. l. c. p. 191.) leaves semi-cylindrical, acute, gibbous below, smooth, erectish, finely tomentose; cymes terminal, compound. ♄. D. G. Native of the Cape of Good Hope. Crássula móllis, Lin. fil. suppl. p. 189. Thunb. fl. cap. p. 284. Stem frutescent, angular, a foot high, simple, erect. Leaves somewhat triquetrous, and therefore it is probably a distinct genus according to Haworth. Flowers white.

Soft Globulea. Fl. Aug. Clt. 1774. Shrub 1 foot.

Cult. *Globùlea* is a very pretty genus of succulent plants. Sandy loam and brick rubbish is a good soil for them; and the pots should be well drained. Cuttings root easily if laid to dry a few days after cutting off, before they are planted, to dry up the wound, that they may not rot. A good situation for the plants is on the shelves of a greenhouse.

VIII. CURTO'GYNE (*κυρτος, kurtos*, gibbous, and *γυνη, gyne*, a style, in botanical language; in reference to the gibbous ovaria). Haw. rev. succ. p. 8. D. C. prod. 3. p. 392.

Lin. syst. *Pentándria, Pentagýnia.* Calyx 5-parted, much shorter than the corolla. Petals 5, united at the base into 5-parted corolla. Stamens 5. Scales 5, short. Ovaria 5, terete-oblong, gibbous at the apex, ending each in a long sublateral style.—Subshrubs, natives of the Cape of Good Hope. Leaves opposite, flat, rather fleshy, cartilaginously ciliated, ovate. Inflorescence disposed in umbellate cymes. Flowers white.—This is an intermediate genus between *Crássula* and *Ròchea*.

1 C. unda'ta (Haw. rev. p. 8.) leaves oblong, or ovate-tongue-shaped, expanded: upper ones waved. ♄. D. G. Native of the Cape of Good Hope. Curtógyne dejécta, D. C. prod. 3. p. 392. Crássula dejécta, Jacq. schœnbr. t. 433. Crássula undàta, Haw. suppl. 19. Stems much branched, weak. Petals snow white, spreading; anthers exserted, purple, but at length blackish.

Wavy-leaved Curtogyne. Fl. July, Aug. Clt. 1818. Pl. decumbent.

2 C. undula'ta (Haw. rev. p. 9.) leaves connate, ovate, expanded, cartilaginously crenated: superior ones ovate-elliptic, undulately incurved; stems dichotomous. ♄. D. G. Native of the Cape of Good Hope. Crássula undulàta, Haw. syn. p. 53. Similar to the first species, but differs in all the parts being much smaller and more branched. Flowers white.

Undulate-leaved Curtogyne. Fl. Aug. Clt. 1797. Sh. ½ ft.

3 C. undòsa (Haw. in phil. mag. 1827. p. 184.) leaves ovate-tongue-shaped, curled: those of the flowering branches retroflexed. ♄. D. G. Native of the Cape of Good Hope.

Waved-leaved Curtogyne. Fl. Jul. Aug. Clt. 1824. Sh. 1 ft.

Cult. The culture and propagation of the species of this genus are the same as that recommended for *Globùlea*, above. A pretty succulent genus.

IX. GRAMMA'NTHES (from *γραμμα, gramma*, a writing, and *ανθος, anthos*, a flower; in consequence of the segments of the corolla having some supposed resemblance to the letter V marked on them; hence also its synonymous name *Vauánthes*). D. C. prod. 3. p. 392. mem. crass. t. 1. f. 6. Vauánthes, Haw. rev. p. 18.—Crássula species of Lin. and others.

Lin. syst. *Pentándria, Pentagýnia.* Calyx campanulate, 5-cleft, erect. Corolla gamopetalous, having the tube the length of the calyx; and the lobes 5-6, oval, expanded. Stamens 5-6, alternating with the lobes, inserted in the tube of the corolla, and inclosed within it. Scales wanting. Carpels 5.—Herbs annual. Leaves opposite, ovate-oblong, remote, flat, sessile. Flowers disposed in cymose corymbs.

1 G. chlorælòra (Haw. l. c.) leaves oblong. ⊙. D. G. Native of the Cape of Good Hope. Herm. lugd. bat. p. 553, with a figure. Crássula retroflexa, Thunb. fl. cap. p. 282. but not of Meerb. Crássula dichótoma, Lin. amœn. 6. p. 86. Ait. hort. kew. ed. 1. vol. 1. p. 392. Pedicels lateral. Flowers yellow. The segments of the corolla elegantly marked with the inverted letter V. in red.

Var. β; flowers orange-coloured. Crássula retroflexa, Ait. hort. kew. ed. 2. vol. 2. p. 194. Haw. syn. p. 57.

Chlora-flowered Grammanthes. Fl. Jul. Clt. 1774. Pl. ½ ft.

2 G. gentianoìdes (D. C. prod. 3. p. 393.) leaves ovate-oblong. ⊙. G. Native of the Cape of Good Hope. Crássula gentianoìdes, Lam. dict. 2. p. 175.—Pluk. mant. 89. t. 415. f. 6. Flowers pale blue, ex Pluk. and Lam. but the flowers are more likely yellow, and have become bluish on drying. Perhaps sufficiently distinct from the preceding.

Gentian-like Grammanthes. Pl. ½ foot.

Cult. Sow the seeds thinly in pots filled with a mixture of gravelly sand or lime rubbish and loam, draining them well with sherds. The species are singular succulent plants.

X. RO'CHEA (in honour of M. de la Roche, author of a monograph on the genus Eryngium, &c.). D. C. pl. grass. no. 103. prod. 3. p. 393. mem. crass. t. 1. f. 3. Laròchea, Pers. ench. no. 753. Rœm. et Schultes, syst. no. 1255. Haw. syn. p. 50.

Lin. syst. *Pentándria, Pentagýnia.* Calyx 5-lobed. Petals 5, united into gamopetalous hypocrateriform corolla; with a short tube, equal in length to the spreading limb, or shorter than it. Stamens 5, alternating with the petals, a little exserted. Glands and carpels 5.—Tall, fleshy, simple, succulent shrubs. Leaves opposite, connate at the base, thick, white. Flowers disposed in terminal corymbs, without any bracteas.

1 R. falca'ta (D. C. pl. grass. t. 103.) leaves rather connate, thick, glaucous, oblong, bluntish, bent down in the form of a sickle. ♄. D. G. Native of the Cape of Good Hope. Laròchea falcàta, Haw. syn. p. 50. Tratt. thes. t. 20. Crássula falcàta, Willd. enum. p. 341. Sims, bot. mag. t. 2035. Crássula retrofléxa, Meerb. with a figure. Crássula oblìqua, Andr. bot. rep. p. 414. exclusive of the synonyms. Crássula Swellingrebliàna and Cr. decussàta, Hort. gall. Flowers scarlet, with the tube about 4 lines long, forming a large, dense, terminal corymb.

Var. β, *mìnor* (Haw. rev. succ. p. 3.) all parts of the plant smaller.

Sickle-leaved Rochea. Fl. Ju. Sept. Clt. 1795. Sh. 3 to 8 ft.

2 R. perfolia'ta (Haw. rev. p. 6. under *Laròchea*) leaves connate, lanceolate, acuminated, rather channelled above, convex beneath, of a greenish glaucous colour. ♄. D. G. Native of the Cape of Good Hope. Crássula perfoliàta, Lin. spec. 404. Haw. syn. p. 51. Flowers scarlet, disposed in large, terminal corymbs. Leaves said to be ciliated.

Var. β, *albiflòra* (Haw. l. c.) flowers white. Crássula perfoliàta, D. C. pl. grass. t. 13.—Dill. hort. elth. f. 113. Mill. fig. t. 108. Comm. præl. t. 23. without any flower, and is therefore referrible to *A'loe pertùsa*, Haw. in Lin. trans. 7. p. 25.

Perfoliate-leaved Rochea. Fl. July, Aug. Clt. 1700. Sh. 3 to 6 feet.

3 R. albiflòra (D. C. prod. 3. p. 393.) leaves distinct, ovate, acuminated, spreading, cartilaginously ciliated. ♄. D. G. Native of the Cape of Good Hope. Crássula albiflòra, Sims. bot. mag. t. 2391. Flowers white, disposed like those of *R. falcàta*, but larger than those of *R. perfoliàta*. Anthers blackish, and a little more exserted than those of the other species.

White-flowered Rochea. Fl. July, Aug. Clt. 1800. Shrub 2 to 3 feet?

Cult. Large, succulent plants, elegant when in flower. Their culture, propagation, and treatment are the same as that recommended for *Globùlea*, p. 106.

XI. KALOSA'NTHES (from καλος, *kalos*, beautiful, and ανθος, *anthos*, a flower; flowers elegant). Haw. rev. succ. 1821. p. 6. but not of Blume.—Dietríchia, Tratt. tab. t. 449. arch. gew. (1812.) no. 449. but not of Ræusch.—Ròchea, sect. 2. Francíscea, D. C. prod. 3. p. 393.

Lin. syst. *Pentándria, Pentagýnia.* Calyx 5-lobed (f. 26. *a.*). Petals 5, united into a gamopetalous hypocratriform corolla (f. 26. *a.*), with a cylindrical tube 2 or 3 times longer than the spreading limb (f. 26. *a.*). Stamens 5, alternating with the petals; anthers in the throat of the tube of the corolla. Glands and carpels 5.—Succulent shrubs. Leaves opposite, oval, or oblong, connate, flat, cartilaginously ciliated. Flowers disposed in cymose umbels or heads, involucrated with numerous bracteas.

1 K. coccínea (Haw. rev. p. 18.) leaves connate and sheathing at the base, ovate-oblong, acutish. ♄. D. G. Native of the Cape of Good Hope. Laròchea coccínea, Haw. syn. p. 50. Crássula coccínea, Lin. spec. Curt. bot. mag. t. 495. Dietríchia coccínea, Tratt. thes. t. 19.—Comm. rar. t. 24. Bradl. succ. t. 50. Burm. afr. t. 23. f. 1. Flowers scarlet; tube an inch long. According to Breyn. prod. 3. t. 20. f. 1. there is a variety with flesh-coloured flowers; and according to Bradl. succ. t. 50. and Haw. rev. p. 8. there is a variety with white flowers, but in the gardens it is not to be found but with scarlet flowers.

Scarlet-flowered Kalosanthes. Fl. June, Aug. Clt. 1710. Shrub 1 to 3 feet.

2 K. me'dia (Haw. rev. p. 7.) leaves oblong-lanceolate, connate, stem-clasping; flowers variable in colour. ♄. D. G. Native of the Cape of Good Hope. Ròchea mèdia, D. C. prod. 3. p. 394.

Middle Kalosanthes. Fl. Ju. Jul. Clt. 1810. Shrub 1 ft.

3 K. versícolor (Haw. rev. p. 7.) leaves oblong-lanceolate, acute, connate and sheathing at the base; stem erect, branched; flowers in umbellate heads. ♄. D. G. Native of the Cape of Good Hope, on the Table Mountain. Crássula versícolor, Burch, ex Ker. bot. reg. t. 320. Ròchea versícolor, D. C. prod. 3. p. 394. Flowers about the size of those of *K. coccínea*, having the tube white, and the segments of the limb oval, white in the middle, edged with scarlet. Calyx as long as ¾ of the tube of the corolla.

Party-coloured-flowered Kalosanthes. Fl. Mar. Sept. Clt. 1817. Shrub 1 to 2 feet.

4 K. odoratíssima (Haw. rev. p. 7.) leaves linear-lanceolate, gradually acuminated, connately stem-clasping; flowers in umbellate heads; segments of the corolla oblong, acutish. ♄. D. G. Native of the Cape of Good Hope. Crássula odoratíssima, Andr. bot. rep. t. 26. Jacq. hort. schœnbr. t. 434. Laròchea odoratíssima, Haw. syn. p. 51. Dietríchia odoratíssima, Tratt. Ròchea odoratíssima, D. C. prod. 3. p. 394. The flowers are yellow, according to Andrews; yellowish, Haworth; but with red claws and white lamina, according to Jacquin; they have the scent of those of *Polyánthus tuberòsus*, or Tube-rose.

FIG. 26.

Var. β, *álba* (D. C. prod. 3. p. 394.) flowers white. ♄. D. G. Native of the Cape of Good Hope. Crássula capitàta, Lodd. bot. cab. t. 1029. Leaves less ciliated, according to the figure, than those of the species.

Sweet-scented Kalosanthes. Fl. Ju. Jul. Clt. 1793. Sh. 1 ft.

5 K. bi'color (Haw. rev. p. 7.) flowers capitate, sessile, yellow, and scarlet. ♄. D. G. Native of the Cape of Good Hope. Very like the preceding species, but larger and more rigid, and the leaves are more acute.

Two-coloured-flowered Kalosanthes. Fl. Ju. Jul. Clt. 1810. Shrub 1 foot.

6 K. fla'va (Haw. syn. p. 50. under *Laròchea*) leaves connate, sheathing, smooth, approximate, linear, thick, acute. ♄. D. G. Native of the Cape of Good Hope. Burm. afr. t. 23. f. 3. Pluk. alm. t. 314. f. 2. Crássula flàva, Lin. mant. p. 60. Flowers yellow, disposed in a panicled corymb.

Yellow-flowered Kalosanthes. Shrub 1 to 2 feet?

7 K. cymòsa (Haw. rev. p. 7.) leaves connate, sheathing, linear; cymes terminal; stem shrubby. ♄. D. G. Native of the Cape of Good Hope. Crássula cymòsa, Lin. mant. 222. C. capitàta, Lam. dict. 2. p. 171. Laròchea cymòsa, Haw. syn. p. 50. Flowers red.

Cymose-flowered Kalosanthes. Fl. Aug. Clt. 1800. Pl. ½ ft.

8 K. jasmí'nea (Haw. rev. p. 6.) leaves lanceolate, sessile, bluntish; flowers few, capitate; stems suffruticose, decumbent. ♄. D. G. Native of the Cape of Good Hope. Crássula jasmíneа, Sims, bot. mag. 2178. Crássula jasminiflòra, Haw.

Lodd. bot. cab. 1040. Crássula obtùsa, Haw. suppl. p. 16. Ròchea jasmínea, D. C. prod. 3. p. 394. Flowers white at first, but becoming reddish as they fade, very like those of the common jasmine, scentless. Tube of corolla almost 3 times longer than the calyx. Heads containing 2-4 flowers.

Jasmine-flowered Kalosanthes. Fl. April, May. Clt. 1815. Shrub decumbent.

9 K. BICONVE'XA (Haw. in phil. mag. 1824. p. 185.) leaves narrow-linear, distinctly convex on both surfaces. ♄. D. G. Native of the Cape of Good Hope. Crássula biconvéxa, Haw. misc. p. 175. syn. 53. Ròchea biconvéxa, D. C. prod. 3. p. 394. Flowers white?

Double-convex-leaved Kalosanthes. Fl. Jul. Aug. Clt. 1823. Shrub ½ to 1 foot.

10 K. FASCICULA'RIS (Schultes, syst. 6. p. 709. under *Laróchea*,) leaves connately sheathing at the base, linear-lanceolate; flowers in fascicles; segments of the calyx lanceolate, acute, ciliated. ♄. D. G. Native of the Cape of Good Hope. Crássula fasciculàris, Lam. dict. 2. p. 171. Leaves glabrous, cartilaginously ciliated. Corolla almost as in *K. coccínea*, but is a little shorter.

Fascicled-leaved Kalosanthes. Shrub 1 to 2 feet.

Cult. Elegant succulent shrubs, worth cultivating in every collection for the beauty of their flowers. The culture, propagation, and treatment they require are the same as that recommended for *Globùlea*, p. 106.

XII. KALANCHO'E (Chinese name of one of the species). Adans. fam. 2. p. 248. D. C. pl. grass. no. 64. D. C. prod. 3. p. 394. Haw. in phil. mag. 1829. p. 301.—Calanchòe, Pers.—Verèia, Andr. bot. rep. t. 21. Vèrea, Willd.

LIN. SYST. *Octándria, Tetragýnia.* Calyx 4-parted (rarely 5-parted); sepals united only at the very base, lorate, acute, spreadingly recurved at the apex. Corolla gamopetalous, hypocrateriform with an obversely clavate tube, and a 4-parted (rarely 5-parted) spreading limb. Stamens 8, 4 of which are adnate to the tube, nearly to the middle, the other 4 almost to the apex. Scales 4, linear, but almost obsolete in the *K. vàrians*. Carpels 4, continuous, with the filiform styles.—Succulent subshrubs, from 1 to 2 feet high, erect, a little branched. Leaves opposite, fleshy, more or less irregularly impari-pinnate, or ovate, toothed or serrated, and often of a glaucous hue. Flowers disposed in loose cymose terminal panicles, yellow, or rufescent, rarely white, scentless. This is a very natural genus.

* *Leaves pinnatifid.*

1 K. CERATOPHY'LLA (Haw. rev. p. 23. phil. mag. l. c.) leaves pedately bipinnatifid, deeply and broadly toothed, pale green; stem branched. ♄. D. S. Native of China. Flowers yellow. Braan. icon. chin. t. 9.

Horn-leaved Kalanchoe. Fl. July, Aug. Clt. 1820. Shrub 1 to 2 feet.

2 K. LACINIA'TA (Haw. syn. p. 111.) leaves simply pinnatifid, glaucous; segments deeply and broadly toothed. ♄. D. S. Native of Java, Moluccas, and Mauritius; and of Egypt. D.C. pl. grass. t. 100. Planta anàtis, Rumph. amb. 5. t. 95. Cotylèdon laciniàta, Lin. spec. 1. p. 615.—Weinm. phyt. t. 435. Flowers yellow.

Jagged-leaved Kalanchoe. Fl. July, Aug. Clt. 1781. Shrub 1 to 2 feet.

* * *Leaves simple; but in K. vàrians some of them are tricuspidate.*

3 K. VA'RIANS (Haw. in phil. mag. 1829. p. 302.) smooth, glaucous; leaves oval, broadly toothed: upper ones sometimes tricuspidate. ♄. D. S. Native of the East Indies. Flowers yellow, sometimes 5-cleft.

Varying Kalanchoe. Fl. July, Aug. Clt.? Shrub 2 feet.

4 K. CRENA'TA (Haw. syn. p. 109.) leaves oblong-lanceolate, broadly toothed, crenated: crenæ usually double. ♄. D. S. Native of Sierra Leone. Kalanchòe Vèrea, Pers. ench. 1. p. 446. Verèia crenàta, Kennedy in Andr. bot. rep. 1. t. 21. Cotylèdon crenàta, Sims, in bot. mag. 1436. Vent. malm. t. 49. Cotylèdon Vèrea, Jacq. schœnbr. t. 435.—Pluk. alm. t. 228. f. 3. Flowers yellow.

Crenated-leaved Kalanchoe. Fl. Aug. Sept. Clt. 1793. Sh. 1 to 2 feet.

5 K. ACUTIFLÒRA (Haw. syn. p. 109.) leaves broad-lanceolate, crenated, glabrous, thick; segments of attenuated corolla acute. ♄. D. S. Native of the East Indies. Verèia acutiflòra, Kennedy in Andr. bot. rep. t. 560. Flowers whitish.

Acute-flowered Kalanchoe. Fl. Aug. Sept. Clt. 1806. Shrub 1 to 2 feet.

6 K. LANCEOLA'TA (D. C. prod. 3. p. 395.) leaves lanceolate, crenated at the apex; stem, peduncles, calyxes, and corollas, villous; cymes panicled. ♄. D. G. Native of Arabia. Cotylèdon lanceolàta, Forsk. desc. p. 89. Flowers said to be reddish yellow, that is, probably brownish.

Lanceolate-leaved Kalanchoe. Shrub 1 to 2 feet.

7 K. BRASILIE'NSIS (St. Hil. fl. bras. 2. p. 196.) puberulous; lower leaves roundish: middle ones obovate-lanceolate: upper ones linear; all crenately serrated; cymes dense; lobes of corolla very acute. ♄. D. S. Native of Brazil, near Rio Janeiro by the sea side. Corolla with a yellow tube, and a rose-coloured limb. This plant seems to be an exception from the exciting and acrid properties peculiar to the rest of *Crassulàceæ*, it being used by the Brazilians in their domestic medicine.

Brazilian Kalanchoe. Shrub 1 to 2 feet.

8 K. ALTE'RNANS (D. C. prod. 3. p. 395.) leaves roundish-spatulate, quite entire; panicles glabrous. ♄. D. G. Native of Arabia, on mountains. Cotylèdon altérnans, Vahl. symb. 2. p. 51. but not of Haw. Cotylèdon orbiculàta, Forsk. cat. arab. p. 112. Segments of corolla reddish yellow, that is, probably brown.

Alternating Kalanchoe. Shrub 1 to 2 feet.

9 K. ROTUNDIFÒLIA (Haw. in phil. mag. July, 1825. p. 31.) plant straight and slender; leaves thick: lower ones roundish: upper ones obovate, and almost entire; flowers small. ♄. D. G. Native of the Cape of Good Hope. Flowers rufescent or yellow.

Round-leaved Kalanchoe. Fl. July, Aug. Clt. 1820. Shrub 1 to 2 feet.

10 K. ÆGYPTI'ACA (D. C. pl. grass. t. 64. prod. 3. p. 395.) leaves obovate-spatulate, crenated: lower ones obtuse, and rather concave: upper ones acute; cyme a crowded panicle. ♄. D. G. Native of Egypt, on Mount Melhan. Cotylèdon intègra, Medik. comm. pal. 3. p. 200. t. 9. Cotylèdon nudicaúlis, Vahl. symb. 2. p. 59. Cotylèdon defíciens, Forsk. descr. p. 89. Flowers orange-coloured.

Egyptian Kalanchoe. Fl. July, Aug. Clt. 1820. Sh. 1 to 2 ft.

11 K. SPATULA'TA (D. C. pl. grass. t. 65.) leaves obovately-spatulate, crenated, glabrous: lower ones obtuse: upper ones acute; cymes panicled, loose. ♄. D. G. Native of China. Cotylèdon hýbrida, Hort. par. Cotylèdon spatulàta, Poir. suppl. 2. p. 373. Flowers yellow.

Spatulate-leaved Kalanchoe. Fl. July, Aug. Clt. 1820. Sh. 1 to 2 feet.

Cult. The species of *Kalanchòe* being succulent, require very little water unless when growing freely; and the pots in which they are grown ought to be well drained with sherds. A mixture of loam and sand appears to be the best soil for them. The species are easily increased by cuttings. A leaf taken off any

of the species, and laid on the pot of mould, or on a tan-bed, will shoot out young plants from the notches on the edges of the leaf.

XIII. BRYOPHY'LLUM (from *βρυω, bryo,* to sprout, and *φυλλον, phyllon,* a leaf; plants spring from the notches on the edges of the leaves when taken off the plant, and placed in a moist situation). Salisb. par. 3. D. C. prod. 3. p. 395.—Crassoúvia, Comm. mss.—Physocalỳcium, Vest. in fl. 1820. p. 409.—Cotylèdon species, Lam.—Calanchòe species, Pers.

Lin. syst. *Octándria, Tetragýnia.* Calyx inflated, bladdery before flowering, hardly 4-cleft to the middle; lobes 4, valvate. Corolla gamopetalous, hypogynous, having a long cylindrical tube, which is bluntly tetragonal at the base; and the lobes of the limb triangular and acute. Stamens 8, adnate to the base of the tube. Glands 4, oblong.—A fleshy, erect, branched, glabrous shrub. Leaves opposite, thick, petiolate; some impari-pinnate, with one or 2 pairs of segments, the terminal segment large; others solitary, all ovate and crenated; crenæ bearing an opaque dot in each, which is easily made to evolve into a plant. Cymes panicled, terminal. Flowers yellowish red, or green and red. Calyx almost like that of *Silène inflàta.*

1 B. calycìnum (Salisb. l. c.) ♄. D. S. Native of the Moluccas and the Mauritius. Sims, bot. mag. 1409. herb. amat. t. 317. Crassoúvia floripéndula, Comm. mss. Cotylèdon pinnàta, Lam. dict. 2. p. 141. Calanchòe pinnàta, Pers. ench. 1. p. 446. Cotylèdon calyculàta, Soland. in herb. Banks. Cotylèdon rehizophýlla, Roxb. Cotylèdon calycìna, Roth, nov. spec. 217.

Large-calyxed Bryophyllum. Fl. April, July. Clt. 1806. Shrub 2 to 3 feet.

Cult. See *Kalanchòe* above for culture and propagation.

XIV. COTYLE'DON (from *κοτυλη, kotyle,* a cavity; cup-like leaves of some species). D. C. bull. phil. 1801. no. 49. p. 1. prod. 3. p. 396. mem. cras. t. 1. f. 7. Cotylèdones Capénses, Lin. Burm. Haw, &c.

Lin. syst. *Decándria, Pentagýnia.* Calyx 5-parted, much shorter than the tube of the corolla. Corolla gamopetalous; tube ovate-cylindrical; limb 5-lobed, spreadingly reflexed or revolute; lobes obtuse. Stamens 10, adnate to the base of the tube of the corolla: the upper part free, exserted or almost inclosed. Scales oval. Carpels 5, continuous, with the styles, which are subulate.—Fleshy shrubs, native of the Cape of Good Hope. Leaves usually scattered. Flowers loose, panicled, purplish or orange-coloured. This genus has been divided into sections from the form of the corolla by the Prince Salm-Dyck, but the corolla being unknown in a great many of the species we cannot follow these divisions.

* *Leaves opposite.*

1 C. undula'ta (Haw. suppl. 20. rev. 20.) leaves opposite, rhomboid-ovate, with an acumen, pale green: older ones large and very thick, margined with red at the apex: when young lean and waved. ♄. D. G. Native of the Cape of Good Hope. Flowers unknown. Very similar to *C. orbiculàta,* but the stem is more humble, and the leaves longer, and less obtuse at the apex. Salm-Dyck. in litt.

Undulated-leaved Cotyledon. Fl. Ju. Jul. Clt. 1818. Sh. 1 ft.

2 C. orbicula'ta (Lin. spec. 614.) leaves opposite, flat, obovately-spatulate, obtuse, with an acumen, glaucous, and mealy, margined with red; flowers panicled; caudex erect, branched. ♄. D. G. Native of the Cape of Good Hope. D. C. pl. grass. no. 76. Ait. hort. kew. ed. 2. vol. 3. p. 108. Flowers reddish.

Var. α, *rotundifòlia* (D. C. prod. 3. p. 396.) leaves roundish.—C. orbiculàta, Haw. succ. syn. p. 105. C. orbiculàta γ, rotúnda, D. C. l. c.

Var. β, *obovàta* (D. C. l. c.) leaves obovate, margined with red.—C. ovàta, Haw. l. c. C. orbiculàta var. α, D. C. pl. grass. t. 76. Curt. bot. mag. t. 321.—Mor. oxon. sect. 12. t. 7. f. 39. Herm. lugd. bat. 551. with a figure.

Var. γ, *oblónga* (D. C. l. c.) leaves oblong.—C. oblónga, Haw. l. c. C. orbiculàta β, Ait. l. c.

Var. δ, *elàta* (Salm-Dyck. in litt.) leaves orbicularly obovate, white, and mealy; stem tall, firm, a little branched. C. elàta, Haw. suppl. p. 20.

Var. ε, *ramòsa* (Salm-Dyck. in litt.) leaves ovate-spatulate, white, and mealy; caudex much branched; branches effuse. C. ramòsa, Haw. suppl. p. 20. C. ramosíssima, Mill. dict. C. orbiculàta γ, Ait. hort. kew.

Orbicular-leaved Cotyledon. Fl. July, Aug. Clt. 1798. Shrub 2 to 4 feet.

3 C. crassifòlia (Haw. in phil. mag. 1826. p. 272.) stem erect, shrubby; plant white from mealiness; leaves rhomboid, obcuneated, thick. ♄. D. G. Native of the Cape of Good Hope. Leaves distant, decussately opposite, edged with brownish purple on the margin above the middle. Flowers not seen.

Thick-leaved Cotyledon. Clt. 1824. Shrub 1½ to 3 feet.

4 C. vi'ridis (Haw. in phil. mag. 1826. p. 272.) stem shrubby, erect, nearly simple; leaves obovate-cuneated, green. ♄. D. G. Native of the Cape of Good Hope. Leaves middle-sized, lean. In habit it follows *C. crassifòlia.*

Green Cotyledon. Shrub 2 to 4 feet.

5 C. ramosi'ssima (Haw. suppl. p. 25.) leaves oblong-spatulate, farinose, margined with red at the apex; caudex much branched; young branchlets erect: old ones twisted, and crowded. ♄. D. G. Native of the Cape of Good Hope. C. paniculàta, Lin. fil. suppl. Flowers unknown. Leaves not half the size of those of the smallest variety of *C. orbiculàta,* hardly 15 lines long, and 9 lines broad.

Most-branched Cotyledon. Fl. May, Ju. Clt. 1816. Shrub 1 to 2 feet.

6 C. coru'scans (Haw. suppl. p. 21.) leaves decussate, aggregate, cuneate-oblong, channelled, with thickened margins, apiculated, covered with white mealiness; flowers pendulous, disposed in umbellate panicles. ♄. D. G. Native of the Cape of Good Hope. Sims, bot. mag. 2601. Lodd. bot. cab. t. 1030. C. canalifòlia, Haw. in phil. mag. 1825. July, p. 33. Flowers orange-coloured like those of *C. orbiculàta,* but paler and rather longer.

Glittering Cotyledon. Fl. June. Clt. 1818. Sh. 1 to 2 ft.

7 C. ungula'ta (Lam. dict. 2. p. 139.) leaves opposite, semicylindrical, channelled, glabrous, purple, and furnished with a callous point at the margin near the apex; flowers in a kind of panicle, glabrous; caudex erect. ♄. D. G. Native of the Cape of Good Hope. Burm. afr. dec. 3. p. 24. t. 22. f. 1. Flowers purplish, pendulous. Very like *C. orbiculàta.*

Claw-leaved Cotyledon. Shrub 1 to 2 feet.

8 C. papilla'ris (Lin. fil. suppl. p. 242.) leaves opposite, terete-ovate, fleshy, glabrous, acute, erect; flowers in panicles, glabrous; caudex decumbent, clothed with fine villi. ♄. D. G. Native of the Cape of Good Hope. Haw. suppl. p. 21. Thunb. fl. cap. p. 397. C. decussàta, Sims, bot. mag. t. 2518. Lindl. bot. reg. t. 915. Corolla red, unguicular, with a somewhat pentagonal tube, and oblong acute reflexed lobes. Leaves as in *C. corúscans,* and *C. ungulàta,* truncate at the apex, and with a marginal claw or point.

Papillose Cotyledon. Fl. Aug. Clt. 1819. Shrub 1 to 2 ft.

9 C. tricuspida'ta (Haw. in phil. mag. 1825. July, p. 32.) plant white from mealiness; leaves narrow, usually deeply tricuspidate. ♄. D. G. Native of the Cape of Good Hope.

Very like *C. papillàris*, but differs in the leaves being tricuspidate.

Tricuspidate-leaved Cotyledon. Clt. 1823. Shrub 1 foot.

10 C. PURPU'REA (Thunb. fl. cap. p. 396.) leaves opposite, linear-oblong, fleshy, concave, glabrous; flowers panicled, glabrous; caudex erect, nearly herbaceous. ♄. D. G. Native of the Cape of Good Hope. Corolla purple, an inch long.

Purple-flowered Cotyledon. Shrub 1 foot.

11 C. TERETIFÒLIA (Thunb. prod. p. 83. fl. cap. p. 397. but not of Lam.) leaves opposite, nearly terete, fleshy, hairy, obtuse, with an acumen; flowers panicled, hairy; caudex erect, simple. ♄. D. G. Native of the Cape of Good Hope.

Terete-leaved Cotyledon. Shrub 1 foot.

12 C. CUNEIFO'RMIS (Haw. in phil. mag. March, 1828. p. 185.) stems short, branched; leaves crowded, obovate, mucronate, rather white from mealiness. ♄. D. G. Native of the Cape of Good Hope. Like *C. crassifòlia*, but much more humble.

Wedge-leaved Cotyledon. Shrub 1 foot.

** *Leaves alternate, marcescent.*

13 C. CURVIFLÒRA (Sims, bot. mag. t. 2044.) leaves scattered, semicylindrical, glabrous; cicatrices of the stem, where the old leaves have fallen off, rather prominent; flowers panicled, nodding; calyxes loose; tube of corolla pentagonal, incurved. ♄. D. G. Native of the Cape of Good Hope. Flowers of a dirty yellow-colour, almost reddish, about an inch long. Styles longer than the stamens.

Curve-flowered Cotyledon. Fl. Oct. Clt. 1818. Sh. 1 to 2 ft.

14 C. TUBERCULÒSA (Lam. dict. 2. p. 139.) leaves scattered, subcylindrical, linear-oblong, acute; cicatrices of the old leaves tubercular; flowers subpanicled, erect; peduncles and calyxes pubescent. ♄. D. G. Native of the Cape of Good Hope. —Burm. afr. t. 20. f. 1. C. grandiflòra, N. L. Burm. prod. fl. cap. 13. C. tuberculòsa, D. C. pl. grass. 1. t. 86. Flowers showy, orange-coloured, tubular, an inch or more long; limb spreading, not replicate.

Tubercular Cotyledon. Fl. June, Aug. Clt. 1820. Shrub 1 to 2 feet.

15 C. CACALIOÌDES (Lin. fil. suppl. p. 242.) leaves scattered, terete, acute; cicatrices of the old leaves pitted; flowers panicled, erect, seated on a long, elongated, nearly naked stem. ♄. D. G. Native of the Cape of Good Hope. Burm. afr. t. 20. f. 2. Flowers yellow, rather villous, half an inch long. Leaves deciduous when the plant is in flower; hence Burmann called it *C. aphýlla*.

Cacalia-like Cotyledon. Fl. May. Clt. 1818. Sh. 1 foot.

16 C. VENTRICÒSA (N. L. Burm. prod. fl. cap. p. 13.) leaves scattered, linear-oblong, acute at both ends; cicatrices on old stems tubercular; flowers in loose racemes, pedicellate, erect; tube ventricose, pentagonal; lobes acute. ♄. D. G. Native of the Cape of Good Hope. Burm. afr. dec. 3. p. 51. t. 21. f. 1. Flowers greenish, almost like those of *C. hemisphæ'rica*. Leaves like those of *C. tuberculòsa*, according to Burm.

Ventricose-flowered Cotyledon. Shrub 1 to 2 feet.

17 C. SPU'RIA (Lin. spec. p. 614.? exclusive of the synonymes,) leaves almost radical, terete, oblong, fleshy, obtuse, narrower at the base; caudex very short, thick; flowering stem erect, naked; flowers somewhat panicled. ♄. D. G. Native of the Cape of Good Hope. Burm. afr. p. 43. t. 19. f. 1. Pluk. alm. t. 323. f. 1.—Willd. spec. 2. p. 754. C. teretifòlia, Lam. dict. 2. p. 139. but not of Thunb.

Spurious Cotyledon. Fl. July, Aug. Clt. 1731. Shrub 1 ft.

18 C. FASCICULA'RIS (Ait. hort. kew. ed. 1. vol. 2. p. 106.) leaves scattered, but in fascicles at the tops of the branches, cuneiform, obtuse, flat, thick; caudex thickened, branched; flowers panicled, pendulous, with revolute limbs. ♄. D. G. Native of the Cape of Good Hope. Burm. afr. p. 41. t. 18. C. paniculàta, Thunb. fl. cap. p. 396. ex Burm. syn. C. tardiflòra, Bonpl. nav. t. 37. Corolla with a short, greenish, broad, subpentagonal tube, and a reddish revolute limb.

Fascicled-flowered Cotyledon. Fl. July, Sept. Clt. 1759. Shrub 1 foot.

*** *Leaves alternate, permanent.*

19 C. TRIFLÒRA (Thunb. prod. p. 83. fl. cap. p. 396.) leaves scattered, oblong-spatulate, obtuse, fleshy, of a greyish shining colour; flowers by threes, in spikes, approximate, with replicate limbs; stem suffrutescent. ♄. D. G. Native of the Cape of Good Hope, near Zehorivier. Salm-Dyck. obs. p. 6. C. elàta, Haw. suppl. Corolla with a green tube, and an acute limb, variegated with white and purple.

Three-flowered Cotyledon. Fl. May, July. Clt. 1821. Shrub 1 to 2 feet.

20 C. MACULA'TA (Salm-Dyck. obs. p. 5.) leaves scattered, ovate-spatulate, somewhat auriculated at the base, fleshy, shining, marked with dark red spots on both surfaces; flowers spicate, almost alternate: limb spreading; stem suffruticose. ♄. D. G. Native country unknown. C. altérnans, Haw. suppl. ex Salm-Dyck. but not of Vahl. Spike terminal, generally simple. Tube of corolla green, subventricose, with the segments of the limb acute, variegated with white and purple.

Spotted-leaved Cotyledon. Fl. July, Aug. Clt. 1816. Sh. 1 ft.

21 C. RHOMBIFÒLIA (Haw. in phil. mag. 1825. July, p. 33.) leaves approximate, obovate-rhomboid, mucronate, white and mealy; stem branched, strong, decumbent. ♄. D. G. Native of the Cape of Good Hope. Allied to *C. hemisphæ'rica*, but more humble and branched, and the leaves are rhomboid, and more acuminated. Flowers unknown.

Rhomb-leaved Cotyledon. Clt. 1823. Shrub decumbent.

22 C. JASMINIFLÒRA (Salm-Dyck, obs. Haw. rev. p. 20.) leaves rather crowded, green, rhomboid-spatulate, fleshy; stem humble; peduncle terminal, branched; flowers erect, with a green tube, and a revolute limb, variegated with white and purple; pedicels long, thickened. ♄. D. G. Native of the Cape of Good Hope. Allied to *C. hemisphæ'rica*, but the stems are more humble, thickened from the root; the leaves longer, and the flowers with the tube and limb more ample, and more like a jasmine flower. Salm-Dyck in litt.

Jasmine-flowered Cotyledon. Fl. July, Aug. Clt. 1818. Sh. 1 foot.

23 C. HEMISPHÆ'RICA (Lin. spec. p. 614.) leaves scattered, ovate-roundish, thick, dotted, glabrous; flowers nearly sessile, erect, along an elongated peduncle; lobes of corolla spreading. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. 2. t. 95. f. 111. C. hemisphæ'rica, D. C. pl. grass. 1. t. 87. Flowers small, with a green tube, and the limb variegated with white and purple.

Hemispherical Cotyledon. Fl. Ju. July. Clt. 1731. Sh. 1 ft.

24 C. ROTUNDIFÒLIA (Haw. in phil. mag. 1826. p. 273.) shrubby, dwarf; leaves straight, crowded, roundish, dirty green; branches short, decumbent. ♄. D. G. Native of the Cape of Good Hope. Leaves flat, convex beneath, mealy. Allied to *C. hemisphæ'rica*.

Round-leaved Cotyledon. Shrub decumbent.

25 C. MAMILLA'RIS (Lin. fil. suppl. p. 242.) leaves scattered, crowded into something like whorles, terete, ovate, obtuse, glabrous; flowers spreading on short pedicels, which are seated on an elongated peduncle; stem creeping. ♄. D. G. Native of the Cape of Good Hope, near Olyfants Bad. Thunb. fl. cap. p. 397. Haw. rev. p. 21. suppl. 22. Corolla tubular, glabrous, with a green tube, and a spreadingly reflexed limb, which is variegated with white and purple.

Mamillary Cotyledon. Fl. June, July. Clt. 1818. Sh. cr.

26 C. cunea'ta (Thunb. fl. cap. p. 395.) leaves radical, cuneated, fleshy, hairy, with purple margins; stem erect, somewhat herbaceous, pubescent, viscid; corolla hairy. ♄. D. G. Native of the Cape of Good Hope.

Cuneated-leaved Cotyledon. Fl. May. Clt. 1818. Sh. 1 ft.

27 C. interje'cta (Haw. in phil. mag. March, 1828, p. 185.) leaves glaucescent, narrow-oblong, acute, incurved, channelled; stem short, strong. ♄. D. G. Native of the Cape of Good Hope. Very like *C. spùria*, but differs in being higher, in the leaves being shorter, thicker, and narrower, more channelled, and without doubt incurved.

Cast Cotyledon. Clt. 1823. Shrub ½ foot.

28 C. caryophylla'cea (N. L. Burm. prod. fl. cap. 13.) leaves aggregate, ovate, thick, flat, glaucous; flowers panicled, on long erect pedicels; stem branched. ♄. D. G. Native of the Cape of Good Hope. Burm. afr. dec. 2. p. 39. t. 17. Corolla tubular, form of the bud of a clove; lobes spreading, ovate, acute, flesh-coloured, with a red line. Very like *C. hemisphæ'rica*, but differs in the flowers being distinctly pedicellate.

Clove-like Cotyledon. Stem 1 foot.

29 C. mucrona'ta (Lam. dict. 2. p. 142.) leaves nearly radical, oval, flat, with undulated margins, mucronate at the apex; stem branched, very short; floriferous stem naked; flowers erect, in loose panicles. ♄. D. G. Native of the Cape of Good Hope. Burm. afr. p. 44. t. 19. f. 2. C. undulàta, Haw. Lobes of corolla acute.

Mucronate-leaved Cotyledon. Fl. June, July. Clt. 1818. Shrub ½ foot.

† *Species not sufficiently known.*

30 C. reticula'ta (Thunb. fl. cap. p. 393.) leaves scattered at the tops of the branches, terete, acute, erect, soft, glabrous; stem erect, shrubby, fleshy; flowers erect, in dichotomous panicles. ♄. D. G. Native of the Cape of Good Hope, in Carro. Caudex a hand high. Panicle decompound.

Reticulated Cotyledon. Shrub ¾ foot.

31 C. dicho'toma (Haw. suppl. 27. ex rev. 22.) leaves channelled; cymes dichotomous, puberulous, bracteated by spines; tube of corolla somewhat bottle-formed, with a replicate limb. ♄. D. G. Native of the Cape of Good Hope.

Dichotomous Cotyledon. Shrub ½ to 1 foot.

32 C. pa'rvula (Burch. cat. geogr. no. 1818. ex voy. cap. 1. p. 219.) leaves oval, rather compressed, thick; panicle dichotomously branched; pedicels erect, very long, capillary; stem erect. ♄. D. G. Native of the Cape of Good Hope. Plant 6-9 inches high.

Small Cotyledon. Pl. ½ to 1 foot.

33 C. trígyna (Burch. trav. afr. 2. p. 226.) stemless; leaves glabrous, flattened, fleshy, cuneate-oval or nearly orbicular; flowers erect, alternate on an elongated simple scape, rarely on a bifid one. ♄. D. G. Native of the Cape of Good Hope. Corolla cylindrical, purplish, with a short reflexed limb, and a purple throat. Carpels 3.

Trigynous Cotyledon. Pl. ½ to 1 foot.

34 C. crista'ta (Haw. phil. mag. 1827, April 1, p. 123.) leaves petiolate, cuneately triangular, curled and crested at the apex. ♄. D. G. Native of the Cape of Good Hope. Herb succulent, leafy, evergreen. Stem short, with the surculi densely clothed with rufous hairs. Leaves erect, an inch long, thick, purplish at the apex, beset with dots of scurfy down. Spikes terminal. Flowers small, open in the morning.

Crested Cotyledon. Fl. Sept. Clt. 1820. Pl. ½ foot.

35 C. clavifòlia (Haw. l. c.) leaves petiolate, club-formed, incurved, acuminated, and rather curled at the apex. ♄. D. G. Native of the Cape of Good Hope. Allied to the preceding species; but the flowers are about twice the size, and purple.

Club-leaved Cotyledon. Fl. Sept. Clt. 1824. Pl. ½ foot.

Cult. *Cotylèdon* is a genus of pretty succulent plants. The culture, propagation, and management of the species are the same as that for *Globùlea*, p. 106.

XV. PISTORI'NIA (meaning unknown to us). D. C. prod. 3. p. 399. mem. crass. p. 25. t. 10. f. 5.—Cotylèdon species of authors.

Lin. syst. *Decándria*, *Pentagýnia*. Calyx 5-parted, much shorter than the tube of the corolla. Corolla gamopetalous, funnel-shaped; tube long, terete; limb spreading, 5-parted. Stamens 10, adnate the whole length of the tube, but free at the throat, and exserted. Scales 5, oblong, obtuse. Carpels 5, each ending in a long filiform style.—Erect annual or biennial herbs. Leaves nearly terete, oblong, scattered, sessile. Flowers cymose, red. Habit of the plants belonging to that section of *Umbilìcus* called *Mucizònia*, and the flowers like those of *Cotylèdon*.

1 P. Hispa'nica (D. C. prod. 3. p. 399.) ☉. or ♂. H. Native of Spain and Barbary, in exposed sandy places. Cotylèdon Hispánica, Lœfl. itin. p. 77. t. 1. Lin. spec. 615. D. C. pl. grass. t. 122. Cotylèdon Pistorínia, Ort. mon. 1772. with a figure.

Spanish Pistorinia. Fl. June, July. Clt. 1796. Pl. ¼ foot.

Cult. Sow the seeds in any dry situation in a light soil in the open border, or on rock-work.

XVI. UMBILI'CUS (from *umbilicus*, the navel; hollow leaves of some species). D.C. in bull. phil. 1801. no. 49. prod. 3. p. 399.

Lin. syst. *Decándria*, *Pentagýnia*. Calyx 5-parted. Corolla gamopetalous, campanulate, 5-cleft; lobes ovate, acute, erect, about the length of the tube. Stamens 10, inserted in the corolla. Scales 5, obtuse. Carpels 5, attenuated at the apex. Styles subulate.—Herbs, indigenous to the south of Europe and the Levant. Leaves rosulate or alternate, quite entire, or a little toothed. Flowers white or yellow, in branched or simple terminal racemes, never in cymes.

Sect. I. Rosula'ria (from *rosa*, a rose; in reference to the leaves being rosulate, or disposed like the petals in the flower of a rose). D. C. prod. 3. p. 399. Sepals equal to the tube of the corolla. Leaves radical, rosulate. Scapes subpanicled, annual.—Perennial herbs, natives of the Levant, with the habit of *Sempervìvum*.

1 U. Libano'ticus (D. C. prod. 3. p. 399.) leaves radical, rosulate, cuneated, thickish, papillose; scape naked; panicle racemose, loose. ♃. H. Native of Mount Libanon, and near Damascus. Cotylèdon Libanótica, Labill. syr. dec. 3. p. 3. t. 1. Flowers yellow?

Libanon Navel-wort. Pl. ½ foot.

2 U. sempervìvum (D. C. l. c.) leaves radical, rosulate, crowded, cuneated, ciliately scabrous; scape naked; panicle racemose, loose. ♃. H. Native of Eastern Caucasus, among stones on the mountains. Cotylèdon sempervìvum, Bieb. casp. p. 176. append. no. 46. ann. bot. 2. p. 444. fl. taur. 1. p. 351. Perhaps sufficiently distinct from the preceding species.

Houseleek-like Navel-wort. Pl. ½ foot.

3 U. pube'scens (Meyer in verz. pflanz. p. 150. under *Cotylèdon*,) plant pubescent; leaves linear-oblong, bluntish: radical ones rosulate, cauline ones scattered, erectly spreading; racemes corymbose; corolla twice the length of the calyx, with the segments of the limb acute and spreading at the apex; stem herbaceous, simple. ♃. H. Native of Caucasus, among rocks in shady places on the mountains of Talush, at the altitude of 1200 to 2700 feet. Sèdum pilòsum, Bieb. fl. taur. 1. p. 352. Flowers reddish.

Pubescent Navel-wort. Pl. $\frac{1}{4}$ foot.

4 U. Sa'mius (D. C. l. c.) radical leaves narrow, spatulate-lanceolate, long, fleshy; cauline leaves sessile, linear; stem simple, glabrous, leafy; flowers racemose, pedicellate, usually twin. ♃. H. Native of the Island of Samos, among high naked rocks, and of Palestine. Sèdum Libanóticum, Lin. spec. 617. Cotylèdon Sàmium, D'Urv. enum. arch. p. 50. no. 402. Flowers yellow?

Samos Navel-wort. Pl. $\frac{1}{4}$ foot.

Sect. II. Mucizònia (meaning unknown to us). D. C. prod. 3. p. 399. Cauline leaves alternate. Annual herbs, with the habit of *Sèdum*.

5 U. hi'spidus (D. C. prod. 3. p. 399.) stems diffuse, erect, pubescent; leaves glabrous, oblong, terete; racemes terminal, leafy, clothed with clammy villi. ⊙. H. Native of Spain, Barbary, and Teneriffe, on the mountains. Cotylèdon Mucizònia, Ort. mon. 1772. with a figure. Jacq. coll. 5. p. 112. t. 13. f. 2. Cotylèdon viscòsa, Vahl. symb. 2. p. 51. Cotylèdon híspida, Lam. dict. 2. p. 141. Desf. atl. 1. p. 359. Flowering branches opposite the flowers. Flowers white or dirty reddish.

Hispid Navel-wort. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

6 U. sedioìdes (D. C. prod. 3. p. 400. mem. crass. pl. 4. f. B.) stems rooting a little, glabrous; leaves oblong, convex, obtuse, glabrous; flowers few, at the tops of the stems, almost sessile. ⊙. H. Native of the higher Pyrenees, particularly on the eastern side. Cotylèdon sedioìdes, D. C. rap. 1808. p. 78. fl. fr. suppl. p. 521. Poir. suppl. 2. p. 373. Cotylèdon sedifórmis, Lapeyr. Herb small, simple, or branched, almost with the appearance of *Sèdum atràtum*. Flowers large for the size of the plant.

Stone-crop-like Navel-wort. Pl. $\frac{1}{8}$ foot.

Sect. III. Coty'le (from κοτυλη, *cotyle*, a cavity; in reference to the cup-like leaves). D. C. prod. 3. p. 400. Umbilìcus J. and C. Bauh. Roots tuberous. Stems usually branched. Radical leaves petiolate, cucullate, more or less peltate. Corolla hardly 5-cleft to the middle.

7 U. pendulìnus (D. C. pl. grass. t. 156.) lower leaves peltate, concave, repandly crenated, roundish; bracteas entire; flowers tubular, pendulous, or spreading. ♃. H. Native of Europe, among stones and rocks, on walls and under hedges; in Britain, on moist dripping rocks and old walls. Cotylèdon Umbilìcus, Lin. spec. 615. var. α. Sow. engl. bot. t. 325. Cotylèdon umbilicàta, Lam. C. rupéstris, Salisb. Cotylèdon Umbilìcus véneris, Blackw. herb. t. 263. Root tuberous. Flower-bearing stem branched; with its branches bearing racemes. Flowers yellow.

Var. β, *peltàtus* (D. C. prod. 3. p. 400.) raceme simple. ♃. H. Cotylèdon peltàtum, Wendl. obs. p. 49. Hardly distinct from the species.

Drooping or Common Navel-wort. Fl. Ju. Jul. Brit. Pl. $\frac{1}{2}$ ft.

8 U. ere'ctus (D. C. fl. fr. 4. p. 384. exclusive of the country) lower leaves peltate, dentately crenated, roundish; bracteas a little toothed; flowers erect. ♃. H. Native of England, on moist walls and rocks, but rare, particularly in the West Riding of Yorkshire; and of Portugal. Dodart. pempt. p. 73. with a figure. Cotylèdon Umbilìcus, Lin. spec. 615. Cotylèdon lùtea, Huds. angl. p. 194. Smith, engl. bot. 1522. Cotylèdon Lusitánica, Lam. dict. 2. p. 140. Root fleshy, creeping. Flowers yellow, larger than those of the first species.

Erect Navel-wort. Fl. June, Jul. Brit. Pl. $\frac{1}{2}$ foot.

9 U. parviflòrus (D. C. prod. 3. p. 400.) lower leaves petiolate, cucullate, orbicular, rather repand: upper ones ovate; flowers sub-campanulate, in dense racemes. ♃. H. Native of Candia, on the sphaceotic mountains. Cotylèdon parviflòra, Sibth. et Smith, fl. græc. t. 445. Desf. cor. Tourn. 75. t. 57. C. Crética tuberòsa rădice flore luteo parvo. Tourn. cor. 2. Flowers yellow, smaller than those of *C. pendulìnus*. Racemes branched, cylindrical, dense-flowered. Leaves lined with red.

Small-flowered Navel-wort. Pl. $\frac{1}{2}$ foot.

10 U. horizonta'lis (D. C. prod. 3. p. 400.) stem nearly simple; lower leaves peltate, concave, repandly crenated, roundish; bracteas entire, linear-setaceous, longer than the peduncles; corolla at first erect, but at length becoming horizontal, with acuminated segments. ♃. H. Native of Sicily and Naples, among stones and on walls. Cotylèdon horizontàlis, Guss. ind. sem. hort. pan. 1826. p. 4. Ten. fl. neap. app. 5. p. 13. Flowers yellow. Differs from *U. pendulìnus* in the flowers being nearly sessile, and horizontal, not drooping.

Horizontal-flowered Navel-wort. Pl. $\frac{1}{2}$ foot.

Sect. IV. Pistorinioìdes (plants intermediate between *Pistorínia* and *Umbilìcus*). Roots perennial, thick, woody. Leaves terete, subulate. Stems numerous, erect, simple, fistular, densely leafy, for the most part naked below, in consequence of the leaves having fallen.

11 U. Lieve'nii; glabrous; stems herbaceous, erect, simple; leaves scattered, crowded, nearly terete, bluntish; flowers cymose; limb of corolla erect. ♃. H. Native of Altaia, between the river Irtysch and Lake Noor-Saisan, in dry saltish fields; in fields on the mountain of Kurtchum, Arkaul, and at the rivulet called Urmichaika, near Buchtorminsk. Cotylèdon Lievènii, Led. fl. ross. alt. t. 57. fl. alt. 2. p. 197. Corolla fine red. Carpels 5-6.

Lieven's Navel-wort. Fl. May. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

12 U. subula'ta; plant quite smooth, glaucescent; leaves all scattered, terete, subulate, acute, erectly spreading; racemes corymbose; corolla twice the length of the calyx, with the segments of the limb acute and erect; stem herbaceous, very simple. ♃. H. Native of Caucasus, among stones, on the mountains of Talusch, at the altitude of 2700 to 3300 feet. Cotylèdon subulàta, Meyer. in verz. pflanz. p. 150. Very nearly allied to *U. Lievènii*, but the leaves are acute and erectly spreading, and the corolla is white, twice the length of the calyx, not rose-coloured, and 4 times longer than the calyx.

Subulate-leaved Navel-wort. Pl. $\frac{1}{2}$ foot.

Sect. V. Oro'stachys (from ὁρος, *horos*, the ends, and σταχυς, *stachys*, a spike; the spike of flowers terminate the scapes). D. C. prod. 3. p. 400. Oróstachys, Fisch. cat. gor. 1808. p. 99. Roots not tuberous. Stems simple. Leaves not peltate nor cucullate; radical ones rosulate. Corolla 5-parted.

13 U. serra'tus (D. C. l. c.) leaves oblong, cartilaginously crenated; stems subspicate; peduncles 2-3-flowered; root fibrous. ♂.? H. Native of Candia (Dill.) and of Galicia, on old walls. Bess. append. fl. gall. p. 352.—Dill. hort. elth. 1. t. 95. f. 112. Cotylèdon serràtus, Lin. spec. p. 615. Smith, fl. græc. t. 444. Flowers variegated with white and red. Habit of *Saxífraga lingulàris*.

Serrated-leaved Navel-wort. Fl. Ju. Jul. Clt. 1732. Pl. $\frac{1}{2}$ ft.

14 U. spinòsus (D. C. l. c.) leaves oblong, pointed by a spine at the apex, quite entire: radical ones rosulate, spatulate, convex beneath towards the apex: cauline leaves lanceolate, flat; corolla twice the length of the calyx; peduncles all 1-flowered; anthers of one colour; stems spicate, very simple. ♂. H. Native of Siberia, China, and Japan. Cotylèdon spinòsa, Lin. spec. 615. Sèdum spinòsum, Thunb. fl. jap. p. 186.—Murr. comm. gœtt. 7. p. 33. t. 5. Crássula spinòsa, Lin. mant. 388. Gmel. sib. 4. t. 67. f. 2. Oróstachys chloránthа, Fisch. in mem. soc. descr. nat. mosc. 2. p. 274. Sèdum, &c. Amm. ruth. p. 73. no. 95. Sempervìvum cuspidàtum, Haw. misc. 186. syn. p. 170. rev. p. 68.—Gmel. fl. sib. 4. p. 173. no. 87. and 68. f. 2.

Flowers yellow, 5-parted, on short pedicels, collected into a cylindrical spike.

Var. β, polystàchyus (Led. fl. alt. 2. p. 200.) spikes numerous, rising from the axils of the radical or cauline leaves, somewhat fastigiate.

Spiny Navel-wort. Fl. June, Jul. Clt. 1810. Pl. 1 foot.

15 U. malachophy'llus (D. C. prod. 3. p. 400.) leaves lanceolate, acutish, unarmed, quite entire; radical ones rosulate before flowering; stem spicate, simple. ♂. H. Native of Dahuria, among mountain rocks. Cotylèdon malachophýlla, Pall. itin. 3. append. t. O. f. 1. ed. gall. 8vo. 8. p. 312. t. 70. f. 1. Oróstachys malachophýlla, Fisch. cat. gor. Flowers white, 5-parted, crowded into a dense cylindrical spike.

Soft-leaved Navel-wort. Fl. June, July. Clt. 1815. Pl. ½ ft.

16 U. thyrsiflòrus (D. C. l. c.) leaves oblong, quite entire, ending each in a soft spine; radical ones rosulate; stem spicate, simple. ♂. H. Native of the mountains of Siberia, at Aga. Sèdum cotylèdonis facie floribus carneis, Amm. ruth. p. 72. no. 94. Oróstachys thyrsiflòra, Fisch. cat. gor. Flowers white and flesh-coloured (ex Fisch), 5-parted. Allied to *U. malachophýllus*.

Thyrse-flowered Navel-wort. Pl. ¼ to ½ foot.

17 U. leuca'ntha; leaves terminated by a spine; radical ones rosulate, spatulate, convex beneath towards the apex: cauline ones teretely trigonal; corolla thrice the length of the calyx: peduncles all 1-flowered; anthers discoloured. ♂. H. Native of Altaia, in very sterile fields in the Soongarian desert, between the mountains of Arkat and Kar-karaly; and among stones in the tract of the river Katunja. Root fusiform, or a little branched. Corolla white. Cotylèdon leucántha, Led. fl. ross. atl. ill. t. 395. fl. atl. 2. p. 198.

White-flowered Navel-wort. Fl. Aug. Pl. ¼ to ½ foot.

Cult. The hardy perennial species of this genus thrive well on rock-work, or on old walls; they will also grow freely in pots, in a soil composed of loam, peat, and sand, which should be placed among other alpine plants; these are propagated by offsets from the roots or by seeds. The seeds of annual and biennial kinds should be sown on rock-work, or in the open border, in a sandy or gravelly soil.

XVII. ECHEVE'RIA (this genus is named after M. Echeveri, author of the fine drawings of the Flora Mexicana, commenced under the direction of MM. Sesse, Mocino, and Cervantes). D. C. prod. 3. p. 401. mem. crass. p. 28.—Cotylèdon species of authors.

Lin. syst. *Decándria, Pentagýnia.* Calyx 5-parted; sepals erect, referrible to leaves, united at the very base (f. 27. *a.*). Petals 5 (f. 27. *b.*), also united at the base, erect, thick, stiffish, thickest at the middle nerve, and nearly trigonal at the base, acute. Stamens 10 (f. 27. *c.*), shorter than the petals, and adnate to them at the base. Scales 5, short, obtuse. Carpels 5, ending each in a subulate style. —Fleshy shrubs, natives of Mexico. Leaves alternate, cauline, or rosulate, and nearly opposite, nerveless. Flowers sessile, disposed along the rachis or branches of the cyme, scarlet or yellow.

FIG. 27.

* *Shrubs. Flowers panicled or spicate, scarlet.*

1 E. grandifòlia (Haw. in phil. mag. sept. 1828. p. 261.) leaves orbicularly cuneated; petioles thick; flowers in spicate panicles. ♄. D. G. Native of Mexico. Sweet, fl. gard. 275. Lower leaves rosulate, all white or glaucous. Corolla of a reddish orange-colour, with a tinge of purple. Stamens white.

Great-leaved Echeveria. Fl. Oct. Clt. 1828. Pl. 1 to 2 ft.

2 E. gibbiflòra (D. C. prod. 3. p. 401. mem. crass. p. 29. t. 5.) leaves flat, cuneiform, acutely mucronate, crowded at the tops of the branches; panicle spreading; flowers on short pedicels along the branches of the panicle. ♄. D. G. Native of Mexico. Moc. et Sesse. fl. mex. icon. ined. Petals gibbous at the base, between the lobes of the calyx, straight, acute, white at the base, and rather scarlet at the apex.

Gibbous-flowered Echeveria. Fl. July, Oct. Clt. 1826. Sh. 1 to 2 feet.

3 E. coccínea (D. C. prod. 3. p. 401.) plant soft, pubescent; leaves spatulately lanceolate; spikes of flowers axillary, elongated, leafy. ♄. D. G. Native of Mexico. Cotylèdon coccínea, Cav. icon. 2. p. 54. t. 170. Lodd. bot. cab. t. 832. Sèdum spicàtum, Moc. et Sesse, fl. mex. icon. ined. Corolla scarlet on the outside, and yellow on the inside, or paler. Stamens yellowish.

Scarlet-flowered Echeveria. Fl. Oct. Dec. Clt. 1816. Sh. 1 to 2 feet.

4 E. racemòsa (Schlecht. et Cham. in Linnæa 2. p. 554.) plant quite glabrous; radical leaves thickish, elliptic, acute, awnless, rosulate; scapes simple, naked; scales of scape alternate, and bracteas scale-formed and caducous; racemes spike-formed and elongated; flowers alternate, erect, on short pedicels. ♃. D. G. Native of Mexico, on walls at Jalapa. Leaves an inch or 2 inches long. Flowers scarlet, and are in every respect like those of *E. coccínea*, as well as every other part of the plant; but the sepals are shorter and mucronate, not acuminated, and the petals are narrower.

Racemose-flowered Echeveria. Pl. ½ to 1½ foot.

5 E. teretifòlia (D. C. prod. l. c. mem. crass. p. 29. pl. 1. f. 1.) leaves terete, acute, scattered, almost loose at the base; spikes secund, few-flowered. ♄. D. G. Native of Mexico. Sèdum teretifòlium, Moc. et Sesse, fl. mex. icon. ined. Very nearly allied to *E. coccínea*.

Terete-leaved Echeveria. Shrub 1 to 2 feet.

6 E. lu'rida (Haw. in phil. mag. 1831. p. 416.) plant rather tufted; lower leaves lanceolate-cuneated, of a livid colour: superior ones lanceolate; flowers disposed in racemose spikes. ♄. D. G. Native of Mexico. Corolla as in *E. grandifòlia*, but more scarlet.

Lurid-leaved Echeveria. Fl. Jul. Clt. 1830. Pl. 1 foot.

** *Plant subherbaceous. Flowers subcymose, yellow.*

7 E. cæspitòsa (D. C. prod. 3. p. 401.) leaves rosulate, narrow, tongue-formed, obcuneated at the apex, and rather mucronate; flowers cymose. ♃. D. G. Native of California. Cotylèdon cæspitòsa, Haw. misc. p. 180. Coty. linguifórmis, Ait. hort. kew. 3. p. 109. Sèdum Cotylèdon, Jacq. fil. eclog. 1. f. 17. Cotyl. refléxa, Willd. enum. suppl. p. 24. Flowers yellow.

Tufted Echeveria. Fl. Jul. Aug. Clt. 1796. Pl. 1 foot.

Cult. Fine glaucous, succulent plants, which deserve to be cultivated in every collection. Their culture, propagation, and treatment are the same as that recommended for *Globùlea*, p. 106.

XVIII. SE'DUM (from *sedeo*, to sit; manner of growth, upon stones, rocks, walls, and roofs of houses). D. C. in bull. phil. no. 49. mem. crass. t. 1. f. 1. Sèdum and Rhodìola, Lin. spec. —Sèdum and Anacámpseros, Tourn. Haw.—Anacámpseros, Adans. fam. 2. p. 248.

Lin. syst. *Decándria, Pentagýnia.* Calyx 5-parted (f. 29. *a.*); sepals ovate, usually turgid, leaf-formed. Petals 5 (f. 29. *b.*),

generally spreading. Stamens 10. Nectariferous scales entire, or hardly emarginate. Carpels 5.—Herbs or subshrubs. Stems usually branched from the base. Sterile stems or surculi usually crowded with leaves. Leaves alternate, rarely opposite, fleshy, terete or flat, quite entire, rarely toothed. Flowers cymose, white, purple, or blue, but usually yellow; in some species the flowers are 4 or 6-7-petalled, and the stamens always double that number.

* *Leaves flat. Flowers yellow.*

1 S. Rhodìola (D. C. fl. fr. ed. 3. vol. 4. p. 386. pl. grass. t. 143.) leaves oblong, serrated at the apex, glabrous, glaucous; root rather tuberous; stems simple; flowers corymbose, usually of 4 petals, octandrous, and dioecious from abortion. ♃. H. Native of middle Europe, on the mountains; of Siberia, and of North America, on the Arctic Sea shore, and Islands; of Newfoundland and Labrador; and on the Rocky Mountains, Kotzebue's Sound, &c.; in Britain, in the north of England, Scotland, and Wales, on the mountains. Rhodìola ròsea, Lin. spec. 1465. Smith, engl. bot. t. 508. fl. dan. t. 183. Plant glaucous. The flowers are yellow, and are said to be sometimes hermaphrodite, but are usually of different sexes on different plants. The root is sweetish when dried; in this state a fragrant water may be distilled from it. The inhabitants of the Farro Island use it as a remedy for scurvy. In Greenland they eat it as garden stuff. A cataplasm of the fresh roots, applied to the forehead, is said to relieve the head-ache, and to heal malignant ulcers. The specific name is from ῥοδον, a rose; in reference to the fragrance of the roots.

Rhodiola or Common Rose-root. Fl. May, July. Brit. Pl. ½ to ¾ foot.

2 S. Asia'ticum (D. C. prod. 3. p. 401.) leaves linear-lingulate, quite entire, obtuse; umbels few-flowered; calycine segments 4, oblong, obtuse; flowers 4-petalled, hermaphrodite. ♃. H. Native of Gosainsthan, in Nipaul. Rhodìola Asiática, D. Don, prod. fl. nep. p. 213. Root fleshy; caudex very thick, 3-4 inches long, turgid. Stems tufted, ascending. Leaves 1-2 lines long, glaucous. Flowers corymbose, octandrous, and tetragynous, of a golden yellow colour.

Asiatic Rose-root. Pl. ¼ foot.

3 S. elonga'tum (Led. fl. atl. 2. p. 193.) leaves scattered, oblong, almost quite entire, glabrous, hardly glaucescent; root rather tuberous; stems simple; flowers in cymose corymbs; pedicels hardly exceeding the flowers in length; nectariferous scales 3 times longer than broad; carpels recurved. ♃. H. Native of Altaia, in alpine humid places, on the edges of rivulets. Plant glaucous. Flowers yellow? hermaphrodite, but sometimes dioecious or polygamous from abortion, as in *S. Rhodìola*. Stamens 8 or 10.

Elongated Rose-root. Fl. May, July. Pl. 1 foot.

4 S. Alta'icum; leaves scattered, obovate-lanceolate, serrated at the apex, glabrous, glaucous; root rather tuberous; stems simple; flowers in cymose corymbs; pedicels shorter than the flowers; nectariferous scales about as long as broad; carpels erect. ♃. H. Native of Altaia and Siberia. S. Rhodìola, Led. fl. alt. 2. p. 194. Rhodìola Sibírica, Hortul. Flowers yellow, octandrous, dioecious or polygamous.

Altaian Rose-root. Fl. May, June. Clt. 1827. Pl. ½ foot.

5 S. Himale'nsis (D. Don, prod. fl. nep. p. 212.) stem erect; leaves oval-lanceolate, flat, acute, toothed, glaucous, smooth; corymbs almost simple; root thick. ♃. H. Native of Gosainsthan, in the alpine regions of the Himalaya or Emodi. Habit of *S. Rhodìola*. Flowers yellow.

Himalaya Stonecrop. Pl. ½ foot.

6 S. aizo'on (Lin. spec. 617.) leaves lanceolate, flat, serrated, alternate, glabrous; stems erect; cymes terminal, crowded. ♃. H. Native of Siberia, in woods; on shady rocks, at Lake Teletzkoi. D. C. pl. grass. t. 101.—Amm. ruth. no. 96. t. 11. Perhaps Anacámpseros Aizòon, Haw. syn. p. 112.? Flowers yellow, varying with from 4-6 petals and 8-12 stamens. Root branched, fascicled, thickish.

Ever-living Stonecrop. Fl. Jul. Sept. Clt. 1757. Pl. 1 ft.

7 S. hy'bridum (Lin. spec. 617.) leaves cuneiform, rather concave, bluntly serrated, rather crowded, alternate, glabrous; those of the branches crowded; stems ascending, rooting at the base; cymes terminal. ♃. H. Native of Altaia and Tartary, at the bottom of the Ural mountains; on the upper Irtish. Murr. nov. comm. goett. 6. p. 35. t. 5.—Gmel. fl. sib. 4. p. 171. no. 851. t. 62. f. 1. Anacámpseros hýbrida, Haw. l. c. Flowers sulphur-coloured. This is not a hybrid, but a true species. S. Altàica, Bess. enum. sem. crem. 1823.

Hybrid Stonecrop. Fl. May, Jul. Clt. 1766. Pl. 1 to 2 ft.

8 S. spatulifòlium (Hook, fl. bor. amer. 1. p. 227.) glabrous; stem erect; leaves obovate-spatulate, flattish, acute: upper ones linear; cyme terminal, leafy, trichotomous; flowers pedicellate, decandrous; petals linear-spatulate, much longer than the calyx. ♃. H. Native of the north-west coast of America; common on dry rocky places of the Columbia river. Flowers yellow, very like those of *S. stenopétalum*. Lower parts of stems decumbent.

Spatulate-leaved Stonecrop. Pl. ¼ to ½ foot.

9 S. Dougla'sii (Hook, fl. bor. amer. 1. p. 228.) stem erect, proliferous above from recurved branches; leaves linear-subulate, very acute, flat on the inside, and a little keeled on the back, with dry membranous edges; cymes dichotomous; flowers sessile, decandrous; petals narrow-lanceolate, twice the length of the calyx. ☉. H. Native of North America; common on rocky places on the Columbia to the mountains. Flowers yellow, like those of *S. stenopétalum*.

Douglas's Stonecrop. Pl. ½ foot.

10 S. a'lgidum (Led. fl. ross. alt. ill. t. 418.) leaves scattered, linear, quite entire, flat, glabrous; root thick, of many necks; stems numerous, simple; corymb terminal, simple; pedicels about equal in length to the flowers; breadth of nectariferous scales exceeding their length; petals longer than the stamens. ♃. H. Native of Altaia, on the higher alps, about the fountains of the rivers Inja, Uba, and Sentelek, and on the mountains Kokorga, at the sides of rivulets. Flowers at first yellow, but fading to a dirty red. Allied to *S. quadrífidum*.

Algid Stonecrop. Fl. June, July. Pl. ½ foot.

** *Leaves flat. Flowers white.*

11 S. involucra'tum (Bieb. fl. taur. 1. p. 352.) leaves cuneiform, crenated, opposite, pubescent, ciliated; stems declinate, hairy; corymbs crowded, involucrated; petals subulate. ♃. H. Native of Caucasus, among stones, at the foot of Mount Kaischaur. Flowers white, about the size of those of *S. hýbridum*.

Involucrated Stonecrop. Pl. 1 foot.

12 S. latifòlium (Bert. amœn. itin. p. 366.) leaves ovate, cordate, very blunt, serrated, glabrous, usually opposite; corymbs cymose, on long peduncles; stamens longer than the corolla. ♃. H. Native of Switzerland, on the mountains; Germany, Italy, France, &c.—Clus. hist. 2. p. 66. f. 1. S. Telèphium, var. máximum, Lin. spec. 616. S. máximum, Hoffm. germ. 1. p. 156. Flowers greenish-white. Anacámpseros máxima, and probably A. álbicans, Haw. syn. p. 111.

Broad-leaved Orpine. Fl. July, Sept. Clt. 1794. Pl. 2 feet.

13 S. obtusifòlium (Meyer. verz. pflanz. p. 150.) plant glabrous, green; stems erect; leaves orbicularly-obovate, obtuse, nearly quite entire, with scabrous margins: lower ones opposite; rays of cyme elongated, spreading, and leafy; flowers nearly sessile; petals acute, longer than the calyx. ♃. H. Native of Caucasus, on the Talusch mountains, towards Perim-

bal, at the height of 3000 feet. Flowers white. This species differs from *S. latifòlium*, *Telèphium*, and *S. Anacámpseros* in the inflorescence; and from *S. hýbridum*, *involucràtum*, *spúrium*, *stoloníferum*, and *oppositifòlium*, in the erect stems and form of the leaves.

Blunt-leaved Stonecrop. Pl. 1 foot.

14 S. PECTINA'TUM (D. C. prod. 3. p. 403.) leaves lanceolate-oblong, pectinately toothed; flowers terminal, capitate, 4-cleft. ♃. H. Native country unknown. Anacámpseros pectinàta, Haw. rev. p. 24. Petals greenish-white. Habit of *Penthòrum*.

Pectinated-leaved Stonecrop. Fl. April, Aug. Clt. 1818. Pl. ½ foot.

15 S. LI'VIDUM (Willd. enum. suppl. p. 24.) stems ascending; leaves glaucous, oblong, somewhat attenuated at the base, glabrous, and somewhat crenated at the apex; flowers cymose, terminal. ♃. H. Native country unknown. Anacámpseros lívida, Haw. rev. p. 25. Flowers white.

Livid Stonecrop. Fl. June, Aug. Clt. 1816. Pl. ½ foot.

16 S. CRUCIA'TUM (Desf. cat. p. 162. D. C. fl. fr. 4. p. 389.) leaves flattish, thick, convex beneath, 4 in a whorl; stems branched at the base, diffuse, ascending, pubescent at the apex; flowers subpanicled, on long pedicels; petals acuminated. ♃. H. Native of Piedmont, in mountain valleys about Monregal. Balb. misc. p. 23. t. 6. Reich. icon. 3. f. 438. Flowers white, almost like those of *S. Cepæ'a*.

Cross-leaved Stonecrop. Pl. ½ foot.

17 S. MAGELLE'NSE (Ten. fl. neap. pr. p. 26.) stem erect, or ascending, herbaceous; leaves obovate-oblong, sessile; flowers racemose, scattered, pedunculate; petals lanceolate, acute. ♃. H. Native of Samnius, on many of the mountains, in shady groves, and on mossy rocks, and at the roots of old trees; of Naples, in the groves of Magella. Racemes terminal, nodding before expansion. Flowers dirty white.

Magella Stonecrop. Pl. from ⅛ to 1 foot.

18 S. OPPOSITIFÒLIUM (Sims, bot. mag. t. 1807.) leaves cuneately-spatulate, toothed above, opposite, puberulous on the margins, rib, under side, as well as on the stems; cymes sessile, terminal, crowded; petals oblong, acute. ♃. H. Native of Caucasus. S. denticulàtum, Donn, cat. ed. 8. Anacámpseros ciliàris, Haw. syn. 113. rev. p. 25. Flowers white. Stems decumbent, rooting; floriferous ones erect. Crássula crenàta, Desf. choix. cor. Tourn. t. 58. ann. mus. 11. t. 46.

Opposite-leaved Stonecrop. Fl. Jul. Sept. Clt.? Pl. dec.

19 S. LANCEOLA'TUM (Torrey. in ann. lyc. new york. 2. p. 205.) leaves flat, rather alternate: lower ones crowded, oblong-lanceolate, acutish, glabrous, with glandularly serrulated edges; stems branched, assurgent; flowers in cymose corymbs; petals lanceolate, spreading. ♃. H. Native of North America, near the Rocky Mountains. Stem a little branched at the base, creeping. Leaves about half an inch long. Flowers white, decandrous. Petals 7.

Lanceolate-leaved Stonecrop. Pl. cr.

20 S. TERNA'TUM (Michx. fl. bor. amer. 1. p. 277.) leaves flat, glabrous, quite entire; lower leaves obovate, attenuated at the base, 3 in a whorl, upper ones sessile, lanceolate, inordinate; cymes trifid; flowers sessile along the branches; petals oblong, acute. ♃. H. Native of Pennsylvania, Virginia, and Carolina, on rocks, and on the rocks about Niagara and Lake Erie, common. Ker. bot. reg. t. 142. Sims, bot. mag. 1977. S. portulacoìdes, Willd. enum. p. 484. S. defíciens, Donn, hort. cant. S. octogònum, Hortul. Anacámpseros ternàta, Haw. Flowers white.

Ternate-leaved Stonecrop. Fl. Ju. Aug. Clt. 1789. Pl. ¼ ft.

21 S. POPULIFÒLIUM (Lin. fil. suppl. p. 242.) leaves scattered, flat, coarsely toothed, petiolate, glabrous: lower ones cordate: upper ones ovate; stems much branched, erect, shrubby: corymbs rather panicled, terminal, many-flowered; petals oblong-lanceolate. ♄. H. Native of Siberia, on the mountains, in many parts. D. C. pl. grass. t. 110. Curt. bot. mag. t. 211. —Pall. itin. 3. p. 730. append. no. 89. t. O. f. 2. Flowers white; anthers purple. There is a variety of this plant with ovate leaves and few flowers, and is perhaps referrible to *S. Notarjánni*.

Poplar-leaved or Shrubby Stonecrop. Fl. July, Aug. Clt. 1780. Shrub 1 foot.

22 S. NOTARJA'NNI (Ten. fl. neap. 1. p. 245. t. 40.) stems ascending, suffruticose; leaves petiolate, flat, ovate, bluntly and sinuately toothed, glabrous; flowers solitary or few, terminal; petals lanceolate. ♄. H. Native of Naples, near Funda, among calcareous rocks. S. Notarjánni, Ten. cat. 1819. p. 43. Very like *S. populifòlium*, but differs in the stems being almost herbaceous, in the leaves not being cordate, in the flowers being nearly solitary, and in the anthers being yellow.

Notarjanni's Stonecrop. Shrub 1 foot.

23 S. STELLA'TUM (Lin. spec. 617.) leaves flat, roundish, angularly toothed, tapering into the petioles, opposite, or alternate, glabrous; flowers axillary, sessile along the branches of the cyme; petals lanceolate. ⊙. H. Native of the Islands of Corsica, Melos, and of Italy, and the south of Switzerland. Smith, fl. græc. 446. Comm. hort. 7. t. 2. Col. phyt. 32. t. 11. Petals white, tinged with red.

Starry-flowered Stonecrop. Fl. Ju. Jul. Clt. 1614. Pl. ½ ft.

24 S. CEPÆ'A (Lin. spec. 617.) stem herbaceous, terete, pubescent; leaves flat, quite entire; lower ones rather spatulate: upper ones oblong or linear; flowers panicled; petals ending in an awned point. ♂. H. Native of middle and south Europe, in hedges and among bushes. Smith, fl. græc. 447.—Clus. hist. 2. p. 68. with a figure.—Mor. hist. 3. p. 473. sect. 12. t. 7. f. 37. —S. paniculàtum, Lam.—Anacámpseros Cepæ'a, Haw. Flowers white.

Var. β, galioìdes (D. C. prod. 3. p. 404.) upper leaves nearly opposite: lower ones in whorls, spatulate. S. galioìdes, All. pedem. no. 1742. t. 65. f. 3. S. verticillàtum, Latour, but not of Lin.

Var. γ, alsinefòlium (D. C. l. c.) leaves oval, for the most part alternate. S. alsinefòlium, All. ped. no. 1740. t. 22. f. 2. bad. Petals acuminated.

Cepæa or Purslane-leaved Stonecrop. Fl. July, Aug. Clt. 1640. Pl. ½ to 1 foot.

25 S. SPATULA'TUM (Waldst. et Kit. pl. rar. hung. 2. p. 108. t. 104.) stem herbaceous, terete, pubescent; leaves flat, entire, nearly all alternate, spatulate: upper ones cuneiform; flowers panicled; petals ending each in an awn. ♂. H. Native of Hungary. S. Cepæ'a, var. γ, spatulàtum D. C. prod. 3. p. 404. Flowers white.

Spatulate-leaved Stonecrop. Fl. Ju. Jul. Clt. 1815. Pl. ½ ft.

26 S. TETRAPHY'LLUM (Smith, fl. græc. t. 448. prod. 1. p. 309.) plant pubescent; leaves spatulate, quite entire, four in a whorl; stem branched at the base; peduncles axillary, few-flowered, the whole forming a terminal panicled raceme; petals ending in a long point. ♂. H. Native of Greece. Ray. syn. ext. 233. Petals white, with a red keel.

Four-leaved Stonecrop. Pl. ½ foot.

27 S. ERIOCA'RPUM (Smith, fl. græc. t. 449.) stem twisted, pubescent above; leaves smooth, alternate, oblong, obtuse; stems cymose; flowers axillary, nearly sessile; petals mucronated; calyx glabrous; ovaries hairy. ⊙. H. Native of Greece. Flowers red.

Woolly-fruited Stonecrop. Fl. June, July. Clt.? Pl. ¼ to ½ ft.

* * * *Leaves flat. Flowers purple or red; rarely blue.*

28 S. CYANÆ'UM (Rud. mem. petersb. 1811. p. 351. t. 2. f. 2.)

stems simple; leaves flat, nearly linear, entire, sessile; cymes leafy. ♂. H. Native of Eastern Siberia. Flowers blue.

Blue-flowered Stonecrop. Pl. ½ foot.

29 S. DELTOI'DEUM (Ten. cat. 1819. p. 43.) stems erectish; leaves alternate, flat, deltoidly-cuneiform, unequal, crenated, and toothed; cymes lateral. ⊙. H. Native of the kingdom of Naples, on Monte Novo and Goat's Island. Flowers purple. The rest unknown.

Deltoid-leaved Stonecrop. Pl. ½ foot.

30 S. SEMPERVI'VUM (Led. ex Spreng. syst. 2. p. 434.) leaves spatulate-ovate, acute, flat, quite entire, pubescent: lower ones collected into a circle: cauline ones half stem-clasping; stems simple; corymb rather panicled; petals lanceolate-subulate. ♃. H. Native of Iberia. S. sempervivoìdes, Fisch. mss. Bieb. suppl. p. 313. Sims, bot. mag. t. 3474. Habit of a species of *Sempervìvum*. Flowers deep purple, showy, size of those of *S. spùrium*.

Houseleek-like Stonecrop. Fl. Jul. Aug. Clt. 1823. Pl. ½ ft.

31 S. HÆMATO'DES (Mill. dict. no. 15.) stems erect, fleshy; leaves ovate, quite entire: upper ones stem-clasping; corymbs terminal. ♃. H. Native of Louisiana. There are two varieties of this plant, one with white and another with purple flowers. Said to be allied to *S. Telèphium* and *S. Anacámpseros*.

Bloody Orpine. Fl. July, Sept. Pl. 1 to 2 feet.

32 S. ANACA'MPSEROS (Lin. spec. 616.) leaves cuneiform, obtuse, quite entire, almost sessile, alternate, flat, glabrous; stems decumbent; flowers corymbose. ♃. Native of Provence, Piedmont, Savoy, Switzerland, &c. on rocks among the mountains. D. C. pl. grass. t. 33. Curt. bot. mag. t. 118. —Lob. icon. 1. t. 390. f. 2. S. rotundifòlium, Lam. dict. fl. fr. 3. p. 82. Anacámpseros sempervìrens, Haw. syn. p. 112. Flowers purple.

Anacampseros or Evergreen Orpine. Fl. July, Aug. Clt. 1596. Pl. trailing.

33 S. PU'LCHRUM (Michx. fl. bor. amer. 1. p. 277.) stems assurgent, glabrous; leaves scattered, linear, obtuse; cymes of many spikes; flowers sessile, of 4 petals and 8 stamens. ♃. H. Native of the mountains of Virginia, Carolina, and Georgia, on the banks of the river Ohio. Flowers purple. Allied to *S. reflèxum*, according to Pursh, but according to Nutt. to *S. ternàtum*.

Fair Stonecrop. Pl. trailing.

34 S. DENTA'TUM (D. C. prod. 3. p. 403.) leaves alternate, glabrous, cuneate-obovate; upper ones pinnatifidly toothed downwards, and more petiolate; cyme sessile, terminal. ♃. H. Native country unknown. Anacámpseros dentàta, Haw. rev. p. 26. Allied to *S. spùrium* and *S. oppositifòlium*. Perhaps the same as S. dentàtum, Donn, hort. cant. Flowers purple.

Toothed-leaved Stonecrop. Fl. Ju. July. Clt. 1810. Pl. ¼ ft.

35 S. IBE'RICUM (Stev. in Bieb. fl. taur. suppl. p. 312.) leaves cuneiformly obovate, repandly crenated, petiolate, with scabrous margins: cauline leaves opposite; cymes leafy, dichotomous; flowers nearly sessile; petals subulate. ♃. H. Native of the north of Iberia, in subalpine places. Flowers reddish. Habit of *S. spùrium*.

Iberian Stonecrop. Pl. ¼ foot.

36 S. RÒSEUM (Stev. mem. soc. nat. cur. mosq. 3. p. 263.) leaves spatulately obovate, opposite, quite entire, fleshy, glabrous, imbricated at the tops of the surculi; stems much branched, loose, creeping; cymes terminal; petals lanceolate-subulate. ♃. H. Native of Eastern Caucasus, among stones. Bieb. suppl. 314. Flowers almost like those of *S. spùrium*, of an elegant rose-colour.

Rose-coloured-flowered Stonecrop. Pl. ¼ to ½ foot.

37 S. SPU'RIUM (Bieb. fl. taur. 1. p. 852.) leaves cuneiformly-obovate, crenately toothed in front, pubescent beneath, somewhat ciliated; cauline leaves opposite; radical ones in fascicles usually alternate; corymbs terminal, compound; petals lanceolate. ♃. H. Native of Caucasus, among rocks. Sims, bot. mag. t. 2370.—Buxb. cent. 5. p. 33. t. 61. f. 2. Anacámpseros spùria, Haw. rev. p. 25. Flowers purple.

Spurious Stonecrop. Fl. July, Sept. Clt. 1816. Pl. ¼ foot.

38 S. EWE'RSII (Led. fl. alt. ill. t. 58. fl. alt. 2. p. 191.) leaves opposite, obsoletely denticulated, adnate: inferior ones broad-elliptic: superior ones sessile, cordate; corymbs terminal, compound; petals lanceolate, acute, a little longer than the stamens. ♃. H. Native of Altaia, at the rivers Uba, Buchtorm, and Kokoryo; and at the Golden Lake Teletz-koe Osero. Flowers purple. Stem rooting at the base.

Ewers's Stonecrop. Fl. July, Aug. Clt. 1829. Pl. ¼ foot.

39 S. TELEPHIOÌDES (Michx. fl. bor. amer. 1. p. 324.) leaves ovate, flat, acutish at both ends, toothed; corymb compound, in fascicles. ♃. H. Native of Virginia and Carolina, on rocks among the mountains. Anacámpseros telephioìdes, Haw. syn. 114. Flowers pale purple. Hardly distinct from *S. Telèphium* according to Nuttall.

Orpine-like Stone-crop. Fl. July, Sept. Clt. 1810. Pl. 1 to 2 feet.

40 S. TELE'PHIUM (Lin. spec. 616. α, β, et γ,) leaves oblong or oval, attenuated at the base, flat, toothed, glabrous; stems erect; cymes corymbose, terminal; stamens not exceeding the corolla. ♃. H. Native of Europe, in exposed places; in Britain on the borders of fields, or in hedges or bushy places, on a gravelly or chalky soil. Smith, eng. bot. 1319. Curt. lond. 3. t. 25. 210. Oed. fl. dan. 686. Blackw. 191. There are several varieties of this plant:—1, leaves opposite (Anacámpseros álbida, Haw. syn. p. 111.)—2, leaves 3 in a whorl (Anacámpseros triphýlla, Haw. syn. p. 111. Sèdum triphýllum, Haw.)—3, leaves alternate; flowers purple (D. C. pl. grass. t. 92. Anacámpseros purpùrea, Haw. syn. p. 111. Fuschs, hist. 801. with a figure), and white (Fuschs. hist. l. c. t. 800. Anacámpseros vulgàris, Haw. syn. p. 111.)—4, leaves oblong-lanceolate, sharply toothed (Anacámpseros argùta, Haw. Sèdum argùtum, Haw.)—5, leaves cuneately obovate, slightly 4-toothed towards the apex; stems decumbent (Anacámpseros paúcidens, Haw. rev. p. 24.). All these are referrible to this species. A decoction of the leaves in milk is a forcible diuretic. It has been given with success in the cure of hæmorrhoids.

Orpine. Fl. July, Sept. Britain. Pl. 2 to 3 feet.

41 S. VULGA'RE (Link. enum. pl. hort. berol. 1. p. 437.) leaves nearly opposite, ovate-elliptic, obtuse, rounded at the base, exactly sessile, bluntly and dentately serrated; panicle subcorymbose; stamens shorter than the corolla. ♃. H. Native of Siberia, on the mountains near Kolywan; and also in sandy woods about Barnaoul. S. Telèphium α, Willd. spec. 2. p. 760. S. Telèphium, Patrin, fl. barn. mss. Bieb. fl. taur. 1. p. 351. S. Telèphium, Besser. enum. pl. volh. p. 17. S. Telèphium γ mìnus, Falk, topog. 2. no. 522. Anacámpseros vulgàris, Haw. succ. p. 112. Flowers whitish or purplish.

Common Orpine. Fl. June, Sept. Clt.? Pl. 1 to 2 feet.

42 S. VERTICILLA'TUM (Lin. amœn. 2. p. 352. t. 4. f. 14. exclusive of the synonyme of Ray,) stem erect; leaves 4 in a whorl, lanceolate, serrated; racemes axillary, few-flowered, shorter than the leaves. ♃. H. Native of Kamtschatka. Leaves a finger in length. Flowers small, purple? or pink? This species is allied to *S. Telèphium* according to Steven.

Whorled-leaved Orpine. Fl. July, Sept. Clt.? Pl. 1 foot.

* * * * *Leaves terete. Flowers white.*

43 S. MORANE'NSE (H. B. et Kunth, nov. gen. 6. p. 44.) stems branched, creeping at the base, ascending, glabrous; leaves scattered, loosened at the base, thick, fleshy, obtuse; cymes secund; flowers nearly sessile; petals 5, oblong-linear, bluntish. ♃. H.

Native of Mexico, near Real de Moran. The colour of the flowers is unknown, but the plant is said to be very like *S. Anglicum*, and the flowers are therefore perhaps white.

Moran Stonecrop. Pl. $\frac{1}{8}$ foot.

44 S. A'NGLICUM (Huds. angl. p. 196.) stems ascending, humble, branched at the base; leaves crowded, alternate, short, ovate, gibbous, loosened at the base, glabrous; cyme branched, few flowered; flowers sessile along the branches; petals acuminately awned. ♃. H. Native of Norway, Britain, west of France, Portugal, on walls, roofs of houses, meadows, on exposed stony hills, and among rocks. In England on the sandy or rocky sea coast, as well as upon mountains; in Scotland and the north of England frequent. Smith, engl. bot. 171. S. rùbens, Oed. fl. dan. t. 82. Lightf. scot. 235. S. arenàrium, Brot. fl. lus. 2. p. 212. phyt. t. 1. f. 2. S. Guettárdi, Vill. dauph. 3. p. 678. in a note. S. atràtum, Aubl. S. ánnuum, Gunn. but not of Lin. Petals white, with a red keel.

Var. β, *microphýllum;* plant very small.

Var. γ, *Hibérnicum;* plant large, rather downy.

English Stonecrop. Fl. June, Aug. Britain. Pl. $\frac{1}{8}$ foot.

45 S. OBLO'NGUM (Haw. rev. p. 29.) leaves ovate, parabolically-oblong, convex beneath, 4 lines long, rather distant; scales of germens brown. ♃. H. Native of England. Petals white, with a red keel. Very like *S. ánglicum*, but twice the size, the leaves fewer, and more distant.

Oblong-leaved Stone-crop. Fl. June, Aug. Brit. Pl. $\frac{1}{8}$ ft.

46 S. ATRA'TUM (Lin. spec. 1673.) stem erect, branched at the base; leaves scattered, terete, obtuse, glabrous, loosened at the base; cymes corymbosely fastigiate; petals ovate, hardly mucronate; carpels stellately spreading. ⊙. H. Native of the Alps of Europe and the Pyrenees, among rocks. D. C. pl. grass. t. 120. All. pedem. t. 65. f. 4. Jacq. aust. 1. t. 8. S. hæmatódes, Scop. carn. 4. p. 323. but not of Mill. Petals small, white. Plant red when old. Carpels dark red.

Var. β; lower branches lying on the ground. Native of the Alps. D. C. fl. fr. ed. 3. vol. 4. p. 391. exclusive of the synonymes.

Dark Stone-crop. Fl. Aug. Clt. 1795. Pl. $\frac{1}{8}$ foot.

47 S. GLAU'CUM (Waldst. et Kit. pl. rar. hung. 2. p. 198. t. 181.) stem erectish, puberulous; leaves nearly terete, glaucous, alternate; sterile branches crowded, erect; cymes trifid, few-flowered; petals 6, mucronate. ♂. H. Native of Hungary, on sandy hills. Willd. enum. p. 486. S. Hungáricum, Poir. S. Andersònii, G. Don in Loud. hort. brit. p. 184. According to Willd. this species differs from *S. séxfidum* in the stem being a little branched at the base, in the petals being 1-nerved, not finely 3-nerved. Flowers sometimes hexandrous.

Glaucous Stonecrop. Fl. June, July. Clt. 1816. Pl. $\frac{1}{4}$ ft.

48 S. SE'XFIDUM (Bieb. fl. taur. suppl. no. 874.) stem erectish, branched, when young rather procumbent; leaves nearly terete-scattered, spreading, glaucous, glabrous; cymes somewhat panicled; flowers sessile along the branches; petals 6, acuminated. ⊙. H. Native of Caucasus, on rocks. Willd. enum. 487. Flowers white; anthers bay-coloured. The flowers contain also 12 stamens, and are allied to *S. rùbens*. The petals are said to be 3-nerved, the lateral nerves very fine.

Six-cleft-flowered Stonecrop. Fl. June, July. Clt. 1816. Pl. $\frac{1}{8}$ foot.

49 S. ANDEGAVE'NSE (D. C. prod. 3. p. 406.) stem erect, simple at the base, trichotomous at the apex; leaves ovate, obtuse, erect, fleshy, glabrous: lower leaves opposite, the rest alternate; flowers pentandrous in the forks, and scattered and sessile along the branches; petals ovate, acutish. ⊙. H. Native of Andegavany, on walls and on schistous rocks. S. atràtum, Bast. ess. fl. p. 167. exclusive of the synonyme. Crássula Andegavénsis, D. C. suppl. fl. fr. p. 522. Truly distinct from *S. atràtum*, but perhaps only a pentandrous variety of *S. dasyphýllum*, and the flowers are probably white like it.

Andegavenny Stonecrop. Pl. $\frac{1}{4}$ foot.

50 S. DASYPHY'LLUM (Lin. spec. p. 618.) stems weak, decumbent; leaves ovate, nearly globose, fleshy, glabrous, opposite, rarely alternate; sterile branches rather imbricated; cymes puberulous, few-flowered, terminal; petals bluntish. ♃. H. Native of Europe, on walls and rocks. In England plentiful about London, as at Hammersmith, Kew, Chelsea, &c.; on walls at Malton, Yorkshire, and at Clifton near Bristol. Jacq. hort. vind. t. 153. D.C. pl. grass. t. 93. Smith, engl. bot. t. 656. Curt. fl. lond. 3. t. 26. 147. S. glaúcum, Lam. fl. fr. Flowers white, sometimes composed of 6 petals? Perhaps S. reticulàtum, Schrank. bot. beob. in dennsk. baier. ges. 1815. is different from *S. dasyphýllum*. Plant glaucous.

Thick-leaved Stonecrop. Fl. June, July. Brit. Pl. $\frac{1}{4}$ foot.

51 S. BREVIFÒLIUM (D. C. rapp. voy. 1808. p. 79. suppl. no. 3615. α, mem. crass. t. 4. f. A.) stems fruticulose, glabrous, twisted at the base; leaves opposite, ovate, obtuse, short, thick; cymes quite glabrous, loose, terminal; petals bluntish. ♃. H. Native of the Pyrenees and of Corsica, among rocks in dry pastures. S. sphæ'ricum, Lapeyr. abr. 1813. p. 259. Sepals of calyx thin, not as in *S. dasyphýllum* (to which species it is nearly allied) thick.

Short-leaved Stonecrop. Pl. $\frac{1}{4}$ foot.

52 S. CO'RSICUM (Duby, in D. C. syn. fl. fr. ed. 2.) stems ascending, branched at the base, twisted; leaves ovate, obtuse, hispid; sterile shoots crowded; cymes terminal, few-flowered, glabrous; petals acutish. ♃. H. Native of Corsica, where it was detected by Ph. Thomas, on the walls of the city of Corte; and of Sardinia, at the town of Jessu. Flowers smaller than those of *S. dasyphýllum*, appearing of a dirty pale purple in the dried specimen; but white in the recent state.

Corsican Stonecrop. Pl. $\frac{1}{4}$ foot.

53 S. HIRSU'TUM (All. ped. no. 1754. t. 65. f. 5.) floriferous stems erect, nearly naked; leaves remote, alternate, oblong-cylindrical, obtuse, hairy; sterile stems crowded; cymes terminal, few-flowered; petals acuminately awned. ♂. H. ex All. ♃. H. ex Pourr. Native of the Alps of Piedmont, Provence, Cevennes, Pyrenees, and on the mountains of Leone and Corsica, especially among schistous rocks. S. globíferum, Pourr. act. tol. 3. p. 327. S. híspidum, Poir. dict. 4. p. 633. but not of Desf. Petals white, downy, marked with a purple line.

Hairy Stonecrop. Pl. $\frac{1}{4}$ foot.

54 S. PILÒSUM (Bieb. fl. taur. 1. p. 352.) stems ascending, leafy; leaves oblong, obtuse, rather fleshy, hairy, alternate; radical ones in fascicles; cymes terminal, corymbose; petals lanceolate, hardly twice the length of the sepals. ♃. H. Native about the port of Caucasus, among rocks. Allied to *S. hirsùtum*, but differs in the leaves being flattish, in the sepals of the calyx being twice the length, and in the duration being perennial, not biennial.

Pilose Stonecrop. Pl. $\frac{1}{4}$ foot.

55 S. HISPA'NICUM (Lin. spec. 618.) stem erect, branched, glabrous; leaves scattered, terete, acutish, glaucous; sterile stems rosulate, crowded; cymes branched; flowers sessile, along the branches of the cyme; petals 6, acuminately awned. ♃. H. Native of Spain, Switzerland, and the south of Germany. Jacq. aust. 5. t. 47.—Dill. hort. elth. 2. p. 332. S. aristàtum, Tenore, fl. neap. 1. p. 250. Petals white, with a dirty red keel. Carpels glabrous. Very like *S. glaúcum* and *S. rùbens*, but the root is perennial.

Spanish Stonecrop. Fl. June, July. Clt. 1732. Pl. $\frac{1}{3}$ foot.

56 S. A'LBUM (Lin. spec. 619.) branches perennial, rooting, when young rather puberulous; leaves ovately club-shaped, green, nearly terete, glabrous; cymes branched, terminal, sub-

corymbose; petals bluntish. ♃. H. Native of Europe, in dry meadows, on walls and rocks. In England on walls and roofs, not common; at Kentish Town and Bromley, Middlesex; on rocks about Great Malvern, Worcestershire; upon walls at Peterborough; but rare in Scotland. Smith, engl. bot. t. 578. Curt. lond. 1. t. 31. Oed. fl. dan. t. 66. All. ped. 1751. t. 65. f. 2. S. álbum var. γ túrgidum, D. C. prod. 3. p. 406. Flowers cymose, white.

White Stonecrop. Fl. June, July. Britain. Pl. ¼ foot.

57 S. MICRA'NTHUM (Bast. in litt. D. C. suppl. fl. fr. 3613. Haw. in phil. mag. Sept. 1831, p. 415.) branches perennial, rooting, slightly puberulous; leaves clavately oblong, green, nearly terete, glabrous; cymes branched, terminal, subcorymbose; petals bluntish. ♃. H. Native of France, in Andegaveny. In England near Gloucester. S. túrgidum, Bast. ess. p. 167. S. álbum β micránthum, D. C. prod. 3. p. 406. Very like *S. álbum*, but is 2 or 3 times larger; flowers more numerous, and the petals narrower.

Small-flowered Stonecrop. Fl. June, July. Brit. Pl. ¼ ft.

58 S. GRA'CILE (Meyer, verz. pflanz. p. 151.) plant glabrous and green; stems herbaceous, diffuse; leaves subulate, bluntish, loose at the base, those of the sterile branches imbricated; rays of cyme elongated, much spreading; flowers decandrous, almost sessile; petals acuminated, longer than the calyx; style rather longer than the breadth of the acute capsule. ♃. H. Native of Caucasus. Flowers white.

Var. α, *mìnus* (Meyer, l. c.) flowers smaller. On Mount Gutgora at the altitude of 3300 feet.

Var. β, *màjus* (Meyer, l. c.) flowers almost twice the size of those of var. α. On the Talusch Mountains, at the altitude of 1400 to 2700 feet.

Slender Stonecrop. Pl. diffuse.

59 S. TERETIFÒLIUM (Lam. fl. fr. 3. p. 84. Haw. in phil. mag. Sept. 1831, p. 415.) branches elongated, rooting, perennial, quite glabrous; leaves equally terete, rather elongated, a little depressed, green, glabrous; cymes branched, terminal, subcorymbose; petals bluntish. ♃. H. Native of Europe, on walls, rocks, and in dry pastures. In England near Hereford. S. álbum, D. C. prod. 3. p. 406.—Fuschs, hist. 35. with a figure. Oed. fl. dan. t. 66. D. C. pl. grass. t. 22. S. teretifòlium α, Lam. fl. fr. 3. p. 84. Flowers white.

Terete-leaved Stonecrop. Fl. June, July. Brit. Pl. ½ foot.

60 S. ATHO'UM (D. C. prod. 3. p. 407.) stems erect, a little creeping at the base; leaves semi-cylindrical, short, remote, and are, as well as the stem, glabrous; cyme terminal, somewhat corymbose, many-flowered; petals acute. ♃. H. Native on the top of Mount Athos. S. túrgidum, D. Urv. enum. p. 51. exclusive of the synonymes. Flowers white, like those of *S. álbum*, but the petals are acute and distinct.

Athos Stonecrop. Pl. ½ foot.

* * * * * *Leaves terete. Flowers red or blue.*

61 S. CŒRU'LEUM (Vahl. symb. 2. p. 51.) stem flat on the ground at the base, ascending; leaves oblong, alternate, obtuse, loosened at the base; cymes bifid, glabrous; petals 7, obtuse. ⊙. H. Native of Tunis, in the fissures of rocks. Shaw. itin. 550. with a figure. Sims, bot. mag. 2224. Ker. bot. reg. 520. S. azùreum, Desf. fl. atl. 1. p. 362. Flowers not blue, but at first purplish, and fading to blue (f. 28.).

FIG. 28.

Blue-flowered Stonecrop. Fl. July, Aug. Clt. 1822. Pl. ⅛ foot.

62 S. HEPTAPE'TALUM (Poir. voy. barb. 2. p. 169. dict. 4. p. 630.) stems erect, branched at the apex; leaves ovate-oblong, scattered, depressedly gibbous; cymes panicled; petals 7, acuminated. ⊙. H. Native of Barbary, Corsica, and Malta, on rocks by the sea-side. D. C. fl. fr. 4. p. 392. Flowers purplish as in *S. cœrùleum*, fading to blue. S. heptapétalum, Horn. hort. hafn. suppl. p. 138. said to be originally from the Russian empire, is perhaps distinct from this species, but is not sufficiently known.

Seven-petalled Stonecrop. Pl. ¼ foot.

63 S. BRACTEA'TUM (Viv. fl. lyb. 24. t. 8. f. 3.) stems erect, branched at the apex, beset with spreading hairs, as well as the leaves; leaves alternate, linear, thick, obtuse; cymes trichotomous; flowers on short pedicels along the branches of the cyme; petals 5, elliptic, keeled. ⊙. H. Native of the Great Syrtus, in Lybia on the sea shore. The colour of the flowers agrees with that of *S. cœrùleum*, but the habit is that of *S. Hispánicum*. Nectariferous scales emarginate.

Bracteated-flowered Stonecrop. Pl. ¼ foot.

64 S. VILLÒSUM (Lin. spec. 620.) stem erect, almost simple, beset with viscid hairs; leaves semi-terete, rather remote, erect, also beset with viscid pili; cymes terminal, few-flowered; petals acutish. ⊙. H. Native of Europe, in boggy places. In England in wet mountainous pastures, and the clefts of moist rocks; in the north of Westmoreland, Durham, and the north-west part of Yorkshire, not unfrequent. More abundant in Scotland.—Smith, engl. bot. t. 394. Oed. fl. dan. t. 24. D. C. pl. grass. t. 70.—Mor. hist. sect. 12. t. 8. f. 48.—Petiv. brit. t. 42. f. 7. Flowers pale red.

Var. β, *pentándrum* (D. C. fl. fr. suppl. p. 524.) stamens 5 (especially those that are epipetalous are abortive) or 6; the 4 epipetalous ones of which having vanished.

Villous Stonecrop. Fl. June, July. Britain. Pl. ⅛ to ¼ ft.

65 S. RU'BENS (D. C. prod. 3. p. 405.) stem erect, branched; leaves oblong, obtuse, nearly terete, sessile, spreading, glabrous; cymes branched, pubescent; flowers sessile, unilateral along the branches of the cyme, pentandrous; petals 5, acuminately awned. ⊙. H. Native of south and middle Europe, in cultivated sandy fields. Crássula rùbens, Lin. syst. veg. p. 253. D. C. pl. grass. t. 55. S. rùbens β pentándrum, D. C. prod. 3. p. 405. Flowers pale red. Mature carpels puberulous. The epipetalous stamens are all or for the most part abortive, and therefore the flowers are pentandrous.

Reddening-flowered Stonecrop. Fl. May, June. Clt. 1769. Pl. ¼ to ½ foot.

66 S. PUBE'RULUM (D. C. mem. crass. p. 33.) stems erect, branched, puberulous; leaves scattered, terete, acutish, glabrous; cymes branched; flowers sessile along the branches of the cyme; petals 6, acuminately awned. ⊙. H. Native of Calabria. This species comes very near *S. pállidum* and *S. rùbens*.

Puberulous Stonecrop. Pl. ¼ foot.

67 S. PA'LLIDUM (Bieb. fl. taur. 1. p. 353.) stem erect, branched; leaves oblong, obtuse, nearly terete, spreading, glabrous; cymes branched, pubescent; flowers sessile, unilateral along the branches of the cyme, decandrous; petals acuminately awned. ⊙. H. Native of Caucasus. Flowers pale red or white. Mature carpels puberulous.

Pale Stonecrop. Fl. June, July. Clt. 1817. Pl. ¼ foot.

68 S. CÆSPITÒSUM (D. C. prod. 3. p. 405.) leaves ovate, turgid, imbricated, glabrous; stems nearly simple, glabrous; flowers lateral, sessile, solitary; carpels stellately spreading. ⊙. H. Native of Spain, Provence, Tauria, in exposed places. Magn. bot. p. 238. and 237. with a figure. Crássula Magnòlii, D. C. fl. fr. suppl. no. 3604. Tillæ'a rùbra, Gouan. hort. p. 77.

Tillæ'a erécta, Sauv. monsp. p. 129. Crássula verticillàris, Lin. mant. 261.? Crássula cæspitòsa, Cav. icon. t. 69. f. 2. Bieb. fl. taur. 1. p. 257. Flowers pale red. The 5 fertile stamens alternating with the petals, and the rudiments of the 5 sterile ones in front of the petals.

Tufted Stonecrop. Fl. June, July. Clt. 1788. Pl. $\frac{1}{4}$ foot.

* * * * * * *Leaves terete. Flowers yellow.*

69 S. QUADRI'FIDUM (Pall. itin. 3. p. 730. append. no. 90. t. P. f. 1.) leaves scattered, terete, bluntish; root thick, of many necks; stems numerous, erect, simple; corymbs terminal, few-flowered, simple; pedicels about equal in length; length of nectariferous scales exceeding the breadth; flowers octandrous, 4-cleft; stamens a little longer than the petals. ♃. H. Native of Dahuria, the Ural Mountains, and Altaia, in humid stony places, on the tops of the Alps. Pall. ed. gall. in 8vo. vol. 8. p. 311. t. 104. f. 4. S. quinquéfidum and S. hexapétalum, Haw. rev. p. 26.? Flowers yellow.

Quadrifid-flowered Stonecrop. Fl. July. Clt. 1800. Pl. $\frac{1}{4}$ ft.

70 S. A'CRE (Lin. spec. 619.) stems rather creeping at the base; branches erect; leaves ovate, adnate, sessile, gibbous, erectish, alternate, glabrous; cymes trifid; flowers sessile along the branches of the cyme; petals lanceolate, acuminated. ♃. H. Native of Europe, common on walls, roofs of houses, rocks, and dry sandy ground; plentiful in Britain. Bull. herb. t. 30. D. C. pl. grass. t. 117. Smith, engl. bot. 839. Woodv. med. bot. t. 231. Curt. lond. 1. t. 32. Flowers yellow. The whole plant is acrid, and chewed in the mouth has a hot biting taste; whence, and from its common place of growth, it has the name of wall-pepper. Applied to the skin it blisters, and taken inwardly it excites vomiting. In scorbutic cases and quartern agues, it is an excellent medicine under proper management. For the former, a handful of the herb is directed to be boiled in eight pints of beer till they are reduced to four, of which 3 or 4 ounces are to be taken every morning. Milk has been found to answer this purpose better than beer. Not only ulcers simply scorbutic, but those of a scrofulous or even cancerous tendency, have been cured by the use of this plant. It is likewise useful as an external application, in destroying fungous flesh, and in promoting a discharge in gangrenes and carbuncles.

Var. β, diminùtum (Haw. in phil. mag. 1831. p. 416.) much smaller than the species, hardly an inch high; stem creeping. ♃. H. Native of the higher Alps of Provence; also on Swaffan Heath, Norfolk. S. àcre β graciàle, D. C. prod. 3. p. 407. S. glaciàle, Clarion in D. C. fl. fr. 4. p. 393.

Var. γ, elongàtum (Haw. l. c.) pendulous branches 7 inches high: erect ones 4 inches; leaves loosely imbricating.

Acrid Stonecrop. Fl. June. Britain. Pl. $\frac{1}{8}$ to $\frac{1}{4}$ foot.

71 S. SEXANGULA'RE (Lin. spec. 620.) stems branched at the base, floriferous ones erect; leaves nearly terete, adnate-sessile, usually by threes on the flowering stems, and 3 in a whorl on sterile branches, imbricating in 6 spiral rows; cymes trifid; petals lanceolate, acuminated. ♃. H. Native of Europe, in dry sandy ground, and on walls. In England, but not common; as near Northfleet, Sheerness, and on the Isle of Sheppy; on Greenwich Park wall on the south side, near the western corner; on the famous rotten walls of Old Sarum; also of Cambridgeshire. D. C. pl. grass. t. 118. Curt. lond. 4. t. 33. Smith, engl. bot. 1646. S. àcre β, Huds. Lam. fl. fr. S. spiràle, Haw. in phil. mag. 1824. no. 176.—Cam. epit. 856. with a figure. Flowers yellow. Habit of *S. àcre*.

Sixangled Stonecrop. Fl. June, July. Britain. Pl. $\frac{1}{4}$ foot.

72 S. BOLONIE'NSE (Lois. not. p. 71.) stem branched at the base; floriferous ones erect; leaves nearly terete, obtuse, loosened at the base, glabrous, imbricated on all sides; cymes trifid; flowers sessile, along the branches; petals acuminated. ♃. H. Native of sandy woods, about Bologna. D. C. suppl. 523. Root creeping. Sepals cylindrical, obtuse. Branches of cyme 6-10-flowered. S. schistòsum, Lejeune, fl. spa. Flowers yellow. Perhaps sufficiently distinct from *S. sexangulàre*.

Bologna Stonecrop. Pl. $\frac{1}{4}$ foot.

73 S. AMPLEXICAU'LE (D. C. rapp. voy. 2. p. 80. suppl. fl. fr. p. 526. mem. cras. t. 7.) stems branched at the base, erect; leaves terete, subulate, glabrous, dilated at the base into a stem-clasping membrane; cymes bifid; flowers remote, sessile along the branches of the cyme; petals 5-7, lanceolate, acute. ♃. H. Native of Spain, south of France, Italy, Candia, &c. in dry mountain pastures. S. rostràtum, Tenore, fl. neap. prod. p. 26. S. tenuifòlium, Sibth, prod. fl. græc. 1. p. 335. and Sieb. herb. cret. Sempervìvum anómalum, Lag. nov. spec. 17. Flowers yellow, almost like those of *S. refléxum*. Sepals subulate, acute.

Stem-clasping Stonecrop. Pl. $\frac{1}{2}$ foot.

74 S. RUPE'STRE (Lin. spec. p. 618.) stems branched at the base, floriferous ones erect; leaves terete-subulate, glaucous, loosened at the base; sterile stems cylindrical, densely imbricated; flowers cymose, 5-7-petalled; sepals bluntish. ♃. H. Native of Europe, on walls and rocks. In England on St. Vincent's rock, Bristol; on Chedder rocks, Somersetshire, and upon walls about Darlington. Engl. bot. t. 170.—Dill. elth. 2. f. 333. Reich. icon. 3. f. 439. S. mìnus, Haw. in phil. mag. 1825. p. 174.? S. refléxum, D. C. pl. grass. t. 116. Flowers yellow (f. 29.).

FIG. 29.

Rock Stonecrop. Fl. July, Aug. England. Pl. $\frac{1}{4}$ foot.

75 S. SEPTANGULA'RE (Haw. syn. 116. and in phil. mag. 1824. p. 175.) glaucous; leaves imbricating in 7 rows, incurved, spreading, middle-sized, acute. ♃. H. Native of Europe. Flowers yellow. S. rupéstre β, septangulàre, D. C. prod. 3. p. 407. S. rupéstre, D. C. pl. grass. t. 115. Very like *S. cæruléscens*, but is distinguished by the shorter and hardly subulate leaves, and in being more branched, and the branches shorter.

Seven-angled Stonecrop. Fl. June, July. Clt. 1795. Pl. $\frac{1}{4}$ ft.

76 S. ALBE'SCENS (Haw. rev. succ. p. 28.) stems branched at the base; flowers erect; leaves terete-subulate, glaucous, loosened at the base; sterile stems elongated, with spreading leaves; flowers cymose, 5-7-petalled; sepals lanceolate. ♃. H. Native of England and Denmark, on barren sandy hills and walls. In England, especially on the sides of some rough hills near Mildenhall, Suffolk. S. glaúcum, Smith, engl. fl. 2. p. 321. engl. bot. 2471. but not of Waldst. et Kit. S. refléxum, fl. dan. t. 113. Flowers yellow.

Whitish-leaved Stonecrop. Fl. July, Aug. Brit. Pl. $\frac{1}{4}$ foot.

77 S. FORSTERIA'NUM (Smith, comp. 71. engl. bot. 1802.) stems branched at the base; flowers erect; leaves semicylindrical, bluntish, green tinged with red; sterile stems short; leaves crowded, somewhat rosulate at the tops of the branches; flowers cymose, 5-7-petalled; sepals obtuse. ♃. H. Native of Wales, on rocks at the falls of Rhydoll, near the Devil's-bridge, Cardiganshire; on the rocks of Hisval, overhanging the little valley of Nant-phrancon. S. Forstèrii, Haw. syn. p. 117. S. rupéstre, D. C. pl. grass. 115.? Flowers yellow.

Forster's Stonecrop. Fl. July, Aug. Wales. Pl. $\frac{1}{4}$ foot.

78 S. REFLE'XUM (Lin. spec. 618. Smith, fl. brit. p. 490.) stems branched at the base; floriferous ones erect; leaves terete-subulate, green, loosened at the base; sterile shoots somewhat

cylindrical, spreading; flowers cymose, 5-7-petalled; sepals bluntish. ♃. H. Native of Europe, in fields and on walls; in Britain on walls and thatched roofs, abundant. Smith, engl. bot. t. 695.—Park. theat. 1. t. 734. f. 1. Flowers yellow.

Var. β, *recurvàtum* (D. C. prod. 3. p. 408.) leaves glaucescent; sterile stems somewhat reflexed. S. recurvàtum, Willd. enum. suppl. 23. Perhaps a variety of *S. albéscens*, according to Haw.

Var. γ, *collìnum* (D. C. l. c.) leaves glaucescent; sterile stems spreading. S. collìnum, Willd. l. c. p. 25. S. élegans, Lejeune fl. spa. 1. p. 205. ?

Var. δ, *cristàtum* (D. C. l. c.) sterile branches crestedly somewhat fasciculate; leaves green, spreading. S. cristàtum, Schrad. hort. gœtt. t. 10. S. Portlándicum, Lob. icon. 380.

Reflexed-leaved Stonecrop. Fl. June, July. Brit. Pl. ½ ft.

79 S. VI'RENS (Ait. hort. kew. 2. p. 110.) leaves scattered, subulate, green, loosened at the base; flowers cymose; petals lanceolate, much longer than the sepals. ♃. H. Native of Portugal. S. refléxum, Willd. enum. suppl. p. 25. S. crassicaúle, Link. enum. 1. p. 438. Flowers yellow. Very like *S. refléxum*, and probably only a variety of it.

Green Stonecrop. Fl. June, July. Clt. 1774. Pl. ½ foot.

80 S. VIRE'SCENS (Willd. enum. suppl. p. 25.) stems branched: floriferous ones erect; leaves terete-subulate, those of the sterile branches spreading and glaucescent; flowering stems spreading, compressed; branches of cyme crowded, erect. ♃. H. Native of Siberia. The leaves, according to Haw. in rev. p. 29. are green, and the flowers nearly white; but according to Willd. l. c. the leaves are glaucescent, and the flowers greenish-yellow, therefore two species are probably confounded under this name, and perhaps both are only varieties of *S. refléxum*.

Greenish-flowered Stonecrop. Fl. Ju. Aug. Clt. 1815. Pl. ½ ft.

81 S. SUBCLAVA'TUM (Haw. in phil. mag. 1831. p. 414.) leaves imbricated, rosulate at the tops of the branches, somewhat clavate, turgid, green, attenuated towards the apex, and acute. ♃. H. Native of North America. Flowers not seen. From habit this species appears to come nearest *S. Forsteriànum*.

Subclavate-leaved Stonecrop. Clt. 1830. Pl. ½ foot.

82 S. STENOPE'TALUM (Pursh, fl. amer. sept. 1. p. 324.) stems assurgent, glabrous; leaves scattered, crowded, adnate-sessile, compressed, subulate, acute; cymes terminal, trichotomous, and dichotomous; spikes recurved; flowers sessile, decandrous; petals 5, linear, much longer than the calyx. ♃. H. Native of North America, on the banks of Clark's river, and the Kooskoosky; and frequent on the east side of the Rocky Mountains. Flowers golden yellow. Said to be allied to *S. refléxum*.

Narrow-petalled Stonecrop. Fl. Ju. Jul. Clt. 1826. Pl. ½ ft.

83 S. CŒRULE'SCENS (Haw. in. phil. mag. 1825. p. 174.) leaves long, spreading, subulate, acute, bluish-glaucous, flattish above. ♃. H. Native country unknown. Very like *S. altíssimum*, but not half the size, more bluish-glaucous; leaves more distant, petals more acute, pale yellow.

Blueish Stonecrop. Fl. June, July. Clt. 1820. Pl. ¼ foot.

84 S. ALTI'SSIMUM (Poir. dict. 4. p. 634.) stem fruticulose, branched at the base; floriferous ones erect; leaves nearly terete, acute, glaucous, glabrous: superior ones scattered, flattish above; those of the sterile branches imbricated; cymes branched, many-flowered; flowers sessile along the branches of the cyme, which are twisted at the apex; petals 6-8, lanceolate, acute, spreading. ♃. H. Native of the south of Europe. D. C. pl. grass. t. 116. Sempervìvum sedifórme, Jacq. hort. vind. t. 81. and var. monstròsa misc. 1. p. 133. t. 5. S. fruticulòsum, Brot. fl. lus. 2. p. 206. S. rufescens, Tenore, fl. neap. t. 41. S. Nicæénse, All. ped. no. 1752. t. 90. f. 1. S. Jacquíni, Haw. in phil. mag. 1825. p. 174. S. rupéstre α, Gouan. S. dioícum, Donn, hort. cant. Flowers cream-coloured. Lobes of calyx bluntish. A large, strong, glaucous plant.

Tallest Stonecrop. Fl. Jul. Aug. Clt. 1769. Pl. 1 foot.

85 S. OCHROLEU'CUM (Smith, in Lin. trans. 10. p. 7.) stem branched; leaves glaucous, scattered, acute: lower ones terete: upper ones elliptic, depressed; cymes branched, many flowered; flowers sessile along the branches of the cyme; calycine segments acutish; petals oblong-spatulate. ♃. H. Native of the south of Europe. S. altíssimum β, ochroleùcum, D. C. prod. 3. p. 408. Flowers pale yellow. Very like *S. altíssimum*, but rather larger.

Cream-coloured-flowered Stonecrop. Fl. July. Clt. 1818. Pl. 1 foot.

86 S. ANOPE'TALUM (D. C. rapp. 2. p. 80. suppl. fl. fr. p. 526. mem. crass. t. 8.) stems branched at the base, erect; leaves nearly terete, rather depressed, loosened at the base, glaucous, mucronate; those of the sterile branches imbricated; cyme 4-cleft, corymbose; petals lanceolate, acuminated, erect. ♃. H. Native of the south of France, on calcareous rocks, and among stones. Bauh. hist. 3. p. 428. S. Hispánicum, D. C. fl. fr. no. 1326. but not of Lin. S. rupéstre, Vill. dauph. 3. p. 678. but not of Lin. S. anopétalum, Spreng. syst. 2. p. 435. exclusive of the synonyme of Tenore. Flowers cream-coloured. There is also a variety with orange-coloured flowers, according to Haworth.

Upward-petalled Stonecrop. Fl. Ju. Jul. Clt. 1818. Pl. ½ ft.

87 S. URVI'LLEI (D. C. prod. 3. p. 408.) stems glabrous; erect, creeping, and branched at the base; leaves scattered, nearly terete, obtuse, dilated, and stem-clasping at the base; cyme 2-3-cleft; flowers sessile along the branches; petals acuminately awned. ⊙. H. Native of the Island of Lazaretto. S. pállidum, D'Urv. enum. p. 51. but not of Bieb. Flowers yellow. Capsules pale, somewhat stellate.

D'Urville's Stonecrop. Pl. ¼ foot.

88 S. VIRI'DULUM (Haw. in phil. mag. 1827. p. 183.) leaves erectish, linear-subulate, green, somewhat mucronulate on one side. ♃. H. Native country unknown. Very like *S. vìrens*, and *S. recurvàtum*, Willd. but the leaves are a little larger and flatter, greener and blunter. It is less than *S. anopétalum*.

Small-green Stonecrop. Fl. Ju. Jul. Clt. 1820. Pl. ½ ft.

89 S. LITÒREUM (Guss. pl. rar. p. 185. t. 37. f. 2.) stem erect, branched at the base; branches ascending; leaves spatulate-cuneated, semiterete, obtuse, glabrous; flowers sessile, lateral, solitary. ⊙. H. Native of Calabria, among rubbish by the sea-side. Flowers pale yellow, alternate. Petals a little longer than the calyx, linear-lanceolate.

Sea-shore Stonecrop. Pl. 2 inches high.

90 S. SAXA'TILE (Willd. spec. 2. p. 706.) stem erect, branched from the base; leaves scattered, rather remote, terete, obtuse, loosened at the base; cymes leafy, spreading; flowers on short pedicels, along the branches of the cyme; petals oblong, mucronate. ⊙. H. Native of Europe, among rocks; in Norway, Germany, Switzerland, Dauphiny, Denmark, Mount Cenis, &c. D. C. pl. grass. t. 119. Smith, fl. græc. t. 450. S. æstìvum and saxátile, All. pedem. no. 1746. and 1749. t. 65. f. 6. S. alpéstre, Vill. dauph. 3. p. 684. S. rupéstre, Œd. fl. dan. t. 59. but not of Lin. S. Œdèri, Roth. prod. fl. scand. ed. 2. no. 562. S. ánnuum, Lin. spec. 620. exclusive of the character and synonymes. S. divaricàtum, Lapeyr. abr. 260. but not of Ait. S. schistòsum, Lejeune, fl. spa. 1. p. 206. Herb 2-4 inches long. Flowers yellow or pale yellow.

Rock Stonecrop. Fl, Ju. Jul. Clt. 1820. Pl. ¼ foot.

91 S. TENE'LLUM (Meyer, verz. pfl. p. 152.) plant glabrous, glaucescent; stems herbaceous, erectish; leaves subulate, bluntish, loose at the base; those of the sterile branches imbricated; rays of cyme short, few-flowered, coarctate; flowers decandrous,

rather shorter than the pedicels; petals acute, longer than the calyx; capsule truncate at the apex, and apiculated by the short styles. ♃. H. Native of Caucasus, in stony places, at the altitude of 3000 feet. Flowers orange-coloured.

Tender Stonecrop. Pl. 1 foot.

92 S. RE'PENS (Schleich. in D. C. fl. fr. suppl. 525.) stems ascending, creeping, and branched at the base; leaves scattered, semiterete, obtuse; cymes few-flowered; petals ovate. ♃. H. Native of the higher Pyrenees. S. Guettárdi, Vill. dauph. 3. t. 45. exclusive of the synonymes. S. rùbens, Hænk. sud. 114? S. ánnuum, All. pedem. no. 1763.? S. Monregalénse, Balb.? S. atràtum β, D. C. fl. fr. no. 3615. An intermediate plant between *S. atràtum* and *S. saxátile*. Petals pale yellow.

Creeping Stonecrop. Fl. Ju. Jul. Clt. 1817. Pl. ⅛ foot.

93 S. PUBE'SCENS (Vahl. symb. 2. p. 52.) stem erect, branched, pubescent; leaves alternate, elongated, obtuse, rather pilose above; cymes trifid, many-flowered; petals lanceolate. ⊙. H. ex Desf. fl. atl. 1. p. 360. Native of Tunis, in the fissures of rocks. Petals yellow, pubescent on the outside.

Pubescent Stonecrop. Pl. ¼ foot.

94 S. HÍSPIDUM (Desf. fl. atl. 1. p. 361. but not of Poir.) stem erect, branched above, hispid; leaves scattered, nearly terete, depressed above, spreading; branches of cyme filiform, rather panicled; flowers pedicellate; petals 5-6, lanceolate, acute.—Native of the north of Africa, on Mount Atlas. S. Atlánticum, Pers. ench. no. 35. S. filifórme, Poir. Flowers golden yellow.

Hispid Stonecrop. Pl. ¼ foot.

† *Species not sufficiently known.*

* *Shrubby species.*

95 S. NU'DUM (Ait. hort. kew. 2. p. 112.) stem shrubby, branched, erectish; branches twisted, glabrous; leaves scattered, oblong-cylindrical, obtuse; cymes terminal, and are as well as the calyxes glabrous. ♄. D. G. Native of Madeira. Petals 5, yellow, lanceolate. Scales orange-coloured, thick, and obtuse. Leaves almost like those of *S. álbum*.

Naked Stonecrop. Fl. Jul. Aug. Clt. 1777. Shrub ¾ foot.

96 S. LAXIFLÒRUM (D. C. prod. 3. p. 409) stem shrubby, branched, ascending, glabrous; branches twisted; leaves scattered, ovate-cylindrical, thick, obtuse, glabrous; cymes loose, divaricate; flowers pedicellate, beset with glandular pubescence. ♄. D. G. Native of Teneriffe. Petals small, apparently white. Sepals broad.

Lax-flowered Stonecrop. Shrub 1 foot.

97 S. OXYPE'TALUM (H. B. et Kunth, nov. gen. amer. 6. p. 45.) stem shrubby, glabrous, branched; leaves alternate, flat, quite entire, obovate-spatulate, rounded at the apex, and somewhat emarginate; cymes terminal, somewhat dichotomous; flowers secund, sessile; petals 5, linear, each ending in a narrow acumen. ♄. D. G. Native of Mexico, in gardens. Flowers reddish.

Sharp-petalled Stonecrop. Shrub 5 feet.

98 S. DENDROÌDEUM (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 3. p. 409. mem. crass. t. 9.) stem shrubby, branched, erect; leaves scattered or opposite, obovate-cuneated, glabrous; those of the sterile branches rosulate; thyrse panicled, much divided; flowers secund, sessile, bractless; petals 5, lanceolate. ♄. D. G. Native of Mexico. Flowers yellow. Very like a species of *Sempervìvum*.

Tree-like Stonecrop. Shrub 1 to 2 feet.

99 S. EBRACTEA'TUM (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 3. p. 409. mem. crass. t. 6. f. β.) stem shrubby, fleshy, twisted at the base, creeping; flowering stems erect; leaves scattered, glabrous, ovate, thick, obtuse: those of the flowering stems spreading, those of the sterile stems imbricated; thyrse panicled; flowers secund, sessile, bractless: petals 5, lanceolate. ♄. D. G. Native of Mexico. Flowers white. Habit of a species of *Sempervìvum*.

Bractless Stonecrop. Shrub ½ foot.

* * *Herbaceous plants.*

100 S. A'LTUM (Clark, in Spreng. neue. entd. 3. p. 161.) floriferous stems erect; leaves lanceolate, acute, quite entire; racemes subfastigiate; pedicels short, secund; petals 6, lanceolate.—Native of Palestine. The rest unknown.

High Stonecrop. Pl. 1 foot.

101 S. TORRE'YI; leaves roundish, flat, entire, scattered; cymes terminal, trichotomous. ♃. H. Native near the Rocky Mountains. Sèdum, nov. spec. Torrey. in amer. lyc. new york. 2. p. 205.

Torrey's Stonecrop. Pl.?

102 S. LINEA'RE (Thunb. fl. jap. 187.) stem glabrous, a little branched; leaves terete, linear, opposite, stem-clasping, acute, spreading; cyme trifid.—Native of Japan. Flowers yellow.

Linear-leaved Stonecrop. Pl. ¼ foot.

103 S. TENE'LLUM (Bieb. fl. taur. suppl. p. 315.) stems branched at the very base; floriferous ones erect; leaves scattered, oblong, obtuse, nearly terete, loosened at the base; corymb simple, few-flowered; petals 5, lanceolate-subulate, twice the length of the calyx. ⊙. H. Native of Caucasus, on the alps. Flowers smaller than those of *S. álbum*, but the colour is unknown.

Slender-Stonecrop. Pl. ¼ foot.

104 S. ARISTA'TUM (Vill. dauph. 4. p. 680. t. 45.) stems lying on the ground at the base: floriferous ones erect; leaves terete, acute at both ends, loosened at the base; those of the sterile stems densely imbricated; cymes few-flowered; petals 5, acuminately awned. ♃. H. Native of Dauphiny, near Segoyer. Petals white. Perhaps only a variety of *S. anopétalum*.

Awned-petalled Stonecrop. Pl. ¼ to ½ foot.

105 S. PRUINA'TUM (Brot. fl. lus. 2. p. 209.) stem erect, branched at the base, glabrous, glaucous, pruinose; leaves fleshy, oblong, convexly flattish, loosened at the base; cymes bifid; sepals and petals 6, lanceolate, acuminated, spreading. ⊙. H. Native of Portugal. Sempervìvum pruinàtum, Spreng. syst. 2. p. 169. Colour of flowers unknown.

Frosted Stonecrop. Pl. ½ foot.

106 S. CONFE'RTUM (Delil. fl. eg. ill. no. 451.) leaves subulate, scattered, crowded.—Native of Egypt, about Cairo. Sèdum no. 243, Forsk. fl. ægyp. p. 71. The rest unknown.

Crowded-leaved Stonecrop. Pl. ¼ foot.

107 S. QUITE'NSE (H. B. et Kunth, nov. gen. amer. 6. p. 46.) stems herbaceous, glabrous; leaves alternate, flat above, convex beneath, spatulately-lanceolate, acutish, quite entire; racemes elongated; flowers pedicellate; petals 5, oblong, acuminated. ♃. D. G. Native of South America, among rubbish, near Guamcabamba, and on the walls of the town of Quito. Flowers orange-coloured. Perhaps a species of *Echevèria*. There is a variety of this plant having the leaves margined with red.

Quito Stonecrop. Pl. ½ foot.

108 S. BI'COLOR (H. B. et Kunth, l. c. p. 45.) stem herbaceous, glabrous; leaves alternate, flat, obovate-spatulate, acutish, quite entire; racemes terminal, flowers pedicellate; petals 5, oblong, acute. ♃. D. G. Native near Caraccas, in humid places, and among rocks at Meneses, near Pasto. Petals yellow inside, and red or orange-coloured outside. Perhaps the flowers are truly racemose, and the plant is therefore probably a species of *Echevèria*.

Two-coloured-flowered Stonecrop. Pl. ½ foot.

109 S. BORYA'NUM (D. C. prod. 3. p. 410.) stems naked,

erect; flowers yellow, disposed in short recurved spikes; leaves linear, scale-formed, reflexed.—Native of Spain, on the rocks called Borrequillos, in Sierra Nevada. Perhaps a species of *Sempervìvum*, ex Bory. ann. gen. 3. (1820.) p. 14. The rest unknown.

Bory's Stonecrop. Pl. ½ foot.

110 S. MELANANTHE'RUM (D. C. prod. 3. p. 410.) stems weak; leaves ovate, attenuated at the apex; flowers in corymbose panicles.—Native of Spain, in Sierra Nevada, on the rocks of Borrequillos. Flowers small, densely panicled, rather sweet scented. Anthers black. The rest unknown.

Black-anthered Stonecrop. Pl. ¼ foot.

† *Species only known by name.*

1 *S. stoloníferum* (Gmel. itin. 3. t. 35. f. 2.).
2 *S. liliàceum* (Led. ex Steud. nom.).
3 *S. procúmbens* (Schrank, bav. p. 726.).
4 *S. Monregalénse* (Balb.).

N.B. *Rhodìola biternàta*, Lour. coch. p. 627. is totally different from *Rhodìola*, Lin. and is perhaps a plant belonging to *Sapindàceæ*.

Cult. The greater part of the species being quite hardy, and all succulent, they therefore succeed best on rock-work, for which they are well adapted. Some of the rarer kinds may be grown in small pots. They succeed best in light, sandy soil, or one composed of loam and brick rubbish. All are readily increased by cuttings. The seeds of the annual species only require to be sown on rockwork. There are a few of the species marked greenhouse; these will require the same treatment as that recommended for the species of *Globùlea*, see p. 106.

XIX. SEMPERVI'VUM (from *semper vivo*, to live for ever; the tenacity of life of the Houseleek tribe is well known). Lin. gen. no. 612. Lam. ill. t. 413. D. C. in bull. philom. no. 49. prod. 3. p. 411.

LIN. SYST. *Dodecándria, Dodecagýnia.* Calyx 6-20-parted. Petals 6-20, oblong, acute. Stamens double the number of the petals. Scales at base of carpels toothed or jagged at the apex. Carpels equal in number to the petals.—Herbs sometimes stemless, with young plants rising from the axils; or caulescent, without any young plants; or shrubby and fleshy. Leaves usually revolute. Branches of cymes sometimes disposed into a corymb, and sometimes into a panicle. Petals yellow, white, or purplish.

SECT. I. CHRONÒBIUM (χρονος, *chronos*, time, and βιοω, *bioo*, to live; plants living only for a time, and are not so tenacious of life as those of the following section). D. C. pl. rar. gard. gen. no. 21. Young plants, none from the axils. Flowers usually yellow, rarely white. Species all natives of the Canary Islands.

* *Shrubby species.*

1 S. AIZOÌDES (Lam. dict. 3. p. 290.) stem frutescent, erect, branched; leaves scattered, obovate, flat, quite entire, glabrous; flowers corymbose; petals 5-8, spreading. ♄. D. G. Native of Madeira. Sèdum aizoìdes, D. C. pl. grass. t. 4. Sèdum divaricàtum, Ait. hort. kew. ed. 1. vol. 2. p. 108. Perhaps also Anacámpseros divaricàta, Haw. syn. p. 113.? Flowers yellow.

Aizoon-like Houseleek. Fl. May, Jul. Clt.? Shrub 1 ft.

2 S. TORTUÒSUM (Ait. hort. kew. ed. 1. vol. 2. p. 148.) stem frutescent, erect, branched; leaves obovate-spatulate, scattered, rather convex beneath; petals 7-8, spreading; scales 2-lobed. ♄. D. G. Native of the Canary Islands. Curt. bot. mag. t. 296. D. C. pl. grass. t. 156. Flowers yellow. Leaves 11-12 lines long and 4-5 lines broad.

Twisted Houseleek. Fl. Jul. Aug. Clt. 1779. Sh. ½ to ¾ ft.

3 S. VILLÒSUM (Haw. syn. p. 166. rev. 65. but not of Ait.) stem frutescent, erectish, twisted; leaves obovate, crowded, gibbous beneath, villous; scales of flower fringed. ♄. D. G. Native of the Canary Islands. Flowers yellow. Leaves 5 lines long and 3 lines broad. S. villòsum, Ait. is referrible to *S. stellàtum*.

Villous Houseleek. Fl. Ju. Jul. Clt. 1777. Sh. ½ to ¾ ft.

4 S. CILIA'TUM (Willd. enum. 1. p. 508. mem. crass. t. 10.) stem frutescent, glabrous; leaves oblong-obovate, somewhat spatulate, mucronate, cartilaginously ciliated; thyrse panicled, having the branches crowded, with flowers at the apex; petals 6-7. ♄. D. G. Native of the Canary Islands. Coll. hort. rip. append. 4. t. 7. Flowers pale yellow.

Ciliated-leaved Houseleek. Clt. 1815. Shrub 1 to 1½ feet.

5 S. GLANDULÒSUM (Ait. l. c. p. 148.) stem frutescent; leaves orbicularly spatulate, with clammy margins; glands globose; scales of flower wedge-shaped, truncate. ♄. D. G. Native of Madeira. Flowers yellow. Glands fringed, yellow, ex Haw. rev. p. 65.

Glandular Houseleek. Fl. Mar. May. Clt. 1777. Shrub ½ to 1 foot.

6 S. GLUTINÒSUM (Ait. l. c. p. 147.) stem frutescent; leaves cuneiform, viscid, rather scattered, fringed with adpressed, cartilaginous ciliæ; petals 8-10. ♄. D. G. Native of Madeira. Jacq. hort. schœnbr. 4. t. 464. Sims, bot. mag. t. 1963. Ker. bot. reg. t. 278. Branches of panicle loose. Flowers golden yellow. The stem rises to the height of 2 feet, and even more, according to Prince de Salm-Dyck. The fishermen of Madeira rub their nets with the fresh leaves of this species, by which they are rendered as durable as if tanned, provided they are steeped in some alkaline liquor. (f. 30.)

FIG. 30.

Clammy Houseleek. Fl. July, Aug. Clt. 1777. Shrub 1 to 2 feet.

7 S. U'RBICUM (C. Smith, mss. Horn. suppl. p. 66. Haw. in phil. mag. 1827. p. 125.) stem frutescent, erect, leafy at the top; leaves broad, cuneiform, glabrous, cartilaginously ciliated on the margins, running into the petiole at the base, broad and blunt at the apex, and ending in a small point. ♄. D. G. Native of the Canary Islands, on the walls of towns and the roofs of houses. Leaves green. Flowers yellow. Perhaps the same as *S. latifòlium*. Hoffm. verz. 2. p. 208. Haworth's plant is probably the same as that of Hornemann.

City Houseleek. Fl. Ju. Aug. Clt. 1816. Shrub 1 to 2 ft.

8 S. RETU'SUM (Haw. in phil. mag. 1827. p. 125.) stem frutescent, simple, leafy at the apex; leaves broadly cuneated, expanded, smooth, ciliated, somewhat cuneated at the apex, truncate and retuse. ♄. D. G. Native of Teneriffe, on walls and the roofs of houses. Flowers yellow. Very like *S. úrbicum*, but differs in the form of the leaves.

Retuse-leaved Houseleek. Fl. June, Aug. Clt. 1824. Sh. 1 to 2 feet.

9 S. ARBÒREUM (Lin. spec. p. 664.) stem arborescent, smooth, branched; leaves cuneiform, glabrous, ciliated, spreading and rosulate at the tops of the branches; panicle loose; petals 9-11. ♄. D. G. Native of Portugal, Barbary, Candia, &c. Bradl. succ. pl. 1. t. 31. Ker. bot. reg. 99. D. C. pl. grass. t. 125.

Smith, fl. græc. 473. Shrub from 3-6 feet. Flowers golden yellow.

Var. β, variegàtum; leaves margined with white or purple.

Tree Houseleek. Fl. Mar. Dec. Clt. 1640. Sh. 3 to 6 ft.

10 S. FRUTE'SCENS (Haw. phil. mag. 1827. p. 125.) stem shrubby, simple; leaves crowded in a rosulate manner at the tops of the branches, spatulately cuneated, green, ciliated. ♄. D. G. Native of Teneriffe. Flowers yellow. Very like *S. arbòreum*, but the plant is not above half a foot high.

Frutescent Houseleek. Fl. Mar. Dec. Clt. 1824. Pl. ½ to 1 ft.

11 S. TABULÆFÓRME (Haw. suppl. p. 69. rev. 63.) stem frutescent, erect, simple; leaves spatulate, flat, ciliated, attenuated at the base, crowded at the top of the stem, and forming a rosulate flat disk, in consequence of the leaves being so closely imbricated over each other. ♄. D. G. Native of Madeira. Stems branching after the first time of flowering. Petals 10-12, linear-lanceolate, very pale sulphur-coloured. Glands minute, pedunculate.

Table-formed Houseleek. Fl. Ju. Jul. Clt. 1817. Pl. 1 ft.

12 S. CANARIE'NSE (Lin. spec. p. 664.) stem short, frutescent; radical leaves expanded, rosulate, obovately-spatulate, villous, large; leaves scattered along the flowering stem, ovate; branches of panicle expanded; flowers pedicellate; petals 9-10. ♄. D. G. Native of the Canary Islands.—Comm. hort. amst. 2. t. 95. D. C. pl. grass. t. 141. Petals white, linear.

Canary-Island Houseleek. Fl. Ju. Jul. Clt. 1699. Sh. 1½ ft.

13 S. SMI'THII (Sims, bot. mag. t. 1980.) stems frutescent, erect, hispid; leaves scattered, obovate, acuminated, flat, concave, a little spotted; branches of panicle revolute at the points, bearing sessile flowers on the upper side; petals 12. ♄. D. G. Native of the Canary Islands. S. foliòsum, C. Smith, hort. berol. p. 38. Petals pale yellow, oval-oblong, spreading. Glands wanting, ex Haw. rev. p. 63.

Smith's Houseleek. Fl. Jul. Aug. Clt. 1815. Shrub 1 ft.

14 S. BARBA'TUM (C. Smith, in hort. ber. p. 37.) stem frutescent; leaves ovate-spatulate, acute, with cartilaginously ciliated margins, marked with brown lines on both surfaces; flowers panicled; petals 6. ♄. D. G. Native of the Canary Islands. S. lineolàre, Haw. suppl. p. 69. rev. p. 65. S. spatulàtum, Horn. suppl. p. 60. Flowers yellow.

Var. β, hybridum (Salm-Dyck. and Haw.) all parts of plant larger.

Bearded Houseleek. Fl. Jul. Aug. Clt. 1815. Sh. 1 to 2 ft.

15 S. CÆSPITÒSUM (C. Smith, in hort. berol. p. 38.) stem frutescent, very short, at length a little branched, leafy at the apex; leaves oblong-linear, glabrous, stiffly ciliated, marked with brown lines on both surfaces, crowded in a rosulate manner, but the cauline ones are scattered; flowers in cymose corymbs, with the branchlets dichotomous; petals 7-8, spreading. ♄. D. G. Native of the Grand Canary Island, on rocks on the highest mountains. D. C. rapp. jard. bot. 1822. no. 13. S. ciliàre, Sims, bot. mag. t. 1978. but not of Willd. S. ciliàre, Haw. rev. p. 64. S. Símsii, Sweet, hort. suburb. p. 230. S. barbàtum, Horn. suppl. p. 61. but not of Smith. Flowers yellow. This plant survived 18 months in paper in the herbarium of C. Smith, and afterwards when put into the earth grew.

Tufted Houseleek. Fl. Apr. Sept. Clt. 1815. Sh. ½ foot.

* * *Herbaceous plants.*

16 S. DODRANTA'LE (Willd. enum. p. 508.) stem herbaceous, erect, glabrous; leaves flat, glabrous, quite entire; radical ones obovate, attenuated at the base, disposed in a spreading rosulate manner: cauline ones erect, oval, sessile, obtuse at both ends; cymes corymbose; petals 20. ♂. D. G. Native of the Canaries. D. C. mem. crass. t. 11. Pedicels puberulous. Corymbs few-flowered. Petals linear; pale when dried.

Nine-inch Houseleek. Fl. July, Aug. Clt. 1815. Pl. ½ ft.

17 S. AU'REUM (C. Smith, in hort. berol. p. 37.) stem herbaceous, erect, glabrous; leaves obovate-spatulate, with membranaceously cartilaginous, quite entire margins, glaucous; branches of panicle dichotomous, many-flowered; petals 20. ♂. or ♄. D. G. Native of Teneriffe, on the mountains. S. calyciförme, Haw. suppl. p. 69. Ker. bot. reg. t. 892. Flowers yellow. Petals linear, and are as well as stamens 20, and the pistils are numerous, according to C. Smith. Perhaps the same as *S. dodrantàle*, Willd.

Golden Houseleek. Fl. Jul. Aug. Clt. 1815. Pl. 1 foot.

18 S. PUNCTA'TUM (C. Smith, in Buch. can. p. 155.) stem herbaceous, erect, branched; leaves scattered, obovate, petiolate, flat, glabrous, crenated on the margin at the top, dotted in the recesses of the crenæ; panicle loose; pedicels puberulous; petals 6-9. ☉. ♂. D. G. Native of the Canary Islands. D. C. mem. crass. t. 12. Petals oval, acute, yellow.

Dotted-leaved Houseleek. Pl. 1 foot.

19 S. STELLA'TUM (Smith, in Lin. soc. trans. 1. p. 251.) stem herbaceous, erect, branched, puberulous; leaves scattered, oblong, spatulately cuneiform, obtuse, villous; flowers panicled; petals 6-8, spreading; scales palmate, with subulate lobes. ☉. D. G. Native of Madeira. S. villòsum, Ait. hort. kew. ed. 1. vol. 2. p. 148. Sims, bot. mag. t. 1809. Flowers golden yellow. Herb 6-8 inches high.

Stellate Houseleek. Fl. Jul. Aug. Clt. 1790. Pl. ½ foot.

20 S. DICHÓTOMUM (D. C. jard. gen. t. 21.) stem herbaceous, terete, erect, dichotomous, beset with soft spreading hairs; leaves obovately spatulate, tapering into the petiole, dotted with soft villi; flowers in loose corymbs; petals 8-9, spreading; scales of flower 2-lobed, small. ♂. D. G. Native of the Canary Islands, among rocks. S. láxum, Haw. rev. 65. Nearly allied to *S. hírtum*, ex Buch. cat. Flowers yellow. This plant is nearly allied to *S. tortuòsum*, but differs in being herbaceous.

Dichotomous Houseleek. Fl. Jul. Aug. Clt. 1815. Pl. ½ ft.

21 S. PYGMÆ'UM (C. Smith, in Buch. can. p. 155.) stem declinate, few-leaved, 1-flowered; leaves spatulate, attenuated at the base, retuse, hairy; calyx villous; petals awned.—Native of the Island of Lancerotta. Flowers small, yellow. Plant hardly an inch high. The rest unknown.

Pygmy Houseleek. Pl. 1 inch.

SECT. II. JOVIBA'RBA (*Jupiter, Jovis*, Jupiter, and *barba*, a beard; Jupiter's beard; application not evident). D. C. pl. rar. gen. no. 21. obs. prod. 3. p. 413. Young plants rising from the axils of the lower leaves. Flowers purplish or pale yellow.—European species.

* *Flowers yellowish.*

22 S. HI'RTUM (Lin. spec. p. 605.) leaves somewhat ciliated; young plants globose; petals 6, erect, fringed. ♃. H. Native of Thuringia and Carinthia, on walls; and in woods about Moscow. D. C. pl. grass. t. 107. S. sobolíferum, Sims, bot. mag. t. 1457. S. globíferum, Hoppe, cent. Haw. rev. p. 67. Jacq. aust. 5. p. 50. append. t. 40. Leaves of the flowering, stems lanceolate, imbricate, loose, disposed in 3 spiral series. Offsets falling off of themselves. Petals pale cream-coloured, twice the length of the calyx.

Hairy House-leek. Fl. June, July. Clt. 1804. Pl. ½ foot.

23 S. GLOBI'FERUM (Lin. l. c.) leaves ciliated; offsets rather contracted; petals 15-20, spreading, very long. ♃. H. Native of Vallais, on rocks; and probably of Austria. Curt. bot. mag. t. 507. Schrad. icon. 95. t. 26. S. grandifiòrum, Haw. rev. 66. Petals yellowish, 3 times longer than the calyx.

Var. β; offsets rather loose; petals 12. ♃. H. Sims, bot. mag. 2115. More villous and pale than the species.

Globe-bearing or Hen and Chicken House-leek. Fl. Ju. Jul. Clt. 1731. Pl. ½ to 1 foot.

** *Flowers purplish.*

24 S. tectòrum (Lin. spec. p. 664.) leaves ciliated; offsets spreading; petals 5-9, spreading; scales of flowers cuneiform, carunculate. ♃. H. Native of Europe, on rocks and roofs of houses; also in many parts of Britain, on walls and cottage roofs, but perhaps not properly indigenous. D. C. pl. grass. t. 104. Smith, engl. bot. 1320. Curt. lond. 3. t. 29. Oed. fl. dan. 601. Blackw. t. 366. Sèdum tectòrum, Scop. carn. ed. 2. no. 529. Flowers purplish. Stamens sometimes changed into carpels according to Pet. Thouars, in bull. phil. nov. 1807. The juice of the common house-leek either applied by itself, or mixed with cream, gives present relief in burns, and other external inflammations; it is also said to cure corns. With honey it is a useful application in the thrush. Boerhaave found 10 ounces of the juice beneficial in dysenteries, and others have found it useful in gonorrhœas; but it is not admitted into modern practice. The house-leek had several names formerly, as *sengreen* and *aygreen*, both translations of *Sempervìvum*. It has also been called *jupiter's eye*, *bullock's eye*, and *jupiter's beard*. In German it is called *hauswurz*; in French *la grande joubarbe*, and in Italian *sempervivo maggiore*.

Roof or Common House-leek. Fl. June, Sept. Britain. Pl. 1 foot.

25 S. flagellifórme (Fisch. in Link, enum. 2. p. 20.) leaves ovate, mucronate, papillose, with papillously ciliated margins; offsets spreading, lateral; branches of cyme bifid. ♃. H. Native of Siberia. Allied to *S. montànum*, but differs in being larger, and in the offsets being at the ends of long flagellæ. The leaves of the offsets terminate in a stiff brown point; cauline leaves narrower. Corolla reddish.

Flagelliform Houseleek. Fl. July, Aug. Clt. 1823. Pl. ½ to ¾ foot.

26 S. monta'num (Lin. spec. p. 665.) leaves of the offsets obovate-oblong, shortly acuminated, beset with glandular pubescence on both surfaces, obsoletely ciliated, entire, pubescent; offsets rather contracted; flowers rotate; petals 10-14, lanceolate, acuminated, spreading, 3 times longer than the calyx, scales of flowers small, nearly quite entire; style discoloured at the apex. ♃. H. Native of the Pyrenees and the Alps of Europe, &c. on rocks. D. C. pl. grass. t. 105. Jacq. fl. aust. 5. append. t. 41. Flowers deep red. This species differs from *S. tectòrum* in the smaller stature, and in the nectariferous scales being almost wanting; and from *S. arachnoìdeum* in the absence of the cobwebbed wool. Scales of flower square and retuse.

Mountain House-leek. Fl. Ju. July. Clt. 1752. Pl. ½ to ¾ ft.

27 S. Fu'nkii (Braun, in bot. zeit. Jan. 1832. p. 4. t. 1.) leaves of the offsets oblong, shortly acuminated, beset with glandular pubescence on both surfaces, with ciliated margins; flowers rotate; petals lanceolate, acuminated, about 3 times longer than the calyx; germens dilated, ovate; style discoloured at the apex. ♃. H. Native of the Alps of Europe, as in Switzerland, Piedmont, &c.

Funk's House-leek. Fl. June, July. Clt.? Pl. ½ foot.

28 S. arachnoìdeum (Lin. spec. 665.) leaves covered with interwoven cobwebbed hairs or wool; offsets globose; petals 8-9, spreading; scales of flower truncately emarginate. ♃. H. Native of the Alps of Europe and the Pyrenees, &c. among rocks. D. C. pl. grass. t. 106. Curt. bot. mag. t. 68. Jacq. austr. 5. append. t. 42. Flowers purple.

Cobwebbed House-leek. Fl. Ju. July. Clt. 1699. Pl. ½ ft.

29 S. pu'milum (Bieb. fl. taur. 1. p. 381.) leaves lanceolate, acute, ciliated by long hairs; offsets globose; stem few-flowered; petals 12, hairy. ♃. H. Native of Caucasus, at the torrent of Terek, on rocks. Flowers red. Very like *S. arachnoìdeum*, but differs in the hairs on the leaves being distinct, not cobwebbed.

Dwarf House-leek. Fl. June, July. Clt. 1824. Pl. ½ foot.

30 S. tenuifòlium (Smith, fl. græc. prod. 1. p. 335. fl. græc. t. 474.) leaves subulate: lower ones dilated at the base, and sheathing; cauline ones adnate, sessile, prolonged at the base; flowers with 7-10 styles; offsets cylindrical. ♃. H. Native of Calabria, on arid hills. Sèdum rostràtum, Ten. fl. nap. prim. p. 26. Sèdum amplexicaùle, D. C. fl. fr. suppl. p. 526. Sèdum carinàtum, Link. Sempervìvum anómalum, Lag. ex Spreng. Petals yellow. More the habit of a *Sèdum* than a *Sempervìvum*, and has much the habit of *Sèdum rupéstre*.

Fine-leaved House-leek. Pl. ¼ foot.

Sect. III. Mona'nthes (from μονος, *monos*, one, and ανθος, *anthos*, a flower; flowers one on each peduncle). Haw. rev. succ. p. 68. D. C. prod. 3. p. 414. Real offsets none. Leaves clavate, crowded in a somewhat rosulate manner. Flowers purple. Glands large, orbicularly cochleate, serrulated when examined through a lens, one-half shorter than the petals, but 4 times broader, and rufous. Haw.—A very small nearly stemless herb.

31 S. mona'nthes (Ait. hort. kew. ed. 1. vol. 2. p. 149.) leaves terete, clavated, glabrous, crowded in a rosulate manner; peduncles naked, generally 1-flowered, rarely few-flowered; petals 6-9, hardly longer than the calyx; scales of flower obcordate. ♃. D. G. Native of the Canary Islands. Curt. bot. mag. t. 93. D. C. pl. grass. t. 157. Monánthes polyphýlla, Haw. rev. p. 68. Flowers small, purplish. Plant tufted.

One-flowered House-leek. Fl. July, Sept. Clt. 1777. Pl. 1 or 2 inches.

† *Species hardly known.*

32 S. Africa'num (Mill. dict. ed. 8. no. 7.) margins of leaves serrately toothed; offsets spreading. ♃. D. G. Native of the Cape of Good Hope. Haw. syn. p. 367. This species has never been seen except by Miller; it is therefore doubtful. Sprengel says it is the same as *S. arbòreum*.

African House-leek. Clt. 1768. Shrub.

33 S.? Seguie'ri (D. C. prod. 3. p. 414.) stem herbaceous, erect; leaves opposite, obovate.—Native on Mount Baldo. Sèdum pertræ'um, &c. Scarella in Seg. ver. 2. p. 360. t. 17. S. stellàtum, Poll. fl. ver. 2. p. 114. exclusive of the synonyme of Smith. It is probably a variety of *Sèdum dasyphýllum*, but the flowers are said to be yellow. The plant is therefore very doubtful.

Seguier's House-leek. Pl. ¼ foot?

34 S.? Hispa'nicum (Willd. enum. p. 508.) leaves subulate, semi-terete, ciliated, imbricated; cymes bifid. ♃. H. Native of Spain. The rest unknown. Perhaps a species of *Sèdum*.

Spanish House-leek. Pl. ¼ to ½ foot.

35 S. clavicula'tum, Sieb. } These two species are only
36 S. muta'bile, Schlecht. } known by name.

Cult. The greenhouse kinds of house-leek are chiefly natives of the Canary Islands. A mixture of sand, loam, and brick-rubbish is a good soil for them; and care must be taken not to give them too much water when not in flower. Cuttings taken off the plants, and laid to dry a few days, will strike root freely without any covering of glass. Cuttings of some species are difficult to obtain, such as of *S. tabulifórme*, &c.; the best way in such cases is to cut the top out, and lateral shoots will be immediately produced. The hardy kinds are well fitted for rock-work, or to grow on walls; and they are easily increased by the offsets, which are issued in great abundance. A light soil suits them best.

Tribe II.

CRASSULA'CEÆ ANO'MALÆ (the plants contained in this

tribe are anomalous in the order, in consequence of the carpels being united into a many-celled capsule, and dehiscing on the outside). D. C. prod. 3. p. 414. Carpels united at the base into a many-celled capsule.

XX. DIAMO'RPHA (from *διαμορφοω, diamorphoo*, to deform; in reference to the fruit, which is formed differently and contrary to the rest of the order). Nutt. gen. amer. 1. p. 293. D. C. prod. 3. p. 414.

Lin. syst. *Octándria, Tetragýnia.* Calyx 4-lobed. Petals 4. Stamens 8. Carpels 4, united at the base, but diverging at the apex, cuspidate, opening on the outside, usually containing about 4 seeds.—A small biennial herb, with the branches disposed in whorles from the base. Flowers small, white, disposed in cymes. Leaves alternate, nearly terete.

1 D. pusi'lla (Nutt. l. c.) ♂. H. F. Native of North Carolina, about Camden, among moss on rocks. Sèdum pusíllum, Michx. fl. bor. amer. 1. p. 276. Tillæ'a cymòsa, Nutt. gen. amer. 1. p. 110.

Small Diamorpha. Pl. 1 inch.

Cult. The seeds of this plant should be sown in a pot, filled with peat, and the plants need not be shifted into other pots; but be preserved through the winter by a frame.

XXI. PENTHO'RUM (from *πεντε, pente*, five, and *ὁρος, horos*, a boundary; in reference to the 5 beaks which terminate the capsule). Lin. gen. no. 580. Gærtn. fruct. 1. p. 312. t. 65. D. C. prod. 3. p. 414.

Lin. syst. *Decándria, Pentagýnia.* Calyx 5-parted. Petals 5. Stamens 10. Scales wanting? Carpels 5, united at the base, in a 5-beaked 5-celled capsule, which is pentagonal at the apex, and opening under the beaks. Seeds numerous, small, fixed on every side of the broad placenta, and probably exalbuminous.—Erect perennial herbs, with scattered, membranous, oblong-linear, unequally serrated leaves: and unilateral cymes, which are turned back at the points.

1 P. sedioìdes (Lin. spec. p. 620.) stem a little branched; leaves lanceolate; cymes numerous, panicled, many-flowered; seeds scobiform. ♃. H. Native of North America, in bogs, from New England to Carolina, and on La Grande Chaudiere. Lin. act. ups. 1744. t. 2. Lam. ill. t. 390. Flowers white or pale yellow.

Stonecrop-like Penthorum. Fl. July, Aug. Clt. 1768. Pl. 1 ft.

2 P. Chine'nse (Pursh. fl. amer. sept. 1. p. 323. in obs.) stem simple; leaves long, linear-lanceolate; cymes few, corymbose, few-flowered; seeds ovate, horny. ♃. H. Native of China. D. C. mem. crass. pl. 13. Very like *P. sedioìdes*, but the seeds are certainly distinct. Stems, as in it, terete at the base, and angular at the apex.

China Penthorum. Pl. 1 foot.

Cult. The species of this genus grow freely in light sandy soil, and are easily increased by dividing at the roots. Cuttings also strike freely under a hand-glass. *P. Chinénsis*, if ever it should be introduced to the gardens, will require protection in winter until its hardiness be ascertained.

Order CXIV. FICOI'DEÆ (plants agreeing in character with *Mesembryánthemum*, or Fig-marygold, in particular characters). Juss. gen. p. 315. dict. sc. nat. 16. p. 528. D. C. prod. 3. p. 415.

Calyx constantly of a definite number of sepals, usually 5, but varying from 4 to 8, more or less united at the base, either cohering with the ovarium, or almost distinct from it, equal or unequal, quincuncial or valvate in æstivation. Petals indefinite, coloured, narrow, a little combined at the base, sometimes wanting, but in that case the inside of the calyx is coloured. Stamens indefinite, arising from the calyx, distinct; anthers oblong, incumbent. Ovarium distinct, or adnate to the calyx, many-celled, crowned by numerous distinct stigmas. Capsule either girded by the fleshy calyx or naked, usually many-celled, but often 5-celled, opening in a stellate manner at the apex. Seeds attached to the inner angle of the cells, definite or indefinite. Embryo lying on the outside of a mealy albumen, curved.—Shrubby or herbaceous plants, variable in habit. Leaves fleshy, opposite, simple. Flowers usually terminal.

The curved embryo and mealy albumen, along with the superior calyx, and distinctly perigynous stamens, characterise these among their neighbours, independently of their succulent habit. With *Crassulàceæ*, *Chenopòdeæ*, and *Caryophýlleæ* they are more or less closely related. *Reaumurièæ* and *Nitrariàceæ* are families different in affinity. The hottest sandy plains in the Cape of Good Hope nourish the largest part of this order. A few are found in the south of Europe, north of Africa, Chili, China, Peru, and the South Seas. The succulent leaves of a few of the species are eaten, as of *Tetragònia expánsa*, *Mesembryánthemum edùle*, and *Sesùvium portulacástrum*; others yield an abundance of soda. *Mesembryánthemum nodiflòrum* is used in the manufacture of Moroquin leather.

Synopsis of the genera.

1 Mesembrya'nthemum. Calyx of 5, rarely of 2-8 sepals. Petals indefinite, linear. Stamens indefinite, inserted in the top of the calyx along with the petals. Capsule adnate to the calyx, from 4 to many-celled; cells many-seeded.

2 Tetragònia. Calyx 4, rarely 3-cleft; lobes coloured inside. Petals wanting. Stamens variable in number. Capsule 3-8-celled; cells 1-seeded.

3 Sesu'vium. Calyx 5-parted; lobes coloured inside. Petals wanting. Stamens 15-30, inserted in the top of the tube of the calyx. Capsule 3, rarely 4-5-celled; cells many-seeded.

4 Aizòon. Calyx 5-parted, coloured inside. Petals wanting. Stamens about 20, inserted in the bottom of the calyx, 3-5 in each fascicle. Capsule 5-celled; cells many-seeded.

5 Glìnus. Calyx 5-parted, coloured inside, with 3 inner sepals and 2 outer ones. Petals 5-20, tongue-shaped, 2-4-cleft at the apex. Capsule covered by the calyx, 5-celled; cells many-seeded.

6 Ory'gia. Calyx 5-parted. Petals numerous (20), lanceolate. Stamens indefinite. Capsule globose, 5-celled, many-seeded.

I. MESEMBRYA'NTHEMUM (from *μεσημβρια, mesembria*, mid-day, and *ανθεμον, anthemon*, a flower). Lin. gen. 628. Gærtn. fruct. 2. t. 126. Lam. ill. t. 438. Haw. obs. mes. 1. vol. 8. 1794. misc. 1803. p. 15. syn. pl. succ. 1819. p. 202. D. C. prod. 3. p. 415.—Mesembryánthemum and Hymenógyne, Haw. rev. succ. p. 74. and p. 192.

Lin. syst. *Icosándria, Tetra-Polygýnia.* Calyx of 5, rarely of 2-8 sepals; sepals united to themselves, and to the ovarium even to the middle; lobes unequal, usually leaf-formed. Petals innumerable, in one, but more often in many series, united among themselves at the base. Stamens indefinite, disposed in many series, inserted with the petals at the top of the calyx. Ovarium adnate to the calyx, many celled inside (4-20), but usually 5-

celled. Stigmas 4-20, but usually 5. Capsule many-celled, opening stellately at the apex, adnate to the permanent calyx. Seeds numerous. Embryo curved at the side of a mealy albumen. Cotyledons thick, very blunt.—Subshrubs, rarely herbs, almost all natives of the Cape of Good Hope. Leaves usually opposite, thick, fleshy, flat, terete or trigonal. Flowers terminating the branches, white, yellow or purple, the greater part of which open in the heat of the sun, very few of them opening in the evening. Fruit opening in a humid atmosphere, and relieving the seeds, which are then dispersed by the wind along with the sand.

In consequence of this genus being very large, we think it necessary to give a synoptical table of the sections, in order to render a reference to the species more easy.

Synoptical Table of the Sections.

- Leaves not papulose.
  - stemless or nearly so . . . . . ACAU'LIA (I.), §. 1—15.
  - plants evidently with stems.
    - leaves crowded at the tops of the branches . . . CEPHALOPHY'LLA (II.), §. 16, 18.
    - leaves disposed along the branches
      - stem creeping . . . . . REPTA'NTIA (III.), §. 19-23.
      - stems erect or prostrate, not creeping.
        - leaves connate or sheathing . PERFOLIA'TA (IV.), §. 24-27.
        - leaves distinct or nearly so . . . TRIQUE'TRA (V.), §. 28-36.
          - leaves triquetrous.
          - leaves terete or semi-terete . . . . TERETIU'SCULA (VI.), §. 37-42.
- Leaves papulose.
  - leaves terete or semi-terete . . . . . PAPILLÒSA (VII.), §. 33-53.
  - leaves flat . . . . . PLANIFÒLIA (VIII.), §. 54-59.

SUBDIVISION I. ACAU'LIA (*acaulis*, without a stem; plants stemless or nearly so). Haw. rev. succ. p. 81. Stems wanting or very short. Root perennial. Leaves large, variable in form and thickness, but not flat.

§ 1. *Sphæroídea* (from σφαιρα, *sphaira*, a sphere; in reference to the leaves being joined together into a globe). *Salm-Dyck.—Mínima et Sphæroídea, Haw. rev. succ. Plants stemless. Leaves opposite, very blunt, joined even to the apex into a globe, but separating at length at the apex, and becoming marcescent, but still sheathing at the base. Flowers solitary, sessile, central. Calyx 4-5-cleft. Stigmas 4-5. Petals joined into a loose tube.*

1 M. MINU'TUM (Haw. obs. 126. misc. 21. rev. 82.) plant stemless, obconical, glaucous, without spots; flowers long, tubular. ♃. D. G. Native of the Cape of Good Hope. Sims, bot. mag. t. 1376. Plant hardly the size of a common bean. Petals pale reddish in the free part, spreading; tube slender, half an inch long, inclosing the ovarium.

Minute Fig-marigold. Fl. Sept. Nov. Pl. $\frac{1}{2}$ inch.

2 M. MI'NINUM (Haw. obs. 126. misc. 21. syn. 203. rev. p. 82.) plant stemless, obconical, glaucescent, with confluent rather branched spots; ovarium exserted. ♃. D. G. Native of the Cape of Good Hope. Petiv. gaz. t. 39. f. 3.? ex Haw. Flowers very pale yellow, almost white, sessile. The cultivated plants of this species are sometimes somewhat caulescent. Offsets fewer from this species than from the other allied species.

Smallest Fig-marigold. Fl. Sept. Dec. Clt. 1776. Pl. $\frac{1}{2}$ inch.

3 M. PERPUSI'LLUM (Haw. rev. p. 82.) plant stemless, obconical, green, with strong confluent branched dots; ovarium inclosed. ♃. D. G. Native of the Cape of Good Hope. Very nearly allied to *M. mínimum*, but the colour of the flowers is deeper, and the offsets more numerous.

Very-small Fig-marigold. Fl. Sept. Dec. Clt. 1819. Pl. $\frac{1}{2}$ inch.

4 M. OBCORDE'LLUM (Haw. misc. 21. syn. 203. rev. 82.) plant stemless, obconical, glaucescent, with confluent branched dots; ovarium inclosed. ♃. D. G. Native of the Cape of Good Hope. Sims, bot. mag. 1647. Flowers small, sessile, nearly white. Petals twice the size of those of *M. perpusíllum*, to which it is very nearly allied.

Small-obcordate Fig-marigold. Fl. Feb. Oct. Clt. 1776. Pl. $\frac{1}{2}$ inch.

5 M. OBCONE'LLUM (Haw. misc. 21. syn. 203. rev. 83.) plant stemless, obconical, green, with confluent, rather tubercle-formed dots; ovarium inclosed. ♃. D. G. Native of the Cape of Good Hope. Calyx 4-cleft. Corolla white.

Little-cone Fig-marigold. Fl. Feb. Oct. Clt. 1786. Pl. $\frac{1}{2}$ in.

6 M. FICIFÓRME (Haw. rev. p. 83.) plant stemless, rather pyramidal or pear-shaped, glaucous, retusely obtuse at the apex, with the dots usually distinct, greenish, and nearly obsolete. ♃. D. G. Native of the Cape of Good Hope. Plant pale. Flowers unknown.

Fig-formed Fig-marigold. Fl. Feb. Oct. Clt. 1819. Pl. $\frac{1}{2}$ in.

7 M. TRUNCATE'LLUM (Haw. misc. 22. syn. 203. rev. 83.) plant stemless, much depressed, and rather glaucous, with the dots rather distinct; ovarium exserted. ♃. D. G. Native of the Cape of Good Hope. Flowers straw-coloured.

Small-truncated Fig-marigold. Fl. Feb. Oct. Clt. 1795. Pl. $\frac{1}{2}$ inch.

8 M. FIBULÆFÓRME (Haw. misc. p. 22. syn. 203. rev. p. 83.) plant stemless, rather canescent, and somewhat pubescent, very much depressed, and spotless. ♃. D. G. Native of the Cape of Good Hope. Flowers unknown.

Button-shaped Fig-marigold. Fl.? Clt. 1795. Pl. $\frac{1}{2}$ inch.

9 M. TURBINIFÓRME (Haw. rev. p. 84.) plant stemless, obconical, exactly truncate, and therefore top-formed, obscurely dotted. ♃. D. G. Native of the Cape of Good Hope. Burch. cat. 1630. 2. voy. 1. p. 310. This species is twice or thrice the size of *M. truncàtum*.

Top-shaped Fig-marigold. Pl. 2 inches.

10 M. UVÆFÓRME (Haw. rev. p. 84.) plant stemless, nearly globose, green, form and size of a grape berry, with small, rather confluent deeper dots. ♃. D. G. Native of the Cape of Good Hope. Burm. afr. t. 10. f. 2.?

Grape-formed Fig-marigold. Fl.? Clt. 1820. Pl. ½ inch.

11 M. NUCIFÓRME (Haw. obs. 129. misc. 22. syn. 204. rev. 84.) plant stemless, glaucous, without dots, nearly spherical; tops of leaves unequal, distinct, flat above. ♃. D. G. Native of the Cape of Good Hope. Flowers unknown.

Nut-formed Fig-marigold. Clt. 1790. Pl. 1 inch.

§ 2. *Subquadrifòlia* (the plants belonging to this section are usually furnished with about 4 leaves). *Salm-Dyck, obs.* 17.—*Semiovàta and Obtùsa, Haw. rev. p.* 85. *Plants almost stemless. Leaves* 4-6, *decussate, quite entire, obtuse, flat above, convex beneath. Flowers nearly sessile, solitary. Calyx* 4-6-*cleft. Stigmas* 4-6. *The upper leaves are usually connate, as in section Sphæroídeæ, and at length separate, but more distinctly.*

12 M. TRUNCA'TUM (Thunb. fl. cap. p. 412.) plant stemless; leaves spheroid-obconical, umbilicately truncate; peduncle solitary, 1-flowered, compressed; calyx 4-cleft. ♃. D. G. Native of the Cape of Good Hope.

Truncate Fig-marigold. Pl. 1 to 2 inches.

13 M. TESTICULA'RE (Ait. hort. kew. 2. p. 181.) plant stemless; leaves 4-8, white, smooth, semi-terete, ovate or parabolic, expanded. ♃. D. G. Native of the Cape of Good Hope. M. testiculàre, Thunb. fl. cap. p. 412. Hew. obs. 133. syn. 205. exclusive of variety β and γ, misc. 24. rev. 85. Flowers white.

Testicular Fig-marigold. Fl. Nov. Clt. 1774. Pl. 1 inch.

14 M. OCTOPHY'LLUM (Haw. rev. p. 85.) plant stemless; leaves 6-8, white, smooth, rather erectish, convex beneath, flat above. ♃. D. G. Native of the Cape of Good Hope. M. testiculàre γ, Haw. misc. p. 24. M. testiculàre β et γ, Haw. syn. 205. M. testiculàre β, Sims, bot. mag. 1573. Flowers yellow, and when expanded they are 8 or 10 lines in diameter. Calyx 6-cleft, furnished with two leaf-formed bracteas at the base. According to the Prince de Salm-Dyck, this is merely a variety of *M. testiculàre*.

Eight-leaved Fig-marigold. Fl. Nov. Clt. 1819. Pl. ⅛ ft.

15 M. OBTU'SUM (Haw. misc. 25. syn. 206. rev. 86.) plant green, almost stemless; leaves unequal, semi-terete, acinaciform, obtuse; flowers almost sessile; calyx 6-lobed. ♃. D. G. Native of the Cape of Good Hope. M. fissoìdes, Haw. obs. 135. Old stem 2 inches high. Flowers pale red, bibracteate at the base; petals an inch long. Styles 6.

Blunt Fig-marigold. Fl. March, April. Clt. 1792. Pl. ⅛ ft.

16 M. FI'SSUM (Haw. obs. 134. misc. 25. syn. 205. rev. 86.) plant almost stemless; leaves equal, half-terete, very blunt, glaucescent. ♃. D. G. Native of the Cape of Good Hope. Old stem 1 or 2 inches high; branchlets very short, and alternate. Flowers unknown.

Cleft Fig-marigold. Clt. 1776. Pl. ⅛ foot.

17 M. DIGITIFO'RME (Thunb. fl. cap. p. 412.) plant stemless; leaves 3-4, terete, smooth, obtuse; flowers sessile, solitary, axillary. ♃. D. G. Native of the Cape of Good Hope. M. digitàtum, Ait. hort. kew. 2. p. 181. Flowers white, according to Thunberg. Leaves alternate. Perhaps belonging to a different section.

Finger-shaped Fig-marigold. Clt. 1775. Pl. 1 inch.

§ 3. *Monilifórmia* (from *monile*, a bracelet, and *forma*, form; appearance of stems). *Haw. and Salm-Dyck, l. c. Stems very short, moniliform, leafless in the summer. The two first leaves united even to the apex, and deciduous; the two following leaves elongated, and joined at the base, marcescent, and deciduous. Calyx* 4-6-*cleft, and is, as well as the leaves, full of crystalline papulæ. Stigmas* 7-8.

18 M. PISIFO'RME (Haw. misc. 23. syn. 205. rev. 93.) leaves full of crystalline papulæ; the first two united into the form of a pea; the following 2 semi-terete; caudex much branched, and very dwarf. ♃. D. G. Native of the Cape of Good Hope. The first leaves are produced in autumn, and the second in winter. Flowers unknown.

Pea-formed Fig-marigold. Clt. 1796. Pl. 1 inch.

19 M. MONILIFO'RME (Haw. obs. 132. misc. 24. syn. 207. rev. 93.) first leaves joined into a spherical form; the following ones half-terete, subulate, very long, green, and somewhat recurved. ♃. D. G. Native of the Cape of Good Hope. Thunb. fl. cap. p. 413. Peduncles 2 inches long, terminal. Calyx 4-cleft. Petals snow white. Styles 7, ex Haw.

Necklace-formed Fig-marigold. Fl. March, April. Clt. 1791. Pl. ⅛ foot.

§ 4. *Aloídea* (plants resembling Aloe in habit). *D. C. prod. 3. p.* 419. *Aloídea and Magnipúncta, Haw. rev. p.* 86. *and* 87. *Ringéntia intègra, Salm-Dyck. obs. p.* 20. *Plants stemless. Leaves triquetrous, gradually thickened towards the apex, having the carinal angle gibbous; the two superior ones entire. Flowers central, sessile, yellow.*

20 M. NO'BILE (Haw. in phil. mag. 1823. p. 381.) plant rather caulescent; leaves coarsely and triquetrously clavate, obtuse, somewhat recurved, rather concave above, marked by large elevated tubercles. ♃. D. G. Native of the Cape of Good Hope. Flowers large, sessile, opening before meridian, yellow, scentless, bibracteate at the base. Calyx 6-cleft, according to Salm-Dyck.

Noble Fig-marigold. Fl. July, Aug. Clt. 1822. Pl. ⅛ foot.

21 M. MAGNIPU'NCTUM (Haw. rev. p. 86.) plant stemless; leaves perfect, usually about 4, large, clavately triquetrous, very thick, glaucescent, flat above, keeled beneath, obtuse at the apex, marked with very large and numerous dots. ♃. D. G. Native of the Cape of Good Hope. M. magnipunctàtum, Haw. suppl. p. 87. Flowers yellow, sessile.

Large-dotted Fig-marigold. Clt. 1822. Pl. ¼ foot.

22 M. CA'NUM (Haw. obs. p. 158. misc. 25. syn. 219. rev. 87. but not of Salm-Dyck,) plant stemless; leaves hoary, semi-terete at the base, attenuated, gibbously keeled at the apex. ♃. D. G. Native of the Cape of Good Hope. Very like *M. magnipúnctum*, but is easily distinguished by its hoary aspect. Flowers unknown.

Hoary Fig-marigold. Clt. 1795. Pl. 1 to 2 inches.

23 M. ALOÌDES (Haw. suppl. 88. rev. 87.) plant stemless; leaves entire, semi-terete, green, marbled with white dots, acute upwards, rather concave above, carinately triquetrous at the apex. ♃. D. G. Native of the Cape of Good Hope. Old plant tufted; root fusiform. Flowers sessile, central, yellow, middle-sized. Perhaps the same as *M. compáctum*, no. 86. Perhaps M. aloìdes, Burch. trav. afr. 2. p. 332.

Aloe-like Fig-marigold. Fl. Sept. Clt. 1819. Pl. ⅛ foot.

§ 5. *Albinòta* (from *albus*, white, and *nota*, a mark; plants marked with white). *Haw. in phil. mag. Aug.* 1826. *p.* 126. *Plants almost without stems, tufted. Roots perennial. Leaves decussate, entire, obliquely incurved, green, spreading, full of large tubercular white dots, semi-terete at the base, acinaciformly triquetrous at the apex, or nearly equal-sided, more or less mucronulated. Flowers central, solitary, sessile, yellow. Stamens erectly spreading, as in those of section Ringéntia.*

24 M. ALBINÒTUM (Haw. in phil. mag. Aug. 1826. p. 126.) leaves acinaciformly triquetrous upwards, with a recurved

mucrone, full of scattered, rather elevated whitish dots. ♃. D. G. Native of the Cape of Good Hope. Flowers yellow.

White-marked Fig-marigold. Fl. Sept. Clt. 1824. Pl. $\frac{1}{8}$ ft.

25 M. albipuncta'tum (Haw. l. c.) leaves semi-terete, beset with white tubercular dots. ♃. D. G. Native of the Cape of Good Hope. Flowers yellow. Very like *M. albinòtum*, but the leaves are twice or thrice smaller, and more numerous. There is also a larger variety of this species mentioned by Haworth.

White-dotted Fig-marigold. Fl. Sept. Clt. 1824. Pl. $\frac{1}{8}$ ft.

§ 6. *Ringéntia* (from *ringens*, gaping; appearance of the two upper leaves of the plants). *Haw. syn. p.* 216. *phil. mag.* 64. *p.* 110. *Spreng. syst. p.* 515. *D. C. prod.* 3. *p.* 419.—*Ringéntia ciliàta, Salm-Dyck.—Ringéntia et Scapígera, Haw. rev. p.* 87, 88. *Plants stemless. Leaves triquetrous, gradually thickening to the top or gibbous, usually ciliately toothed, without papulæ. Flowers yellow, opening after meridian. Calyx* 4-5-*cleft. Stigmas* 4-5.

26 M. mustelli'num (Salm-Dyck and Haw. suppl. p. 87. rev. p. 89.) plant almost stemless, green, full of pellucid dots; leaves triquetrous, gradually thickening towards the apex, ciliately toothed, pustulately gibbous on the inside at the base; flowers on short pedicels; calyx 4-cleft. ♃. D. G. Native of the Cape of Good Hope. Salm-Dyck, obs. 1820. p. 9. Flowers yellow, expanding in the evening, sweet-scented.

Weasel-chop Fig-marigold. Clt. 1820. Pl. $\frac{1}{8}$ foot.

27 M. erminìnum (Haw. in phil. mag. Aug. 1826. p. 126.) plant almost stemless, glaucous; leaves wrinkled from large dots; margins with short teeth at the apex. ♃. D. G. Native of the Cape of Good Hope. Herb densely tufted. Flowers solitary, terminal, yellow, opening in the evening. Nearest allied to *M. murìnum*.

Var. β, màgus (Haw. l. c.) corolla yellow, red at the apex.

Ermine-chop Fig-marigold. Fl. May, Jul. Clt. 1824. Pl. $\frac{1}{8}$ ft.

28 M. agnìnum (Haw. in phil. mag. Aug. 1826. p. 126.) plant almost stemless, canescent, wrinkled from dots; leaves semi-terete, serrulated from elevated dots, and hence somewhat toothed, pustulate on the inside at the base. ♃. D. G. Native of the Cape of Good Hope. Leaves with a large white pustule on the inside at the base. Flowers sessile, solitary, central, expanding in the evening.

Var. β; plant a little smaller; teeth of leaves more obscure.

Var. γ; leaves more erect, entire.

Lamb-chop Fig-marigold. Fl. May, June. Clt. 1824. Pl. $\frac{1}{8}$ ft.

29 M. murìnum (Haw. obs. p. 165. misc. p. 30. syn. 217. rev. 90. phil. mag. 64. p. 111.) plant almost stemless, glaucous; leaves ciliately denticulated, 3 rows on each side, and full of tubercular dots, with the margins and keel ciliately denticulated at the apex; flower sessile. ♃. D. G. Native of the Cape of Good Hope. Flowers small, yellow. Styles 5, very short, erect, green, a little thickened towards the apex.

Mouse-chop Fig-marigold. Fl. Sept. Clt. 1790. Pl. $\frac{1}{8}$ ft.

30 M. felìnum (Haw. obs. p. 161. misc. p. 31. syn. p. 216. rev. p. 89.) plant stemless, glaucescent; leaves ciliated with long teeth, obsoletely dotted, cartilaginously keeled at the apex, full of pellucid dots when examined by the light; flowers sessile. ♃. D. G. Native of the Cape of Good Hope. D. C. pl. grass. t. 158.—Dill. hort. elth. f. 220. M. ríngens β, Lin. spec. p. 698. Flowers yellow, expanding after meridian. Styles 5, filiform, equal in length to the stamens.

Cat-chop Fig-marigold. Fl. Aug. Nov. Clt. 1730. Pl. $\frac{1}{8}$ ft.

31 M. lupìnum (Haw. in phil. mag. 64. p. 111.) plant stemless; leaves glaucescent, marginal ciliæ very long, and very numerous. ♃. D. G. Native of the Cape of Good Hope. Very like *M. felìnum*, but differs according to Salm-Dyck in the leaves being narrower, more attenuated, and in the ciliæ being longer and more numerous, but probably it is only a mere variety of it.

Wolf-chop Fig-marigold. Pl. $\frac{1}{4}$ foot.

32 M. tigrìnum (Haw. obs. p. 164. misc. p. 21. syn. 216. rev. p. 89.) plant stemless, greenish; leaves stem-clasping, ovate-cordate, expanded, marbled with white, flat above, ciliated with long hairs, cartilaginously keeled at the apex; flowers sessile. ♃. D. G. Native of the Cape of Good Hope. Ker. bot. reg. t. 280. Flowers yellow, expanding after meridian, large, central. Styles 4, filiform, equal in length to the stamens.

Tiger-chop Fig-marigold. Fl. Sept. Nov. Clt. 1790. Pl. $\frac{1}{4}$ foot.

33 M. canìnum (Haw. obs. p. 159. syn. 217. rev. p. 87.) plant almost stemless; leaves glaucous, carinately triquetrous, rather club-shaped, incurved towards the apex, and somewhat toothed, as well as the bracteas; peduncles longer than the leaves. ♃. D. G. Native of the Cape of Good Hope. D. C. pl. grass. t. 95.—Dill. elth. f. 231.—Bradl. succ. t. 17. M. ríngens α, Lin. spec. 698. Flowers of a yellowish orange-colour, opening after meridian.

Dog-chop Fig-marigold. Fl. Aug. Oct. Clt. 1717. Pl. $\frac{1}{4}$ ft.

34 M. vulpìnum (Haw. syn. p. 417. rev. p. 88.) plant almost stemless; leaves glaucous, carinately triquetrous, rather club-shaped, with large teeth at the apex or entire; old leaves horizontal; bracteas entire; peduncles longer than the leaves. ♃. D. G. Native of the Cape of Good Hope. M. canìnum β, Haw. misc. p. 32. Very like *M. canìnum*, but taller, and the leaves are longer and greener, with fewer teeth. It is, however, perhaps only a variety of it. Flowers yellow.

Fox-chop Fig-marigold. Fl. May, Oct. Clt. 1795. Pl. $\frac{1}{4}$ ft.

35 M. hy'bridum (Haw. syn. 218. rev. p. 88.) plant stemless, smooth, white; leaves semi-terete, entire, carinately triquetrous above, and a little thickened, ending in a recurved mucrone each. ♃. D. G. Raised in the gardens from the seeds of *M. álbidum*, impregnated by the pollen of *M. canìnum*.

Hybrid Fig-marigold. Fl. May, Oct. Pl. $\frac{1}{4}$ foot.

36 M. musculìnum (Haw. in phil. mag. nov. 1826. p. 328.) margins and keel of leaves usually bearing but one tooth each; branches prostrate, half a foot long. ♃. D. G. Native of the Cape of Good Hope. Flowers yellow, opening in the morning, scentless. This plant is very like *M. murìnum*, but differs in the prostrate branches, and in the teeth of the leaves being fewer. It comes perhaps nearest in habit to *M. erminìnum*, but differs in the petals being a line broad, not capillaceous.

Little-mouse-chop Fig-marigold. Fl. July, Aug. Clt. 1824. Pl. prostrate.

§ 7. *Rostràta* (from *rostrum*, a beak). *Haw. syn. p.* 211. *Salm-Dyck, obs. bot.* 1820. *p.* 20. *Plants stemless or nearly so. Leaves* 4-6, *erectish, connate, semi-terete, attenuated, rather keeled, and somewhat denticulated at the apex. Flowers solitary, pedunculate, yellow. Calyx* 4-8-*cleft. Stigmas* 8-12.

37 M. a'lbidum (Lin. spec. p. 699.) plant stemless, smooth, whitish; leaves thick, subulate, triquetrous, obtuse, with an acumen, but semi-terete at the base: all quite entire. ♃. D. G. Native of the Cape of Good Hope.—Dill. hort. elth. f. 232. Bradl. succ. t. 43. Sims, bot. mag. t. 1824. Haw. rev. p. 88. Flowers large, yellow, opening early in the morning, but afterwards remaining expanded through the whole day, sweet-scented. Stigmas 11. This plant is intermediate between the section *Ringéntia* and *Rostràta*.

White Fig-marigold. Fl. July, Aug. Clt. 1714. Pl. $\frac{1}{4}$ foot.

38 M. denticula'tum (Haw. obs. 149. misc. 30. syn. p. 215. rev. 91.) plant stemless; leaves very glaucous, subulately triquetrous, compressed, dilately keeled at the apex; keel usually

denticulated; scape bibracteate, 1-flowered; styles 15. ♃. D. G. Native of the Cape of Good Hope. Flowers pale straw-colour, 3 inches in diameter.

Var. a, cànum (Haw. obs. 149.) leaves canescent from minute down.

Var. β, glaúcum (Haw. obs. p. 151.) leaves glaucous-white, rather dilated at both ends, a little toothed.

Var. γ, candidíssimum (Haw. l. c.) leaves white, elongated, a little toothed, compressed on both sides.

Denticulated Fig-marigold. Fl. April. Clt. 1793. Pl. ¼ ft.

39 M. ROBU'STUM (Haw. misc. p. 28. syn. 211. rev. p. 91.) stem robust, a little branched, short, decumbent; leaves obtuse, dotted, subulate, pustulate inside at the base. ♃. D. G. Native of the Cape of Good Hope. Flowers unknown.

Robust Fig-marigold. Clt. 1795. Pl. ¼ foot.

40 M. COMPA'CTUM (Ait. hort. kew. 2. p. 191.) plant stemless; leaves connate, dotted, semi-terete, triquetrous at the apex, rather reflexed, acute; flowers sessile; calyx subcylindrical, 6-cleft. ♃. D. G. Native of the Cape of Good Hope. Haw. syn. 211. rev. 91. Flowers yellow. A very doubtful species, and probably the same as *M. nóbile*, no. 20.

Compact Fig-marigold. Fl. Nov. Clt. 1780. Pl. ¼ foot.

41 M. QUADRÍFIDUM (Haw. misc. 28. syn. 212. rev. 91.) plant almost stemless, at length branched; leaves subulate, obtuse, hoary-glaucous, marked by a few dots towards the apex; scape terminal, 1-flowered, longer than the leaves; calyx 4-cleft. ♃. D. G. Native of the Cape of Good Hope. Old stems 2-3 inches long. Flowers yellow. Styles about the length of the stamens.

Four-cleft Fig-marigold. Fl. Nov. Clt. 1795. Pl. ¼ foot.

42 M. BI'FIDUM (Haw. misc. p. 29. syn. 212. rev. p. 92.) plant almost stemless; leaves subulate, glaucous, obtuse, with many dots; scape nearly terminal, 1-flowered: calyx bifid. ♃. D. G. Native of the Cape of Good Hope. Flowers yellow. Lobes of calyx 2, unequal. Allied to *M. quadrífidum*, but weaker, and the leaves are shorter and blunter.

Bifid Fig-marigold. Fl. Nov. Clt. 1795. Pl. ¼ foot.

43 M. BIBRACTEA'TUM (Haw. syn. p. 215. rev. 92.) plant almost stemless, branched; leaves elongated, subulate, dotted, very glaucous; bracteas 4, decussate, shorter than the scape; calyx 5-cleft. ♃. D. G. Native of the Cape of Good Hope. Very like *M. rostràtum*. Flowers yellow, expanding in the sun. Styles 10, subulate, erect, length of stamens.

Bibracteate Fig-marigold. Fl. April, Nov. Clt. 1803. Pl. ⅓ ft.

44 M. PURPURA'SCENS (Salm-Dyck, obs. bot. ann. 1822.) plant almost stemless, branched; leaves dotted, smooth, gibbous inside at the base, of a bluish glaucous-colour, obtuse, and triquetrous at the apex; keel usually extended; sheaths purplish. ♃. D. G. Native of the Cape of Good Hope.

Purplish Fig-marigold. Pl. ¼ foot.

45 M. ROSTRA'TUM (Lin. spec. p. 696.) plant stemless; leaves subulate, elongated, acute, dotted; bracteas 2, longer than the scape; calyx 4-cleft. ♃. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 229. without a flower. Haw. obs. p. 152. misc. 29. syn. 214. rev. 92. Flowers yellow, expanding in the sun. Styles very short, approximate.

Var. β, tuberculàtum (Mill. dict. ed. 8. no. 32.) leaves tubercular on the outside.

Beaked Fig-marigold. Fl. April. Clt. 1742. Pl. ¼ foot.

46 M. RAMULÒSUM (Haw. misc. 29. syn. 215. rev. p. 92.) young plant nearly stemless; old stem 3 inches high, branched, and decumbent; leaves subulate, obtuse, pustulate inside at the base: when old expanded; scape terete, bracteate at the base; calyx 5-cleft. ♃. D. G. Native of the Cape of Good Hope. M. rostratoìdes, Haw. obs. 154. Flowers yellow. This is the smallest of all the section.

Small-branched Fig-marigold. Fl. March, Nov. Clt. 1791. Pl. ¼ foot.

§. 8. *Linguæfórmia* (from *lingua*, a tongue, and *forma*, a form; shape of leaves). *Haw. misc. p. 32. rev. p. 93. Salm-Dyck, obs.* 18. *Plants stemless or nearly so. Leaves more or less tongue-shaped, flat above, and convex beneath, soft, and shining. Flowers solitary, large, sessile, or pedunculate. Calyx usually 4-cleft, rarely 5-cleft. Petals shining, yellow, broadish. Stigmas* 8, *rarely* 10. *Capsule* 8-10-*celled.*

* *Dísticha* (from διστιχος, *distichos*, having two rows, a distich; leaves disposed exactly in two opposite rows). *Haw. misc. p. 32. —Linguæfórmia, Haw. rev. p. 93.—Glossoìdea, Spreng. syst. 2. p. 514. Leaves exactly distich.—Perhaps all the plants contained in this division are nothing more than varieties of one species, and probably of garden origin. The whole have been collected under the name of M. linguæfórme in Lin. spec. p. 699. and D. C. pl. grass. no.* 71.

47 M. SCALPRA'TUM (Haw. obs. p. 187. misc. p. 32. syn. p. 220. rev. p. 94.) plant stemless; leaves sloped down much, scalprate, very broad, one of the margins thicker than the other, pustulate inside at the base; flowers sessile. ♃. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 224. M. oblìquum, Willd. spec. 2. p. 1027. ex Salm-Dyck, obs. 1820. p. 19. M. linguæfórme *α*, Lin. spec. p. 669. Flowers yellow.

Knife-leaved Fig-marigold. Fl. Aug. Oct. Clt. 1714. Pl. ½ foot.

48 M. FRA'GRANS (Salm-Dyck, obs. 1820. p. 8.) plant almost stemless; leaves tongue-shaped, thick, one side rather convex, and obtuse at the apex, the other side thrown out into a keel; flower on a short peduncle. ♃. D. G. Native of the Cape of Good Hope. Haw. rev. p. 95. Hoffmans. verz. 1. p. 220. Otto et Link, abb. gew. t. 43. Flowers fragrant, yellow, 3 inches in diameter. Calyx 5-cleft. Allied to *M. scalpràtum*, but the leaves are narrower and thicker.

Fragrant Fig-marigold. Fl. Aug. Pl. ½ foot.

49 M. PRÆPÍNGUE (Haw. obs. 179. misc. p. 35. syn. p. 222. rev. p. 95.) plant stemless; leaves obliquely tongue-shaped, pale green, very soft, when young ciliated with pubescence, ending in an incurved point at the apex; flowers nearly sessile; calyx 4-cleft. ♃. D. G. Native of the Cape of Good Hope. Willd. enum. p. 529. M. heterophýllum, Andr. bot. rep. t. 540.? but not of Haw. Capsule 8-celled, conically depressed. Old stem half a foot long, procumbent. Flowers yellow.

Very-fat-leaved Fig-marigold. Fl. Aug. Oct. Clt. 1792. Pl. ½ foot.

50 M. GRANDIFLÒRUM (Haw. in phil. mag. nov. 1826. p. 328.) leaves broad tongue-shaped, long, thick, having a large pustule on the inside at the base; petals very broad. ♃. D. G. Native of the Cape of Good Hope. Flowers yellow, almost scentless, large, sessile; petals 3-4 lines broad. Leaves 3½ inches long, and 15 lines broad. Capsule subconical. This is the largest species in the present section.

Var. β (Haw. l. c.) leaves deeper green.

Great-flowered Fig-marigold. Fl. July. Clt. 1824. Pl. ¼ ft.

51 M. ME'DIUM (Haw. suppl. p. 88. rev. p. 95.) plant almost stemless; leaves tongue-formed, sloping, cultrate, deep green, without any claw-like point at the apex; peduncles longer than the flowers. ♃. D. G. Native of the Cape of Good Hope. Leaves 4 inches long, and an inch broad. Peduncles an inch long. Flowers yellow.

Middle Fig-marigold. Fl. Aug. Oct. Pl. ¼ to ½ foot.

52 M. CULTRA'TUM (Salm-Dyck, obs. 1820. p. 7.) plant almost stemless; leaves distich, exactly tongue-shaped, cultrate at the margin and apex; peduncles compressed, rather longer than the

flowers; calyx 5-cleft. ♃. D. G. Native of the Cape of Good Hope. Haw. rev. p. 95. Leaves 3-4 inches long. Petals of a shining yellow above, and reddish beneath.

Cultrate-leaved Fig-marigold. Fl. Aug. Oct. Clt. 1820. Pl. ½ foot.

53 M. LÓNGUM (Haw. obs. p. 177.) plant stemless; leaves elongated, tongue-shaped, shining, deep green; flowers pedicellate. ♃. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 227. M. linguæfórme δ, Lin. spec. p. 699. D. C. pl. grass. t. 71. M. lùcidum, Haw. rev. p. 95. Flowers yellow.

Var. β, fláccidum (D. C. prod. 3. p. 421.) flowers almost sessile. M. lóngum α, Haw. rev. 96. M. depréssum, Sims, bot. mag. t. 1866.

Long-leaved Fig-marigold. Fl. Aug. Oct. Clt. 1725. Pl. ½ ft.

54 M. ADSCE'NDENS (Haw. syn. 220. rev. p. 96.) plant stemless; leaves broadly tongue-shaped, very blunt, ascending, green; flowers pedunculate. ♃. D. G. Native of the Cape of Good Hope. Flowers yellow. Probably only a variety of *M. lóngum.*

Ascending Fig-marigold. Fl. Aug. Nov. Clt. 1805. Pl. ½ ft.

55 M. PUSTULA'TUM (Haw. suppl. p. 88. rev. p. 96.) plant stemless; leaves tongue-shaped, ascending, elongated, furnished with large pustules on the inside at the base. ♃. D. G. Native of the Cape of Good Hope. Leaves 5-6 inches long, and 3-11 lines broad. Flowers yellow.

Blistered Fig-marigold. Fl. Aug. Clt. 1818. Pl. ½ foot.

56 M. LINGUÆFÓRME (Haw. obs. p. 188. misc. p. 33. syn. p. 221. rev. p. 97.) plant stemless; leaves unequally tongue-shaped, thick, green, keeled on one side; flower on a very short peduncle; calyx 4-cleft. ♃. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 226. M. linguæfórme γ, Lin. spec. 669. M. oblìquum, Pers. but not of Haw. Flowers yellow.

Var. β, ruféscens (Haw. syn. p. 221.) leaves very closely imbricated, rufescent.

Tongue-formed-leaved Fig-marigold. Fl. Mar. Nov. Clt. 1732. Pl. ½ foot.

57 M. LA'TUM (Haw. obs. 186. misc. p. 32. syn. p. 220. rev. p. 98.) plant stemless; leaves tongue-shaped, green, obtuse, thick, usually sloping, and somewhat excavated; flowers nearly sessile; calyx 5-cleft; capsule large, conical. ♃. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 225. M. linguæfórme β, Lin. spec. 699. Flowers yellow.

Var. β, brève (Haw. rev. p. 99.) leaves short, very blunt, depressed on the ground; capsule small, depressed.

Broad-leaved Fig-marigold. Fl. Mar. Nov. Clt. 1620. Pl. ¼ ft.

58 M. DEPRE'SSUM (Haw. misc. p. 33. syn. 221. rev. 99.) plant almost stemless, prostrate; leaves pale, narrow-tongue-shaped, obtuse, recurved, depressed, variously incurved at the apex; capsule depressed. ♃. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 226.? Flowers yellow.

Var. β, lìvidum (Haw. l. c.) leaves of a livid rufescent colour.

Depressed Fig-marigold. Fl. Sept. Nov. Clt. 1795. Pl. ½ ft.

* * *Cruciàta* (from *crux*, a cross; leaves disposed crosswise more or less). *Haw. syn. p. 222.—Cruciàta and Diffórmia, Haw. rev.* 100. *and* 101. *Leaves more or less cruciate, usually obliquely decussate.*

59 M. CRUCIA'TUM (Haw. obs. p. 173. misc. 35. syn. 224. rev. 35.) plant nearly stemless; leaves linear-tongue-shaped, semi-cylindrical, very soft, cruciate; peduncles 2-edged; calyx 4-cleft. ♃. D. G. Native of the Cape of Good Hope. Old stems 3 inches high. Peduncles 1-2 inches. Corolla large, yellow.

Cross-leaved Fig-marigold. Fl. May, Nov. Clt. 1792. Pl. ¼ ft.

60 M. TAURI'NUM (Haw. syn. p. 224. rev. 100.) plant almost stemless; leaves disposed in 2 rows, obliquely cruciate, semi-terete, obtuse, very thick, of a yellowish green colour, incurved; flowers sessile; calyx bifid? ♃. D. G. Native of the Cape of Good Hope. Calycine segments unequal. Styles 8. Old stem branched at the base, half a foot high. Flowers yellow.

Bull's-horn Fig-marigold. Fl. Sept. Nov. Clt. 1795. Pl. ¾ ft.

61 M. SA'LMII (Haw. suppl. p. 89. rev. p. 100.) plant nearly stemless; leaves decussate, semi-cylindrical, attenuated and acute at the apex, or oblique and bluntish; flowers exactly sessile; calyx 4-cleft; capsule half closed. ♃. D. G. Native of the Cape of Good Hope. Salm-Dyck. obs. bot. 1820. Link. et Otto. abb. gew. t. 44. Flowers large, yellow. Leaves pustulate at the base, according to Haworth.

Var. β, semi-cruciàtum (Salm-Dyck. l. c.) leaves obliquely distich, straight, and more tongue-shaped than the species.

Salm-Dyck's Fig-marigold. Fl. Sept. Nov. Clt. 1818. Pl. ½ ft.

62 M. SURRE'CTUM (Haw. rev. p. 101.) leaves decussate, erectish, or spreading, more or less semi-terete, subulate, acute, soft, usually pustulate at the base; ovarium exserted, somewhat pedunculate. ♃. D. G. Native of the Cape of Good Hope. Flowers yellow.

Raised Fig-marigold. Fl. Sept. Nov. Clt. 1819. Pl. ½ ft.

63 M. HETEROPHY'LLUM (Haw. obs. p. 420. misc. 36. syn. 225. rev. 101.) plant stemless; leaves green, difformed, without dots; upper ones the longest. ♃. D. G. Native of the Cape of Good Hope. Flowers yellow. Leaves obliquely cruciate: lower ones like those of *M. cànum:* upper ones like those of *M. diffórme.*

Variable-leaved Fig-marigold. Clt. 1795. Pl. ½ foot.

64 M. ANGU'STUM (Haw. obs. 176. misc. p. 34. syn. 222. rev. p. 101.) plant almost stemless; leaves linear-tongue-shaped, semi-cylindrical, very long; flowers nearly sessile; calyx 4-cleft. ♃. D. G. Native of the Cape of Good Hope. Flowers yellow, having the petals broader than any other species of this section. Calyx 4-cleft; stigmas 10, according to Haworth.

Var. β, pállidum (Haw. rev. p. 101.) leaves paler, obliquely cruciate. Perhaps this plant appertains to *M. heterophýllum.* Andr. bot. rep. t. 540.

Narrow Fig-marigold. Fl. Mar. Oct. Clt. 1790. Pl. ½ ft.

65 M. DIFFÓRME (Lin. spec. p. 669.) plant nearly stemless; leaves obliquely cruciate, long, semi-cylindrical, oblique, furnished with 1-2 obscure teeth at the apex; flowers nearly sessile; calyx 4-cleft. ♃. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 242. Haw. obs. p. 169. misc. 35. syn. 225. rev. p. 103. Old stems 2-3 inches long, decumbent. Flowers large, yellow, fading to a copper colour. Styles 8.

Var. β, brevicaúle (Haw. rev. p. 103.). Caudex shorter.

Difformed Fig-marigold. Fl. Aug. Clt. 1732. Pl. dec.

66 M. BIGIBBERA'TUM (Haw. in phil. mag. nov. 1825. p. 329.) leaves obliquely somewhat cruciate, semi-cylindrical, pale green, varying at the apex, usually with 2 gibbosities; capsule depressed. ♃. D. G. Native of the Cape of Good Hope. Very like *M. diffórme*, but smaller and slenderer. Flowers yellow.

Two-bunched-leaved Fig-marigold. Fl. Aug. Clt. 1820. Pl. ¼ foot.

67 M. BIDENTA'TUM (Haw. suppl. p. 89. rev. p. 103.) plant stemless; leaves semi-cylindrical, thick, soft, oblique at the apex, and difformed, bearing 2 large, almost opposite, fleshy teeth in the middle. ♃. D. G. Native of the Cape of Good Hope. Flowers large, yellow, on short peduncles; petals erosely toothed at the apex. Capsule a little depressed.—The figure in Dill. hort. elth. f. 241. is referrible to this plant and not to the next.

Bidentate-leaved Fig-marigold. Fl. Aug. Clt. 1818. Pl. ½ ft.

68 M. SEMICYLI'NDRICUM (Haw. obs. p. 238. misc. p. 36. syn. 225. rev. 103.) plant rather caulescent; leaves very narrow, tongue-shaped, semi-terete, oblique towards the apex, furnished

with 1 obsolete tooth on one side, and another stronger one on the other; flowers on short pedicels; calyx 4-cleft. ♃. D. H. Native of the Cape of Good Hope.—Pluk. mant. t. 325. f. 4. Flowers yellow, size of those of *M. linguæfórme*. Styles 8.

Semi-cylindrical-leaved Fig-marigold. Fl. Mar. Nov. Clt. 1732. Pl. ½ foot.

§ 9. *Dolabrifórmia* (from *dolabra*, an axe or hatchet, and *forma*, form; shape of leaves). *Salm-Dyck. obs. p.* 19.—*Dolabrifórmia and Carinántia, Haw. rev. p.* 90. *Plants stemless, or on short stems. Leaves decussate, with a keeled gibbous angle. Flowers yellow. Calyx 5-cleft. Stigmas 5. Capsule 5-celled.*

69 M. DOLABRIFÓRME (Lin. spec. p. 699.) young plant stemless, but as it grows old it becomes caulescent and erect; leaves glaucous, dotted, exactly dolabriform, *i. e.* depressed at the base, and compressed at the apex, obtuse, and somewhat emarginate; flowers on short pedicels. ♄. D. G. Native of the Cape of Good Hope.—Dill. hort. elth. f. 237. D. C. pl. grass. t. 6. Curt. bot. mag. t. 32. Haw. obs. p. 366. misc. p. 37. syn. 1. p. 219. Flowers yellow, opening in the evening. Styles 5, filiform, longer than the stamens.

Var. β, mìnus (Haw. l. c.). M. dolabriformoìdes, Haw. obs. 168.

Hatchet-form-leaved Fig-marigold. Fl. May, Nov. Clt. 1705. Pl. ½ foot.

70 M. CARI`NANS (Haw. rev. p. 90.) plant nearly stemless; leaves elongated, somewhat incurved and spreading, semiterete at the base, compressed at the apex, and dilated into a keel, whitish and dotted. ♃. D. G. Native country and flowers unknown. M. cànum, Salm-Dyck. obs. p. 20. but not of Haw. Flowers by threes, yellow, expanding in the evening. Very like *M. dolabrifórme*.

Keeling Fig-marigold. Fl. Aug. Sept. Clt. 1818. Pl. ½ ft.

71 M. SCA'PIGER (Haw. in phil. mag. dec. 1824. p. 423.) plant almost stemless; leaves carinately triquetrous, green, roughish and dotted on the margins; scape strong, 2-edged, bracteate, rather panicled. ♃. D. G. Native of the Cape of Good Hope. Flower middle-sized, yellow. Calyx 5-cleft. Stigmas 5, slender.

Scape-bearing Fig-marigold. Fl. Aug. Sept. Clt. 1823. Pl. ½ foot.

§ 10. *Gibbòsa* (from *gibbosus*, crooked-backed or bunched; back of some of the leaves). *Haw. rev. p.* 104.—*Abbreviàta, Haw. misc.* 1. *p.* 36.—*Inæquifòlia gibbòsa, Salm-Dyck. obs. p.* 18. *Plants nearly stemless. Leaves difformed, connate a great way at the base, large, unequal, one of which is short and gibbous, the other usually oblique. Flowers sessile, or on short pedicels, small, reddish. Calyx 6-cleft. Stigmas 6.*

72 M. GIBBÒSUM (Haw. obs. p. 137. misc. p. 36. rev. p. 104.) plant nearly stemless; leaves connate, difformed, of a yellowish green colour, spreading, ovate, semi-cylindrical, very rarely keeled at the apex; peduncles short, 2-edged. ♃. D. G. Native of the Cape of Good Hope. Petals reddish, with paler edges. Stigmas 6, very short. Calyx 6-lobed; lobes unequal.

Gibbous-leaved Fig-marigold. Fl. Jan. Apr. Clt. 1780. Pl. ½ ft.

73 M. LU`TEO-VÍRIDE (Haw. syn. p. 226. rev. p. 104.) stem short, prostrate, weak; leaves connate, oblong, semi-cylindrical, triquetrous at the apex, greenish-yellow; flowers sessile. ♃. D. G. Native of the Cape of Good Hope. M. pervíride β, Haw. misc. p. 37. Stem 1-2 inches. Calyx 6-cleft. Styles 6, very short, at length spreading. Petals reddish, marked by a deeper line each. Perhaps only a variety of *M. pervíride*.

Yellowish-green Fig-marigold. Fl. Jan. Clt. 1795. Pl. ¼ ft.

74 M. PERVÍRIDE (Haw. obs. p. 136. misc. p. 37. exclusive of var. β, syn. p. 227. rev. 104.) stem weak, prostrate; leaves connate, semi-cylindrically triquetrous, or somewhat ovate, very green; pedicels very short, 2-edged. ♃. D. G. Native of the Cape of Good Hope. Calyx small, 6-cleft. Petals reddish, paler than those of *M. gibbòsum*. Styles 6, much spreading, length of filaments. Stem 2-3 inches long. Leaves shorter and broader than in *M. lùteo-víride*.

Very-green Fig-marigold. Fl. Jan. Aug. Clt. 1792. Pl. pr.

75 M. PUBE'SCENS (Haw. obs. p. 138. misc. 137. syn. 227. rev. p. 104.) plant almost stemless; leaves pubescent, hoary, or silky, smooth, semi-cylindrical, oblique at the apex. ♃. D. G. Native of the Cape of Good Hope. Flowers unknown. The form of the plant agrees with the 2 preceding species, but differs in being silky or downy.

Pubescent Fig-marigold. Fl. Jan. May. Clt. 1792. Pl. ¼ ft.

§ 11. *Calamifórmia* (from *calamus*, a reed, and *forma*, form; long taper leaves). *Haw. rev. p.* 104. *Plants almost stemless. Leaves numerous, nearly terete, greenish, dotted. Flowers on short peduncles, of a dirty white colour. Calyx 5-cleft. Stigmas* 8.

76 M. CALAMIFÓRME (Lin. spec. 690.) stemless; leaves subulate, nearly terete, glaucescent, dotted, flat above; flowers on short peduncles. ♃. D. G. Native of the Cape of Good Hope.—Bradl. succ. f. 19.—Dill. elth. f. 228. D. C. pl. grass. t. 5. Haw. obs. p. 140. misc. p. 26. syn. 208. rev. 105. Calyx 5-cleft, with 3 of the lobes fleshy, and 2 of them membranous. Petals whitish. Stigmas 8, acute. Capsule 8-celled.

Reed-shaped-leaved Fig-marigold. Fl. Jul. Sept. Clt. 1717. Pl. ¼ foot.

77 M. OBSUBULA`TUM (Haw. misc. 26. syn. 208. rev. p. 105.) stemless; leaves inversely subulate, or gradually thickening towards the apex, thick, obtuse, greenish. ♃. D. G. Native of the Cape of Good Hope. Flowers unknown. Very like *M. calamifórme*.

Obsubulate-leaved Fig-marigold. Clt. 1796. Pl. ¼ foot.

§ 12. *Teretifòlia* (from *teres*, cylindrical, and *folium*, a leaf). *Haw. rev. p.* 105. *Plants stemless or subcaulescent. Leaves nearly terete, greenish, dotted. Flowers pedunculate, showy, very pale red. Calyx 4-cleft. Stigmas* 12.

78 M. CYLI'NDRICUM (Haw. obs. p. 411. misc. 27. syn. p. 209. rev. p. 102.) plant almost stemless; leaves triquetrously terete, rather glaucous, dotted, but when young more glaucous and more triquetrous; peduncles compressed at the base, bibracteate. ♃. D. G. Native of the Cape of Good Hope. Leaves 3 inches long. Peduncles 1-2 inches long. Bracteas filiform. Old stems 2 inches long, crowdedly branched. Flowers red.

Cylindrical-leaved Fig-marigold. Fl. Feb. Sept. Clt. 1792. Pl. ¼ foot.

79 M. TERETIFÒLIUM (Haw. syn. p. 210. rev. p. 105.) plant subcaulescent; leaves nearly terete or cylindrical, greenish, rather dotted: but when young polished, very green, and semiterete; peduncle nearly terete, bibracteate. ♃. D. G. Native of the Cape of Good Hope. M. cylíndricum β, Haw. misc. p. 37. Branches procumbent. Bracteas filiform. Leaves 4 inches long. Flowers red.

Terete-leaved Fig-marigold. Fl. Feb. Sept. Clt. 1794. Pl. ½ foot.

80 M. TERETIU'SCULUM (Haw. obs. 410. misc. 27. exclusive of the synonymes) plant stemless; leaves triquetrously terete, firm, thick, green, dotted. ♃. D. G. Native of the Cape of Good Hope. Leaves 2 inches long. Flowers unknown, but probably red.

Nearly terete-leaved Fig-marigold. Clt. 1794. Pl. ¼ foot.

§ 13. *Bellidiflòra* (from *bellis*, a daisy, and *flos*, a flower; the flowers bear some resemblance to those of the daisy). *Haw. rev. p.* 106. *Plants stemless or caulescent. Leaves triquetrous,*

acute at the angles, toothed at the apex. Flowers solitary, pedicellate. Petals purple on the ribs and white on the margins. Calyx 5-cleft. Capsule 5-celled. Stigmas numerous, small, hair-formed.

81 M. BELLIDIFLÒRUM (Lin. spec. p. 690.) caudex short, suffruticose; leaves triquetrous, compressed, rather acinaciform, denticulated at the apex; pedicels short. ♃. D. G. Native of the Cape of Good Hope. Petals red and white.

Var. β, glaucéscens (Haw. rev. p. 105.) leaves rather glaucous, with the teeth in 3 rows at the apex.—Dill. elth. f. 233.

Var. γ, víride (Haw. rev. p. 105.) leaves pale green, toothed beneath on the keel.

Daisy-flowered Fig-marigold. Fl. June, Aug. Clt. 1717. Pl. $\frac{1}{4}$ foot.

82 M. SUBULA'TUM (Mill. dict. ed. 8. no. 10.) caudex branched; leaves rather glaucous, triquetrously subulate, denticulated at the apex. ♃. D. G. Native of the Cape of Good Hope. Haw. syn. 208. M. bellidiflòrum símplex, D. C. pl. grass. t. 41. Flowers reddish. The plant is very like *M. bellidiflòrum*, but is much smaller and more branched.

Subulate-leaved Fig-marigold. Fl. Ju. Jul. Clt.? Pl. $\frac{1}{4}$ ft.

83 M. BURMA'NNI (Haw. rev. p. 106.) floriferous stems erect, simple; leaves triquetrous, with 3 rows of teeth at the apex; pedicels rather elongated. ♃. D. G. Native of the Cape of Good Hope.—Burm. afr. t. 25. This species is hardly known.

Burmann's Fig-marigold. Pl. $\frac{1}{4}$ foot.

§ 14. *Acùta* (from *acutus*, acute; leaves acute). *Haw. rev.* 107. *Plants stemless or nearly so. Leaves semiterete, subulate, incurved, triquetrous at the apex, green, full of pellucid dots. Flowers pedicellate; petals deep purple. Calyx 5 cleft. Stigmas* 10 *?*

84 M. ACU'TUM (Haw. misc. p. 26. syn. 207. rev. 107.) plant stemless; leaves semi-cylindrical, acute, green, full of pellucid dots, finely wrinkled. ♃. D. G. Native of the Cape of Good Hope. M. subulatoìdes, Haw. obs. p. 141. M. subrostràtum, Willd. enum. p. 529. ex Haw. Allied to *M. diminùtum*, but larger. Scape bibracteate at the base; bracteas filiform. Calyx 5-cleft. Petals purple, cleft at the apex. Stigmas 10, length of filaments.

Acute-leaved Fig-marigold. Fl. Apr. Nov. Clt. 1793. Pl. $\frac{1}{4}$ ft.

85 M. PUNCTA'TUM (Haw. obs. p. 411. rev. p. 107.) plant smooth, stemless; leaves semiterete, triquetrous at the top, flat above, full of pellucid dots, pale green, furnished with a minute white point at the apex. ♃. D. G. Native of the Cape of Good Hope. Flowers unknown. Perhaps only a variety of *M. diminùtum*.

Dotted-leaved Fig-marigold. Fl. April, Nov. Clt. 1793. Pl. $\frac{1}{4}$ foot.

86 M. DIMINU'TUM (Haw. misc. p. 26. syn. p. 230. rev. 107.) plant nearly stemless, smooth, shining; leaves semiterete, triquetrous at the apex, flat above, full of pellucid dots, terminating in a white point at the apex. ♃. D. G. Native of the Cape of Good Hope. M. corniculàtum, Haw. obs. p. 226. exclusive of the synonymes. M. lòreum, Lin. spec. and Haw. exclusive of the synonyme of Dillenius ex Haw. Flowers red or purplish.

Var. β, cauliculàtum (Haw. suppl. 90. rev. 107.) stem half erect; leaves longer, and with larger dots, but is perhaps only an old plant.

Diminished Fig-marigold. Fl. Apr. Clt. 1789. Pl. $\frac{1}{4}$ ft.

§ 15. *Macrorhìza* (from μακρος, *makros*, long, and ῥιζα, *rhiza*, a root; root large and tuberous). *D. C. prod. 3. p. 425. Plant nearly stemless. Leaves opposite, connate, triquetrous, crowded. Flowers pedicellate, white. Calyx 5-cleft, having 2 of the lobes very long. Stigmas 5. Capsule subglobose.*

87 M. MACRORHÌZUM (Haw. l. c. D. C. l. c.) stem very short; root large, tuberous; leaves connate, bluntly triquetrous, crowded, spreading; branches erect, bent; flowers 1-3 together, nearly terminal, pedicellate. ♃. D. S. Native of the Island of Bourbon, among scoria near the sea. Stems 3 inches high. Flowers small, white, numerous. The leaves have an acrid taste when eaten, as those of *Salsòla*. La Lavangere, Comm. mss. and figure. Ficoìde, De Pet. Th. mel. bot. p. 37.

Large-rooted Fig-marigold. Fl. Ju. Jul. Clt. 1823. Pl. $\frac{1}{4}$ ft.

SUBDIVISION II. CEPHALOPHY'LLA (from κεφαλη, *cephale*, a head, and φυλλον, *phyllon*, a leaf; in reference to the leaves being collected in heads at the tops of the branches). Haw. rev. 108. Stems suffruticose, decumbent. Leaves long, triquetrous, or nearly cylindrical, disposed in heads. Flowers pedunculate, yellow. Calyx 5-cleft. Stigmas 10-20.—This division is perhaps not very natural.

§ 16. *Corniculàta* (from *corniculàtus*, horned; shape of leaves). *Haw. rev. p.* 108.—*Prostràta, Haw. misc. p. 38. syn. 220.—Calamifórmia prostràta, Salm-Dyck. Caudex branched, prostrate, rather strumose at the knots, and nearly sarmentaceous. Leaves crowded at the nodi, elongated, triquetrous, or nearly cylindrical, glabrous, and without any papulæ. Flowers pedunculate, yellow. Calyx 5-cleft. Stigmas* 10-20. *Ovarium depressed.*

88 M. LÒREUM (Haw. syn. p. 229. rev. 108.) stems prostrate, rather nodose: adult ones nearly terete; leaves crowded in heads, semi-cylindrically triquetrous, elongated, recurved, rather glaucous. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 255. Peduncles solitary, an inch and a half long, bibracteolate at the base. Flowers straw-coloured. Calyx 5-6-cleft. Styles 15-18.

Var. β, congéstum (Haw. l. c.) plant more greenish; lower pair of leaves very long.

Thong Fig-marigold. Fl. Sept. Clt. 1732. Pl. pr.

89 M. DIVERSIFÒLIUM (Haw. misc. p. 38. syn. p. 230. rev. p. 108.) stems prostrate, rather nodose: adult ones robust, angular, red, and yellow; leaves very long, triquetrously semi-cylindrical, rather recurved, green, crowded in heads. ♄. D. G. Natives of the Cape of Good Hope.—Dill. elth. f. 252. M. diversiphýllum, Haw. obs. p. 228. M. corniculàtum β, Willd. Flowers pedunculate. Calyx 5-cleft. Petals of yellowish brown colour, striated by a red line on the outside. Styles 17. ex Haw.

Var. α, glaúcum (Haw. l. c.) leaves rather glaucous.

Var. β, brevifòlium (Haw. l. c.) leaves shorter than in any of the other varieties.

Var. γ, læ'te-vìrens (Haw. l. c.) leaves pale green.

Var. δ, atrovìrens (Haw. l. c.) leaves dark green.

Diverse-leaved Fig-marigold. Fl. Mar. Oct. Clt. 1726. Pl. pr.

90 M. DECI'PIENS (Haw. rev. p. 110.) stems prostrate, with rather distant nodi; leaves rather crowded, long, arcuately ascending, triquetrously semi-cylindrical, green, shining, minutely and finely wrinkled. ♄. D. G. Native of the Cape of Good Hope. Flowers pale yellow.

Deceiving Fig-marigold. Fl. May. Cl. 1820. Pl. pr.

91 M. DU'BIUM (Haw. misc. p. 39. syn. 231. rev. 110.) stems prostrate, nearly terete, with the nodi contiguous; leaves rather crowded, longish, triquetrously semi-cylindrical, ascending, green, shining; stigmas 12. ♄. D. G. Native of the Cape of Good Hope.—Bradl. succ. t. 40. Petiv. gaz. 77. f. 10. Leaves 2 inches long, but shorter than those of *M. corniculàtum*. Peduncles terminal, shorter than the leaves. Petals sulphur-

coloured on the inside, and of an orange red colour on the outside.

Doubtful Fig-marigold. Fl. May, Nov. Clt. 1800. Pl. pr.

92 M. CORNICULA'TUM (Lin. spec. 676.) stems spreading, angular, with distant nodi; leaves rather crowded, triquetrously semi-cylindrical, very long, glaucous, incurved; stigmas 12-18. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 254. D. C. pl. grass. t. 108. Haw. misc. 39. syn. 231. rev. 110. Peduncles slender, length of leaves. Calyx 5-cleft. Petals yellow, with a red dorsal line. Stigmas purple. Capsule many-celled.

Horned Fig-marigold. Fl. May. Clt. 1732. Pl. pr.

§ 17. *Procumbéntia* (*procumbens*, procumbent; plants). *Haw. in phil. mag. dec.* 1826. *p.* 329. *Old stems procumbent. Leaves connate at the base, long, semiterete or cylindrical.*

93 M. PROCU'MBENS (Haw. rev. 111.) stems flexuous, procumbent; leaves by pairs, recurved, corniculate, semi-cylindrically triquetrous, glaucescent. ♄. D. G. Native of the Cape of Good Hope. M. dùbium, Salm-Dyck. obs. p. 22. Allied to *M. trícolor*, but the leaves are shorter and more expanded, &c.

Procumbent Fig-marigold. Fl. Mar. May. Clt. 1820. Pl. pr.

94 M. TRICOLÒRUM (Haw. obs. 233. misc. 39. syn. 232. rev. 111.) stems prostrate; branches distant; leaves exactly cylindrical, acute, green; stigmas 20, short, expanded. ♄. D. G. Native of the Cape of Good Hope. M. stramíneum, Willd. enum. p. 533. ex Salm-Dyck. obs. p. 22. Flowers large, shining. Petals straw-coloured, blood-coloured at the base; anthers brown; stigmas green.

Three-coloured-flowered Fig-marigold. Fl. Apr. May. Clt. 1794. Pl. pr.

95 M. PURPU'REO-A'LBUM (Haw. in phil. mag. dec. 1826. p. 329.) branches short, angular, prostrate, furrowed, yellowish; leaves green, triquetrously semi-cylindrical, full of little dots, upper ones crowded. ♄. D. G. Native of the Cape of Good Hope. Peduncles filiform. Flowers showy; petals white, polished, naked, with a broad, dark, purple line. Styles 10, reddish.

Purple and white-flowered Fig-marigold. Fl. Aug. Clt. 1824. Pl. pr.

§ 18. *Capitàta* (from *capitatus*, headed; leaves crowded into heads at the top of the stems or branches). *Haw. syn.* 227. *rev.* 111. *Salm-Dyck. obs. p.* 30. *Caudex erect, much branched. Leaves crowded at the tops of the branches, alternate, very long, triquetrous, or semi-terete, without either dots or papulæ. Floriferous branches disposed in something like whorls, decumbent. Peduncles bracteate at the base. Flowers large, yellow. Calyx 5-lobed; lobes elongated. Petals ciliated at the base. Stigmas* 10-20. *The species are very nearly allied to each other.*

96 M. PUGIONIFÓRME (Lin. spec. 699.) stem suffruticose, erectish; branches few, terete, decumbent; leaves alternate, crowded at the tops of branches, glaucous, triquetrous; petals shorter than the calyx; stigmas 15, expanded. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 269. Bradl. succ. t. 14. D. C. pl. grass. t. 82. Haw. misc. 42. syn. 218. rev. 112. Flowers large, pale yellow. Perhaps the flesh-coloured and purple-flowered varieties mentioned in Breyn. cent. p. 164. belong to this species.

Dagger-formed-leaved Fig-marigold. Fl. July, Sept. Clt. 1714. Shrub 1 foot.

97 M. CAPITA'TUM (Haw. misc. p. 41. syn. 228. rev. 112.) stem simple, suffruticose, with the leaves alternate and crowded at its top, rather glaucous, and triquetrous; petals length of calyx; stigmas 16, straight, setaceous. ♄. D. G. Native of the Cape of Good Hope. Ker. bot. reg. 494. M. pugioniformе, Haw. obs. p. 390. Stem simple. Flowers pale yellow.

Var. β, ramígerum (Haw. l. c.) stem a little branched.

Capitate Fig-marigold. Fl. Jul. Sept. Clt. 1717. Sh. 1 ft.

98 M. BREVICAU'LE (Haw. suppl. p. 91. rev. 113.) caudex suffruticose, simple, erect, with the leaves alternate, greenish, triquetrous, and crowded at its apex. ♄. D. G. Native of the Cape of Good Hope. Breyn. cent. p. 165. Much smaller than *M. capitàtum*. Flowers pale yellow.

Short-stemmed Fig-marigold. Fl. Jul. Sept. Clt. 1820. Sh. ½ ft.

99 M. CORU'SCANS (Haw. suppl. 90. rev. 113.) stem shrubby; leaves alternate, dagger-shaped, long, glittering, crowded at the top of the stem. ♄. D. G. Native of the Cape of Good Hope. Flowers yellow.

Glittering Fig-marigold. Fl. July, Sept. Clt. 1812. Sh. 1 ft.

100 M. ELONGA'TUM (Haw. obs. p. 236. misc. p. 40. syn. p. 228. rev. p. 113.) stem weak, flexuous; leaves crowded at the top of the stem, alternate, rather glaucous, bluntly triquetrous, channelled or semiterete; root large, tuberous, fleshy. ♄. D. G. Native of the Cape of Good Hope. Flowers yellow. Stigmas 12-19. D. C. pl. grass. t. 72.

Var. β, mìnus (Haw. l. c.) corolla a little smaller; petals hardly ciliated. Ker. bot. reg. t. 493.

Var. γ, fusifórme (Haw. l. c.) root fusiform. Breyn. cent. p. 33. M. fusifórme, Haw. misc. p. 41.

Elongated Fig-marigold. Fl. May. Clt. 1793. Sh. 1 foot.

SUBDIVISION III. REPTA'NTIA (*reptans*, creeping; plants creeping). Haw. rev. p. 114. Stems suffrutescent, decumbent, creeping; branches angular. Leaves opposite, connate at the base, acutely triquetrous. Flowers pedunculate, reddish except in *M. edùle*. Stigmas 5-20.

§ 19. *Sarmentòsa* (from *sarmentosus*, full of twigs; branches numerous and twiggy). *Salm-Dyck. obs.* 38. *Haw. rev. p.* 114. *Stems shrubby, decumbent; branches rooting, sarmentaceous. Leaves opposite, connate, acutely triquetrous, dotted with serrulated margins. Peduncles usually ternate, bibracteate. Flowers middle-sized, reddish, with a deeper-coloured dorsal line. Calyx 5-cleft. Stigmas 5.*

101 M. GEMINIFLÒRUM (Haw. rev. 114.) stem shrubby, diffuse; branches elongated, slender, creeping; leaves triquetrous, nearly equal-sided, rather connate at the base, acute, and a little hooked at the apex, dotted; pedicels twin or tern; stigmas 5. ♄. D. G. Native of the Cape of Good Hope. M. geminàtum, Jacq. fragm. t. 50. but not of Haw. Petals purple. Flowers hardly half an inch in diameter. Leaves 12-15 lines long, scabrous from elevated dots.

Twin-flowered Fig-marigold. Clt. 1819. Pl. creeping.

102 M. SÍMILE (Haw. rev. p. 115.) stems shrubby, firm, procumbent; leaves triquetrous, equal-sided, glaucescent, full of very small dots, straight at the apex, longer than the internodes: margins not serrulated. ♄. D. G. Native of the Cape of Good Hope. Flowers unknown. Allied to *M. geminiflòrum*, but the branches are shorter; and to *M. láxum*, but the internodes are shorter.

Similar Fig-marigold. Clt. 1819. Pl. pr.

103 M. LA'XUM (Willd. enum. p. 536.) stem loose, diffuse, shrubby; branches creeping, very slender; leaves connate, compressed, triquetrous, more green than the others, tubercularly dotted, usually shorter than the internodes: with the margins and keel finely denticulated. ♄. D. G. Native of the Cape of Good Hope. Haw. rev. 115. Flowers reddish.

Loose Fig-marigold. Fl. May. Clt. 1820. Pl. creeping.

104 M. SARMENTÒSUM (Haw. syn. 238. rev. 115.) stem shrubby, diffuse; branches prostrate, rooting, sarmentaceous; leaves crowded, compressed, triquetrous, pale green, roughish on the edges; peduncles club-shaped above; stigmas 5. ♄. D. G.

Native of New Holland. Branches short, opposite. Leaves 2 inches long. Calyx 5-cleft. Petals reddish, with a deeper-coloured line. Styles short, recurved at the apex, greenish yellow.

Twiggy Fig-marigold. Fl. April. Clt. 1805. Pl. pr.

105 M. RIGIDICAU'LE (Haw. rev. p. 116.) stem firm, procumbent, not pendulous; leaves long, triquetrous, equal-sided, straight, with roughish margins. ♄. D. G. Native of the Cape of Good Hope. The rest unknown.

Stiffish-stemmed Fig-marigold. Fl. May, Ju. Clt. 1819. Pl. pr.

106 M. VA'LIDUM (Haw. in phil. mag. dec. 1826. p. 329.) leaves long, pale green, with roughish margins; branches robust, stiff, decumbent; flowers usually by threes; keel of bracteas entire. ♄. D. G. Native of the Cape of Good Hope. Flowers showy, rose-coloured, with a deeper coloured line in the middle.

Strong Fig-marigold. Fl. May, Ju. Clt. 1824. Pl. pr.

107 M. SCHÓLLII (Salm-Dyck. obs. 1820. p. 10. Haw. rev. p. 116.) stems firm, decumbent, sarmentose; leaves connate, compressed, triquetrous, spreadingly recurved, dotted, serrulated on the lateral angles, and on the upper part of the keel; peduncles tern, bibracteate in the middle; stigmas 5. ♄. D. G. Native of the Cape of Good Hope. M. adúncum, Jacq. fragm. t. 51. f. 2. but not of Willd. M. recúrvum, Haw. suppl. p. 90. but not of Mœnch. Petals reddish, acute, with a deeper-coloured line in the middle of each.

Scholl's Fig-marigold. Fl. May, June. Clt. 1810. Sh. dec.

§ 20. *Humíllima* (from *humillimus*, very humble). *Haw. rev. p.* 121.—*Reptántia, Salm-Dyck. obs. p.* 30.—*Reptántia humíllima, Haw. syn. p.* 241. *Stems suffruticose, and are as well as the branches humble, prostrate, and creeping, rooting at the joints. Leaves opposite, rather connate, triquetrous, usually crowded, with smooth margins. Flowers pedunculate, middle-sized, reddish. Calyx 5-cleft. Stigmas* 5.

108 M. RE'PTANS (Ait. hort. kew. vol. 2. p. 185.) stems filiform, very slender, creeping; leaves much crowded, triquetrous, acute, glaucous, scabrous from large pellucid dots. ♄. D. G. Native of the Cape of Good Hope. Flowers reddish. (ex Ait.), yellow (ex Salm-Dyck.), rarely flowering (ex Haw. obs. p. 349. misc. 80. syn. 212. rev. 121.).

Creeping Fig-marigold. Fl. Jul. Aug. Clt. 1774. Pl. cr.

109 M. CRASSIFÒLIUM (Lin. spec. p. 693.) stem semi-terete, creeping; leaves triquetrous, dotless, very green, smooth, semicylindrical at the base; peduncles a little compressed; stigmas 5, spreading. ♄. D. G. Native of the Cape of Good Hope. —Dill. elth. f. 257.—Bradl. succ. t. 38. Haw. obs. 350. misc. 78. syn. 241. rev. 122. Flowers middle-sized, deep red. Peduncles 1-2 inches long. Calyx 5-cleft. Stigmas broad at the base, and subulate at the apex.

Thick-leaved Fig-marigold. Fl. May, Aug. Clt. 1727. Pl. cr.

110 M. DE'BILE (Haw. in phil. mag. dec. 1826. p. 331.) plant smooth; branches filiform, a little compressed; leaves crowded about the knots of the creeping stems, bluntly and acinaciformly triquetrous, glaucescent. ♄. D. G. Native of the Cape of Good Hope. This species differs from *M. réptans* in being smooth, not rough. Flowers unknown.

Weak Fig-marigold. Clt. 1824. Pl. creeping.

111 M. CLAVELLA'TUM (Haw. misc. 79. syn. 242. rev. 122.) branches angular, creeping; leaves crowded, expanded, obsoletely triquetrous, firm, clavate, very blunt, mucronulate, green; peduncles rather compressed; stigmas 5, very slender. ♄. D. G. Native of New Holland. Flowers like those of *M. crassifòlium*, but more beautiful and of a deeper red. Calyx 5-cleft; stigmas setaceous, green.

Small-club-leaved Fig-marigold. Fl. June, Jul. Clt. 1803. Shrub creeping.

112 M. AUSTRA'LE (Ait. hort. kew. 2. p. 187.) stems semiterete, creeping; leaves triquetrous, glaucescent, dotted, smooth, incurved; peduncles bluntly 2-edged, bibracteate at the base; stigmas 5, subulate. ♄. D. G. Native of New Holland. Flowers middle-sized, pale red. Calyx 5-cleft. Haw. obs. p. 349. misc. 79. syn. 241. rev. 122. M. demíssum, Willd. enum. suppl. p. 36.

Southern Fig-marigold. Fl. Jul. Aug. Clt. 1773. Pl. cr.

§ 21. *Rubricaúlia* (*ruber*, red, and *caulis*, a stem; stems red). *Salm-Dyck. obs. p.* 29. *Haw. rev. p.* 116. *Stems suffruticose; branches usually reddish, erect, hardly decumbent. Leaves triquetrous, rather acinaciform, opposite, connate, rough and serrulated at the angles. Flowers pedicellate, solitary, bractless, deep red. Calyx 5-cleft. Stigmas* 5-8.

113 M. FILAMENTÒSUM (Lin. spec. 694.) stems short, decumbent; leaves compressed, triquetrous, rather acinaciform, crowded, thick, pale green, dotted, longer than the internodes, roughly serrulated on the edges; flowers solitary; stigmas 5. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 273. Haw. obs. 380. misc. 78. syn. 238. rev. 116. Flowers middle-sized, deep red. Calyx 5-cleft.

Filamentose Fig-marigold. Fl. Nov. Dec. Clt. 1795. Pl. pr.

114 M. SERRULA'TUM (Haw. misc. 77. syn. 239. rev. 117.) stem shrubby, when young erect; branches erectly decumbent; leaves compressed, triquetrous, rather acinaciform, and rather glaucous, usually longer than the internodes, with the margins minutely serrulated, but hardly cartilaginous; flowers solitary; stigmas 7-8, ramentaceous. ♄. D. G. Native of the Cape of Good Hope. Flowers reddish, and ternately disposed, as in *M. rubricaúle:* lateral ones usually abortive.

Var. β, *virídius* (Haw. l. c.) leaves green.

Serrulate-leaved Fig-marigold. Fl. Nov. Dec. Clt. 1795. Shrub pr.

115 M. RUBRICAU'LE (Haw. misc. p. 77. syn. 239. rev. 117.) stem shrubby, when young erectish; branches opposite, rather effuse; leaves compressed, triquetrous, usually shorter than the internodes, cartilaginous and serrulated on the margins; flowers solitary; stigmas 5, expanded. ♄. D. G. Native of the Cape of Good Hope. Willd. enum. p. 536. Flowers middle-sized, pale purple. There is a more dense variety, and a greenish one.

Red-stemmed Fig-marigold. Fl. Feb. Dec. Clt. 1802. Pl. pr.

§ 22. *Acinacifórmia* (from ακινακης, *akinakes*, a Persian sword or scymitar, and *forma*, form; shape of leaves). *Salm-Dyck. obs. p.* 20. *Haw. rev. p.* 118.—*Reptántia majòra, Haw. syn. p.* 233. *Stems suffruticose, robust, rather decumbent; branches angular, prostrate, or decumbent. Leaves opposite, connate a short way at the base, acinaciform, triquetrous, thick. Flowers solitary, terminal, large, reddish (or as in M. edùle yellow). Fruit fleshy. Stigmas* 6-10.

116 M. EDU'LE (Lin. spec. 695.) branches expanded, with quite entire angles; leaves equally triquetrous, dotless, a little channelled, attenuated at both ends, with the keel serrulated; stigmas 8. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. 272. Seb. thes. 1. t. 19. f. 6. Haw. obs. 392. misc. 76. syn. 234. rev. 110. Flowers large, yellow. Calyx 5-cleft. Capsule 8-celled, with the baccate calyx edible. Rarely flowering in the gardens.

Edible Fig-marigold or Hottentot Fig. Fl. July, Aug. Clt. 1690. Shrub pr.

117 M. ACINACIFÓRME (Lin. spec. 695.) stems rather procumbent, long; leaves opposite, compressed, triquetrous, acinaciform, rather curled at the edges, and roughish; flowers solitary, terminal; stigmas 12-17. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 270, 271. Andr. bot. rep. 508. Salisb. par. t. 90. Haw. obs. 397. misc. 76. syn. 233. rev. 118.

Flowers large, reddish. There are two varieties of this species, one with short and the other with longer branches.

Scymitar-formed-leaved Fig-marigold. Fl. Aug. Sept. Clt. 1714. Shrub pr.

118 M. LÆVIGA'TUM (Haw. syn. 233. rev. 118.) stems rather procumbent, long; leaves acinaciform, smooth, glaucous, with cartilaginous, entire margins. ♄. D. G. Native of the Cape of Good Hope. Flowers unknown. Allied to *M. acinaciförme*, but differs in being smaller, and the branches being angular, &c.

Smooth Fig-marigold. Fl. June. Clt. 1802. Pl. pr.

119 M. RUBROCI'NCTUM (Haw. syn. p. 284. rev. 118.) stems rather procumbent, long; leaves acinaciform, with rough red edges and keel. ♄. D. G. Native of the Cape of Good Hope. There is a variety of this species with thicker and more compressed leaves.

Red-bordered-leaved Fig-marigold. Fl. May. Clt. 1811. Pl. pr.

120 M. SUBALA'TUM (Haw. misc. 76. syn. 235. rev. 199.) branches 2-edged at the apex, somewhat undulately winged; leaves compressed, triquetrous, equal-sided, dotless, rather acinaciform, with cartilaginous margins, which are scabrous on both sides. ♄. D. G. Native of the Cape of Good Hope. Flowers unknown, but probably reddish.

Rather-winged Fig-marigold. Clt. 1796. Shrub pr.

121 M. LA'CERUM (Salm-Dyck. obs. 1820. p. 31.) stem shrubby, erect; branches erectly spreading, 2-edged; leaves rather acinaciform, acutely triquetrous, rather compressed, glaucous, full of pellucid dots: with the keel lacerately toothed; stigmas 10, very short, approximate. ♃. D. G. Native of the Cape of Good Hope. M. acinaciförme, D. C. pl. grass. t. 80. M. dimidiàtum, and probably M. làcerum, Haw. rev. 119. and 131. M. Millèri, Willd. enum. suppl. 31. and M. gladiàtum, Jacq. ex Salm-Dyck. Flowers large, red, opening in the sun; petals linear, very numerous. Calyx 5-cleft; lobes leaf-formed. Stigmas for the most part 10, but sometimes even to the number of 20.

Jagged-keeled Fig-marigold. Clt.? Shrub 1 to 2 feet.

122 M. VÌRENS (Haw. rev. 121.) stem erectish; branches at length spreading; leaves compressed, triquetrous, rather acinaciform, smooth, dotted, green, pustulate on the inside at the base, having the keel roughish at the apex. ♄. D. G. Native of the Cape of Good Hope. Flowers reddish, disposed by threes. This species hardly belongs to this section, according to Salm-Dyck.

Green Fig-marigold. Fl. June. Clt. 1821. Pl. 1 foot.

§ 23. *Carnicaúlia* (from *caro, carnis*, flesh, and *caulis*, a stem; stems fleshy while young). *Haw. in phil. mag. dec.* 1826. *p.* 330. *Stems usually elongated, weak, prostrate, and creeping: when young thick and fleshy. Leaves triquetrous, with the sides nearly equal, thick, usually soft. Flowers solitary, terminal, reddish, large, showy, and hexagynous. Capsule pulpy on the outside, even when ripe.*

123 M. ÆQUILATERA'LE (Haw. misc. 77. syn. 237. rev. 120.) stems weak, prostrate; leaves almost equally triquetrous, greenish; peduncles angular, thickening towards the top; calyx 5-cleft; stigmas 6, short, erect. ♄. D. G. Native of New Holland. Flowers showy, reddish.

Var. β, decágynum (D. C. prod. 3. p. 429.) stigmas 10; branches shorter.

Equal-sided-leaved Fig-marigold. Fl. Ju. Clt. 1791. Sh. pr.

124 M. GLAUCE'SCENS (Haw. syn. p. 236. rev. 120.) stems robust, decumbently prostrate; young leaves a little incurved, triquetrous, with the sides equal, soft, glaucous: with cartilaginous, smoothish margins; flowers solitary, sessile; stigmas 7. ♄. D. G. Native of New Holland. Branches furrowed at the top. Calyx 5-cleft. Petals pale purple.

Glaucescent Fig-marigold. Fl. July. Clt. 1804. Sh. pr.

125 M. Róssii (Haw. rev. p. 120.) stems decumbently prostrate; leaves acinaciform, or compressedly triquetrous, glaucescent, with red, smooth, cartilaginous edges. ♄. D. G. Native of Van Diemen's Land. Flowers unknown. Very like *M. glaucéscens*.

Ross's Fig-marigold. Clt. 1820. Shrub pr.

126 M. ABBREVIA'TUM (Haw. in phil. mag. dec. 1826. p. 330.) plant tufted; stems short, coarse, and prostrate, crowded; leaves acutely triquetrous, thick, green, much longer than the internodes, which are short. ♄. D. G. Native of New Holland. This species comes very near to *M. glaucéscens*, but the leaves are more crowded. Flowers not seen.

Short-stemmed Fig-marigold. Clt. 1825. Shrub pr.

127 M. VIRE'SCENS (Haw. syn. p. 236. rev. 120.) stems decumbently prostrate; leaves triquetrous, with the sides nearly equal, greenish; peduncles terminal, solitary, 2-edged, winged; calyx 4-cleft; stigmas 8, filiform. ♄. D. G. Native of New Holland. Corolla showy, pale red; petals white at the base, and obtuse at the apex.

Greenish Fig-marigold. Fl. June. Clt. 1804. Shrub pr.

Subdivision IV. Perfolia'ta (from *per*, through, and *folium*, a leaf; stem running through the leaves). Haw. rev. p. 123. Usually erect shrubs, with erect or decumbent branches. Leaves opposite, connate, and sheathing at the base, usually triquetrous towards the top, and for the most part hooked at the apex. Flowers white, red, or reddish. Calyx 5-cleft. Stigmas 5.

§ 24. *Forficàta* (from *forfex*, a pair of scissors; form and disposition of leaves). *Salm-Dyck, obs. p.* 33.—*Forficàta Geminàta, &c. Haw. Stems frutescent; branches erect or decumbent. Leaves opposite, triquetrous, compressed, scissor-shaped, erect, with the carinal angle drawn out. Flowers reddish, solitary, on short peduncles. Calyx 5-cleft; petals very narrow. Stigmas 5, short, thick.*

128 M. HETEROPHY'LLUM (Haw. misc. 67. syn. 294. rev. 128.) stem shrubby, short; branches crowded, ascending; leaves crowded, glaucous, compressed, triquetrous, rather acinaciform: with cartilaginous edges, and a jagged keel; petals unequal, shorter than the calyx, which is large and 5-horned; stigmas 5, very short. ♄. D. G. Native of the Cape of Good Hope. Willd. enum. suppl. 36. Petals white.

Various-leaved Fig-marigold. Fl. May, Aug. Clt. 1794. Shrub 1 to 2 feet.

129 M. MUTA'BILE (Haw. obs. 377. misc. 74. syn. 294. rev. 133.) stem shrubby, erect; branches 2-edged; leaves nearly distinct, crowded, triquetrous, dotted: with a cartilaginous, entire keel; petals subulate; stigmas 5, short, thick. ♄. D. G. Native of the Cape of Good Hope. Flowers reddish.

Changeable Fig-marigold. Fl. Jul. Sept. Clt. 1792. Sh. 1½ ft.

130 M. GLAUCI'NUM (Haw. suppl. 97. rev. 132.) stem shrubby, erect; leaves much crowded, compressed, triquetrous, rather acinaciform, glaucescent, entire, with subcartilaginous edges, a little dotted; petals subulate; stigmas 5, short, thick. ♄. D. G. Native of the Cape of Good Hope. Flowers reddish. Perhaps sufficiently distinct from *M. mutábile*.

Glaucous Fig-marigold. Fl. Jul. Aug. Clt.? Shrub 1½ ft.

131 M. MARGINA'TUM (Haw. obs. p. 412. misc. p. 73. syn. 294. rev. 123.) stem dwarf; branches erect; leaves triquetrous, rather acinaciform, glaucous, with whitened margins. ♄. D. G. Native of the Cape of Good Hope. Stem 4 inches high. Leaves small. Flowers unknown.

White-edged-leaved Fig-marigold. Clt. 1793. Shrub ½ ft.

132 M. INCLU'DENS (Haw. syn. 295. rev. 133.) stem shrubby: leaves triquetrous, rather deltoid, smooth, green, with a gibbous

crenulated keel; inner petals very short, and imbricated. ♄. D. G. Native of the Cape of Good Hope. Andr. bot. rep. t. 384. Sims. bot. mag. 1663. Flowers deep red, always expanded. Petals broader than in any of the allied species. Stigmas 6, thick.

Encompassing Fig-marigold. Fl. Ju. Sept. Clt. 1805. Sh. 1 to 2 feet.

133 M. FORFICA'TUM (Lin. spec. 695.) stems suffrutescent, decumbent; leaves opposite, compressed, triquetrous, green, ending in a spinulose mucrone at the apex; peduncles angular; petals in 1 series; stigmas 5, very short. ♄. D. G. Native of the Cape of Good Hope. Haw. obs. 394. descript. misc. p. 78. syn. 280. rev. 123. Jacq. vind. 1. t. 26. M. filamentòsum *β*, D. C. Petals purplish, with a deeper-coloured keel.

Scissor-leaved Fig-marigold. Fl. Sept. Oct. Clt. 1758. Shrub decumbent.

134 M. GEMINA'TUM (Haw. misc. p. 92. syn. 280. rev. 123.) stem suffruticose, dwarf; branchlets dichotomous, ascending; leaves connate a long way, triquetrous, erect, glaucous, smooth, cartilaginous at the margins. ♄. D. G. Native of the Cape of Good Hope. Flowers unknown, but probably white.

Twin-shooted Fig-marigold. Clt. 1792. Shrub 1 foot.

§ 25. *Rostellàta* (from *rostellum*, a little beak; leaves tipped with a little beak). *Haw. rev. p. 123. Stems prostrate. Leaves terete, subulate, connate at the base, recurved. Flowers white and red. Calyx 5-cleft. Stigmas 5.*

135 M. ROSTELLA'TUM (Haw. rev. 123.) stems branched, prostrate; leaves beaked, connate, semi-terete, subulate, recurved, dotted, green; peduncles clavate, bibracteate at the base; stigmas 5, spreading. ♄. D. G. Native of the Cape of Good Hope. Calyx with 5 long lobes. Corolla expanded before meridian, whitish, tipped with red.

Little-beaked-leaved Fig-marigold. Fl. Ju. Clt. 1820. Sh. pr.

§ 26. *Uncinàta* (from *uncinatus*, hooked; points of leaves). *Haw. rev. 124.—Perfoliàta, Salm-Dyck, obs. p. 24.—Perfoliàta axillària, Haw. syn. 281. Stems shrubby, erect; branches hard. Leaves opposite, dotted, connate and sheathing at the base; sheaths obconical, fleshy, covering the internodes; limbs of leaves rather triquetrous at the apex, acute, toothed under the keel. Floriferous branches axillary, 1-flowered. Flowers middle-sized, reddish. Calyx 5-cleft. Stigmas 5-7.*

136 M. PERFOLIA'TUM (Mill. dict. ed. 8. no. 19.) stem shrubby, erect, with few branches; leaves connate and sheathing at the base, rather decurrent, triquetrous, hard, whitish-glaucous, dotted, acuminated at the apex, recurved; keel tridentate beneath. ♄. D. G. Native of the Cape of Good Hope. Haw. misc. 92. syn. 281. rev. 124.—Dill. elth. 240. Bradb. succ. 46. M. forcinàtum *β*, Lin. spec. 690. D. C. pl. grass. no. 54. Flowers red.

Var. β, monacánthum (Bradl. succ. f. 26.) keel of leaves furnished with only one tooth beneath.

Var. γ, edéntulum (Haw. rev. p. 125.) keel of leaves toothless. Burm. afr. t. 26. f. 3.

Perfoliate-leaved Fig-marigold. Fl. June, Aug. Clt. 1714. Shrub 1 to 3 feet.

137 M. UNCINE'LLUM (Salm-Dyck, in litt. and Haw. rev. p. 124.) stem shrubby, erect, with numerous branches; leaves connate and sheathing at the base, rather decurrent, triquetrous, thick, whitish, dotted, recurved at the apex; keel furnished with one tooth beneath. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 239. Flowers reddish.

Small-hooked-leaved Fig-marigold. Fl. June, Aug. Clt. 1819. Shrub 1 foot.

138 M. SEMIDENTA'TUM (Haw. suppl. 95. rev. 125.) stem shrubby, with simple striated branches; leaves connate and sheathing at the base, triquetrous, compressed, white, dotted; keel furnished with 1-4 teeth. ♄. D. G. Native of the Cape of Good Hope. Salm-Dyck, obs. 1820. p. 9. Leaves 2 inches long. Flowers on short peduncles, reddish. Differs in the length of the leaves from *M. perfòliatum*.

Half-toothed-leaved Fig-marigold. Fl. Aug. Clt. 1820. Shrub 1 foot.

139 M. UNCINA'TUM (Mill. dict. ed. 8. no. 18.) stem shrubby, erect; leaves connate, and sheathing at the base, rather decurrent, green, dotted, triquetrous, furnished with 2 spines underneath at the apex. ♄. D. G. Native of the Cape of Good Hope. Bradl. succ. f. 27. M. uncinàtum α, Lin. spec. 692. D. C. pl. grass. t. 54. Flowers red.

Hooked-leaved Fig-marigold. Fl. Aug. Clt. 1725. Shrub 1 to 2 feet.

140 M. VI'RIDE (Haw. obs. p. 314. misc. 93. syn. 282. rev. 126.) stem shrubby; leaves connate and sheathing at the base, quite entire, deep green, dotless, smooth, uncinately recurved at the apex; stigmas 7, subulate. ♄. D. G. Native of the Cape of Good Hope. Peduncles clavate, bibracteate, axillary. Calyx 5-cleft. Petals pale red, expanded both by night and by day.

Green Fig-marigold. Fl. July. Clt. 1792. Shrub 1 foot.

141 M. U'NIDENS (Haw. in phil. mag. Dec. 1826. p. 331.) plant depressed, stiff; branches crowded; leaves rather acinaciform, white, with large dots; keel bearing one tooth near the top. ♄. D. G. Native of the Cape of Good Hope. Leaves less perfoliate than any other of the section. Flowers not seen.

One-toothed Fig-marigold. Clt. 1824. Shrub ½ to 1 foot.

§ 27. *Paniculàta* (from *panicula*, a panicle; disposition of flowers). *Haw. syn. 283. Salm-Dyck, obs. p. 33.—Vaginàta, Lineàta, and Tumídula, Haw. rev. 126-129. Shrubby, erect; branches hard. Leaves connate and sheathing at the base, with the longitudinal lines of the sheath more or less distinct, for the most part glaucous and triquetrous. Flowers panicled, numerous. Peduncles bracteate. Calyx 5-cleft. Stigmas 5. Petals white, rarely reddish.*

142 M. TUMÍDULUM (Haw. syn. p. 286. rev. p. 129.) stem erect, with spreading branches; leaves connate and sheathing at the base, remote, green, smooth, rather recurved at the apex; sheaths tumid at the top. ♄. D. G. Native of the Cape of Good Hope. Leaves an inch and a half long. Flowers reddish.

Tumid-sheathed Fig-marigold. Fl. March. Clt. 1802. Shrub 2 feet.

143 M. FOLIÒSUM (Haw. misc. 97. syn. 287. rev. 130.) stem erect, much branched; branches crowded, hardly erect; leaves connate and sheathing at the base, rather glaucous, smooth, crowded, obtuse, ending in a rather recurved mucrone; sheaths thickened at the top. ♄. D. G. Native of the Cape of Good Hope. Leaves an inch long. Petals reddish, with a deeper coloured line. Stigmas 5, expanded at length.

Leafy Fig-marigold. Fl. Sept. Clt. 1802. Shrub 2 to 3 ft.

144 M. UMBELLA'TUM (Lin. spec. 689.) stem erect, with erectly spreading branches; leaves connate and sheathing at the base, remote, nearly terete, and rather glaucous, scabrous from dots, slender, recurved at the apex; sheaths tumid at the apex. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 266. Haw. obs. p. 336. misc. 97. syn 287. rev. 129. Leaves 1-2 inches long. Peduncles furnished with 2 bracteas. Flowers middle-sized, white. Stigmas 5, erect.

Var. β, apétalum (Haw. rev. p. 129.) petals wanting. M. anómalum, Willd. enum. p. 531. suppl. p. 36.

Umbellate-flowered Fig-marigold. Fl. June, Sept. Clt. 1727. Pl. 2 to 3 feet.

145 M. IMBRICA'TUM (Haw. obs. p. 317. misc. 96. syn. 285.

rev. 128.) stem and branches erect, subtetragonal; leaves connate and sheathing at the base, glaucous, remote, smooth, dotted, rather compressed, triquetrous; calyx turbinate, much attenuated at the base. ♄. D. G. Native of the Cape of Good Hope. Peduncles bracteate even to the calyx. Corolla white, nearly an inch in diameter. Leaves nearly an inch long.

Var. β, màjus (Haw. syn. 285.) leaves green, an inch and a half long.

Imbricated-leaved Fig-marigold. Fl. July. Clt. 1792. Shrub 2 to 3 feet.

146 M. MULTIFLÒRUM (Haw. obs. p. 318. misc. 96. syn. 285. rev. p. 128.) stem and branches erect; leaves connate and sheathing at the base, remote, glaucous, somewhat compressed, triquetrous, smooth, dotted; calyx cylindrical, hardly attenuated at the base. ♄. D. G. Native of the Cape of Good Hope. Peduncles bracteate even at the calyx. Flowers white, larger than those of M. imbricàtum.—Pluk. phyt. t. 117. f. 1.

Var. β, rùbrum (Haw. suppl. 95.) flowers reddish; leaves greenish. Perhaps a proper species.

Var. γ, mìnus (Haw. rev. p. 128.) leaves glaucous; calyx turbinate, much attenuated at the base. Perhaps a variety of *M. imbricàtum.*

Var. δ, pàtens (Haw. l. c.) stem spreading; flowers solitary. M. pàtens, Willd. enum. suppl. p. 37.

Var. ε, nítens (Haw. l. c.) smooth; branches spreading; leaves green. Perhaps a proper species.

Many-flowered Fig-marigold. Fl. July, Sept. Clt. 1792. Shrub 2 to 3 feet.

147 M. RÍGIDUM (Haw. misc. 95. syn. 283. rev. 127.) stem erect; branches very stiff, spreading a little; leaves connate, and sheathing at the base, horizontal, and are, as well as the sheaths, glabrous, but with the keel scabrous at the apex. ♄. D. G. Native of the Cape of Good Hope. Allied to *M. tenéllum.* Leaves 3 lines long. Peduncles bracteate nearly to the apex. Petals snow white, shining.

Stiff Fig-marigold. Fl. Aug. Clt. 1793. Shrub 1 foot.

148 M. TENE'LLUM (Haw. obs. 315. misc. 94. syn. 283. rev. 127.) stem erect, bushy; branches filiform, decumbent; leaves connate and sheathing at the base, rather spreading, slender, and are, as well as the sheaths, scabrous at the margins. ♄. D. G. Native of the Cape of Good Hope. Flowers panicled, snow white. Calyx 4-5-cleft. Stigmas 5, erect, subulate. Leaves 3 lines long, glaucous.

Pliant Fig-marigold. Fl. Aug. Clt. 1792. Shrub 1 foot.

149 M. CU'RTUM (Haw. syn. p. 334. rev. 126.) stem erect, bushy; leaves connate and sheathing at the base, usually approximate, incurved, smooth, green, with the angles rough at the top. ♄. D. G. Native of the Cape of Good Hope. Flowers unknown, but probably white.

Var. β, polìtum (Haw. rev. p. 126.) less smooth, and leaves shorter. M. vaginàtum β, Haw. syn. p. 284. Perhaps a proper species according to Haw. in phil. mag. 64. p. 424.

Var. γ, mìnus (D. C. prod. 3. p. 432.) smaller in all its parts. M. hamàtum, Willd. ex Haw. Perhaps a proper species.

Short-sheathed Fig-marigold. Shrub 1 to 1½ foot.

150 M. ACUTA'NGULUM (Haw. in phil. mag. 64. p. 424.) stem erect, bushy; leaves connate and sheathing at the base, forming a kind of rectangle, triquetrous, acuminated, incurved, green, with roughish margins. ♄. D. G. Native of the Cape of Good Hope. Allied to *M. cúrtum*, but much more dwarf. Flowers unknown.

Acute-angled Fig-marigold. Clt. 1821. Shrub ½ to 1 foot.

151 M. VAGINA'TUM (Haw. misc. 95. syn. 284. exclusive of var. β, rev. 127. but not of Lam.) stem erect, bushy; leaves spreading, straight, remote, triquetrous, rather recurved at the apex, and are, as well as the sheaths, green and glabrous, but with the angles rough near the top. ♄. D. G. Native of the Cape of Good Hope. Flowers panicled, white, small, numerous. Leaves an inch long.

Sheathed Fig-marigold. Fl. July, Aug. Clt. 1802. Shrub 1½ foot.

152 M. PARVIFLÒRUM (Haw. misc. 95. syn. 284. rev. 127. but not of Jacq.) stems and branches erect; leaves connate and sheathing at the base, glabrous, erectish; keel finely serrulated. ♄. D. G. Native of the Cape of Good Hope. Peduncles bracteate even to the calyx. Corolla white, small. Leaves half an inch long.

Small-flowered Fig-marigold. Fl. Aug. Clt. 1800. Shrub 1 to 2 feet.

153 M. LINEOLA'TUM (Haw. rev. p. 130.) stem short, depressed; branches spreading; leaves connate, incurved and a little recurved, obtuse, triquetrous, with nearly equal sides, and having the keel roughish at the apex; sheaths with a short impressed line. ♄. D. G. Native of the Cape of Good Hope. Flowers small, terminal at the tops of the branches, solitary. Peduncles an inch long, compressed, smooth, bibracteate at the base. Calyx 5-cleft, wrinkled. Petals in one series, obtuse, reddish, with a deeper coloured middle line, expanded, rather incurved. Stamens collected; filaments white at the base, and reddish at the apex; anthers pale yellow. Styles 5, subulate, diverging in a stellate manner. This is rather an anomalous species, but it approaches nearest to the section *Uncinàta.*

Var. β, mìnus (Haw. l. c.) margins of leaves roughish.

Var. γ, nítens (Haw. l. c.) leaves shining, greener.

Lined-sheathed Fig-marigold. Fl. Jul. Sep. Clt. 1819. Sh. ½ ft.

SUBDIVISION V. TRIQUE'TRA (from *triquetrus*, triangular; triangular leaves). Haw. rev. 135. Subshrubs. Leaves opposite, distinct more or less, triquetrous. Flowers usually solitary, terminal. Calyx 5-cleft. Stigmas 5.

§ 28. *Deltoìdea* (in reference to the leaves having the outline of a Greek Δ). *Salm-Dyck, obs. 32.—Muricàta, Haw. rev.* 133.—*Carinàlia, Haw. syn. 292. exclusive of some species. Stems shrubby, branched, erect. Leaves opposite, nearly distinct, glaucous, deltoid, that is, short, thick, and triquetrous: with the angles muricately toothed. Flowers numerous, aggregate, rose-coloured, small, and sweet-scented.*

154 M. CAULE'SCENS (Mill. dict. ed. 8. p. 12.) stem erect, branched; leaves much crowded, glaucous, rather long, triquetrously deltoid, with the sides hardly toothed, and the keel entire. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 243, 244. M. cauléscens, Haw. obs. 367. misc. 74. syn. 296. rev. 133. M. deltoìdes β símplex, D. C. pl. grass. no. 53. Flowers red, sweet-scented. Stigmas 5, short, thick, erect.

Caulescent Fig-marigold. Fl. May, July. Clt. 1731. Shrub 1½ foot.

155 M. DELTOÌDES (Mill. dict. ed. 8. p. 13.) stem erect, branched; leaves crowded, very glaucous, triquetrous, deltoid, trifariously toothed; keel of the bracteas and the lobes of the calyx entire. ♄. D. G. Native of the Cape of Good Hope. D. C. pl. grass. t. 53.—Dill. elth. f. 245. and 247. M. deltoìdes α, Lin. spec. 690. Haw. misc. 74. syn. 296. rev. 133. Flowers red. Very like *M. cauléscens.*

Deltoid-leaved Fig-marigold. Fl. May. Clt. 1731. Sh. 1½ ft.

156 M. MURICA'TUM (Haw. obs. p. 364. misc. 75. syn. 297. rev. 133.) stem erect, branched; leaves crowded, deltoid, glaucous, and are, as well as the bracteas, and lobes of calyx trifariously denticulated. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 246. Flowers red. Very like the two

preceding species, but smaller. Stigmas erect, hardly the length of the filaments. Capsule more depressed.

Muricated Fig-marigold. Fl. May. Clt. 1731. Sh. 1½ foot.

§ 29. *Falcàta* (from *falcatus*, hooked; leaves hooked or falcate). *Haw. misc. p.* 69.—*Lunàta and Falcàta, Salm-Dyck, obs.* 31. *and* 32. *Lunàta, Pallidiflòra, and Glomeràta, Haw. rev.* 135. 138. *Stems fruticose or suffruticose; branches erect or divaricate. Leaves opposite, distinct, compressed, triquetrous, falcate, glaucous, usually dotted. Flowers pedunculate, flesh-coloured or pale red.*

* *Flowers aggregate, reddish.*

157 M. MA'XIMUM (Haw. obs. p. 402. misc. 66. syn. 292. rev. 135.) stem woody, erect, bushy; leaves crowded, large, very much compressed, triquetrous, incurvedly half-moon shaped, quite glaucous, obtuse, full of pellucid dots, half-stem-clasping. ♄. D. G. Native of the Cape of Good Hope. Andr. bot. rep. t. 358. Willd. enum. 539. Flowers small, terminal. Peduncles bibracteate. Calyx 5-cleft. Corolla reddish.

Largest Fig-marigold. Fl. March, Aug. Clt. 1787. Sh. 1½ ft.

158 M. LUNA'TUM (Willd. enum. p. 538.) stem woody, erect; branches aggregate; leaves small, much crowded, dotless, rather connate, compressed, triquetrous, incurvedly half-moon shaped. ♄. D. G. Native of the Cape of Good Hope. Haw. rev. 136. Flowers rose-coloured.

Lunate-leaved Fig-marigold. Fl. July. Clt. 1812. Sh. 1 ft.

159 M. FALCIFÓRME (Haw. syn. 299. rev. 127.) stem suffruticose, at length decumbent; leaves much crowded, small, thick, falcate, acinaciform, glaucous, largely toothed; flowers somewhat fastigiate. ♄. D. G. Native of the Cape of Good Hope. Flowers reddish, showy, an inch and a half in diameter.

Sickle-formed-leaved Fig-marigold. Fl. July, Aug. Clt. 1805. Shrub 1½ foot.

160 M. FALCA'TUM (Lin. spec. 694.) stem woody, erect; branches numerous, panicled, filiform; leaves minute, distinct, compressed, triquetrous, falcate, rather glaucous. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 275. and 276. Haw. obs. 366. misc. 72. syn. 298. rev. 136. Flowers small, numerous, pale red, expanded through the day, sweet scented.

Falcate-leaved Fig-marigold. Fl. June, Aug. Clt. 1727. Shrub 1 foot.

161 M. VIRGA'TUM (Haw. misc. p. 88. syn. 290. rev. 142.) stem suffruticose, weak; branches twiggy, distant; leaves compressed, triquetrous, acute, rather glaucous, remote, dotted; flowers few. ♄. D. G. Native of the Cape of Good Hope. M. compréssum, Haw. obs. 416. not 326. Flowers small, light red. Stigmas 5, longer than the filaments, subulate, revolute. Peduncles bractless.

Twiggy Fig-marigold. Fl. Feb. Apr. Clt. 1793. Sh. 2 to 3 ft.

* * *Flowers solitary, rose-coloured or pale red.*

162 M. DECU'MBENS (Haw. obs. 352. misc. 69. syn. 300. rev. 136.) branches much crowded, decumbent; leaves compressed, triquetrous, incurved, attenuated at both ends, very glaucous. ♄ D. G. Native of the Cape of Good Hope. Flowers 2 inches in diameter, almost white, or very pale red.

Decumbent Fig-marigold. Fl. Aug. Oct. Clt. 1759. Shrub decumbent.

163 M. INCU'RVUM (Haw. misc. p. 69. syn. 300. rev. 136.) stem suffruticose, erect; branches slender, effuse, leafy; leaves compressed, triquetrous, very glaucous, attenuated at both ends, acinaciform. ♄. D. G. Native of the Cape of Good Hope. Flowers pale red.

Var. β, dilàtans (Haw. syn. 300. rev. 137.) leaves gibbously dilated below, at length deflexed.

Var. γ,ròseum (Willd. enum. p. 535.) leaves obtuse, attenuated at the base.

Var. δ, multiradiàtum (Jacq. fragm. t. 53. f. 2.) leaves acute, spreading, blunt on the back.

Incurved-leaved Fig-marigold. Fl. June. Clt. 1802. Sh. 1½ ft.

164 M. CONFE'RTUM (Haw. syn. p. 301. rev. 137.) stem erect, much branched; leaves triquetrous, crowded, robust, incurved, very glaucous. ♄. D. G. Native of the Cape of Good Hope. Flowers showy, pale red. Perhaps only a variety of *M. incúrvum*.

Crowded Fig-marigold. Fl. Sept. Oct. Clt. 1805. Sh. 1½ ft.

§ 30. *Stèna* (from στενος, *stenos*, narrow; leaves and petals). *Haw. in phil. mag. Sept.* 1831. *Small subshrubs, with the branches nearly half a foot high, effuse, and are, as well as the leaves, filiform. Petals very narrow, or setaceous, very pale red.*

165 M. STE'NUM (Haw. in phil. mag. 1831. p. 420.) branches effusely decumbent, flexuous, filiform; leaves slender, falcately incurved, triquetrously terete, mucronate, with few dots, glaucescent; flowers 1 or 3 together, terminal. ♄. D. G. Native of the Cape of Good Hope. Flowers expanding before meridian, of a violaceous reddish-colour.

Narrow Fig-marigold. Fl. Aug. Clt. 1829. Shrub ½ foot.

166 M. DE'BILE (Haw. in phil. mag. Nov. 1826. p. 331.) smooth; branches filiform, a little compressed; leaves crowded at the nodes of the reptant stems, bluntly and acinaciformly triquetrous, glaucescent; flowers few, terminal. ♄. D. G. Native of the Cape of Good Hope. Flowers very pale red, or nearly white, expanding before meridian.

Weak Fig-marigold. Fl. Aug. July. Clt. 1824. Pl. creeping.

§ 31. *Microphýlla* (from μικρος, *micros*, small, and φυλλον, *phyllon*, a leaf; in reference to the small leaves of the species). *Salm-Dyck, obs.* 33. *Haw. rev.* 134. *syn.* 297. *exclusive of some species. Plants small, suffruticose, much branched; branches very humble, procumbent, divaricate. Leaves very small, connate, triquetrous, mucronate, crowded, remaining on the plant even when dried. Flowers solitary, small, reddish.*

167 M. MICROPHY'LLUM (Haw. obs. 417. syn. 297. rev. 134.) stem short, densely branched, decumbent; leaves connate, triquetrous, acuminated, a little awned, green, dotted, pustulate on the inside at the base; flowers solitary on short peduncles. ♄. D. G. Native of the Cape of Good Hope. Flowers small, reddish. Calyx 5-cleft. Stigmas 5-6, green, with spreading subulate tops.

Small-leaved Fig-marigold. Fl. May. Clt. 1795. Sh. dec.

168 M. MUCRONA'TUM (Haw. misc. 73. syn. 297. rev. 134.) stem very short, erect, branched; leaves oblong-ovate, triquetrous at the apex, connate at the base, glaucescent, terminating in a white mucrone, coarsely dotted. ♄. D. G. Native of the Cape of Good Hope. Flowers unknown. Leaves 3 lines long.

Mucronate-leaved Fig-marigold. Clt. 1794. Sh. ¼ to ½ ft.

169 M. PYGMÆ'UM (Haw. suppl. 99. rev. 134.) stem very short, branched; leaves connate at the base, oblong-ovate, semiterete, awnless, in winter united nearly to the top. ♄. D. G. Native of the Cape of Good Hope. Flowers unknown, but probably pale red.

Pygmy Fig-marigold. Clt. 1805. Shrub ¼ foot.

170 M. PULCHE'LLUM (Haw. misc. 72. syn. 298.) stems decumbent; leaves acutely triquetrous, with equal sides, somewhat boat-shaped, hoary, obsoletely dotted, ciliated with pubescence on the angles, but especially on the keel, terminating in a recurved mucrone. ♄. D. G. Native of the Cape of Good Hope. M. canéscens, Haw. rev. 135. M. pulchéllum, Willd. enum. 537. Corollas small, red. Stigmas 5, subulate, longer than the filaments, greenish, recurved at the apex.

Var. β, revolùtum (Haw. rev. p. 135.) branches secund, recurved.

Neat Fig-marigold. Fl. April. Clt. 1793. Shrub dec.

§ 32. *Scábrida* (a dim. of *scaber*, rough; rough or scabrous leaves). *Haw. misc.* 71.—*Scàbra, Salm-Dyck, obs.* 27.—*Asperifòlia, Haw. rev.* 138. *Stems suffruticose; branches expanded, filiform. Leaves more or less triquetrous, rather compressed, scabrous from dots, usually a little incurved. Flowers pedunculate, reddish, middle-sized.*

* *Stamens collected.*

171 M. SCA'BRUM (Lin. spec. 692.) stem shrubby, branched; leaves rather triquetrous, green, straight, very rough from shining warts; lobes of calyx ovate, acuminated; petals crenated at the apex; stamens collected. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 251.—Haw. obs. 345. misc. 71. syn. 267. rev. 138. Flowers rose-coloured.

Var. β, purpùreum; flowers purple.

Scabrous Fig-marigold. Fl. July. Clt. 1731. Sh. 1 foot.

172 M. VERSI'COLOR (Haw. misc. 71. syn. 268. rev. 139.) stem shrubby, branched; leaves almost triquetrous, glaucescent, scabrous from warts; lobes of calyx ovate, acuminated; petals somewhat bidentate at the apex; stamens collected. ♄. D. G. Native of the Cape of Good Hope. Petals variable, expanding in the heat of the sun, of a shining white or silvery colour, but when closed in the morning and evening they are pale reddish.

Party-coloured-flowered Fig-marigold. Fl. May, Aug. Clt. 1795. Shrub 1 foot.

173 M. RETROFLE'XUM (Haw. misc. 71. syn. 269. rev. 139.) stem suffruticose; branches decumbent; bark white; leaves rather triquetrous, very glaucous, scabrous; lobes of calyx retroflexed; petals distant; stamens collected. ♄. D. G. Native of the Cape of Good Hope. M. emarginatoides, Haw. obs. 343. M. leptàleum, Haw. rev. 140. and perhaps M. élegans, Jacq. schœnbr. 4. p. 18. which is referred to by the Prince de Salm-Dyck, and therefore it is M. defléxum of Salm-Dyck, obs. 27. but not of Haworth. Petals reddish.

Retroflexed-calyxed Fig-marigold. Fl. May, Oct. Clt. 1724. Shrub dec.

174 M. I'MBRICANS (Haw. suppl. p. 94.) stem erect, shrubby; leaves linear, obsoletely triquetrous, smoothish, of a whitish glaucous-colour, imbricately crowded at the tops of the canescent branches. ♄. D. G. Native of the Cape of Good Hope. Flowers red. Said to be allied to *M. retroflexum.*

Imbricating-leaved Fig-marigold. Fl. May, Oct. Clt. 1818. Shrub 1 foot.

175 M. DEFLE'XUM (Ait. hort. kew. 2. p. 187.) stems shrubby, rather crowded, deflexed; leaves rather triquetrous, glaucous, roughish, attenuated downwards; petals numerous, much imbricated; stamens collected. ♄. D. G. Native of the Cape of Good Hope. Haw. obs. 347. misc. 71. syn. 269. exclusive of the synonymes, rev. 140. There are two varieties of this species, the one having the petals pale reddish and purple at the base, the other having the petals of a deeper colour.

Deflexed-branched Fig-marigold. Fl. July, Oct. Clt. 1774. Shrub 1 foot.

* * *Stamens expanded.*

176 M. POLYA'NTHUM (Haw. syn. 270. rev. 140.) branches bushy, expanded, crowded; bark on young stems rufous; leaves small, glaucous, triquetrous, scabrous; flowers very numerous, panicled; petals imbricated. ♄. D. G. Native of the Cape of Good Hope. Flowers small, very pale red. M. fléxile, Haw. rev. 141. is only a variety of this species in a younger state, which has been confirmed by Salm-Dyck.

Many-flowered Fig-marigold. Fl. Aug. Clt. 1803. Shrub 1 to $1\frac{1}{2}$ foot.

177 M. POLYPHY'LLUM (Haw. rev. 141.) branches bushy, decumbent, assurgent; leaves much glomerated, rather robust, somewhat incurvedly recurved, clavately and bluntly triquetrous, compressed, scabrous from dots, glaucous. ♄. D. G. Native of the Cape of Good Hope. Flowers pale red. Stamens expanded, as in *M. emarginàtum.* Like *M. defléxum*, but double the size.

Many-leaved Fig-marigold. Fl. June, Oct. Clt. 1819. Shrub 1 to 2 feet.

178 M. VIOLA'CEUM (D. C. pl. grass. t. 84.) stem shrubby, erect; branches expanded; leaves triquetrously semi-terete, rough from dots, acute, glaucous; peduncles 1-flowered, naked or bracteate at the very base; lobes of calyx spreading, unarmed, but prickle-formed. ♄. D. G. Native of the Cape of Good Hope. Haw. rev. 141. M. parvifòlium, Lam. dict. 2. p. 482. exclusive of the synonymes. M. puniceum, Jacq. schœnbr. t. 442. Flowers flesh-coloured, expanding in the heat of the sun. Stamens not collected, but rather expanded.

Violaceous-branched Fig-marigold. Fl. June, Oct. Clt. 1820. Shrub 1 to 2 feet.

179 M. EMARGINA'TUM (Lin. spec. 692.) branches expanded; leaves triquetrous, scabrous, glaucescent; peduncles bibracteate; lobes of calyx unarmed, but spine-formed; petals deeply emarginated at the apex. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 250.—Haw. obs. 340. misc. 70. syn. 268. rev. 142. Flowers pale red, like those of *M. violàceum.* Stamens expanded.

Emarginate-petalled Fig-marigold. Fl. June, Aug. Clt. 1732. Shrub 1 to 2 feet.

§ 33. *Bracteàta* (*bracteatus*, bracteate; flowers girded by bracteas). *Salm-Dyck, obs.* 28. *Haw. rev.* 143.—*Adúnca Inclaudéntia, Haw. syn.* 288. *Stems erect, shrubby; branches much compressed. Leaves distinct, triquetrous, hooked at the apex, more or less scabrous from dots. Flowers girded by 2-4 broadly ovate keeled bracteas, which clasp the calyx, solitary, reddish, always expanded; inner petals thread-formed.*

180 M. BRACTEA'TUM (Ait. hort. kew. 2. p. 185.) stem shrubby, erect; branches compressed, of a reddish brown colour; leaves green, triquetrous; bracteas 4, broadly ovate, keeled, clasping the calyx. ♄. D. G. Native of the Cape of Good Hope. Haw. misc. 90. syn. 289. rev. 143. Lodd. bot. cab. 251. Petals reddish, white at the base.

Bracteate Fig-marigold. Fl. July, Oct. Clt. 1774. Shrub $1\frac{1}{2}$ foot.

181 M. A'NCEPS (Haw. syn. 289. rev. 143.) stem shrubby; branches decumbent, 2-edged, of a brownish canescent-colour; leaves acinaciformly triquetrous: sides rather membranous below; dots large, pellucid, elevated. ♄. D. G. Native of the Cape of Good Hope. Flowers of a deep red colour.

Var. β, pállidum (Haw. rev. 143.) branches of a rufous coppery colour; leaves rather incurved; petals pale reddish.

Two-edged-branched Fig-marigold. Fl. Sept. Oct. Clt. 1811. Shrub $1\frac{1}{2}$ foot.

182 M. GRA'CILE (Haw. rev. 144,) stem shrubby; branches very slender, straight; leaves glaucescent, slender, rather scabrous; bracteas ovate, acute, almost clasping the calyx. ♄. D. G. Native of the Cape of Good Hope. M. stellàtum, Haw. obs. 416. misc. 91. syn. 290. but not of D. C. There are varieties of this species with deep red, and pale red flowers.

Slender Fig-marigold. Fl. Aug. Nov. Clt. 1794. Sh. $1\frac{1}{2}$ ft.

183 M. RADIA'TUM (Haw. obs. 232. misc. 90. syn. 289. rev. 144.) stem shrubby; branches crowded; bark canescent; leaves glaucescent, attenuated, and hooked at the apex; bracteas

broadly ovate, clasping the peduncles above. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 249. Corolla reddish, larger than those of its allies.

Ray-flowered Fig-marigold. Fl. Aug. Nov. Clt. 1732. Sh. 1½ foot.

184 M. COMPRE'SSUM (Haw. obs. 326. not 416. misc. 91. syn. 289. rev. 144.) stem shrubby; branches rather compressed; leaves glaucescent, triquetrous, with equal sides, very rough; bracteas ovate, acute, clasping the tops of the peduncles. ♄. D. G. Native of the Cape of Good Hope. Flowers middle-sized, reddish. Perhaps M. compréssum, Horn. hort. hafn. 2. p. 454. is the same species.

Compressed-branched Fig-marigold. Fl. July, Sept. Clt. 1792. Shrub 1½ foot.

185 M. PA'TULUM (Haw. syn. p. 334. rev. 145.) stem shrubby; branches hardly erect; leaves linear, half erect, glaucescent, roughish from pellucid dots. ♄. D. G. Native of the Cape of Good Hope. This species comes near to *M. compréssum*, but is less stiff, the leaves shorter and thicker, and the flowers are larger and paler.

Spreading Fig-marigold. Fl. Oct. Nov. Clt. 1811. Sh. 1½ ft.

186 M. A'SPERUM (Haw. rev. p. 145.) stem shrubby; leaves compressed, triquetrous, longish, of a bluish green-colour, full of pellucid dots, very scabrous, hooked at the apex; keel furnished with one tooth. ♄. D. G. Native of the Cape of Good Hope. Flowers unknown. Perhaps this species does not belong to the present section.

Rough Fig-marigold. Clt. 1818. Shrub 1½ foot.

187 M. SERRA'TUM (Lin. spec. 696.) stem erect, branched; leaves opposite, distinct, triquetrous, subulate, having the carinal angle serrated, with the serratures turned backwards. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 238. Flowers solitary, terminal, pedunculate. Calyx 5-cleft, attenuated at the base. Petals yellow, copper-coloured at the apex. Stigmas 5, short, obtuse, approximate. This species was formerly cultivated by Dillenius, but has now vanished from the gardens, and is therefore very little known.

Serrated-keeled Fig-marigold. Fl. June, July. Clt. 1707. Shrub 1 to 2 feet.

§ 34. *Conférta* (from *confertus*, crowded thick together; branches). *Haw. syn.* 240. *Salm-Dyck, obs.* 29.—*Exímia and Blánda, Haw. rev.* 145-147. *Stems shrubby; branches crowded, ascending. Leaves opposite, rather connate, crowded, triquetrous, entire, acute, with the angles smooth. Flowers pedunculate, solitary or by threes, showy, expanding in the sun, reddish or pale rose-coloured.*

188 M. AMŒ'NUM (Salm-Dyck in litt. ex D. C. prod. 3. p. 436.) stem branched, shrubby; leaves green, crowded, elongated, nearly triquetrous, bluntish, with a mucrone; flowers terminal, showy, disposed by threes. ♄. D. G. Native of the Cape of Good Hope. Flowers red.

Pleasing Fig-marigold. Shrub 1 foot.

189 M. FORMÒSUM (Haw. rev. 145.) stems suffruticose, humble; branches rather decumbent, elongated; leaves triquetrous, long, green, glittering in sunshine, much crowded, but more remote on the branches; flowers terminal, disposed by threes; stigmas 5-6, shorter than the filaments, rather lanceolate. ♄. D. G. Native of the Cape of Good Hope. Petals beautiful red, blunt.

Beautiful Fig-marigold. Fl. Aug. Sept. Clt. 1828. Sh. 1 ft.

190 M. SPECTA'BILE (Haw. obs. 385. misc. 68. syn. 240. rev. 145.) stems rather humble; floriferous ones ascending or erect; leaves glaucous, triquetrous, and are, as well as the branches, crowded; stigmas 5, obovate, one-half shorter than the stamens, which are white. ♄. D. G. Native of the Cape of Good Hope. Curt. bot. mag. t. 396. D. C. pl. grass. t. 153. Leaves rather connate, sometimes furnished with one tooth at the top of the keel. Flowers beautiful reddish, 2 inches in diameter.

Showy Fig-marigold. Fl. May, Aug. Clt. 1787. Shrub 1 ft.

191 M. CONSPÍCUUM (Haw. syn. 240. rev. 146.) floriferous stems erect; leaves green, glittering in sun-shine, triquetrous, and are, as well as the branches, crowded; stigmas lanceolate, length of the stamens. ♄. D. G. Native of the Cape of Good Hope. M. conspícuum, Spreng. nov. prov. 27. but the leaves are there said to be semi-terete. Flowers beautiful red.

Conspicuous Fig-marigold. Fl. Sept. Oct. Clt. 1806. Sh. 1 ft.

192 M. TURBINA'TUM (Jacq. hort. vind. t. 476.) stem shrubby, branched, diffuse; leaves glaucous, elongated, acute, triquetrous, crowded; flowers on long peduncles, reddish; ovarium contracted into a neck beneath the calyx. ♄. D. G. Native of the Cape of Good Hope. Petals numerous, linear, spreading much. Salm-Dyck. in litt.

Turbinate Fig-marigold. Shrub 1 foot.

193 M. BLA'NDUM (Haw. suppl. 95. rev. 147.) stem shrubby; branches numerous, compressed, ascending; leaves compressed, triquetrous, crowded, narrow, acutish, smooth; peduncles equal, longer than the bracteas; stigmas 5, short, ramentaceous. ♄. D. G. Native of the Cape of Good Hope. Ker. bot. reg. 582. Lodd. bot. cab. 599. Flowers large, at first white, but at length rose-coloured or pale red. Branches of a rufous chestnut colour. There are varieties of this species with glaucous and green leaves.

Bland Fig-marigold. Fl. June. Clt. 1810. Shrub 1 foot.

194 M. CURVIFÒLIUM (Haw. rev. p. 47.) stem shrubby, branches robust, terete; leaves compressed, triquetrous, glaucescent; peduncles clavate, length of bracteas; petals incurved. ♄. D. G. Native of the Cape of Good Hope. Branches rufous or bay-coloured. Leaves twice the thickness of those of *M. blándum*, to which it is nearly allied, and the corolla is less open. It is, however, perhaps only a variety of it.

Curved-leaved Fig-marigold. Fl. Ju. Clt. 1818. Sh. 1½ ft.

§ 35. *Cymbifórmia* (from *cymba*, a boat, and *forma*, form; leaves). *Salm-Dyck, obs. p.* 33. *Haw. rev.* 149.—*Tardiflòra, Haw. syn.* 261. *Stems fruticose or suffruticose, with straight, usually decussate branches. Leaves small, distinct, turgidly triquetrous, obtuse, boat-shaped, short. Flowers solitary, reddish, rose-coloured, or yellow.*

195 M. TETRAGÒNUM (Thunb. prod. 91.) stem erect, tetragonal, shrubby; leaves cylindrically trigonal. ♄. D. G. Native of the Cape of Good Hope. Haw. rev. 149. Corolla yellow. This species is omitted by Haworth.

Tetragonal-stemmed Fig-marigold. Shrub 1 foot.

196 M. STRÍCTUM (Haw. misc. 82. syn. 262. rev. 149.) stem woody, branched, very stiff, straight; leaves triquetrous, obtuse, expanded, glaucescent, beset with large dots. ♄. D. G. Native of the Cape of Good Hope. This species grows 2 or 3 feet high in the gardens, but has never yet flowered. But from a specimen of it received from the Cape by Haworth, they are said to be showy and yellow.

Straight Fig-marigold. Clt. 1795. Shrub 2 to 3 feet.

197 M. CYMBIFÓRME (Haw. obs. 264. misc. 82. syn. 263. rev. 149.) stem suffruticose; branches erectish, filiform, crowded; leaves triquetrous, boat-shaped, spreading, glaucous. ♄. D. G. Native of the Cape of Good Hope. Flowers unknown. Perhaps *M. séssile*, Thunb. fl. cap. 419. belongs to this species, which Thunberg says has red flowers.

Boat-formed-leaved Fig-marigold. Clt. 1793. Sh. 1 ft.

198 M. MÓLLE (Ait. hort. kew. 2. p. 192.) branches crowded, 2-edged, decumbent; leaves spreading, turgidly triquetrous, firm, canescent, with the margins blunt, and lined with dots. ♄. D. G. Native of the Cape of Good Hope. Haw. obs.

misc. 83. syn. 261. rev. 149. Flowers solitary, red, small, and terminal.

Soft Fig-marigold. Fl. Oct. Clt. 1774. Shrub 1 foot.

199 M. THUNBE'RGII (Haw. rev. p. 150.) stem decumbent, articulated; leaves connate, trigonal, smooth, dotless, erect; flowers solitary, terminal. ♄. D. G. Native of the Cape of Good Hope. M. læ've, Thunb. fl. cap. 425. but not of Ait. Flowers yellow. Calyx 4-cleft. Perhaps this species belongs to another division of the genus.

Thunberg's Fig-marigold. Shrub decumbent.

200 M. CYMBIFÒLIUM (Haw. in phil. mag. 1824. vol. 64. p. 424.) stem shrubby, erectish; branches few, 2-edged, hoary; leaves trigonal, boat-shaped, pale green, beset with large dots. ♄. D. G. Native of the Cape of Good Hope. Flowers unknown. This species appears to be intermediate between *M. aúreum* and *M. cymbifórme*.

Boat-leaved Fig-marigold. Clt. 1822. Shrub 1 to 2 feet.

§ 36. *Aúrea* (from *aureus*, of gold; in reference to the yellow flowers). *Haw. rev.* 148.—*Æquilateràlia, Salm-Dyck, obs.* 33.—*Frequentiflòra, Haw. syn.* 263. *exclusive of some species. Stems suffruticose, and are as well as the branches erect. Leaves distinct, dotted, bluntly or acutely triquetrous, elongated, glaucous. Flowers large, solitary, yellow, or copper-coloured, expanding in sun-shine. Stigmas thick.*

201 M. GLAU'CUM (Lin. spec. p. 696.) stem suffruticose, erect; leaves triquetrous, much compressed, glaucous, roughish; lobes of calyx ovate, cordate; stigmas yellow. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 248. D. C. pl. grass. t. 146. Bradl. succ. t. 37. Haw. obs. 829. misc. 83. syn. 264. rev. 148. Petals of a yellow sulphur colour.

Glaucous Fig-marigold. Fl. Ju. Jul. Clt. 1696. Sh. 1½ ft.

202 M. AURANTI'ACUM (Haw. misc. 84. syn. 264. rev. 148.) stem suffruticose, erect; leaves bluntly triquetrous, somewhat compressed, very glaucous; bracteas semiterete; lobes of calyx oblong-ovate; alternate stigmas purple. ♄. D. G. Native of the Cape of Good Hope. M. glaucoìdes, Haw. obs. p. 330. M. aurántium, Willd. enum. 537. Flowers of a deep orange-colour, smaller than those of *M. glaúcum*. Perhaps a hybrid between *M. aúreum* and *M. glaúcum*.

Orange-coloured-flowered Fig-marigold. Fl. June, Aug. Clt. 1793. Shrub 1 to 2 feet.

203 M. AU'REUM (Lin. syst. nat. ed. 10. p. 1050.) stem suffruticose, erect; leaves cylindrically triquetrous, rather connate at the base, spreading, acute, full of pellucid dots, glaucous; stigmas dark purple. ♄. D. G. Native of the Cape of Good Hope. Curt. bot. mag. t. 262. D. C. pl. grass. t. 11. Haw. obs. 333. misc. p. 84. syn. 263. rev. 148. Corollas of coppery golden colour, 2 inches in diameter, expanding in sunshine.

Golden-flowered Fig-marigold. Fl. Mar. Oct. Clt. 1750. Shrub 1 to 2 feet.

SUBDIVISION VI. TERETIU'SCULA (a dim. of *teres*, cylindrical; leaves nearly cylindrical). Haw. rev. 150. Subshrubs. Leaves distinct, rarely connate at the base, nearly terete, without any papulæ. Calyx 5-cleft. Stigmas 5, except in one of the species, which vary to 7.

§ 37. *Verruculàta* (from *verrucula*, a little wart; plants beset with little warts). *D. C. prod. 3. p.* 438.—*Perfoliòsa, Haw. misc.* 81.—*Calamifórmia erécta, Salm-Dyck. obs.* 22.—*Sebàcea, Haw. rev. p.* 155. *Stems shrubby, erect, with short branches. Leaves crowded, connate, cylindrical, obtuse, mealy-glaucous, soft, dotless, without papulæ. Flowers yellow or croceous. Calyx 5-cleft. Stigmas* 5. *Capsule small.*

204 M. VERRUCULA'TUM (Lin. spec. 696.) stem erect; leaves much crowded, very glaucous, cylindrical, hardly triquetrous, obtuse, and a little mucronate, sebaceous, longer than the internodes. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. 259. D. C. pl. grass. t. 36. Haw. obs. 260. misc. 81. syn. 258. rev. 155. Flowers small, yellow, subumbellate, expanding in the evening. The stigmas are said to be 5, but Dillenius has seen them varying from 5-7.

Warted Fig-marigold. Fl. May, Ju. Clt. 1731. Sh. 1½ ft.

§ 38. *Cròcea* (from *croceus*, like saffron; colour of flowers). *Haw. in phil. mag. aug.* 1826. *p.* 128. *Sub-shrubs with secund branches. Leaves thick, of a bluish glaucous colour, semi-terete at the base, obsoletely triquetrous at the apex. Flowers terminal, solitary, small, or middle-sized, scentless, at first yellow, but as they become older change to a copper-colour. Peduncles succulent. Calyx succulent, unequal.*

205 M. LU'TEUM (Haw. in phil. mag. aug. 1826. p. 128.) leaves obtuse; flowers small; stem branched, erect, stiff, with the nodes tumid, and throwing out roots. ♄. D. G. Native of the Cape of Good Hope. This species comes very near *M. cròceum, var.* γ, *flàvo-cròceum*, but is taller, more slender, and more branched, and the leaves and flowers are much smaller. Corolla pale yellow, but becoming of a deeper colour as they fade.

Yellow-flowered Fig-marigold. Fl. June, July. Clt. 1820. Shrub 1 to 2 feet.

206 M. LUTE'OLUM (Haw. l. c. p. 129.) leaves crowded, acute at the apex, and a little recurved; branches slender and dense; flowers small. ♄. D. G. Native of the Cape of Good Hope. M. læ've, Thunb. prod.? Flowers yellow, and more numerous than those of the last species. It differs from the last in the leaves and in the more dwarf stature.

Small-yellow Fig-marigold. Fl. Ju. Jul. Clt. 1820. Sh. ½ ft.

207 M. CRÒCEUM (Jacq. fragm. t. 11. f. 2.) stem erect; leaves crowded, semi-cylindrical, mealy, glaucous, bluntish, shorter than the internodes, somewhat sebaceous; lobes of calyx somewhat unequal. ♄. D. G. Native of the Cape of Good Hope. Haw. rev. 156. Leaves evidently connate. Petals obtuse, copper-coloured.

Var. β, *purpùreo-cròceum* (Haw. obs. 257. misc. 81. syn. 259. rev. 155.) flowers copper-coloured, purple on the outside. M. insitítium, Willd. enum. 536. Hardly distinct from the species, and ought probably to be joined with it, according to Salm-Dyck. in litt.

Var. γ, *flàvo-cròceum* (Haw. rev. 155.) flowers yellow on both sides, but as they fade become copper coloured.

Copper-coloured-flowered Fig-marigold. Fl. Aug. Oct. Clt. 1780. Shrub 1 foot.

§ 39. *Tenuiflòra* (from *tenuis*, slender, and *flos*, a flower; slender flowers). *Salm-Dyck, obs.* 24. *Haw. rev.*—*Frequentiflòra, Haw. syn.* 263. *exclusive of the species. Stems shrubby; branches slender, effuse. Leaves opposite, distinct, nearly terete, rather triquetrous or somewhat compressed, without papulæ. Flowers solitary, pedunculate, expanding in the morning, yellow or scarlet. This section is nearly allied to Aúrea.*

208 M. COCCÍNEUM (Haw. obs. 247. misc. 85. syn. 265. rev. 150.) stem shrubby, erect; leaves teretely triquetrous, rather compressed, obtuse, glaucescent; peduncles smooth at the base; lobes of calyx bluntish, nearly equal. ♄. D. G. Native of the Cape of Good Hope. D. C. pl. grass. t. 83. Lodd. bot. cab. t. 1033. Curt. bot. mag. 59. M. bicolòrum mìnus, Haw. obs. 246. M. bicolòrum coccíneum, Willd. spec. 2. p. 1059. Leaves shorter than in the following species. Petals scarlet on both surfaces. There are 2 varieties of this plant, the one with obtuse leaves and the other with acute leaves.

Scarlet-flowered Fig-marigold. Fl. May, Sept. Clt. 1696. Shrub 1½ foot.

209 M. BICOLÒRUM (Lin. spec. ed. 1. p. 485.) stem shrubby, erect; leaves rather triquetrous, acute, green; peduncles and calyxes scabrous; calycine lobes unequal. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 258. Haw. obs. 241. misc. 85. syn. 265. rev. 151. This species is usually confused with *M. coccíneum*, but the leaves are longer and the petals are yellow inside and scarlet outside. Stigmas shorter than the filaments. There are 2 varieties of this plant, one with erect branches and the other with spreading branches.

Two-coloured-flowered Fig-marigold. Fl. May, Sept. Clt. 1732. Shrub 1½ foot.

210 M. INÆQUA'LE (Haw. syn. 266. rev. 151.) stem shrubby, erectish; branches effusely decumbent; leaves rather triquetrous, deep green; fructiferous peduncles compressedly clavate; lobes of calyx very unequal. ♄. D. G. Native of the Cape of Good Hope. Bradl. succ. 7. bad. ex Haworth. Very like *M. bicolòrum*, but differs in the branches being effuse, the flowers being paler on the outside, and in the calycine lobes being longer than the membrane.

Unequal-calyxed Fig-marigold. Fl. May, Sept. Clt. 1716. Shrub 1 foot.

211 M. TENUIFÒLIUM (Lin. spec. 693.) stem shrubby, erectish; leaves semi-terete, rather compressed, subulate, green, glabrous, longer than the internodes; peduncles elongated, naked. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 236. D. C. pl. grass. t. 82. Bradl. succ. t. 9. Haw. obs. 239. misc. p. 86. syn. 267. rev. 151. Flowers of coppery red colour. There are varieties of this species with erect and procumbent stems.

Slender-leaved Fig-marigold. Fl. June, Sept. Clt. 1700. Shrub 1 foot.

212 M. VARIA'BILE (Haw. misc. 85. syn. 266. rev. 152.) stem shrubby, effuse, rather decumbent; leaves somewhat triquetrous, compressed, glaucous, scabrous; lobes of calyx nearly equal. ♄. D. G. Native of the Cape of Good Hope. Petals yellow, at length becoming reddish. There are varieties of the species with distant and crowded leaves and branches.

Variable Fig-marigold. Fl. Ju. Aug. Clt. 1796. Sh. 1½ ft.

§ 40. *Adúnca* (from *aduncus*, hooked; leaves hooked at the apex). *Salm-Dyck, obs.* 25. *Haw. rev.* 152.—*Adúnca claudéntia, Haw. misc.* 87. *Stems suffruticose, hardly half a foot high. Leaves nearly terete, subulate, usually incurved, acutely hooked at the apex. Flowers solitary, expanding before meridian, and closing in the evening, small, reddish. Petals usually striated or white at the base.*

213 M. SPINIFÓRME (Haw. obs. 240. misc. 87. syn. 291. rev. 152.) stem suffruticose, with erect branches; leaves cylindrical, subulate, spine-formed, erect, recurved at the apex; peduncles and keels of the bracteas rather scabrous. ♄. D. G. Native of the Cape of Good Hope. Bark of branches dark. Flowers small, pale red, with the petals paler at the base.

Var. β, subadúncum (Haw. suppl. 96. ex rev. 152.). Leaves less hooked.

Spine-shaped Fig-marigold. Fl. Sept. Oct. Clt. 1793. Sh. ½ ft.

214 M. CURVIFÒLIUM (Haw. misc. p. 88. syn. 290. rev. 152.) stems suffruticose; branches firm, erectish, roughish, angularly compressed; leaves rather distant, expanded at the base, and incurvedly recurved at the apex. ♄. D. G. Native of the Cape of Good Hope. Flowers numerous, middle-sized, pale red. Stigmas blackish. M. ceratophýllum, Willd. enum. suppl. p. 37. is referred to this species by the Prince de Salm-Dyck, but this is doubted by Haworth, who gives a different character to the plant.

Curve-leaved Fig-marigold. Fl. Oct. Clt. 1799. Sh. ½ ft.

215 M. FLEXIFÒLIUM (Haw. suppl. 98. rev. 153.) stem suffruticose; branches filiform, compressed, flexuous, decumbent, crowded; leaves subulate, triquetrous, incurved below, recurved and rather flexuous above, and a little hooked at the apex. ♄. D. G. Native of the Cape of Good Hope. This plant is 3 times smaller than the preceding species, and more depressed. Flowers unknown. There are varieties of this species with pale green and dark green leaves.

Bent-leaved Fig-marigold. Fl. Oct. Clt. 1820. Sh. dec.

216 M. INCONSPI'CUUM (Haw. in phil. mag. aug. 1826. p. 128.) stems suffruticose, very stiff; leaves trigonal-semiterete, small, hooked; flowers solitary, minute, terminal. ♄. D. G. Native of the Cape of Good Hope. A small, bushy subshrub, with spreading, ascending, or incurved, hard, glittering branches; leaves glittering in the sunshine from papulæ. Flowers deep red, expanding in the morning.

Inconspicuous Fig-marigold. Fl. Ju. Aug. Clt. 1823. Sh. ½ ft.

217 M. ADU'NCUM (Haw. syn. 291. rev. p. 153.) stem shrubby; branches erect, much crowded; leaves crowded, semi-cylindrical, acuminated, very much recurved at the apex. ♄. D. G. Native of the Cape of Good Hope. Flowers small, reddish, tipped with a deeper colour. Stigmas subulate, spreading, greenish yellow. This species is very like *M. flexifòlium*, but is less erect.

Hooked-leaved Fig-marigold. Fl. Feb. Mar. Clt. 1795. Shrub ½ foot.

218 M. FILICAU'LE (Haw. syn. 291. rev. 153.) stems tufted, suffruticose, filiform, very weak, creeping; leaves much crowded, semi-cylindrical, acuminated. ♄. D. G. Native of the Cape of Good Hope. Peduncles elongated, flexuous, bibracteate in the middle. Petals pale red inside, but of a deeper colour on the outside, and more so at the apex. Stigmas erect, subulate, green.

Thread-stemmed Fig-marigold. Fl. Aug. Sept. Clt. 1808. Shrub ½ foot.

§ 41. *Haworthiàna* (in honour of A. H. Haworth, F.L.S.; who has done more to elucidate the succulent tribes of plants than any other individual). *D. C. prod.* 3. *p.* 439.—*Corállina, Haw. rev.* 154. *exclusive of M. corállina perhaps.*—*Teretiúscula, Haw. syn.* 301.—*Rubicúnda, Salm-Dyck. obs.* 23. *Stems suffruticose, smooth, erect; branches decussate, numerous, of a chestnut colour. Leaves somewhat cylindrical, subulate, elongated, glaucous. Flowers solitary, showy, reddish, or white.*

219 M. PRODU'CTUM (Haw. in phil. mag. 1824. p. 424.) stem suffruticose, erect; branches finely decussate, numerous; leaves crowded at the tops of the branches, semi-cylindrical, glaucous, rather incurved, full of pellucid dots; flowers terminal, by threes; calycine lobes unequal, two of which are long and the other three short. ♃. D. G. Native of the Cape of Good Hope. Corolla rose-coloured. Stigmas 5, erect.

Produced-calyxed Fig-marigold. Fl. May, June. Clt. 1822. Shrub 1 foot.

220 M. STIPULA'CEUM (Lin. spec. 693.) stem shrubby, and is as well as the branches erect; leaves teretely triquetrous, long, subulate, incurved, glaucous, full of pellucid dots, margined at the base. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 267. and 268. Haw. obs. 256. misc. 65. syn. 301. rev. 154. Axils usually bearing leaves, hence the metaphorical name of *stipulàceum*, there being no stipules. Corolla light red, paler on the under side, 2 inches in diameter.

Stipulaceous Fig-marigold. Fl. May, Ju. Clt. 1723. Sh. 1 ft.

221 M. HAWÓRTHII (Willd. enum. suppl. 36. Donn, hort. cant. ed. 6.) stem shrubby, erect; leaves crowded, compressedly cylindrical, attenuated at both ends, erect when young, but spreading and glaucous when old. (Salm-Dyck. in litt.). ♄. D. G. Native of the Cape of Good Hope. Haw. syn. 302. rev.

154. Corolla purple, 2 inches in diameter. Bark of branches rufous or castaneous. Leaves distinct (ex Haw.), connate (ex Willd.), therefore perhaps there are 2 species confused.

Haworth's Fig-marigold. Fl. Ju. Jul. Clt. 1793. Sh. 1 ft.

222 M. LE'PIDUM (Haw. in phil. mag. 1826. p. 130.) leaves recurved at the apex, rather mucronate; segments of calyx acuminated, spreading, marcescent after flowering. ♄. D. G. Native of the Cape of Good Hope. An erect, slender shrub. Leaves nearly as in *M. produ'ctum*. Flowers large, white, showy, opening before meridian, longer than the peduncles.

Pretty Fig-marigold. Fl. Aug. Sept. Clt. 1823. Sh. 1 ft.

223 M. LÆ'VE (Haw. misc. 64. syn. 302. rev. 154. but not of Thunb.) stem suffruticose, erect; leaves crowded, cylindrical, obtuse, arched, very glaucous, smooth. ♄. D. G. Native of the Cape of Good Hope. M. læ've, Ait. hort. kew. 2. p. 187.? Flowers unknown (ex Haw.), purple (ex Willd. and Salm-Dyck.).

Smooth Fig-marigold. Fl. Jul. Sept. Clt. 1774. Sh. 1½ ft.

224 M. CORA'LLINUM (Haw. rev. 154. but not of Thunb.) stem straight, much branched; leaves nearly terete, incurved, smooth, rather thicker in the middle, glaucous. ♄. D. G. Native of the Cape of Good Hope. Very nearly allied to *M. Haworthii*, but the stems are one half taller and the flowers smaller (ex Salm-Dyck. in litt.). Bark dark and bay-coloured (ex Haw.).

Coral-stemmed Fig-marigold. Fl. May, June. Clt. 1820. Shrub 1 foot.

§ 42. *Spino'sa* (from *spinosus*, full of thorns; the branches become hard and spinose at the tips after flowering). *Salm-Dyck. obs. 25. Haw. rev. 153.—Teretiúscula species, Haw. syn. Stems shrubby, erect; branches stiff, hard, floriferous, usually spinescent after flowering. Leaves teretely triquetrous, distinct. Flowers reddish.*

225 M. SPINO'SUM (Lin. spec. 693.) stem shrubby, erect; branches hard, dichotomous, spinose after flowering; leaves nearly distinct, teretely triquetrous, dotted. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 265. Bradl. succ. t. 39. Haw. obs. 338. misc. 66. syn. 303. rev. 153. Flowers small, purple.

Spinose Fig-marigold. Fl. Ju. Sept. Clt. 1714. Sh. 1 ft.

226 M. MUCRONI'FERUM (Haw. in phil. mag. 1823. p. 381.) stem shrubby, erect, straight; leaves glaucescent, dotted, spreading, bluntly triquetrous, mucronulate; flowers reddish, disposed by threes; peduncles permanent after flowering and spinose. ♄. D. G. Native of the Cape of Good Hope. M. pulverulénteum, Willd. enum. 583. ex ill. Pr. Salm-Dyck.

Mucrone-bearing Fig-marigold. Fl. Jul. Aug. Clt. 1821. Shrub 1 foot.

SUBDIVISION VII. PAPULO'SA (from *papulosus*, full of blisters; leaves beset with papulæ). D. C. prod. 3. p. 440.—Papulòsa-teretifòlia, Haw. rev. p. 79. Shrubs, subshrubs or herbs. Leaves opposite, very rarely alternate, distinct, nearly terete, or thick at one end, channelled above, narrow, more or less beset with glittering papillæ. Calyx 4-6, but usually 5-cleft. Stigmas just so many.

§ 43. *Barbàta* (from *barbatus*, bearded; points of leaves). *Salm-Dyck. obs. 27. Haw. rev. 190.—Barbifòlia, Haw. syn. 277. Stems suffruticose, branched. Leaves nearly terete, distinct, rather papulose, thick, bearded at the apex by 5 pale hairs, which are 5-10, rayed at the apex. Flowers flesh-coloured, rarely white, expanding in the sun. Calyx 5-8-cleft, with as many dark green tubercles on the torus. Stigmas 5-8.*

227 M. BARBA'TUM (Curt. bot. mag. t. 70.) stem erect; branches effusely procumbent; leaves rather remote, spreading, ending in 5-6 radiating hairs at the apex; base of calyx glabrous; lobes 5, nearly equal. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 234. D. C. pl. grass. t. 28. M. barbàtum *α*, Lin. spec. 691. M. stellígerum, Haw. syn. 278. rev. 190. but not of phil. mag. M. barbàtum, Haw. phil. mag. 1824. p. 61. Tubercles 5, dark green within the flower. Stigmas 5. Flowers flesh-coloured.

Bearded-leaved Fig-marigold. Fl. June, Aug. Clt. 1705. Shrub ½ to ¾ foot.

228 M. STELLI'GERUM (Haw. in phil. mag. 1824. p. 61. but not of his syn.) branches procumbent, elongated; leaves remote, half erect, terminating in 5 radiating hairs at the apex; calyx glabrous at the base; lobes very unequal. ♄. D. G. Native of the Cape of Good Hope. M. barbàtum, Haw. syn. 277. rev. 190. but not of phil. mag. Bradl. succ. t. 5. Curt. bot. mag. 70. Perhaps merely a variety of *M. barbàtum*.

Star-bearing Fig-marigold. Fl. May, Oct. Clt. 1793. Sh. ½ to ¾ foot.

229 M. INTÓNSUM (Haw. in phil. mag. 1824. p. 62.) branches erectly decumbent, effuse, hispid; leaves terminating in 10 radiating hairs at the apex; calyx girded by a black beard. ♄. D. G. Native of the Cape of Good Hope. Flowers reddish.

Var. β, álbum (Haw. l. c.) flowers at first white, but at length becoming reddish as they fade.

Unshaved Fig-marigold. Fl. July. Clt. 1824. Shrub ½ ft.

230 M. BULBÒSUM (Haw. in phil. mag. 1824. p. 428.) root tuberous; branches rather villous; leaves horizontal, crowded, terminating in 10 radiating hairs. ♄. D. G. Native of the Cape of Good Hope. Root referrible to that of *M. tuberòsum*; the rest of the plant comes nearest to *M. intónsum*. Flowers middle-sized, reddish.

Bulbous-rooted Fig-marigold. Fl. Aug. Clt. 1820. Sh. 1 ft.

231 M. STELLA'TUM (Mill. dict. no. 14.) branches short, thick; leaves tufted, hoary, thick, scabrous from papulæ, terminating in many radiating hairs at the apex, and ciliated at the base, greenish; peduncles very hairy; calyx hairy at the base, 6-8-lobed. ♄. D. G. Native of the Cape of Good Hope. D. C. pl. grass. t. 29.—Dill. elth. f. 235. M. barbàtum *β*, Lin. spec. 691. M. hirsùtum, Haw. misc. 105. syn. 279. M. stellàtum, Haw. rev. 191. phil. mag. 1824. p. 62. but not of his syn. Flowers pale red.

Starry-haired Fig-marigold. Fl. Sept. Oct. Clt. 1716. Shrub ¾ foot.

232 M. DE'NSUM (Haw. obs. p. 302. misc. 105. syn. 279. rev. 191. phil. mag. 1824. p. 62.) plant densely tufted; leaves semiterete, scabrous from papulæ, terminating in many radiating hairs, rather ciliated at the base, greenish; peduncles very hairy as well as the calyx, which is 6-cleft. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 236. without a flower. Sims, bot. mag. t. 1220. Old stem thick, branched, very short. Flowers expanding in the heat of the sun, purple, larger than those of *M. stellàtum*.

Dense Fig-marigold. Fl. May, Aug. Clt. 1732. Sh. ¼ ft.

§ 44. *Echinàta* (from *echinatus*, set with prickles; leaves). *Salm-Dyck, obs. 27. Haw. rev. 189.—Hispifòlia, Haw. syn. 275. Stems suffruticose, much branched. Leaves nearly terete, distinct, more or less hispid all over, as well as the branches. Lobes of calyx 5, leaf-formed. Corolla white or pale yellow. Stigmas 5.*

233 M. ECHINA'TUM (Ait. hort. kew. 2. p. 194.) stem erect, branched; leaves oblong-ovate, filled, rather triquetrous, gibbous, ramentaceously-echinated; lobes of calyx leaf-formed, unequal. ♄. D. G. Native of the Cape of Good Hope.

Haw. obs. 288. misc. 103. syn. 276. rev. 189. D.C. pl. grass. t. 24. Jacq. schœnbr. t. 437. M. setòsum, Mœnch. Flowers yellow.

Var. β, álbum (Haw. l. c.) flowers white.

Hedge-hog Fig-marigold. Fl. Jul. Oct. Clt. 1774. Sh. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

234 M. STRUMÒSUM (Haw. rev. 190.) stems decumbent, branched; leaves crowded, depressedly cylindrical, hispid all over; lobes of calyx nearly equal; root at length tuberous. ♄. D. G. Native of the Cape of Good Hope. Corolla pale straw-coloured or white.

Strumose Fig-marigold. Fl. Aug. Clt. 1820. Sh. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

§ 45. *Híspida* (from *hispidus*, bristly; branches rough from bristles). *D. C. prod. 3. p. 441.—Hispicaúlia, Haw. syn. 273. rev. 185. Salm-Dyck. obs. 26. Stems suffruticose, bushy; branches hispid from bristles. Leaves distinct, cylindrical, papulose. Peduncles hispid. Flowers middle-sized, expanding before meridian, reddish, or rose-coloured, rarely white. Calyx 5-cleft. Stigmas 5.*

235 M. CALYCI'NUM (Haw. rev. 187.) branches effuse; leaves cylindrical, rather filiform, obtuse, papulose; two of the calycine lobes are foliaceous, much exceeding the other three in length; stamens longer than the stigmas. ♄. D. G. Native of the Cape of Good Hope. Flowers white.

Long-calyxed Fig-marigold. Fl. Jul. Aug. Clt. 1819. Sh. $\frac{3}{4}$ ft.

236 M. TUBERCULA'TUM (D. C. in Pers. ench. 2. p. 44.) stems decumbent, much branched; branches ascending; leaves terete, acute, papulose, soft; branches, peduncles, and calyxes hispid; calyx campanulate at the base; stamens hardly exceeding the stigmas. ♄. D. G. Native of the Cape of Good Hope. M. hispifòlium, Haw. suppl. 94. rev. 189. Petals rose-coloured, but purplish above, with a deeper-coloured middle line. There is also a variety of this with white flowers.

Tubercled Fig-marigold. Fl. Oct. Clt. 1818. Shrub dec.

237 M. ATTENUA'TUM (Haw. rev. 188.) plant slender; branches decumbent, filiform; leaves semi-cylindrical, filled, obtuse, or nearly terete, papulose; peduncles elongated; calyxes hairy at the base. ♄. D. G. Native of the Cape of Good Hope. Petals at first white, or with a rose-coloured middle line, whence there is a rose-coloured circle in the flower.

Attenuated-branched Fig-marigold. Fl. May, Oct. Clt. 1821. Shrub decumbent.

238 M. STRIA'TUM (Haw. obs. 280. misc. 188.) stem erect; leaves semi-cylindrical, subulate, papulose; calyx woolly; stamens collected, length of stigmas. ♄. D. G. Native of the Cape of Good Hope. Capsule angular at the apex.

Var. α,ròseum (Haw. rev. 188.) petals pale rose-coloured, with a deeper-coloured line in the middle.—Dill. elth. f. 231.

Var. β, pállens (Haw. l. c.) petals white, each with a red line at the base. D. C. pl. grass. t. 132.

Striated-flowered Fig-marigold. Fl. May, Oct. Clt. 1727. Shrub $\frac{3}{4}$ foot.

239 M. FLORIBU'NDUM (Haw. misc. p. 100. syn. 274. rev. 187.) branches spreading, very numerous; leaves almost cylindrical, somewhat incurved, papulose, obtuse; calyxes hemispherical, beset with papulose pili; stamens not equalling the stigmas in length. ♄. D. G. Native of the Cape of Good Hope. M. híspidum β, pállidum, Haw. obs. 279. Flowers numerous, pale red; with the petals white at the base.

Var. β, torquàtum (Haw. rev. 187.) flowers fewer, larger and more remote; stamens exceeding the stigmas. According to Salm-Dyck this is not distinct from *M. floribúndum*, which are both perhaps referrible to *M. striàtum*, var. β.

Bundle-flowered Fig-marigold. Fl. May, Oct. Clt. 1704. Shrub $\frac{1}{2}$ foot.

240 M. CA'NDENS (Haw. rev. p. 186.) branches long, weak, procumbent or prostrate; leaves cylindrical, incurved, canescent, and glittering, obtuse. ♄. D. G. Native of the Cape of Good Hope. Flowers unknown. Leaves shining in the sun from papulæ. M. hirtéllum, Salm-Dyck. obs. p. 24. but not of Haw. Perhaps only a variety of *M. hirtéllum*.

Var. α, glaucéscens (Salm-Dyck. in litt.) leaves glaucescent. M. cándens, var. α, mínus, Haw. in phil. mag. dec. 1831. p. 422.

Var. β, viréscens (Salm-Dyck. in litt.) leaves greener; branches less elongated. M. cándens β, virídeus, Haw. l. c.

Glittering Fig-marigold. Clt. 1820. Shrub pr.

241 M. HIRTE'LLUM (Haw. obs. 284. exclusive of the synonymes, misc. 102. syn. 274. rev. 186.) stem erect, bushy; leaves crowded, cylindrical, very blunt, beset with glittering papulæ; calyx turbinate, beset with papulose pili; stamens equal in length to the stigmas. ♄. D. G. Native of the Cape of Good Hope. Flowers larger than those of any other species of this section, showy; petals pale red, white at the base.

Bristly Fig-marigold. Fl. May, Nov. Clt. 1792. Sh. $\frac{1}{2}$ to 1 ft.

242 M. SUBCOMPRE'SSUM (Haw. in phil. mag. Aug. 1826. p. 131.) plant erect and twiggy; leaves greenish-canescent, compressedly semi-terete, obliquely obtuse; upper part of branches rather pilose. ♄. D. G. Native of the Cape of Good Hope. Flowers of a reddish violaceous colour.

Var. β, mìnus (Haw. l. c.) plant not half the size of the species.

Subcompressed-leaved Fig-marigold. Fl. July. Clt. 1825. Shrub 1 foot.

243 M. FURFU'REUM (Haw. in phil. mag. Dec. 1831. p. 421.) shrub bushy; branches crowded, straightish, stiff, furfuraceous; leaves cylindrical, very blunt, and are, as well as the calyx, beset with obsolete crystalline papulæ; flowers small, numerous. ♄. D. G. Native of the Cape of Good Hope. Flowers terminating the branches, usually solitary, very pale red.

Furfuraceous Fig-marigold. Clt. 1830. Shrub 1 foot.

244 M. HI'SPIDUM (Lin. spec. 691.) stem erect, bushy; leaves cylindrical, very blunt, green, glabrous, and covered with glittering papulæ, as well as the calyx, which is conical; stamens exceeding the stigmas. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 278. D. C. pl. grass. t. 66. M. híspidum α, Haw. obs. 277. M. híspidum, Haw. syn. 273. rev. 186. Flowers deep purple.

Hispid Fig-marigold. Fl. May, Oct. Clt. 1704. Sh. $\frac{1}{2}$ to 1 ft.

245 M. SUBHÍSPIDUM (Haw. in phil. mag. Dec. 1831. p. 421.) stem erect; branches and peduncles usually without hairs; leaves cylindrical, very blunt, and are, as well as the obconical calyxes, glabrous, greenish, and covered with glittering papulæ. ♄. D. G. Native of the Cape of Good Hope. M. híspidum β, platypétalum, Haw. rev. 186. Petals pale purple, whitish at the base, emarginate at the apex. Very like *M. hîspidum*, but taller, less branched; but the branches are longer, more erect, and straight, and the flowers paler.

Subhispid Fig-marigold. Fl. May, Oct. Clt. 1704. Sh. 1 foot.

§ 46. *Aspericaúlia* (from *asper*, rough, and *caulis*, a stem; stems rough). *Haw. misc. 97. rev 182. Salm-Dyck, obs. 26. Stems shrubby, hardly a foot and a half high; branches filiform, scabrous. Leaves distinct, remote, nearly terete, glittering from papulæ. Flowers expanding before meridian; reddish or copper-coloured. Calyx 5-cleft. Stigmas 5, but in one of the species the calyx is 6-cleft, and the stigmas are 6.*

* *Flowers reddish.*

246 M. PULVERULE'NTUM (Haw. obs. 265. misc. 89. syn. 272. rev. 185. but not of Willd.) stem erect; branches crowded; leaves cylindrically triquetrous, obtuse, dotted with white, powdery, scabrous; calyx 6-cleft. ♄. D. G. Native of the Cape

of Good Hope. Flowers almost like those of *M. barbàtum*, reddish. Stigmas 6, recurved at the apex.

Powdery Fig-marigold. Fl. May. Clt. 1792. Sh. ½ to 1 foot.

247 M. SE'SSILE (Thunb. fl. cap. 419.) stem erect, terete; branches flexuous, divaricate; leaves globosely trigonal, very blunt, glabrous; flowers sessile. ♄. D. G. Native of the Cape of Good Hope. Leaves a line long. Flowers red.

Sessile-flowered Fig-marigold. Shrub 1 foot.

248 M. SUBGLOBÒSUM (Haw. syn. 273. rev. 185.) branches numerous, filiform, divaricate, rather decumbent; leaves expanded, rather papulose, very short, cylindrically subglobose. ♄. D. G. Native of the Cape of Good Hope. M. capillàre, Thunb. fl. cap. 419. but not of others. M. subglobòsum and M. brevifòlium *α*, Haw. misc. 62. and 99. Flowers red.

Subglobose-leaved Fig-marigold. Fl. July, Oct. Clt. 1795. Shrub 1 foot.

249 M. BREVIFÒLIUM (Ait. hort. kew. 2. p. 188.) stems erectish; branches diffuse, filiform, numerous; leaves cylindrical, very blunt, spreading, papulose. ♄. D. G. Native of the Cape of Good Hope. M. brevifòlium, Haw. misc. p. 99. var. *β*, syn. 272. rev. 185. M. erigerifòlium, Jacq. hort. vind. t. 477. ex Salm-Dyck in litt. Corolla small, red.

Short-leaved Fig-marigold. Fl. July, Oct. Clt. 1777. Sh. 1 ft.

250 M. PARVIFÒLIUM (Haw. rev. 184. but not of Lam.) stem erectish; branches rather crowded, filiform, rough, hard; leaves grain-formed, expanded, bluntly triquetrous, rather glittering from papulæ. ♄. D. G. Native of the Cape of Good Hope. Corolla expanding in the day time, deep purple, nearly like that of *M. hìspidum*, but one-half smaller. Stigmas 5, erect, green.

Small-leaved Fig-marigold. Fl. Aug. Clt. 1820. Sh. ½ to 1 ft.

251 M. OBLI'QUUM (Haw. rev. 183. but not of Willd.) stem erect; branches filiform, hard, roughish, erectish; leaves distant, cylindrical, obtuse, small, glittering from papulæ, with one of the pair deflexed, and the other opposite it ascending. ♄. D. G. Native of the Cape of Good Hope. Ker, bot. reg. 863. Petals purple, spreading, acute. Stamens erect, collected, white. Flowers 9-10 lines in diameter.

Oblique-leaved Fig-marigold. Fl. Aug. Clt. 1819. Sh. 1 ft.

** *Flowers copper-coloured or yellow.*

252 M. FLA'VUM (Haw. rev. 183.) stem erectish; branches very slender, scabrous from dots; leaves nearly terete, rather attenuated at both ends, glittering from papulæ, erectly incurved or variously bent; lobes of calyx obtuse, nearly equal. ♄. D. G. Native of the Cape of Good Hope. Corolla expanded half an inch broad, of a golden yellow-colour, rather reddish on the outside; filaments white.

Yellow-flowered Fig-marigold. Fl. Aug. Clt. 1820. Shrub ½ to 1 foot.

253 M. MI'CANS (Lin. spec. 696.) stem erect; branches scabrous; leaves semi-cylindrical, bluntish, rather recurved, glittering from papulæ; lobes of calyx and petals acutish. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 283. and 423. Bradl. succ. t. 8. Curt. bot. mag. 448. D. C. pl. grass. t. 158. Haw. obs. 268. and 423. misc. 98. syn. 271. rev. 182. Flowers pedunculate, copper-coloured, an inch and a half in diameter, with dark sterile filaments. Stigmas 5, thick, and greenish.

Glittering Fig-marigold. Fl. May, Aug. Clt. 1704. Sh. 1½ ft.

254 M. MACULA'TUM (Haw. syn. 271. rev. 182.) stems erect, covered with rough spots; leaves expanded, remote, obtuse, semi-cylindrical, and rather compressed, papulose. ♄. D. G. Native of the Cape of Good Hope. M. maculàtum and M. mìcans *β*, Haw. misc. 99. Flowers unknown.

Spotted-stamened Fig-marigold. Clt. 1732. Shrub 1½ foot.

255 M. SPECIÒSUM (Haw. obs. 367. misc. 98. syn. 270. rev. 182.) stem erect, with scabrous branches; leaves semi-cylindrical, subulate, acutish, incurved, glittering a little from papulæ; lobes of calyx and petals obtuse; corolla rather funnel-shaped. ♄. D. G. Native of the Cape of Good Hope. Corolla large, deep scarlet, with a green base, less than that of *M. mìcans*, expanding in the height of the sun.

Elegant Fig-marigold. Fl. May, Oct. Clt. 1793. Shrub 1½ ft.

§ 47. *Trichótoma* (the flowers are disposed by threes, or in a trichotomous manner). *Haw. rev.* 178. *Tuberòsa. Salm-Dyck, obs.* 25. *Erect branched subshrubs. Leaves usually nearly cylindrical, and glittering in the sun from papulæ. Calyx 5-cleft. Flowers small, disposed by threes, of various colours, but usually of a yellowish coppery-colour.—An artificial section.*

256 M. TUBERÒSUM (Lin. spec. 693.) stem erect, branched; leaves rather triquetrous, compressed, beset with minute papulæ, recurved at the apex; flowers trichotomous; root tuberous, hard. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 264. D. C. pl. grass. t. 78. Haw. obs. 271. misc. 89. syn. 253. rev. 170. Peduncles usually permanent and spinose, as in *M. spinòsum*. Flowers small, flesh-coloured. Stigmas 5, rarely 6, ex Haw.

Tuberous-rooted Fig-marigold. Fl. June, Oct. Clt. 1714. Shrub 2 to 3 feet.

257 M. MEGARHI'ZUM; root large, tuberous; stem erect, branched; leaves recurvely hooked; branches erect, thong-formed, flexile. ♄. D. G. Native of the Cape of Good Hope. Very like *M. tuberòsum*, but differs from it in the principal stem being more equal in thickness; and in the flowers being more numerous and white. M. macrorhìzum, Haw. in phil. mag. Nov. 1826. p. 332. but not of D. C.

Large-rooted Fig-marigold. Fl. May, Aug. Clt. 1824. Shrub 2 feet.

258 M. TESTA'CEUM (Haw. suppl. 97. rev. 178.) stem shrubby, erect; leaves semi-terete, rather triquetrous, glaucescent; flowers disposed in trichotomous umbels. ♄. D. G. Native of the Cape of Good Hope. Stems 2-3 feet high. Flowers small, of a coppery-colour, pedunculate. Petals in one series. Both the fertile and sterile stamens are snow white, collected into a cone.

Testaceous-flowered Fig-marigold. Fl. Aug. Sept. Clt. 1820. Shrub 2 to 3 feet.

259 M. TRICHO'TOMUM (Thunb. fl. cap. 419.) stem straight; branches divaricate; leaves connate, trigonal, obtuse; flowers terminal, sessile; calyx 4-cleft. ♄. D. G. Native of the Cape of Good Hope. It differs from *M. geniculiflòrum* in the leaves being connate, and without papulæ, and in the flowers being red. Stigmas 4, purple, short.

Trichotomous Fig-marigold. Shrub 2 to 3 feet.

260 M. SUBINCA'NUM (Haw. in phil. mag. Dec. 1824. p. 427.) stem firm, branched, erect; leaves expanded, compressed, trigonal, rather canescent, soft, recurved, and mucronulate at the apex; flowers terminal, disposed by threes; lobes of calyx 5, unequal. ♄. D. G. Native of the Cape of Good Hope. Flowers middle-sized, snow white, expanding before meridian. This species is most nearly allied to *M. trichótomum*.

Rather-hoary Fig-marigold. Fl. Aug, Sept. Clt. 1820. Sh. 2 to 3 feet.

261 M. DECUSSA'TUM (Thunb. fl. cap. p. 414.) stem shrubby, trichotomous; branches erect; leaves connate, linear-semiterete, rather papulose; flowers pedunculate, solitary. ♄. D. G. Native of the Cape of Good Hope. Flowers spreading, snow white. Calyx 5-cleft.

Decussate-leaved Fig-marigold. Shrub 2 to 3 feet.

262 M. BRACHIA'TUM (Ait. hort. kew. 2. p. 119.) stem much branched; branches trichotomous, papulose; leaves cylindrical,

papulose. ♄. D. G. Native of the Cape of Good Hope. Haw. obs. 25. misc. 58. (exclusive of the synonyme of Thunb.) syn. 234. rev. 178. but not of D. C. Flowers yellow.

Armed Fig-marigold. Fl. June, Aug. Clt. 1774. Sh. 1½ foot.

§ 48. *Spinulífera* (from *spinula*, a little thorn, and *fero*, to bear; leaves appearing like little thorns, when old). *Haw. rev.* 176. *Salm-Dyck, obs.* 26. *Stems suffruticose, usually strumose at the base; branches rather fleshy, papillose, when old they appear as if they were spiny from the permanent remains of the dried leaves. Leaves cylindrical, papulose, opposite, somewhat channelled. Flowers expanding before meridian, fulvous or greenish red. Calyx 5-cleft. Stigmas 5.*

263 M. SPINULI'FERUM (Haw. obs. 206. and 443. misc. 57. syn. 252. rev. 176.) caudex and branches erect and thickened; leaves crowded, semi-terete, channelled, papulose; peduncles terminal, subumbellate. ♄. D. G. Native of the Cape of Good Hope. Corolla an inch in diameter, straw-coloured.

Spine-bearing Fig-marigold. Fl. Ju. Oct. Clt. 1794. Sh. 1 ft.

264 M. LONGISPI'NULUM (Haw. in phil. mag. Dec. 1824. p. 426.) branches few, procumbent, nodosely strumose at the base; leaves linear, channelled, and are, as well as the branches, papulose; old leaves permanent, long, hard, and spine-like; flowers usually solitary; peduncles strong, subclavate. ♄. D. G. Native of the Cape of Good Hope. Petals pale yellow or straw-coloured. Stigmas 5, erect.

Long-spined Fig-marigold. Fl. Aug. Nov. Clt. 1820. Shrub procumbent.

265 M. SALMÒNEUM (Haw. rev. p. 176.) stems rather filiform, weak, elongated, prostrate; leaves linear, furrowed, longer than the internodes, beset with sordid papulæ; roots at length strumose above. ♄. D. G. Native of the Cape of Good Hope. Flowers trichotomous, small, at first of a salmon colour, but afterwards becoming white inside. Stigmas 5, erect.

Salmon-coloured-flowered Fig-marigold. Fl. Aug. Oct. Clt. 1819. Shrub pr.

266 M. CANALICULA'TUM (Haw. obs. 218. misc. 57. syn. 253. rev. 177.) stems procumbently prostrate, filiform; leaves linear-semiterete, covered with shining papulæ. ♄. D. G. Native of the Cape of Good Hope. Corolla pale rose-coloured. Old stems half a foot high.

Channelled-leaved Fig-marigold. Fl. July, Oct. Clt. 1794. Shrub pr.

267 M. VIRIDIFLÒRUM (Ait. hort. kew. 2. p. 196.) caudex thickened; branches diffuse, knotted; leaves semiterete, beset with papulose hairs; calyx hairy, pedunculate. ♄. D. G. Native of the Cape of Good Hope. Curt. bot. mag. t. 326. D. C. pl. grass. t. 159. Jacq. fragm. t. 52. f. 2. Petals very narrow, greenish. Stigmas 5, joined in one body.

Green-flowered Fig-marigold. Fl. July, Nov. Clt. 1774. Shrub 1 to 2 feet.

268 M. GRÓSSUM (Haw. misc. p. 57. syn. 252. rev. 176.) caudex thickened; branches effusely decumbent; leaves linear, nearly terete, obtuse, attenuated at both ends, papulose. ♄. D. G. Native of the Cape of Good Hope. M. gróssum, M. cárneum, and M. aggregàtum, Haw. obs. 205, 206. and 419. Corolla middle-sized, pale, at length becoming of a reddish straw colour.

Coarse Fig-marigold. Fl. Aug. Oct. Clt. 1774. Shrub 1 ft.

269 M. TENUIFLÒRUM (Jacq. fragm. t. 32. f. 3.) stems diffuse, weak, cinereous; leaves semiterete, obtuse, channelled, spreading, beset with crystalline papulæ; flowers 1-2, terminal, on short peduncles. ♄. D. G. Native of the Cape of Good Hope. Petals linear-filiform, of a dirty red-colour.

Slender-flowered Fig-marigold. Fl. July, Nov. Clt. 1820. Shrub 1 foot.

270 M. NI'TIDUM (Haw. obs. 412. misc. 57. syn. 243. rev. 177.) stem erect; branches slender, effuse, knotted; leaves semiterete, beset with glittering papulæ; flowers terminal, usually by threes. ♄. D. G. Native of the Cape of Good Hope. Flowers yellow. Salm-Dyck ex Spreng. nov. prov. 27. M. brachiàtum, D. C. pl. grass. t. 129. M. pruinòsum, Thunb. fl. cap. 425. ex Salm-Dyck and Spreng. but according to Haworth this species differs in the stem being decumbent, and in the branches being bent.

Shining Fig-marigold. Fl. July, Oct. Clt. 1790. Sh. 1 to 2 ft.

§ 49. *Noctiflòra* (from *nox*, the night, and *flos*, a flower; flowers expanding at night). *Haw. syn.* 259. *rev.* 179. *Salm-Dyck, obs.* 23. *Slender subshrubs, almost without leaves at the base, at length becoming thickened at the roots; with elongated branches. Leaves distinct, cylindrical, glaucous, remote, dotless, soon falling off. Flowers usually by threes, terminal, white, rose-coloured or straw-coloured on the outside, expanding in the evening. Calyx turbinate, 4-cleft. Stigmas 4.*

271 M. NOCTIFLÒRUM (Lin. spec. 689.) stems suffruticose; branches erect, with white bark; leaves rather remote, obsoletely semicylindrical, glaucous; peduncles biternately cymose. ♄. D. G. Native of the Cape of Good Hope. Haw. rev. 179. Lodd. bot. cab. 495.

Var. α, Phœníceum (Haw. rev. 179.) flowers white inside, and scarlet outside, very sweet-scented.—Dill. elth. f. 262. M. noctiflòrum, D. C. pl. grass. t. 10. Haw. obs. 251. misc. 63. syn. 260.

Var. β, stramíneum (Haw. rev. 179. but not of Willd.) flowers white inside, and straw-coloured on the outside.—Dill. elth. f. 263.

Var. γ? elàtum (Haw. rev. 180.) leaves longer, semi-erect, white from mealiness, cylindrically triquetrous, at length reflexed; flowers by threes, white inside, and rose-coloured on the outside. Perhaps a proper species.

Night-flowering Fig-marigold. Fl. June, Aug. Clt. 1714. Shrub 1 to 2 feet.

272 M. FU'LVUM (Haw. rev. p. 180.) stem suffruticose; bark of branches brownish-grey; leaves remote, nearly cylindrical, glaucescent, exactly half erect; flowers by threes. ♄. D. G. Native of the Cape of Good Hope. M. stramíneum, Haw. obs. 252. (exclusive of the synonyme of Dillenius,) misc. 63. syn. 261. but not of Willd. Flowers fulvous, but white on the inside. Ovarium top-formed. Perhaps distinct from the preceding species, according to the Prince de Salm-Dyck in litt.

Fulvous-flowered Fig-marigold. Fl. June, Aug. Clt. 1820. Shrub 1 to 2 feet.

273 M. CLAVA'TUM (Jacq. hort. schœnbr. t. 108.) stem erect, sparingly branched; leaves nearly terete, remote, horizontal; peduncles clavate, aggregate, cymose. ♄. D. G. Native of the Cape of Good Hope. M. defoliàtum, Haw. misc. 83. rev. 181. Flowers white.

Var. β, horizontàle (D. C. prod. 3. p. 445.) flowers straw-coloured, but white on the inside, disposed by threes. M. horizontàle, Haw. syn. 261. rev. 181. M. stramíneum α, Haw. misc. 63. exclusive of the synonymes. Perhaps a proper species.

Clavate-peduncled Fig-marigold. Fl. June, Aug. Clt. 1795. Shrub 1 to 2 feet.

§ 50. *Geniculiflòra* (from *geniculum*, a little knee, and *flos*, a flower; from the flowers rising in the knees or forks of the branches). *D. C. prod. 3. p. 445. Stems frutescent, erect. Leaves opposite, distinct, papulose, semi-terete. Flowers sessile in the forks of the branches, solitary, yellowish, expanding in the day time.*

274 M. GENICULIFLÒRUM (Lin. spec. 688.) stem frutescent, erect; leaves distinct, semi-terete, papulose; flowers sessile and

solitary in the forks of the branches; calyx 4-cleft. ♄. D. G. Native of the Cape of Good Hope, and of Egypt and Arabia.—Dill. elth. f. 261. Bradl. succ. t. 34. D. C. pl. grass. t. 17. Haw. syn. 254. misc. 59. rev. 167. Petals pale yellow. Stigmas 4, erect, short.

Knee-flowered Fig-marigold. Fl. July, Sept. Clt. 1727. Shrub 1 foot.

§ 51. *Splendéntia* (from *splendens*, shining; in reference to the leaves, which are covered with glittering papulæ, which shine in the sun). *D. C. prod. 3. p. 445.—Digitiflòra and Crassulìna, Haw. rev. 170. and 172.—Teretiúscula albiflòra, Salm-Dyck, obs. p. 23. Stems suffruticose, branched, erect. Leaves opposite, distinct, somewhat cylindrical, when young furrowed above, beset with papillæ more or less, which glitter in the sun. Flowers middle-sized, solitary, rarely by threes, white, expanding before meridian. Calyx generally 5-lobed, rarely 4 or 6-lobed, usually leaf-formed. Stigmas as many as there are calycine lobes.*

275 M. crassuli'num (D. C. prod. 3. p. 445.) stem suffruticose, erect, decumbent; branches numerous, rather effuse; leaves crowded, thick, linear-lanceolate, channelled, almost without papulæ, green; flowers solitary; 3 of the segments of calyx membranous at the base, and 2 larger than the rest. ♄. D. G. Native of the Cape of Good Hope. M. crassuloìdes, Haw. rev. 170. Flowers expanding before meridian; petals 4 lines long, white, but at length becoming pale rose-coloured. Stigmas 5, which after fecundation are very conspicuous above the anthers.

Crassula-like Fig-marigold. Fl. July, Aug. Clt. 1819. Sh. decumbent.

276 M. incómptum (Haw. suppl. 96. rev. 171.) stem suffruticose, branched, bushy; leaves crowded, rather papulose, erectly imbricating, semi-terete, firm, almost subulate; flowers by threes; peduncles clavate; lobes of calyx finger-shaped, acute. ♄. D. G. Native of the Cape of Good Hope. Plant half a foot high, pale green. Corolla snow white. Stigmas 5, ramentaceous, equal in length to the anthers.

Undecked Fig-marigold. Fl. July, Aug. Clt. 1819. Sh. ½ ft.

277 M. sple'ndens (Lin. spec. 689.) stem shrubby, erect, much branched; leaves distinct, crowded, semi-terete, obtuse, spreading, somewhat recurved, dotless, rather papulose; flowers solitary; lobes of calyx finger-shaped. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 260. D. C. pl. grass. t. 35. Haw. obs. 209. misc. 61. syn. 257. rev. 172. Flowers middle-sized, white, shining. Calyx 5-cleft. Stigmas 5, thick, but subulate at the apex.

Shining Fig-marigold. Fl. July, Aug. Clt. 1716. Sh. 1½ ft.

278 M. sulca'tum (Haw. rev. p. 173.) stem shrubby, erect; leaves crowded, linear-subulate, semi-terete, channelled, pale-green, adult ones expanded, semi-terete; lobes of calyx leaf-formed, acute. ♄. D. G. Native of the Cape of Good Hope. Flowers white. Stigmas 5, erect, not exceeding the stamens. Perhaps only a variety of *M. splèndens*.

Furrowed Fig-marigold. Fl. Aug. Sept. Clt. 1819. Shrub 2 to 3 feet.

279 M. acumina'tum (Haw. in phil. mag. 1824. vol. 64. p. 426.) stem and branches erect; leaves crowded, semi-terete, acuminated, green; lobes of calyx 5, 2 of which are much more prolonged than the other 3. ♄. D. G. Native of the Cape of Good Hope. Allied to *M. sulcàtum*, but differs from all the species of this section in the lobes of the calyx being very unequal. Corolla white, expanding before meridian.

Acuminated-leaved Fig-marigold. Fl. Aug. Sept. Clt. 1820. Shrub 1 to 2 feet.

280 M. albicau'le (Haw. in phil. mag. Nov. 1826. p. 331.) stem and branches erect, slender, and whitish; leaves subulate, green, semi-terete, a little recurved, and mucronulated at the apex. ♄. D. G. Native of the Cape of Good Hope. Flowers white. Like *M. acuminàtum* in habit, but three times smaller.

White-stemmed Fig-marigold. Fl. Aug. Sept. Clt. 1824. Shrub 1 foot.

281 M. flexuòsum (Haw. misc. p. 61. syn. 257. rev. 172.) stem suffruticose, and is, as well as the branches, flexuous, slender, and shining; leaves crowded, flexuously incurved, very green, semi-terete; lobes of calyx finger-shaped. ♄. D. G. Native of the Cape of Good Hope. Flowers white, reddish on the outside. Stigmas 4-5.

Flexuous-branched Fig-marigold. Fl. July, Aug. Clt. 1795. Shrub 1½ foot.

282 M. fastigia'tum (Haw. rev. 173. but not of Thunb.) stems slender, erect at first, but at length becoming decumbent; leaves crowded, flexuously reflexed, subulate, semi-terete, glaucescent; lobes of calyx equal, 3 of which are membranous on both sides. ♄. D. G. Native of the Cape of Good Hope. Corolla of a dirty fulvous-colour on the outside, white and paler on the inside. M. fastigiàtum, Haw. misc. p. 60. exclusive of the synonyme of Bradl.

Var. β, refléxum (Haw. rev. p. 173.) lobes of calyx unequal; stem erect. M. refléxum, Haw. misc. 60. var. *a*.

Fastigiate Fig-marigold. Fl. July, Sept. Clt. 1794. Sh. 1 ft.

283 M. umbelliflòrum (Jacq. ex Willd. enum. 534.) stem erect; leaves distinct, nearly terete, papulose; branchlets 1-flowered. ♄. D. G. Native of the Cape of Good Hope. The rest unknown. Perhaps only a variety of M. fastigiàtum, Haw. or a proper species, ex Haw. rev. 174.?

Umbel-flowered Fig-marigold. Fl. Aug. Sept. Clt. 1820. Shrub 1½ foot.

284 M. longi'stylum (D. C. pl. grass. t. 147.) stem suffruticose; branches elongated; leaves opposite, distinct: when young linear-filiform, but at length becoming a little keeled, acute, and minutely papulose; peduncles 1-flowered; calyx 5-cleft, with 2 or 3 of the lobes having hyaline margins; stigmas 5, exceeding the stamens. ♄. D. G. Native of the Cape of Good Hope. M. pállens, Jacq. hort. schœnbr. 3. t. 279. but not of Ait. M. palléscens *β*, Haw. rev. p. 174. Flowers white, or somewhat rose-coloured, half an inch in diameter.

Var. β, purpuráscens (D. C. prod. 3. p. 446.) flowers purplish. M. palléscens *a*, Haw. rev. 174. M. refléxum *β*, Haw. misc. 64.

Long-styled Fig-marigold. Fl. Aug. Sept. Clt. 1820. Shrub 1½ foot.

§ 52 *Júncea* (from *junceus*, like a bull-rush, slender; stems). *Haw. rev. p. 175.—Articulàta, Salm-Dyck, obs. p. 24. Stems suffruticose or herbaceous, rather erect; branches slender, green. Leaves opposite, distinct, small, linear-subulate, slender, deciduous when dry, whence the stems appear to be articulated from the cicatrices of the fallen leaves. Flowers small, pedunculate, white or reddish. Calyx 4-cleft. Stigmas 4.*

285 M. ju'nceum (Haw. misc. 175. syn. 255. rev. 59.) stem shrubby, much branched; branches articulated, filiform; leaves subulate, semi-terete, acute, remote; flowers terminal, dichotomous; lobes of calyx 4, very unequal. ♄. D. G. Native of the Cape of Good Hope. Corolla small; petals reddish, but whitish at the base. Stigmas 4, erect, a little longer than the filaments. M. aphýllum, Hortul. M. articulàtum, Thunb. fl. cap. 415.?

Rushy Fig-marigold. Fl. Aug. Oct. Clt. 1800. Sh. 1 ft.

286 M. granulicau'le (Haw. in phil. mag. 1824. vol. 64. p. 424.) stem very slender, suffruticose; branches terete, dotted from numerous grains; leaves very narrow, obtuse, glaucescent, semi-terete, longer than the internodes. ♄. D. G. Native of the Cape of Good Hope. Flowers unknown.

Granular-stemmed Fig-marigold. Clt. 1820. Shrub 1½ foot.

287 M. micra'nthum (Haw. syn. 257. rev. 174.) stem suffruticose, slender, much branched; leaves linear, keeled, dotless, distinct; peduncles 1-flowered; calyx 4-cleft, having 2 of the lobes very long, and 2 very short. ♄. D. G. Native of the Cape of Good Hope. M. parviflòrum, Jacq. hort. schœnbr. 3. t. 278. but not of Haw. Corolla small, snow white, shorter than the calyx. Stigmas 4, spreading.

Small-flowered Fig-marigold. Fl. June, July. Clt. 1804. Shrub 1½ foot.

288 M. te'nue (Haw. rev. p. 175.) stem suffruticose; branches effuse, very slender, rather secund, articulated; leaves linear, channelled, erect, very slender. ♄. D. G. Native of the Cape of Good Hope. Leaves hardly half an inch long. Flowers unknown. Perhaps different from *M. micránthum.*

Weak Fig-marigold. Clt. 1819. Shrub 1 foot.

289 M. rapa'ceum (Jacq. fragm. 43. t. 52. f. 1.) root tuberous; stem herbaceous; branches terete, and somewhat articulated; leaves distinct, terete, obtuse, dotted, spreading much; peduncles 1-flowered; lobes of calyx filiform; stigmas 5, spreading. ♃. D. G. Native of the Cape of Good Hope. Flowers snow white, 9-10 lines in diameter. Lobes of calyx nearly equal, or very unequal.

Turnip-like-rooted Fig-marigold. Pl. 1 foot.

§ 53. *Nodiflòra* (from *nodus*, a knot, and *flos*, a flower; flowers rising from the knots of the stem, or axils of the leaves). *D. C. prod. 3. p. 446.—Cylindràcea, Haw. rev. 163. Salm-Dyck, obs. 15. Roots annual. Stems herbaceous, branched. Leaves nearly terete or linear, thick, opposite, rarely alternate, papulose. Flowers axillary, nearly sessile. Calyx 4-5-lobed, exceeding the petals, which are small and white. Stigmas 4-5.*

290 M. nodiflòrum (Lin. spec. 687.) stem erectish; leaves opposite and alternate, nearly terete, obtuse, ciliated at the base; flowers axillary, nearly sessile; lobes of calyx very unequal, exceeding the petals, which are small. ⊙. D. G. Native of Egypt, Barbary, Corsica, and Naples, in sandy places by the sea side. D. C. pl. grass. t. 88. Smith, fl. græc. t. 480.—Moris. hist. sect. 5. t. 37. f. 7.—Haw. rev. 166.—Column. ecphr. 2. t. 73. This species is often confused with the two following. Perhaps the calyx is 4-cleft, as mentioned by Haworth, but in some plants which have been examined it has been found to be 5-cleft.

Knot-flowered Fig-marigold. Fl. Aug. Oct. Clt. 1739. Pl. ½ foot.

291 M. Cópticum (Lin. spec. 688.) stem nearly erect; leaves distinct, semi-terete, papulose; flowers sessile in the forks of the branches; calyx 5-cleft, exceeding the petals, which are small. ⊙. D. G. Native of Egypt. Willd. spec. 2. p. 1037.

Coptic Fig-marigold. Pl. 1 foot.

292 M. ape'talum (Lin. fil. suppl. p. 258.) stem diffuse, rather prostrate; leaves papulose, distinct, stem-clasping, linear, flat above, longer than the internodes; flowers pedunculate; calyx 5-cleft, much exceeding the petals, which are very small. ⊙. D. G. Native of the Cape of Good Hope. M. apétalum, Ait. hort. kew. 2. p. 180. Haw. rev. 165. M. Cópticum, Jacq. hort. vind. 3. t. 6. Petals 14-18, white. Stigmas 5, short. Perhaps sufficiently distinct from *M. Cópticum.*

Apetalous Fig-marigold. Fl. July, Aug. Clt. 1774. Sh. pr.

293 M. cadu'cum (Ait. hort. kew. 2. p. 179.) leaves semi-terete, filiform, distinct, beset with ovate papulæ; flowers lateral, sessile, terminal, girded by a pair of leaves. ⊙. D. G. Native of the Cape of Good Hope. The rest unknown.

Caducous Fig-marigold. Fl. July, Aug. Clt. 1774. Pl. 1 ft.

Subdivision VIII. Planifòlia (from *planus*, level or flat, and *folium*, a leaf; leaves flat). Haw. misc. p. 43. but not of rev.—Papulòsa, with flat leaves, Haw. rev. 79.—A'nnua planifòlia, Salm-Dyck, obs. 15. Herbs or subshrubs. Leaves flat, beset with papulæ.

§ 54. *Scapòsa* (from *scapus*, a scape or stalk; in reference to the peduncles). *D. C. prod. 3. p. 447.—Límpida, Haw. rev. 162. Annual nearly stemless herbs. Leaves opposite, almost all radical, linear or cuneiform, quite entire, papulose. Peduncles 1-flowered, rising from the root like scapes. Flowers expanding in sunshine. Lobes of calyx 5, unequal. Petals disposed in one or two series. Sterile filament none. Stigmas 5. The four last species of this section are hardly known.*

294 M. cuneifòlium (Jacq. coll. 2. p. 319. icon. rar. 3. t. 488.) stem short, branched from the base, herbaceous; leaves opposite, cuneiform, flat, obtuse, rather scabrous from papulæ; flowers pedunculate; lobes of calyx 5, unequal, larger ones oblong, and contracted in the middle. ⊙. D. G. Native of the Cape of Good Hope. D. C. pl. grass. t. 134. M. límpidum, Ait. hort. kew. 2. p. 183. Haw. misc. 36. syn. 245. rev. 162. Petals purple, paler on the outside. Stamens very short. Stigmas 5, erect.

Wedge-leaved Fig-marigold. Fl. July. Clt. 1774. Pl. ½ ft.

295 M. pyro'peum (Haw. suppl. p. 99.) plant almost stemless; leaves linear, broadest at the apex, obtuse, rather scabrous from papulæ; flowers pedunculate; lobes of calyx 5, oblong, one of them very long. ⊙. D. G. Native of the Cape of Good Hope. M. trícolor, Willd. hort. berol. t. 22. Sims, bot. mag. t. 2144. but not of Haw. M. pyròpeum *α*, Haw. suppl. 99. M. trícolor *α*, Haw. rev. 163. but not of his syn. Petals shining, greenish-purple, white at the base. Anthers black.

Var. β, ròseum (D. C. prod. 3. p. 447.) flowers rose-coloured. M. pyròpeum var. *β*, Haw. suppl. 99. M. ròseum, Haw.

Var. γ, álbum (Haw. rev. 163.) flowers white. M. lineàre, Thunb. fl. cap. 411.

Wheat-leaved Fig-marigold. Pl. ½ foot.

296 M. grami'neum (Haw. misc. 55. exclusive of the syn. of Thunb.) plant almost stemless; leaves linear; scapes filiform; lobes of calyx 5, lanceolate, longer than the corolla. ⊙. D. G. Native of the Cape of Good Hope.—Petiv. gaz. t. 88. f. 7. Corolla yellow. This species is not sufficiently known. Perhaps it comes nearest to *M. trícolor.*

Grassy-leaved Fig-marigold. Pl. ¼ foot.

297 M. criniflòrum (Hout. pfl. syst. 2. p. 53.) plant almost stemless; leaves radical, connate, obovate, papulose; peduncles rising from the root like scapes; calycine lobes 5, oval, 3 of them longer than the rest. ⊙. D. G. Native of the Cape of Good Hope. Thunb. fl. cap. 411. M. spatulàtum, Thunb. in Willd. spec. 2. p. 1025. Flowers white.

Hair-flowered Fig-marigold. Pl. ¼ foot.

298 M. sabulòsum (Thunb. fl. cap. 422.) plant almost stemless; leaves radical, stem-clasping, oblong, flat, acutish, furrowed above; calycine lobes 5, oblong. ⊙. D. G. Native of the Cape of Good Hope. Flowers yellow.

Gravelly Fig-marigold. Pl. ¼ foot.

299 M. clavifórme (D. C. prod. 3. p. 448.) plant almost stemless; leaves clavate, obtuse; flowers terminal. ⊙. D. G. Native of the Cape of Good Hope.—Petiv. gaz. t. 88. f. 7. M. clavàtum, Haw. obs. 471. misc. 56. rev. 164. but not of Jacq. Flowers golden yellow. Species hardly known.

Club-formed-leaved Fig-marigold. Pl. ¼ foot.

§ 55. *Platyphýlla* (from πλατυς, *platys*, broad, and φυλλον, *phyllon*, a leaf; leaves broad). *Haw. rev. p. 156. Roots annual or biennial. Stems herbaceous. Leaves flat, variable in form, and are papulose, as well as the branches. Flowers of various colours. Calyx 5-cleft. Stigmas 5.*

300 M. CRYSTA'LLINUM (Lin. spec. 688.) plant diffusely procumbent, herbaceous, covered with large glittering papulæ on every part, which makes the plant appear as if covered with ice; leaves ovate, alternate, stem-clasping, undulated; flowers axillary, almost sessile. ⊙. H. Native of the Cape of Good Hope, Canary Islands; and of Greece, about Athens, in the sand by the sea side. Smith, fl. græc. t. 481.—Dill. elth. f. 22. Bradl. succ. t. 48. D. C. pl. grass. t. 128. Haw. misc. 43. Flowers white. There are two varieties of this plant; one a biennial, which is said to be the true *M. crystállinum;* and the other an annual, which is the common ice-plant of the gardens, which is called by Haw. *M. glaciàle.* The whole plant is covered with glittering white papulæ, that shine in the sun, whence it is called ice-plant; others name it the diamond-plant.

Crystalline Fig-marigold or Ice-plant. Fl. May, Aug. Clt. 1775. Pl. procumbent.

301 M. CRI'SPUM (Haw. misc. 44. rev. 157.) leaves alternate, ovate, petiolate, undulated; petals minute. ⊙. H. Native of the Cape of Good Hope.—Petiv. gaz. t. 88. f. 5. M. crispàtum, Haw. obs. 470. Flowers reddish. This species is hardly known.

Curled-leaved Fig-marigold. Pl. pr.

302 M. PINNATI'FIDUM (Lin. fil. suppl. 260.) stems diffuse; leaves opposite, oblong, bluntly pinnatifid, papulose; petals shorter than the calyx. ⊙. H. Native of the Cape of Good Hope, and also said to be a native of Chili. Curt. bot. mag. t. 67. D. C. pl. grass. t. 142. Haw. obs. 112. misc. 44. syn. 244. rev. 157. Stems reddish, papulose. Petals small, yellow in one series. Stigmas 5, ascending. Flowers small in the forks of the branches, pedunculate.

Pinnatifid-leaved Fig-marigold. Fl. May, Oct. Clt. 1774. Pl. pr.

303 M. SESSILIFLÒRUM (Ait. hort. kew. 2. p. 193.) branches divaricate; leaves flat, spatulate, and are, as well as the stems, beset with papulæ; flowers sessile. ⊙. H. Native of the Cape of Good Hope. Flowers yellow. Haw. syn. p. 247.

Var. β, álbum (Haw. rev. 158.) flowers white; leaves ovate, petiolate: upper ones alternate; flowers panicled, small. ♂. D. G. Perhaps a proper species, but is not sufficiently known.

Sessile-flowered Fig-marigold. Fl. July. Clt. 1774. Pl. pr.

304 M. LANCEOLA'TUM (Haw. misc. 45. rev. 159.) stems decumbent; leaves alternate, lanceolate, bluntish, papulose; calyx and peduncles beset with crystalline dots. ⊙. D. G. Native of the Cape of Good Hope. M. Volckamèri, Haw. obs. p. 426. —Volck. norib. p. 266. with a figure? M. filifórme, Thunb. fl. cap. 417.? Flowers white.

Var. β, ròseum (Haw. rev. 159.) flowers reddish; leaves lanceolate-spatulate.

Lanceolate-leaved Fig-marigold. Fl. May, Aug. Clt. 1795. Pl. dec.

305 M. LA'NCEUM (Thunb. fl. cap. 417.) stem erect, rather tetragonal; leaves lanceolate, flat, connate, acute, papulose; flowers terminal. ⊙. H. Native of the Cape of Good Hope. Haw. rev. 170. Flowers white.

Lance-leaved Fig-marigold. Pl. ½ foot.

306 M. PAPULI'FERUM (D. C. prod. 3. p. 448.) stem very short; branches almost radical, somewhat fastigiate, gradually thickened, and are as well as the leaves and calyxes beset with papulæ; leaves connate, ovate; flowers terminal, sessile, 1-3 together; calyx 5-cleft. ⊙. H. Native of the Cape of Good Hope, on hills in very dry places. M. fastigiàtum, Thunb. fl. cap. 413. but not of Haw. Flowers white. Lobes of calyx purple. This species differs from *M. réctum* of Haw. in being annual, not shrubby.

Papulæ-bearing Fig-marigold. Pl. ¼ to ½ foot.

307 M. PAPULÒSUM (Lin. fil. suppl. 259. exclusive of the synonymes) branches decumbent, terete; leaves opposite, spatulately oblong, papulose; flowers pedunculate, rising from the forks of the stem; lobes of calyx linear. ⊙. H. Native of the Cape of Good Hope. Haw. misc. 48. rev. 158. Corolla yellow, hardly longer than the calyx.

Papulose Fig-marigold. Pl. dec.

308 M. CLANDESTÌNUM (Haw. in phil. mag. aug. 1826. p. 129.) branches procumbent, papulose; leaves acutely ovate, petiolate; flowers usually terminal, solitary or by threes, on a terete, clavate peduncle; petals very small. ♄. D. G. Native of the Cape of Good Hope,

Hidden-flowered Fig-marigold. Fl. May, Aug. Clt. 1822. Pl. pr.

309 M. PUBE'RULUM (Haw. in phil. mag. sept. 1831. p. 419.) stems branched, procumbent, papulose; floriferous branches and margins of leaves pubescent; leaves opposite or alternate, obovate-spatulate, channelled, keeled; peduncles subcylindrical. ⊙. D. G. Native of the Cape of Good Hope. Very like *M. papulòsum.* Flowers white.

Puberulous Fig-marigold. Fl. Ju. Aug. Clt. 1829. Pl. pr.

310 M. ANGULA'TUM (Thunb. fl. cap. 426.) stem herbaceous, decumbent, angular, branched; leaves opposite, obovate, sessile, papulose; calyx 5-cleft, angular. ⊙.? D. G. Native of the Cape of Good Hope. Flowers yellow, as in *M. papulòsum,* but the stems are angular, not terete. The stems are angular, however, in *M. Aitònis,* but the flowers are pale red, not yellow.

Angular-stemmed Fig-marigold. Pl. pr.

311 M. AITÒNIS (Jacq. hort. vind. t. 7.) branches decumbent, angular; leaves opposite or alternate, ovate-spatulate, papulose; pedicels short; calyxes angular. ♂. D. G. Native of the Cape of Good Hope. Haw. misc. 48. rev. 158. Flowers expanding in the evening, pale reddish, about the size of those of *M. cordifòlium.* Lobes of calyx very unequal. Stigmas 5, erect, recurved at the apex.

Aiton's Fig-marigold. Fl. June, Oct. Clt. 1774. Pl. pr.

§ 56. *Cordifòlia* (from *cor,* the heart, and *folium,* leaf; shape of leaves). *D. C. prod. 3. p.* 449. *Stem suffruticose. Leaves opposite, distinct, petiolate, flat, ovate, cordate, rather papulose. Flowers purple. Calyx 5-lobed; having 2 of the lobes larger than the rest. Stigmas* 4.

312 M. CORDIFÒLIUM (Lin. fil. suppl. 260.) stems suffruticose, diffuse; leaves opposite, flat, petiolate, ovate-cordate, rather papulose; calyx 4-cleft, 2-horned. ⊙. or ♄. D. G. Native of the Cape of Good Hope. Glox. obs. t. 1. f. a. Smith, pict. t. 6. Jacq. icon. rar. t. 487. D. C. pl. grass. t. 102. Haw. misc. 50. syn. 218. rev. 159. Branches procumbent, rather herbaceous. Flowers solitary, terminal, or rather lateral on the elongated branches. Corolla red. Stigmas 4, erect.

Heart-leaved Fig-marigold. Fl. May, Sept. Clt. 1774. Pl. diffuse.

§ 57. *Expánsa* (from *expansus,* expanded; stems). *D. C. prod. 3. p.* 449.—*Planifòlia* † †, *Haw. rev.* 167. *Stems suffruticose, diffuse, or procumbent, terete. Leaves flat, opposite, almost without papulæ, stem-clasping, a little keeled. Flowers white or pale yellow, rarely pale red. Tube of calyx somewhat pear-shaped; lobes* 4-5, *unequal. Stigmas* 4-5.

313 M. EXPA'NSUM (Lin. spec. 697.) stems divaricate, loosely expanded; leaves distinct, remote, opposite or alternate, flattish, ovate-lanceolate, dotless. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 223. M. tortuòsum, D. C. pl. grass. t. 94. exclusive of the synonymes. M. expánsum, Haw. obs. 195. misc. 50. rev. 168. Lobes of calyx 5, unequal. Corolla large, pale yellow. Stigmas 4-6, short, erect.

Expanded Fig-marigold. Fl. July, Aug. Clt. 1705. Pl. ½ foot.

314 M. VA'RIANS (Haw. misc. p. 51. syn. 249. rev. 168.) branches prostrate; leaves opposite, lanceolate, acuminated, keeled, hence they are bluntly triquetrous and channelled; peduncles very thick. ♄. D. G. Native of the Cape of Good Hope.—Petiv. gaz. t. 78. t. 10. The whole plant is beset with papulæ. Calyx 4-5-cleft. Corolla white on the outside and yellow on the inside; but according to Haworth it is whitish, and according to Petiver yellowish. Stigmas 5, short.

Varying Fig-marigold. Fl. July, Oct. Clt. 1706. Sh. pr.

315 M. TORTUÒSUM (Lin. spec. 697.) stems divaricate, procumbent, twisted: leaves flattish, oblong-ovate, rather papulose, crowded, connate; lobes of calyx 5, very unequal, 2 of which are hardly evident. ♄. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 222. M. tortuòsum, Haw. obs. 196. misc. 51. syn. 250. rev. 168. M. àridum, Mœnch. Flowers pale yellow.

Twisted-stemmed Fig-marigold. Fl. June, Oct. Clt. 1705. Shrub procumbent.

316 M. CONCA'VUM (Haw. rev. 168.) stem procumbent; leaves concave, ovate-lanceolate, alternate, thick; flowers terminal, solitary. ♄. D. G. Native of the Cape of Good Hope.—Burm. afr. dec. 3. t. 26. f. 1. Flowers yellowish. This is a very doubtful species.

Concave-leaved Fig-marigold. Shrub pr.

317 M. PA'LLENS (Ait. hort. kew. 2. p. 182.) stems diffuse; leaves stem-clasping, distinct, glaucous, oblong-lanceolate; inflexedly concave, bluntly keeled, beset with minute papulæ; lobes of calyx 5, ovate-oblong. ♄. D. G. Native of the Cape of Good Hope. Haw. obs. 197. misc. 52. syn. 250. rev. 168. M. expánsum, D. C. pl. grass. t. 47. M. articulàtum, Thunb. fl. cap. 415.? Corolla white, rather longer than the calyx (ex D. C.), but according to Haworth shorter than the calyx.

Pale Fig-marigold. Fl. July, Aug. Clt. 1774. Sh. diffuse.

318 M. LORA'TUM (Haw. rev. 168.) stems diffuse; leaves lorate, canaliculately-inflexed, obtuse, very glaucous, convex beneath; lobes of calyx oblong, attenuated, obtuse. ♄. D. G. Native of the Cape of Good Hope. Flowers white. Perhaps only a variety of *M. pállens*.

Lorate-leaved Fig-marigold. Fl. Jul. Aug. Clt. 1819. Sh. ½ ft.

319 M. CRASSICAU'LE (Haw. in phil. mag. 1824. p. 425.) caudex very short and thick; branches expanded; leaves crowded, flat, lorate, acuminated, green, glabrous, a little incurved; peduncles furnished with 4-5 bracteas; lobes of calyx 5, one of which is smaller than the rest. ♄. D. G. Native of the Cape of Good Hope. Flowers pale yellow, expanding before meridian. Stigmas very short.

Thick-stemmed Fig-marigold. Fl. May, July. Clt. 1815. Pl. ¼ foot.

320 M. RELAXA'TUM (Willd. enum. suppl. p. 36.) stems decumbent, terete, flexuous; leaves linear-lanceolate, obtuse, of a livid glaucous colour, channelled, dotted from papulæ, costately keeled; lobes of calyx 5, foliaceous, one of which is very small. ♄. D. G. Native of the Cape of Good Hope. Spreng. nov. prov. 28. Haw. rev. 169. Flowers purple (ex Willd.), rose-coloured (ex Spreng.), reddish or nearly scarlet (ex Haw.).

Relaxed Fig-marigold. Fl. July, Aug. Clt. 1815. Sh. dec.

321 M. ANATÓMICUM (Haw. misc. 50. syn. 249. rev. 169.) stems filiform, procumbent; leaves opposite, lanceolate-elliptic, full of crystalline papulæ, when dead the nerve alone remains permanent. ♄. D. G. Native of the Cape of Good Hope.

Var. β, frágile (Haw. rev. 169.) leaves large, concave, greener than the species.

Var. γ, emárcidum (D. C. prod. 3. p. 450.) stems erectish. M. emárcidum, Thunb. fl. cap. 415. Perhaps a proper species.

Skeleton-leaved Fig-marigold. Fl. July, Aug. Clt. 1803. Shrub pr.

322 M. OVA'TUM (Thunb. fl. cap. 417.) stem decumbent, rather angular, papulose; leaves ovate, flat, obtuse, spreading; flowers terminal. ♄. D. G. Native of the Cape of Good Hope. Haw. rev. 170. Flowers white.

Ovate-leaved Fig-marigold. Shrub dec.

323 M. HUMIFU'SUM (Ait. hort. kew. 2. p. 179.) stems suffruticose, trailing; leaves stem-clasping, spatulate, keeled, scabrous from conical papulæ; petals very minute. ♄. D. G. Native of the Cape of Good Hope. Corolla white. The rest unknown.

Trailing Fig-marigold. Fl. Jul. Aug. Clt. 1774. Sh. tr.

§ 58. *Tripòlia* (*tripolium* is the name of the Sea Starwort, or *Aster tripòlium*; leaves resembling it). *D. C. prod. 3. p. 450. Roots biennial. Stems herbaceous, loose. Radical leaves crowded: rameal ones alternate, flat, nearly destitute of papulæ. Flowers pedunculate, white. Calyx acutely pentagonal, 5-cleft. Stigmas* 5.

324 M. TRIPÒLIUM (Lin. spec. 690.) stems herbaceous, loose, simple; radical leaves flat, crowded, rameal ones alternate, lanceolate, dotless, almost destitute of papulæ; flowers pedunculate; calyx pentagonal, 5-cleft. ♂. D. G. Native of the Cape of Good Hope.—Dill. elth. f. 220.—Pluk. mant. 329. f. 4. Haw. obs. 122. misc. 49. syn. 247. rev. 167. Flowers middle-sized, white. There is no ally to this species, according to Haworth.

Aster-leaved Fig-marigold. Fl. Ju. Oct. Clt. 1700. Sh. ½ ft.

§ 59. *Helianthoídea* (from *Heliánthus*, sunflower, and *idea*, form; flowers). *D. C. prod. 3. p. 450.—Pomeridiàna and Hymenógyne, Haw. rev. 160. and 192. Roots annual. Stems herbaceous, terete, branched. Leaves lanceolate or spatulate, almost destitute of papulæ, flat, attenuated at the base, opposite, distinct. Peduncles axillary, very long. Flowers yellow, large, expanding after meridian, or in the day time. Calyx rather angular at the base; lobes 5, elongated. Ovarium depressed. Stigmas* 10-20, *sometimes connate.*

325 M. POMERIDIA'NUM (Lin. spec. 698.) leaves broad-lanceolate, flat, smooth, ciliated, nearly distinct; stems, peduncles, and calyxes hairy; petals shorter than the calyx; stigmas 12. ☉. D. G. Native of the Cape of Good Hope. Lin. fil. dec. 1. t. 13. Jacq. icon. rar. t. 489. Curt. bot. mag. 540. Haw. rev. 160. Flowers yellow.

Var. β, glàbrum (Haw. rev. p. 160.) plant more glabrous and naked; upper leaves a little ciliated; petals longer than the calyx. ☉. D. G. Andr. bot. rep. t. 57. Haw. misc. 44. but not of Ait. Perhaps a proper species.

Pomeridian Fig-marigold. Fl. Jul. Aug. Clt. 1774. Pl. 1 ft.

326 M. HELIANTHOÌDES (Ait. hort. kew. 2. p. 198.) leaves flat, spatulate, smooth; peduncles very long; calyxes flat and angular at the base; stigmas usually 10, connate at the base. ☉. D. G. Native of the Cape of Good Hope. Haw. rev. 161. Flowers yellow.

Sun-flower-like Fig-marigold. Fl. Aug. Oct. Clt. 1774. Pl. ¾ foot.

327 M. CALENDULA'CEUM (Haw. rev. 161. but not of his misc.) leaves linear-lanceolate, hardly spatulate, ciliated; peduncles scabrous; petals about equal in length to the lorately-linear, thick, ciliated, calycine lobes; ovarium sparingly pubescent. ☉. D. G. Native of the Cape of Good Hope. Stem much branched. Hairs on the ovarium or tube of the calyx white and short. Flowers yellow. The rest unknown.

Pot-marigold-like Fig-marigold. Fl. Aug. Clt. 1819. Pl. ¾ ft.

328 M. FLA'CCIDUM (Jacq. hort. vind. t. 475.) leaves lanceolate, acute, flat, glabrous, quite entire; peduncles 1-flowered, erectish, glabrous, very long. ♂. D. G. Native of the Cape

of Good Hope. Petals linear, acute at both ends, yellowish. Styles 5. Root biennial (ex Salm-Dyck. in litt.).

Flaccid Fig-marigold. Clt.? Pl. $\frac{1}{2}$ *foot.*

329 M. Candóllii (Haw. rev. p. 160.) leaves lanceolate, flat, acute, ciliated a little, distinct; peduncles very long, hairy; lobes of calyx acuminated, exceeding the petals; stigmas 16-20. ⊙. D. G. Native of the Cape of Good Hope. M. helianthoìdes, D. C. pl. grass. t. 135. Salm-Dyck. obs. p. 15. but not of Ait. ex Haw. Calyx angular at the base. Flowers yellow.

De Candolle's Fig-marigold. Fl. Aug. Oct. Clt. 1774. Pl. $\frac{3}{4}$ foot.

330 M. pilòsum (Haw. rev. p. 161.) leaves linear-lanceolate, ciliated; stems effuse; peduncles, bracteas, and calyxes clothed with wool-like villi; petals longer than the calyx; stigmas 15-20. ⊙. D. G. Native of the Cape of Good Hope.—Breyn. cent. t. 79.—Mor. hist. sect. 12. t. 6. f. 13. M. pilòsum and M. calendulàceum, Haw. misc. 47. Perhaps sufficiently distinct from *M. Candóllii.* Flowers yellow.

Pilose Fig-marigold. Fl. June, Aug. Clt. 1800. Pl. $\frac{3}{4}$ ft.

331 M. gla'brum (Ait. hort. kew. 2. p. 198.) leaves petiolate, spatulately-lanceolate, dilated at the base, and are as well as the branches glabrous; base of calyx hemispherical, with linear, unequal lobes; stigmas usually 12, united into a tube at the base. ⊙. D. G. Native of the Cape of Good Hope. Hymenógyne glàbra, Haw. rev. 192. Corolla straw-coloured; petals rufescent at the base; sterile filaments copper-coloured. Habit almost of *M. Candóllii.* Seeds winged.

Glabrous Fig-marigold. Fl. Jul. Oct. Clt. 1787. Pl. $\frac{3}{4}$ ft.

† *Species not sufficiently known.*

332 M. hu'mile (Haw. misc. 80. rev. 122.) stems prostrate; leaves triquetrous, subulate; calyx 4-cleft. ♄. D. G. Native of the Cape of Good Hope. Leaves opposite, or probably ternate.

Var. α, rùbrum (Haw. l. c.) flowers red.—Petiv. gaz. t. 88. f. 8. Haw. obs. 471.

Var. β. lùteum (Haw. l. c.) flowers yellow.—Pet. gaz. t. 88. f. 8.

Humble Fig-marigold. Pl. prostrate.

333 M. arborifórme (Burch. voy. 1. p. 343. cat. geogr. 2004.). ♄. D. G. Native of the Cape of Good Hope. Allied to *M. parvifòlium.* Shrub 1-2 feet high, branched, with the trunk for the most part simple. Cymes 8-times dichotomous. Flowers minute, of a testaceous colour.

Tree-formed Fig-marigold. Shrub 1 to 2 feet.

334 M. campe'stre (Burch. cat. geogr. 1340. ex voy. 1. p. 259.). ♄. D. G. A plant a foot and a half high, straight. Flowers rose-coloured. Allied to *M. pulchéllum.*

Field Fig-marigold. Shrub $1\frac{1}{2}$ *foot.*

335 M.? laurifòlium (Haw. obs. 470. misc. 49. rev. 157.) root fusiform; stem very flexuous; leaves opposite, cuneately obovate. ♃. D. G. Native of the Cape of Good Hope. —Petiv. gaz. 88. f. 4. Anthers and petals purple. Perhaps a species of *Othòna.*

Laurel-leaved Fig-marigold. Pl. 1 foot?

336 M.? cilia'tum (Ait. hort. kew. 2. p. 179.) leaves opposite, connate, semi-terete; stipulas membranous, reflexed, jagged, in the form of ciliæ. ♄. D. G. Native of the Cape of Good Hope. Corolla white. The rest unknown. Stipulas in all other species of *Mesembryánthemum* are wanting; it is then probably a species of *Arenària.*

Ciliated-stipuled Fig-marigold. Clt. 1774. Pl. $\frac{1}{2}$ foot.

337 M. coria'rium (Burch. cat. geogr. 2487. ex trav. 1. p. 243.). ♄. D. S. Native of the Cape of Good Hope, where it is used in tanning leather. Said to be allied to *M. uncinàtum.*

Hide Fig-marigold. Shrub.

338 M.? villòsum (Lin. spec. 695.) stem shrubby, thickened at the base; branches prostrate; leaves connate, linear, semiterete, channelled, pubescent; peduncles trichotomous; flowers apetalous. ♄. D. G. Native of the Cape of Good Hope. Haw. obs. 222. and 441. misc. 58. syn. 254. rev. 125. Calyx 5-cleft, purplish inside. Capsule fleshy, 5-6-celled. Perhaps a species of *Aizòon, Tetragònia,* or *Sesùvium,* but the description is not sufficient to decide this point.

Villous Fig-marigold. Shrub prostrate.

339 M. granifórme (Haw. misc. 82. syn. 263. rev. 149.) stems expanded, short, suffruticose; leaves distinct, rather triquetrous, ovate grain-formed; stamens collected. ♄. D. G. Native of the Cape of Good Hope. Bradl. succ. t. 20. Stems 3 inches high. Leaves 3 lines long. Flowers yellow, expanding in the evening. This species is entirely unknown at the present day, having been only known to Bradley. According to Haworth's opinion, it comes in section *Cymbifórmia.*

Grain-formed-leaved Fig-marigold. Fl. Sept. Oct. Clt. 1727. Shrub 1 foot.

Cult. This is a vast genus of what are called succulent plants, that is, fleshy-leaved plants. The shrubby kinds should be grown in pots, in a very sandy or gravelly soil; they should be kept almost quite dry, while in a dormant state, but when growing freely and in the flowering season, they require a considerable supply of water. The poorer the soil is, the more dwarf the plants will grow, and bear flowers more abundantly. The shelves in a greenhouse are a good place to preserve them through the winter, however, a good dry frame will answer the purpose equally well, if not better, with a covering of mats in frosty weather. Cuttings of all of them strike root readily, if planted in pots of the same kind of earth recommended for the plants, and kept dry till they begin to wither, when they may have a little water given to them; and under this treatment they will root very soon. There are also several annual and biennial kinds, most of them handsome and curious. The seeds of these should be sown in pots early in spring, and raised in a frame, hot-bed, or greenhouse; and when the plants are of sufficient size, plant them singly in small pots, and set them in the greenhouse, until the warm weather commences, when they may be set out of doors along with the shrubby kinds, where they will flower and seed freely, if the summer proves fine. The same soil and treatment recommended for the shrubby kinds will also suit these well. The ice-plant, *M. crystállinum,* and also *M. pinnatífidum* do well if planted out on rockwork or among stones, where they will make a very curious appearance.

II. TETRAGO'NIA (from τετρα, *tetra,* four, and γωνια, *gonia,* an angle; fruit of some of the species). Lin. gen. no. 627. Gærtn. fruct. 2. t. 127. and 179. Lam. ill. 437. D. C. prod. 3. p. 451.—Tetragonocárpus, Commel.

Lin. syst. *Icosándria, Tri-Octogýnia.* Calyx 4-cleft, rarely 3-cleft, with the tube adhering to the ovarium, and 4-5-horned; lobes coloured on the inside. Petals wanting. Stamens variable in number. Ovarium 3-8-celled. Styles 3-8, very short. Nut bony, winged, or horned, indehiscent, 3-8-celled inside. Seeds solitary in the cells.—Herbs or sub-shrubs. Leaves alternate, flat, fleshy, undivided, usually quite entire. Flowers axillary, pedicellate, or sessile.

Sect. I. Tetragonoìdes (altered from *Tetragònia*). D. C. prod. 3. p. 452. Stamens in fascicles, or solitary in the recesses of the calyx. Nuts usually horned.—Annual or biennial herbs. Flowers sessile or on short pedicels. Horns of calyx sometimes bearing accessory flowers.

1 T. expa'nsa (Ait. hort. kew. 2. p. 178.) herbaceous leaves petiolate, ovate-rhomboid; flowers sessile; fruit 4-horned, 6-8-seeded. ⊙. H. Native of New Zealand and Japan, also of

Chili, about Conception, and Valparaiso. Murr. comm. goett. 1783. t. 5. Scop. inst. t. 14. D. C. pl. grass. t. 114. T. cornùta, Gærtn. fruct. 2. p. 179. f. 3. T. Japónica, Thunb. jap. 208. T. halimifòlia, Forst. prod. p. 223. Roth, abh. t. 8. Demidòvia tetragonoìdes, Pall. hort. dem. t. 1. Stamens 4-5 in each fascicle, 1 fascicle in every recess of the calyx. From all the species this differs in the cells of the pericarp being double the number of calycine lobes, not equal to them in number, as in the rest of the species. The New Zealand spinach is a spreading, rather prostrate plant, with yellow flowers, and leaves an inch and a half long. The whole plant is studded with very minute crystalline dots. It is a native of New Zealand, by the sides of woods, in bushy sandy places, and though not used by the inhabitants, yet, being considered by the naturalist who accompanied Cook, as of the same nature as the *Chenopòdium*, it was served to the sailors boiled every day at breakfast and dinner. It was introduced to this country by Sir Joseph Banks in 1772, and treated as a greenhouse plant; but it has been found to grow in the open garden as freely as the kidney-bean or nasturtium, and has been used as a spinach plant. In the Earl of Essex's family, at Cashiobury, no other spinach was used during the whole summer of 1821, and it is now commonly cultivated for that purpose. It grows so fast that a few plants will suffice for a large family. There are three varieties of this species found in Chili: 1. with leaves smooth on both surfaces: 2. with leaves hoary beneath: and 3. a small grabrous variety.

Expanded Tetragonia or New Zealand Spinach. Fl. Aug. Sept. Clt. 1772. Pl. pr.

2 T. CRYSTA'LLINA (Lher. stirp. nov. 1. p. 81. t. 39.) plant herbaceous, pruinose; leaves ovate, sessile; flowers almost sessile; fruit tetragonal, incurved, 4-seeded. ⊙. or ♄. F. Native of Peru and Chili, about Valparaiso and Coquimbo. D. C. pl. grass. t. 34. Calyx 3-4-lobed. Stamens 3-4 in each fascicle, 1 fascicle in each recess of the calyx.

Crystalline Tetragonia. Fl. June. Clt. 1788. Pl. ½ foot.

3 T. ECHINA'TA (Ait. hort. kew. 2. p. 177.) plant herbaceous; leaves petiolate, ovate-rhomboid; flowers on short pedicels; fruit echinated, 3-4-seeded. ⊙. or ♂. F. Native of the Cape of Good Hope. D. C. pl. grass. t. 113. Calyx 3-4-lobed. Stamens 3-4, 1 in each recess of the calyx. Calyx beset with crystalline papulæ.

Echinated-fruited Tetragonia. Fl. May, Aug. Clt. 1774. Pl. ¾ foot.

SECT. II. TETRAGONOCA'RPOS (from τετρα, *tetra*, four, γωνια, *gonia*, an angle, and καρπος, *karpos*, a fruit; in reference to the fruit being usually furnished with 4 wings). Comm. ex D. C. prod. 3. p. 452. Stamens disposed in 1 series at the base of the calycine lobes. Fruit usually winged.—Herbaceous, perennial, or suffruticose plants. Flowers on long pedicels.

4 T. HIRSU'TA (Lin. fil. suppl. 258.) plant herbaceous, decumbent; leaves ovate, villous, sessile; flowers 3 together, on short pedicels; fruit tetragonal, with a wing on each angle, 4-seeded. ♃. D, G. Native of the Cape of Good Hope. Thunb. fl. cap. 408. Stamens numerous, inserted in the middle of the calyx by bundles, as described by Thunberg. Perhaps not distinct from *T. villòsa*, Poir. dict. 7. p. 604.

Hairy Tetragonia. Pl. decumbent.

5 T. SPICA'TA (Lin. fil. suppl. 258.) plant herbaceous, erect; leaves petiolate, glabrous: lower ones ovate: upper ones lanceolate; flowers pedicellate, branched. ♃. D. G. Native of the Cape of Good Hope. Thunb. fl. cap. 409. where it is called *T. racemòsa*. Pedicels numerous, aggregate.

Spiked-flowered Tetragonia. Fl. Jul. Clt. 1795. Pl. 1 ft.

6 T. HERBA'CEA (Lin. spec. 687.) plant somewhat herbaceous, rather decumbent, smooth; leaves ovate, petiolate; flowers on long pedicels; fruit 4-winged, 4-6-seeded; root strumose. ♃. D. G. Native of the Cape of Good Hope. Thunb. fl. cap. 409. Haw. misc. 121.—Comm. hort. amst. 2. t. 102. Pedicels 1-3 together, nearly an inch long. Flowers 4-cleft, but the terminal ones are 5-cleft. Root fleshy.

Herbaceous Tetragonia. Fl. Ju. Jul. Clt. 1752. Pl. dec.

7 T. DECU'MBENS (Mill. dict. no. 2.) plant suffruticose, decumbent, pruinose; leaves on short petioles, obovate-oblong; flowers 3 together on short pedicels; fruit 4-5-angled, with a wing on each angle. ♄. D. G. Native of the Cape of Good Hope. D. C. pl. grass. t. 23. Mill. fig. t. 263. f. 1. Flowers 4-5-cleft. Styles 4-5. Calyx and anthers of a pale sulphur colour.

Decumbent Tetragonia. Fl. Jul. Sept. Clt. 1758. Sh. dec.

8 T. FRUTICÒSA (Lin. spec. 687.) shrubby, erect; leaves oblong, on very short petioles; flowers 1 or 3 together, on short pedicels; fruit bluntly 3-4-angled, each angle furnished with a wing. ♄. D. G. Native of the Cape of Good Hope.—Comm. hort. amst. 2. t. 103.—Sèba, thes. 2. t. 11. f. 8. Haw. misc. p. 120.—Mill. fig. 2. t. 263. f. 2. Calyx green without and yellow within.

Shrubby Tetragonia. Fl. Jul. Sept. Clt. 1712. Sh. 2 to 4 ft.

9 T. TETRA'PTERIS (Haw. misc. p. 121.) plant suffruticose, erect; leaves oblong-lanceolate, nearly sessile; flowers pedicellate, racemose; fruit furnished with 4 large wings, and other 4 alternate small ones. ♄. D. G. Native of the Cape of Good Hope. Tetrápteris, &c. Pluk. amalth. t. 200. Nut 4-seeded.

Four-winged-fruited Tetragonia. Fl. July, Sept. Clt. 1794. Shrub 1 to 2 feet.

10 T. LINEA'RIS (Haw. rev. p. 73.) plant shrubby and diffusely decumbent; leaves linear, rather revolute at the sides, engraven above by a dorsal line; flowers terminal, racemose. ♄. D. G. Native of the Cape of Good Hope. Leaves greenish.

Linear-leaved Tetragonia. Fl. Sept. Clt. 1819. Sh. dec.

11 T. OBOVA'TA (Haw. rev. p. 73.) plant suffruticose, decumbent, pruinose; leaves obovate or oval; petioles winged, stem-clasping, somewhat decurrent. ♄. D. G. Native of the Cape of Good Hope. Flowers unknown. Very like *T. decúmbens*, but one half larger.

Obovate-leaved Tetragonia. Clt. 1821. Shrub dec.

Cult. The same culture, propagation, and treatment as that recommended for *Mesembryánthemum* will suit the species of *Tetragònia*. The *T. expánsa*, when wanted for spinach, may be planted out in the open ground, about April or May.

III. SESU'VIUM (a name not explained by the author). Lin. gen. 624. Lam. ill. t. 434. D. C. prod. 3. p. 453.

LIN. SYST. *Icosándria, Tri-Pentagýnia.* Calyx 5-parted, permanent; lobes coloured on the inside. Petals wanting. Stamens 15-30, inserted at the top of the calycine tube, which is short. Ovarium distinct, sessile. Style wanting. Stigmas 3-5. Capsule 3, rarely 4-5-celled, circumcised, having the placentiferous axis permanent. Seeds numerous. Embryo hooked. —Smooth fleshy herbs, inhabitants of the sea-side; with opposite, quite entire, veinless leaves; and axillary, solitary, alternate flowers, which are either sessile or on short pedicels. Calyx purplish inside.

1 S. PORTULACA'STRUM (Lin. spec. 446. exclusive of the syn. of Rumphius) leaves linear or lanceolate-oblong, flat; flowers pedicellate. ♃. D. G. Native of the West Indies, Mexico, and Senegal, by the sea-side.—Plum. ed. Burm. t. 223. f. 2. —Jacq. amer. t. 95. Aizòon Canariénse, Andr. bot. rep. 201. Calyx green outside, and reddish within. Stamens 25-30.

Var. α, pedunculàtum; flowers pedicellate. S. pedunculàtum, Pers. ench. 2. p. 39. Lam. ill. t. 434. f. 1.

Var. β, séssile; flowers nearly sessile. S. séssile, Pers. ench.

2. p. 39. D. C. pl. grass. t. 9. The plant is very succulent and full of neutral alkalescent salt, which may be easily extracted, and would probably answer all the purposes for which the salts of the kali are now used.

Sea Purslane. Fl. June, July. Clt. 1692. Pl. dec.

2 S. longifòlium (Willd. enum. p. 521.) leaves linear-spatulate; joints of stem equal; flowers pedicellate. ♃. D. S. Native of South America, by the sea-side. S. Portulacástrum, H. B. et Kunth, nov. gen. amer. 6. p. 86. from Peru and Cumana. Stamens 70-75 (ex Kunth, l. c.). Leaves nearly 2 inches long with the petioles.

Long-leaved Sesuvium. Fl. July, Aug. Clt. 1816. Pl. dec.

3 S. revolutifòlium (Ort. dec. p. 19.) leaves ovate-oblong, with revolute margins; flowers sessile. ♃. D. G. Native of Cuba, by the sea-side. S. Portulacástrum β, Sims, bot. mag. t. 1701. Stamens very numerous. Stigmas 5-6. Leaves rather glaucous, not deep green, as in *S. Portulacástrum*.

Revolute-leaved Sesuvium. Fl. July, Aug. Clt.? Pl. dec.

4 S. re'pens (Willd. enum. p. 521.) leaves spatulate-lanceolate; joints of stem rooting, filiform; flowers pedicellate. ⊙.? D. S. Native of the East Indies.—Rumph. amb. 5. p. 165. t. 72. f. 1.

Creeping Sesuvium. Fl. July, Aug. Clt. 1816. Pl. creep.

5 S. microphy'llum (Willd. l. c.) leaves roundish or lanceolate; stems trailing, having equal joints; flowers pedicellate. ♃. D. S. Native about the Havannah, by the sea-side. Humb. et Bonpl. S. spatulàtum, H. B. et Kunth, nov. gen. amer. 6. p. 87. Leaves 5 lines long with the petioles. Stamens 30. Stigmas 3.

Small-leaved Sesuvium. Pl. creeping.

6 S. parviflòrum (D. C. prod. 3. p. 453.) leaves linear-oblong, flat; flowers sessile. ♃. D. G. Native about Monte Video by the sea-side; and of Chili, near Laguna del Arbolita, on the west side of Rio Saladillo. Sesùvium, Lam. ill. t. 434. f. 2. Triánthema Americàna, Gill. mss. ex Arn. in Cheek. edinb. journ. 1831. p. 354. Perhaps S. Portulacástrum β. Flowers red, one half smaller than those of *S. Portulacástrum*.

Small-flowered Sesuvium. Pl. trailing.

Cult. A mixture of loam, peat, and sand will suit this genus of succulent plants; and they require but little water. Cuttings planted (after being dried a little) in the same kind of soil, root freely, in heat.

IV. AIZO'ON (from *αει*, *aei*, always, and *ζωος*, *zoos*, alive; succulent plant, which will live under most circumstances). Lin. gen. no. 629. Gærtn. fruct. 1. t. 76. Lam. ill. t. 437. D. C. prod. 3. p. 453.—Veslíngia, Fabr. helmst. p. 363.—Ficoídea, Dill. Boerh.

Lin. syst. *Icosándria*, *Pentagýnia*. Calyx 5-parted, coloured, and petaloid inside. Petals wanting. Stamens about 20, inserted in the bottom of the calyx, and disposed in 3-5 bundles. Ovarium distinct, 5-angled. Stigmas 5, thick, sessile. Capsule 5-celled, opening at the apex by 5 chinks, which are disposed in a stellate manner; cells many-seeded.—Humble herbs or subshrubs. Leaves fleshy, quite entire, alternate or opposite. Flowers sessile in the axils of the leaves or forks of the stems, rarely pedicellate, greenish on the outside.

* *Leaves alternate.*

1 A. Canarie'nse (Lin. spec. 700. but not of Andr.) stems herbaceous, procumbent, branched, villous; leaves alternate, obovately cuneiform, pubescent; flowers sessile, rather adnate at the origin of the branches. ♃. D. G. Native of the Canary Islands and Egypt, along the sea shore. D. C. pl. grass. t. 136. Glìnus crystállinus, Forsk. descript. p. 95. t. 14. Ficoídea, Niss. act. par. 1711. t. 13. f. 1. Veslíngia cauliflòra, Mœnch. Veslíngia Heistèri, Fabr. Calyx 5-angled, yellowish inside. Stamens 2-4 at the fifth lobe of the calyx.

Canary-Island Aizoon. Fl. July, Aug. Clt. 1731. Pl. pr.

2 A. glinoìdes (Lin. fil. suppl. 261.) stems herbaceous, decumbent, hairy; leaves alternate, obovate, petiolate, pubescent; flowers sessile, axillary, hairy. ♃. D. G. Native of the Cape of Good Hope. Thunb. fl. cap. 410. Calyx beset with white hairs on the outside, and coloured on the inside; when dry rather rose-coloured. Limb of leaves about equal in length to the petioles.

Glinus-like Aizoon. Fl. June, Aug. Clt. 1774. Pl. dec.

* * *Leaves opposite.*

3 A. Hispa'nicum (Lin. spec. 700.) stem herbaceous, erect, branched; branches spreading and erect, rather papulose at the apex; leaves opposite, linear, lanceolate, glabrous, sessile; flowers solitary, somewhat pedicellate, in the forks of the branches. ⊙. H. Native of Spain, Calabria, and Barbary, by the sea side. D. C. pl. grass. t. 30.—Dill. elth. 1. f. 143. Aizòon sessiliflòrum, Mœnch, meth. Calyx white on the inside, and rather greenish on the outside. The plant from the Cape of Good Hope under this name is different.

Spanish Aizoon. Fl. July, Aug. Clt. 1728. Pl. from 1 inch to ½ foot.

4 A. tomentòsum (Lam. dict. 3. p. 418.) stem suffruticose, tomentose, branched; leaves opposite, tomentose, linear-lanceolate, narrowed at the base, rather spatulate at the apex; flowers sessile in the forks of the stem. ♄. D. G. Native of the Cape of Good Hope. A. Hispánicum, Burm. cap. prod. p. 154. Calyx yellowish inside, 5-lobed, rarely 4-lobed. Stamens 15.

Tomentose Aizoon. Shrub 1 foot?

5 A. stella'tum (Lam. dict. 3. p. 418.) stem suffruticose, branched, hispid at the apex; leaves opposite, linear-spatulate, hairy; flowers panicled: pedicels and calyxes hairy. ♄. D. G. Native of the Cape of Good Hope. Calyx yellowish inside. Stamens about 20.

Stellate Aizoon. Shrub 1 foot.

6 A. perfolia'tum (Lin. fil. suppl. p. 261.) stem suffruticose, erect, tomentose, branched; leaves opposite, connate, obovate-oblong, full of crystalline dots; flowers axillary, pedunculate, solitary. ♄. D. G. Native of the Cape of Good Hope. Thunb. fl. cap. 411. Margins of leaves reflexed.

Perfoliate-leaved Aizoon. Fl. Ju. Aug. Clt. 1818. Sh. 1 ft.

7 A. sarmentòsum (Lin. fil. suppl. 260.) stem suffruticose, erectly diffuse, glabrous, branched; leaves opposite, linear-filiform, rather connate, glabrous; branches rather villous, 3-flowered at the apex, the two lateral flowers are bracteated, and spring from the sides of the middle one. ♄. D. G. Native of the Cape of Good Hope. Thunb. fl. cap. 410.—Burm. afr. t. 26. f. 2. good. Mesembryánthemum hexaphýllum, Haw. rev. p. 165. ex syn. Burm. This species differs from all in the inflorescence. The peduncles and fruit of the preceding year are permanent and lateral.

Sarmentose Aizoon. Shrub sarmentose.

8 A. panicula'tum (Lin. spec. 700.) stems herbaceous, decumbent, hairy; leaves opposite, lanceolate, hairy; flowers nearly sessile on trichotomous peduncles. ♄. D. G. Native of the Cape of Good Hope. Thunb. fl. cap. 410.

Panicled Aizoon. Pl. decumbent.

† *Species not sufficiently known.*

9 A. ri'gidum (Lin. fil. suppl. 261.) stem suffrutescent, decumbent; branches hoary; leaves ovate, acute, covered with glaucous tomentum; flowers sessile, alternate, secund, remote. ♄. D. G. Native of the Cape of Good Hope. Thunb. fl. cap. p. 409. In the character of this species it does not say

whether the leaves are alternate or opposite. The leaves are said to be ovate in the diagnosis, and in the description obovate.

Stiff Aizoon. Shrub decumbent.

10 A. fruticòsum (Lin. fil. suppl. 1. c.) stem shrubby, erect, glabrous, stiff; leaves lanceolate, glaucous, attenuated at the base; flowers sessile. ♄. D. G. Native of the Cape of Good Hope. Thunb. fl. cap. 410. The description does not mention whether the leaves are alternate or opposite.

Shrubby Aizoon. Shrub 1 foot.

11 A. secu'ndum (Lin. fil. suppl. 1. c.) stem herbaceous, hairy, decumbent; leaves ovate, acute, rather petiolate, beset with silky villi; flowers sessile, secund, axillary.—Native of the Cape of Good Hope. Thunb. fl. cap. 409. Leaves a line long; in the diagnosis they are said to be ovate, but in the description obovate.

Secund-flowered Aizoon. Pl. decumbent.

Cult. This genus of succulent plants is not worth growing except in botanical gardens. The culture, treatment, and propagation recommended for the genus *Mesembryánthemum* will answer well for the species of *Aizòon* also.

V. MI'LTUS (from μιλτος, *miltos*, vermilion; in reference to the deep red colour of the whole plant). Lour. coch. p. 302. D. C. prod. 3. p. 454.

Lin. syst. *Icosándria*, *Pentagýnia*. Calyx 5-parted, permanent, spreading, coloured. Petals wanting. Stamens 12, inserted in the bottom of the calyx; anthers standing. Ovarium roundish. Style wanting; stigmas 5, linear. Capsules 5, connate, each containing one seed.—A prostrate shrub, with oblong, opposite, crowded leaves; and crowded lateral flowers. This genus differs from *Glìnus* in the petals being absent in the spreading calyx, and in the capsules being 1-seeded.

1 M. Africa'nus (Lour. l. c.) ♄. D. S. Native of the eastern coast of Africa, in arid places, in the islands of the Mosambique. Glìnus Míltus, Ræusch. nom. Glìnus Mosambicénsis, Spreng. syst. 2. p. 467. The whole herb is reddish.

African Miltus. Shrub prostrate 4 feet long.

Cult. See *Sesùvium*, p. 153. for culture and propagation.

VI. GLI'NUS (a name given by Theophrastus to the maple). Lin. gen. no. 610. Juss. gen. 316. Lam. ill. 413. D. C. prod. 3. p. 455.—Rolòfa, Adans. fam. 2. p. 256.

Lin. syst. *Dodecándria*, *Pentagýnia*. Calyx 5-parted, conniving, permanent, coloured inside, with 3 of the sepals exterior, and the other 2 interior. Petals strap-formed, 2-4-cleft at the apex, from 5 to 20 in number, shorter than the calyx. Stamens about 15. Ovarium distinct. Style very short or wanting; stigmas 5. Capsule covered by the calyx, 5-valved, 5-celled. Seeds numerous, minute, hanging by a very long involute funicle each. Embryo spiral.—Branched procumbent tomentose herbs, with alternate leaves or in unequal pairs. Flowers axillary, almost sessile. The plants have the habit of *Aizòon*, but the embryo is that of *Caryophýlleæ*.

Sect. I. Glinòla (an alteration from the generic name). D. C. prod. 3. p. 455. Alsìne species, Tourn. Glìnus, Rafin. Petals 5. Capsule truly 5-celled.

1 G. lotoìdes (Lin. spec. 663.) plant clothed with white wool, diffuse, herbaceous; leaves obovate, fascicled, unequal; pedicels 1-flowered, axillary. ⊙. H. Native of Spain, Sardinia, North America, north of Africa, Archipelago, and Senegal, Egypt, Asia, &c. in inundated places; also of Chili, about Buenos Ayres. Smith, fl. græc. t. 472.—Burm. fl. ind. t. 36. f. 1.—Barrel. icon. t. 336.—Bocc. sic. t. 11. G. lotoìdes and G. dictamnoìdes, Lam. dict. 2. p. 728. ill. 413. f. 1, 2. Sepals white inside, with red margins. Pedicels aggregate.

Lotus-like Glinus. Fl. July. Clt. 1788. Pl. prostrate.

2 G. dictamnoi'des (Lin. mant. 243.) plant clothed with white tomentum, prostrate, suffruticose; leaves orbicular, flat, on very short petioles; flowers axillary, nearly sessile. ♄. G. Native of the East Indies. Vahl. symb. 3. p. 64.—Pluk. amalth. t. 306. f. 6. Petals yellow.

Dictamnus-like Glinus. Shrub prostrate.

Sect. II. Rolòfa (meaning unknown). D. C. prod. 3. p. 456.—Plénckia, Rafin. speech. 1. p. 194. Petals numerous. Capsule probably 1-celled.

3 G. setiflòrus (Forsk. descr. 95.) plant hoary, suffruticose, diffuse; leaves nearly orbicular, in whorles, petiolate; flowers axillary, capitate. ♄. G. Native of Arabia Felix, about Dahi, in inundated places. Vahl. symb. 3. p. 64. Plénckia setiflòra, Ralin. l. c. Petals numerous, linear, yellow, divided into 3-4 bristles at the apex. Capsule 1-celled, ex Forsk. Very like Glìnus lotoìdes ex Vahl.

Bristle-flowered Glinus. Shrub diffuse.

† *Species not sufficiently known.*

4 G.? trianthemoìdes (Roth, nov. spec. 231.) plant prostrate, glabrous; leaves obovate, wedge-shaped, rounded, mucronate; panicles loose, terete, opposite the leaves.—Native of the East Indies. This plant differs from *Glìnus* in the petals being wanting. It is therefore perhaps a species of *Míltus;* but this is still doubtful because the number of the seeds are unknown.

Trianthema-like Glinus. Pl. prostrate.

Cult. These plants will grow well in a mixture of sand, peat, and loam; and young cuttings of the shrubby kinds will strike root readily in the same kind of soil. The seeds of the annual species had better be reared on the hot-bed, and when the plants are of a sufficient size, they should be planted out into a warm damp situation.

VII. ORY'GIA (altered from the Arabic name of the plant Hörudjrudj). Forsk. descr. p. 103. Juss. gen. p. 317. dict. sc. nat. 36. p. 512. D. C. prod. 3. p. 455.—Portulàca species, Vahl.

Lin. syst. *Icosándria*, *Pentagýnia*. Calyx 5-parted, permanent. Petals numerous (20?), lanceolate. Stamens indefinite. Ovarium distinct. Stigmas 5, filiform. Capsule globose, girded by the calyx, 5-celled, 5-valved, many-seeded.—An Arabian decumbent small shrub, with mealy ovate acute leaves, and reddish violet flowers. O. portulacifòlia is a species of *Talìnum*.

1 O. decu'mbens (Forsk. l. c.) ♄. D. F. Native of Arabia Felix. Portulàca decúmbens, Vahl. symb. 1. p. 33. Talìnum decúmbens, Willd. spec. 2. p. 864. Leaves bluish.

Decumbent Orygia. Pl. decumbent.

Cult. A gravelly or sandy soil will suit this plant, and cuttings will root readily in the same kind of soil.

Order CXV. NITRARIA'CEÆ (this order only contains the genus *Nitrària*). Lindl. introd. nat. syst. p. 163.

Calyx inferior, 5-toothed, fleshy. Corolla of 5 petals, which arise from the calyx, inflexed, valvular in æstivation. Stamens 3 times the number of the petals, perigynous; anthers innate, with 2 oblique, longitudinal lines of dehiscence. Ovarium superior, 3 or more celled, with a continuous fleshy style, at the apex of which are as many stigmatic lines as there are cells in the fruit; ovula pendulous, by means of a long funicle. Fruit drupaceous, opening by 3 or 6 valves. Seeds solitary, without albumen. Embryo straight, with the radicle next the hylum.—Shrubs with deciduous, succulent, alternate leaves, which are

sometimes in fascicles. Flowers in cymes, or solitary. The affinity of *Nitrària* with *Ficoïdeæ* is undoubtedly great, especially with *Tetragònia;* but its very different embryo, and the peculiar æstivation of the petals, which is much more like that of *Rhámneæ* remove it from that order.

I. NITRA'RIA (so named by Schreber, who first found it in Siberia, near the nitre works, with other marine plants). Lin. gen. no. 632. Lam. ill. t. 403. Gærtn. fruct. 1. t. 58. D. C. prod. 3. p. 456.

Lin. syst. *Dodecándria, Monogýnia.* Character the same as that of the order.

1 N. Schöbe'ri (Lin. spec. 638.) leaves cuneate, obtuse, mucronate, quite entire. ♄. H. Native of Siberia, about the nitre works; and of the Soongarian desert, in salt fields every where, and about Loktewsk, as well as on the borders of the Caspian Sea. Pall. fl. ross. 1. t. 50. f. a and b. Lam. ill. t. 403. f. 1. Flowers white, disposed in panicled cymes. The Siberian and Caspian varieties are not different, unless in the more luxuriant growth of the Caspian kind, which is owing to its growing in a more humid situation than that of the Siberian variety.

Schœber's Nitraria. Fl. May, Aug. Clt. 1778. Sh. 3 feet.

2 N. tridenta'ta (Desf. fl. atl. 1. p. 372.) leaves cuneated, retuse, somewhat tridentate at the apex; drupes ovate. ♄. H. Native of Barbary and Egypt, in sandy fields. Péganum retùsum, Forsk. ex. Dill. ill. fl. ægyp. Branches spinose. Flowers white, in panicled cymes. Fruit red.

Tridentate-leaved Nitraria. Clt. 1820. Shrub 1½ foot.

3 N. Senegale'nsis (Lam. ill. t. 403. f. 2. dict. 4. p. 493.) leaves obovate, obtuse, quite entire; drupes trigonal. ♄. S. Native of Senegal. Flowers white, in panicled cymes. This species is easily distinguished from the rest by its pyramidal trigonal drupe.

Senegal Nitraria. Shrub 1 to 2 feet.

† *A doubtful species.*

4 N. Billardie'rii (D. C. prod. 3. p. 456.) leaves linear, attenuated at the base, acutish, quite entire; drupes ovate, acuminated. ♄. G. Native of New Holland. Very nearly allied to *N. Schöbèri,* Labill. mss. but very different from it in the fruit being ovate conical, as well as from growing in a different part of the world.

La Billardier's Nitraria. Shrub 1 to 2 feet.

Cult. This is a genus of singular shrubs: they thrive best in a sandy or gravelly soil, and should be occasionally refreshed with salted water, or they will not flourish; they may be increased by layers; or cuttings planted in sand, with a hand-glass over them, strike root readily. The *N. Senegalénsis,* being a stove plant, and *N. Billardièri* should be grown in pots, in order that they may be placed in their respective situations.

Order CXVI. REAUMURIA'CEÆ (plants agreeing with *Reaumùria* in important characters). Reaumurièa, Ehrenberg in ann. des. sc. 12. p. 78. (1827). Lindl. introd. bot. p. 48.

Calyx 5-parted (f. 31. *a.*), surrounded externally by imbricating bracteas. Petals 5 (f. 31. *b.*), hypogynous. Stamens definite or indefinite (f. 31.), hypogynous, with or without a hypogynous disk; anthers peltate (f. 31. *d.*). Ovarium superior. Styles several (f. 31. *f.*); filiform or subulate. Fruit capsular (f. 31. *e.*), with 2 or 5 valves, and as many cells, opening in the middle of the cells. Seeds definite, villous. Embryo straight, surrounded by a small quantity of mealy albumen, with the radicle next the hylum. Shrubs. Leaves fleshy, scale-like or small, and alternate, without stipulas. Flowers solitary. Dr. Ehrenberg suggests (ann. sc. l. c.) that *Reaumùria* and *Hololáchna,* both of which have according to him hypogynous stamens, may constitute a little group to be called *Reaumurièæ.* The order appears to be more nearly related to *Hypericíneæ* than to either *Ficoïdeæ* or *Nitrariàceæ,* and ought perhaps to have followed that order among the *Thalamiflòræ* in vol. I. From the former it chiefly differs in its succulent habit, and definite villous seeds, agreeing with *Reaumùria,* at least even in the obliquity of the veins of the petals, and in the leaves being dotted. From *Ficoïdeæ* its hypogynous stamens and seeds distinguish it; from *Tamariscíneæ,* its plurilocular ovarium and distinct styles; from *Nitrariàceæ,* its erect villous seeds, distinct styles, and hypogynous stamens. Saline matter is present in these plants in great abundance.

Synopsis of the genera.

1 Reaumu'ria. Calyx 5-parted (f. 31. *a.*), involucrated by crowded leaves on the outside. Filaments indefinite (f. 38.), joined at the base into 5 bundles.

2 Holola'chna. Calyx 4-5-parted. Stamens 8-10, monadelphous.

I. REAUMU'RIA (so named by Haselquist in honour of René Antoine Ferchault de Reaumur, member of the Academy of Sciences at Paris, &c.; author of several Memoirs, Histoire des Insects, &c. He died in 1757). Lin. gen. 686. Lam. ill. 489. D. C. prod. 3. p. 456.

Lin. syst. *Polyándria, Pentagýnia.* Calyx 5-parted (f. 31. *a.*), involucrated by leaves on the outside. Petals 5 (f. 31. *b.*), furnished with a ciliated appendage on each side at the base. Ovarium distinct. Stigmas 5-6, filiform (f. 31. *f.*). Capsule 5-celled, 5-valved; dissepiments easily separated from the valves. Seeds 2 in each cell, very villous.—Oriental shrubs, with fleshy, alternate, glaucous, dotted leaves, exuding globules of a saline alkali. Flowers solitary at the tops of the branches.

1 R. vermicula'ta (Lin. spec. 754.) leaves subulate, semiterete, imbricated, crowded on the branches. ♄. F. Native of Sicily, Barbary, and Egypt, on the sea shore. Lam. ill. 489. f. 1. Desf. atl. 1. p. 481.—Lob. icon. 380. Flowers white or pale red. Habit of *Chenopòdum fruticòsum.* Hairs on the seeds rufous, and very stiff.

Vermiculated Reaumuria. Fl. July, Oct. Clt. 1828. Sh. 1 ft.

2 R. hypericoïdes (Willd. spec. 2. p. 1250.) leaves lanceolate, flat, rather remote. ♄. F. Native of Syria, Tauria, and Persia, in arid places. Lam. ill. 489. f. 2. Ker. bot. reg. t. 845. Hypéricum alternifòlium, Labill. syr. dec. 2. t. 10. R. linifòlia, Sal. par. lond. t. 18. R. cistoïdes, Willd. enum. p. 578. R. vermiculàta var. β, and perhaps also var. α, Bieb. fl. taur. 2. p. 17.—Buxb. cent. 2. t. 35. Flowers of a purplish rose-colour. Hairs on seeds woolly. (f. 31.)

St. John's-wort-like Reaumuria. Fl. Jul. Oct. Clt. 1800. Sh. 1 to 2 feet.

FIG. 31.

Cult. Elegant little shrubs of easy culture; they thrive best in a mixture of sandy loam and peat; and young cuttings readily strike root under a hand-glass.

II. HOLOLA'CHNA. This genus having already been described under the order *Tamaracíneæ*, it is only necessary here to refer to vol. II. p. 728. where all the details of the genus will be found.

ORDER CXVII. CA'CTEÆ (this order contains the genus *Cáctus*, and all the genera recently separated from it). D. C. prod. 3. p. 457. mem. cact. in mem. mus. vol. 17. p. 1-119. —Cactoídeæ, Vent. tabl. 3. p. 289.—Nopàleæ, D. C. theor. elem. 216.—Cácti, Juss. gen. p. 310. exclusive of Grossularièæ.—Opuntiàceæ, Juss. dict. 35. p. 144. exclusive of Grossularièæ. H. B. et Kunth, nov. gen. amer. 6. p. 65.—Cáctus, Lin. gen. no. 613. Willd. enum. hort. berol. p. 30. Link. enum. 2. p. 21. &c.

Calyx composed of many sepals, usually indefinite in number, and confounded with the petals, united and adnate a great length to the ovarium; with the tube smooth in the genera *Mammillària*, *Melocáctus*, and *Rhípsalis*; or with the lobes of the sepals crowning the fruit, and having the tube scaly as in the genera *Céreus*, *Opúntia*, and *Peréskia*. Petals disposed in two or more series, hardly distinguishable from the inner sepals, and somewhat united to them; sometimes irregular, and disposed in a long tube at the base, but distinct at the apex, as in the genera *Mammillària*, *Melocáctus*, and *Céreus*; sometimes equal and distinct to the very base, forming a rotate corolla, as in the genera *Opúntia*, *Peréskia*, and *Rhípsalis*. Stamens indefinite, disposed in many series, more or less cohering with the petals or inner sepals; filaments slender, filiform: in the genus *Opúntia* they are irritable to the touch; anthers ovate, versatile, 2-celled. Ovarium obovate, fleshy, 1-celled: with numerous ovula, arranged upon parietal placentas, which are equal in number to the lobes of the stigma. Style filiform, sometimes full and sometimes fistular; stigmas numerous, either spreading or collected into a cluster. Fruit fleshy, 1-celled, many-seeded, either smooth and crowned by the calyx, or covered with scales, scars, or tubercles, and umbilicate at the apex. Seeds, when young parietal, but when mature imbedded in the pulp with which the cells are filled, oval or obovate, without albumen. Embryo either straight, curved, or spiral; with a short, thick, obtuse radicle; cotyledons flat, thick, foliaceous in *Opúntia* and other leaf-bearing genera, very small in *Melocáctus*, and perhaps almost obsolete in *Mammillària* and other leafless genera.

This order contains fleshy or succulent shrubs, very variable in habit. Stems usually angular, winged, or regularly beset with tubercles, rarely terete, usually jointed; joints compressed. Leaves usually wanting, but when present small, caducous, and terete, sometimes like those of *Sèdum*, rarely flat and expanded, sometimes alternate and disposed in a spiral order, always glabrous and fleshy. Prickles or bristles disposed in fascicles, rising from the axils of the leaves; in the leafless genera the fascicles of spines are disposed on the angles of the stem, rising from tubercles. Flowers very variable, showy, or minute, usually solitary, sessile, rarely in fascicles, ephemeral, expanding by night or by day.

It has already been remarked, on more than one occasion in this work, that the state of that remarkable distention or increase of cellular tissue of vegetables, from which the name of succulent is derived, is no indication of natural affinity, but rather to be considered a modification of structure, which may be common to all tribes. Hence the immediate relationship of *Cácteæ* is neither with *Euphorbiàceæ*, nor *Lauríneæ*, nor any other tribe of succulent plants, but with *Grossularièæ*, in which no tendency whatever to an increase of cellular tissue exists. Through *Rhipsàlis*, which is said to have a central placenta, *Cácteæ* are connected with *Portulàceæ*, to which also the curved embryo of the section of *Opuntiàceæ* probably indicates an approach. De Candolle further traces an affinity between these plants and *Ficoídeæ*. For an elaborate account of this order, see his Memoir above quoted.

The fruit is very similar in properties to those of *Grossulària*, some being refreshing and agreeable to the taste, others mucilaginous and insipid; they are all, however, destitute of the excessive acidity of some gooseberries and currants. The fruit of *Cáctus Opúntia*, has the property of staining red the urine of those who eat it. The juice of *Mammillària vulgàris* is remarkable for being slightly milky, and at the same time sweet and insipid.

Synopsis of the genera.

TRIBE I.

OPUNTIA'CEÆ. *Ovula, and therefore the seeds, fixed to the parietes of the fruit.*

1 MAMMILLA'RIA. Tube of calyx adhering to the ovarium; lobes 5-6, coloured, crowning the young fruit. Petals 5-6, hardly distinguishable from the calyx. Stamens disposed in many series. Stigma 5-7-cleft. Berry smooth.

2 MELOCA'CTUS. Tube of calyx adhering to the ovarium; lobes 5-6, petaloid, crowning the young fruit. Petals 5-6, united into a long tube with the sepals. Stamens disposed in many series. Stigma 5-rayed. Fruit smooth.

3 ECHINOCA'CTUS. Sepals numerous, imbricate, adhering to the ovarium: outer ones in the form of an involucrum: inner ones petal-formed. Stamens numerous. Style multifid at the apex. Berry scaly from the remains of the sepals.

4 CE'REUS. Sepals very numerous, imbricate, adnate to the base of the ovarium, united into an elongated tube: outer ones shorter and like a calyx: middle ones longer and coloured, innermost ones petal-formed. Style multifid at the apex. Berry areolate, tubercular or scaly from the remains of the sepals.

5 EPIPHY'LLUM. Tube of calyx very long, furnished with remote scales; limb of corolla multifid, rosaceous or ringent. Branches flat.

6 OPU'NTIA. Sepals numerous, leaf-formed, adnate to the ovarium: upper ones flat and short: inner ones petal-formed, obovate and expanded, with no tube above the ovarium. Stamens numerous, shorter than the petals. Stigmas numerous,

erect, thick. Berry oval, umbilicate at the apex, either tubercled or spiny.

7 Pere'skia. Sepals leaf-formed, numerous, adnate to the ovarium, and usually permanent above the fruit. Corolla rotate, almost as in *Opúntia*. Stamens numerous, much shorter than the petals. Stigmas aggregate, in a spiral manner. Berry globose or ovate.

Tribe II.

Rhipsalídeæ. *Ovula, and therefore the seeds fixed to the central axis of the fruit.*

8 Rhi'psalis. Tube of calyx smooth, adhering to the ovarium; limb superior, 3-6-parted, short. Petals 6, oblong, inserted in the calyx. Stamens 12-18, fixed to the petals. Stigmas 3-6, spreading. Berry roundish, pellucid, crowned by the dead calyx.

Tribe I.

OPUNTIA'CEÆ (plants agreeing with *Opúntia* in important characters). D. C. prod. 3. p. 458. Ovula, and therefore the seeds fixed to the parietes of the berry.

I. MAMMILLA'RIA (from *mamma*, the nipple; the plants are covered with mammæform tubercles, spirally disposed, the mammæ bearing radiating spines at the apex and deciduous tomentum). Haw. syn. 177. D. C. prod. 3. p. 458.—Cáctus and Mammillària, D.C. cat. hort. monsp. p. 83.—Echinocáctus, Willd. enum. suppl. 30. exclusive of some species.—Cáctus, sect. A. Link. enum. 2. p. 21.

Lin. syst. *Icosándria, Monogýnia.* Tube of calyx adhering to the ovarium; lobes 5-6, coloured, crowning the young fruit. Petals 5-6, hardly distinguishable from the calyx, and longer than it, united into a tube with the sepals. Stamens filiform, disposed in many series. Style filiform. Stigmas 5-7, radiating. Berry smooth. Seeds imbedded in the pulp. Cotyledons obsolete (ex Nutt.). Fleshy, succulent, shrubby plants, of a roundish or subcylindrical form, destitute of a woody axis (perhaps in all ?), lactescent, leafless; bearing rather conical, mammæform, crowded tubercles, which are disposed in a spiral manner, terminating in radiating spines and deciduous tomentum. Flowers sessile at the base of the mammæ, usually disposed in a transverse zone around the plant. Berries obovate, eatable, crowned by the marcescent calyx, which at length becomes deciduous. Tubercles of the stem very similar to the leaves of *Mesembryánthemum barbàtum*.

1 M. magnima'mma (Haw. in phil. mag. vol. 63. p. 41.) plant nearly globose, depressed; tubercles or mammæ large, hard, and very green, when young woolly at the apex, but when old quite smooth, each terminated by 4 very stiff, radiating, recurved, yellow spines: the upper one of which is very minute, and the lower one much elongated. ♄. D. S. Native of Mexico. This is a very pretty species. The tubercles are large, tetragonal, and cylindrical, very broad at the base, and much depressed; the spines very strong and very stiff, broadish, recurved, furrowed longitudinally, when young pale brown and black at the apex, but when old wholly black, and with wool at the base; wool at the base of the spines vanishing.

Large-teated Mammillaria. Clt. 1823. Shrub $\frac{1}{4}$ to $\frac{1}{2}$ foot.

2 M. corona'ria (Haw. rev. p. 69.) plant simple, cylindrical, when young clavate; tubercles or mammæ large, ovate, woolly, and spiny at the apex; spines stiff, rising from white tomentum, exterior ones white: interior ones brown. ♄. D. G. Native of Mexico. Cáctus coronàtus, Willd. enum. suppl. 30. Cáctus cylíndricus, Ort. dec. p. 128. t. 16. but not of Lam. This is a very beautiful species, and the tallest of all the genus; it is about 5 feet high, and half a foot in diameter. Flowers scarlet. Tubercles or mammæ at the top of the stem are the longest, and as if they were forming in a crown.

Crown Mammillaria. Fl. June, Aug. Clt. 1817. Sh. 5 feet.

3 M. díscolor (Haw. syn. 177. D. C. diss. t. 2. f. 2.) plant globose, somewhat depressed, almost simple, with glabrous axils; tubercles or mammæ ovate, hardly woolly at the tips, but bearing spines: outer spines setaceous and white, spreading and stiffish: inner ones fewer and brown, straight and more rigid. ♄. D. S. Native of South America. Colla, hort. ripul. append. 3. t. 11. Cáctus depréssus, D. C. cat. hort. monsp. p. 84. Cáctus pseùdo-mammillàris, Salm-Dyck. mss. C. Spinii, Cólla antol. 6. p. 501. Plant 3-4 inches high. There are 13-15 series of tubercles, winding to the right. Flowers longer than the tubercles, more spreading at the apex than in *M. símplex*, white inside, but of a dirty reddish colour on the outside.

Two-coloured-spined Mammillaria. Fl. June, Aug. Clt. 1800. Shrub $\frac{1}{4}$ to $\frac{1}{2}$ foot.

4 M. lanífera (Haw. in phil. mag. vol. 63. p. 41. D. C. diss. t. 4.) plant simple, terete, obovate, clothed with woolly tomentum all over; tubercles or mammæ bearing 20 or more radiating, straight, spreading spines at the apex: outer spines smaller and white: inner ones strong and fulvescent. ♄. D.S. Native of Mexico. Cáctus canéscens, Moc. et Sesse, fl. mex. icon ined. Plant 3-4 inches high. Flowers red, longer than the tubercles (ex fl. mex.).

Wool-bearing Mammillaria. Clt. 1823. Shrub $\frac{1}{4}$ foot.

5 M. flave'scens (D. C. prod. 3. p. 459.) plant obovate, rather proliferous at the top; axils woolly; tubercles or mammæ ovate, woolly at the apex, and bearing spines; spines stiff, long, straight, yellowish. ♄. D. S. Native of South America. Cáctus flavéscens, D. C. cat. hort. monsp. p. 83. M. stramínea, Haw. ex Salm-Dyck. in litt. Cáctus flavéscens and C. stramíneus, Spreng. syst. 2. p. 494. Plant 4-5 inches high. The tubercles are disposed in 13-14 series, which wind to the right.

Yellowish-spined Mamillaria. Fl. June, Aug. Clt. 1811. Shrub $\frac{1}{4}$ to $\frac{1}{2}$ foot.

6 M. fulvispìna (Haw. in phil. mag. oct. 1829. p. 106.) plant roundish; tubercles or mammæ bearing about 13 spines each at the apex, about 4 of which are a little longer than the rest: outer ones horizontal. ♄. D. S. Native of Brazil. Flowers large, red, nearly like those of *M. rhodántha* (Otto), but probably larger, and the spines are longer; lower spines 3 lines long, white, almost covering the whole plant: and the 4 upper ones spreading, and 2 or 3 times longer than the rest, of a fulvous colour.

Brown-spined Mammillaria. Fl. Sept. Clt. 1829. Sh. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

7 M. prolífera (Haw. syn. 177. suppl. 71.) plant obovate, proliferous at the base; axils woolly; spines long, straight, of a whitish straw-colour. ♄. D. S. Native of South America. Cáctus mammillàris prólifer, Ait. hort. kew. ed. 2. vol. 3. p. 175. Offsets rising from the plant at the very base, from which it is easily known from *M. flavéscens* (ex Salm-Dyck.).

Proliferous Mammillaria. Fl. June, Aug. Clt. 1800. Sh. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

8 M. de'nsa (Link. et Otto, pl. rar. hort. berol. t. 35.) plant cylindrical, glaucescent; tubercles or mammæ conical, dense; spines numerous, yellowish, 1 of which in each fascicle is larger than the others. ♄. D. S. Native of Mexico, on the mountains.

Dense Mammillaria. Clt. ? Shrub $\frac{1}{4}$ foot.

9 M. bícolor (Lehm. in pl. nov. hort. hamb. ex bot. zeit. 1831. p. 132.) plant obovate, proliferous at top; axils woolly; mammæ twisted spirally, ovate, pyramidal, woolly at the apex,

and bearing spines; spines setaceous, divaricate, white, 2 of which are erect in each fascicle, and much longer than the rest, spaceolate at the apex. ♄. D. S. Native of Mexico, on the mountains.

Two-coloured Mammillaria. Clt.? Shrub $\frac{1}{4}$ foot.

10 M. SÍMPLEX (Haw. syn. 177.) plant simple, obovate; axils glabrous; tubercles or mammæ ovate, bearing stiff, straight, radiating spines at the apex. ♄. D. S. Native of South America, and the islands. Cáctus mammillàris, Lin. spec. 666. D. C. pl. grass. t. 3. Cat. hort. monsp. 83. Plant 6-8 inches long. There are about 18 or 20 series of tubercles, winding to the left. Spines shortish and red. Tomentum short, deciduous. Axils, when young, rather tomentose. Flowers white. Berry red.

Simple Mammillaria. Fl. Ju. Aug. Clt. 1688. Sh. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

11 M. PARVIMA'MMA (Haw. suppl. 72.) plant nearly globose, proliferous at the top; tubercles or mammæ numerous, small, clothed with white tomentum at the apex, each terminating in 10 or 12 rather stiff, dark purple spines. ♃. D. S. Native of South America. Cáctus microthèle, Spreng. syst. 2. p. 494. The character is from Salm-Dyck. in litt.

Small-teated Mammillaria. Clt. 1817. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

12 M. ELONGA'TA (D. C. mem. cact. in mem. mus. vol. 17. p. 109.) plant usually multiple at the base, cylindrical, elongated, a little branched, with the axils broad and naked; mammæ or tubercles very short, broad at the base, obtuse at the apex, with the areolæ of the younger ones rather tomentose; prickles setiform, 16-18 in each fascicle, radiating, yellow, much longer than the mammæ, without any central ones. ♄. D. S. Native of Mexico, where it was discovered and sent to Europe by Dr. Coulter, as well as all the following species.

Elongated Mammillaria. Clt. 1830. Pl. $\frac{1}{2}$ foot.

13 M. ECHINA'RIA (D. C. l. c. p. 110.) plant usually multiple at the base, cylindrical, elongated, with the axils broad and naked; mammæ naked, very short, broad at the base, and obtuse at the apex, with the areolæ of the younger ones rather tomentose; prickles bristle-formed, 16-18 in a fascicle, radiating, spreadingly recurved, yellow, much longer than the mammæ, with the 2 central ones stiffer and brownish. ♄. D. S. Native of Mexico. Flowers bearded at the base, sessile in the axils, small and pale.

Hedgehog Mammillaria. Clt. 1830. Pl. $\frac{1}{2}$ foot.

14 M. SUBCRÒCEA (D. C. l. c.) plant usually multiple at the base, cylindrical, with narrow, rather woolly axils; mammæ ovate, short, with the areolæ of the younger ones rather tomentose; prickles bristle-formed, 16-18 in a fascicle, radiating, yellow, longer than the mammæ, but when old becoming copper-coloured, without any central ones. ♄. D. S. Native of Mexico. Coulter, no. 36. Flowers small, sessile, solitary in the axils of the mammæ, forming a circle round the top of the plant. Style permanent; stigma many-cleft. Berry ovate, about the size of a pea, crowned by the floral remains. Plant 2-3 inches high, and 9-11 lines in diameter, with 12-15 mammæ in each series, which series bend to the left.

Subcroceous-spined Mammillaria. Clt. 1830. Pl. $\frac{1}{4}$ foot.

15 M. TE'NUIS (D. C. l. c.) plant multiple at the base, cylindrical, with narrow, naked axils; mammæ ovate, with the areolæ of the young ones rather woolly; prickles bristle-formed, 20-25 in a fascicle, yellow, radiating, a little longer than the mammæ, without any central ones. ♄. D. S. Native of Mexico. Coulter, no. 34. Plant 3-4 inches high, and 5 lines in diameter.

Var. β, mèdia (D. C. l. c.) stem thicker; central prickles wanting or solitary. ♄. D. S. Native of Mexico. Plant 10-12 lines in diameter. Perhaps a proper species, or perhaps *M. cæspitòsa*, Hort. berol. according to Salm-Dyck.

Slender Mammillaria. Clt. 1830. Pl. $\frac{1}{3}$ foot.

16 M. INTERTE'XTA (D. C. l. c.) plant multiple at the base cylindrical, with narrow axils; mammæ ovate, much crowded hidden by the congeries of prickles, with the areolæ smoothish; prickles 20-25 in a fascicle, stiff, yellow, radiating, interwoven from the mammæ being so close together. ♄. D. S. Native of Mexico. Coulter, no. 37. Plant 4 inches high, and 1 inch in diameter. Prickles 3-4 inches long, sometimes somewhat echinated. According to a letter received from Dr. Coulter to De Candolle, this and the 4 preceding species will form, as he conceives, only one species; the appearance of these plants have a striking likeness to each other, but these differences appear to De Candolle real, and permanent, and he considers them as forming a small group of the genus, remarkable for the elongation of their stems, and for their yellow appearance.

Interwoven-spined Mammillaria. Clt. 1830. Pl. $\frac{1}{3}$ foot.

17 M. CYLÍNDRICA (D. C. l. c. p. 111.) plant simple, cylindrical, with a few bristles in the axils; mammæ ovate, with smoothish areolæ; bristles 20-25, in a fascicle, radiating, white, shorter than the mammæ: the 2 central prickles stiff and diverging, twice the length of the surrounding bristles. ♄. D. S. Native of Mexico (Coulter). This plant is easily distinguished from all the preceding, in the colour of the mammæ being deep green, not yellow. Plant 5 inches high, and 1 inch in diameter. Bristles $1\frac{1}{2}$-2 lines long, and the central prickles 3-4 lines long.

Cylindrical Mammillaria. Pl. $\frac{1}{2}$ foot.

18 M. E'LEGANS (D. C. l. c.) plant simple, obovate, somewhat umbilicate at the apex, with naked axils; mammæ ovate, having the areolæ of the young ones rather tomentose; bristles 25-30 in each fascicle, white, radiating, stiffish, and with 1-3 stiff, erect prickles, which are a little longer than the bristles that surround them. ♄. D. S. Native of Mexico. Coulter, no. 48. Plant 2 inches high and 2 inches in diameter.

Var. β, mìnor (D. C. l. c.) plant exactly obovate, one half smaller than the species, but it is probably a young plant of the same.

Var. γ, globòsa (D. C. l. c.) plant larger, globose, with the upper axils bearded. Perhaps the same, but an old plant.

Elegant Mammillaria. Pl. $\frac{1}{8}$ foot.

19 M. RA'DIANS (D. C. l. c.) plant simple, nearly globose, with naked axils; mammæ ovate, large, with the areolæ smoothish; prickles 16-18 in a fascicle, radiating, white, stiff, when young rather tomentose, without any central ones. ♄. D. S. Native of Mexico. Coulter, no. 35. There are varieties of this plant either with an obtuse or a depressed apex, and the spines either white or yellowish. Plant about 3 inches high, and the same in diameter. Prickles 5-6 lines long.

Radiating-prickled Mammillaria. Pl. $\frac{1}{4}$ foot.

20 M. IRREGULA'RIS (D. C. l. c.) plant multiple, and rather tuberous at the base, with ovate offsets, and naked axils; mammæ oblong, with smoothish areolæ; bristles 20-25 in each fascicle, white, a little reflexed, without any central prickles. ♄. D. S. Native of Mexico. Coulter, no. 31. Plant 2 inches high, with offsets an inch in diameter. Bristles 2 lines long.

Irregular Mammillaria. Pl. $\frac{1}{8}$ foot.

21 M. CREBRISPÌNA (D. C. l. c.) plant multiple at the base; offsets ovate; axils naked; mammæ ovate, short, crowded, with the areolæ smoothish; prickles straight, outer 16-17 radiating and white, central 3 brown and erect. ♄. D. S. Native of Mexico. Coulter, no. 14. Plant 2 inches high and $1\frac{1}{2}$ inch in diameter. The prickles, from the mammæ being close, nearly hide the stem.

Thick-spined Mammillaria. Pl. 2 inches.

22 M. CONOÌDEA (D. C. l. c. p. 112.) plant simple, ovate-conical, with the axils woolly in the young state; mammæ ovate, crowded, with the areolæ rather tomentose while young; prickles straight, stiff, the outer 15-16 radiating, but the central 3-5 are erectly diverging, brown, and rather longer than the ray ones.

ħ. D. S. Native of Mexico. Coulter, no. 22. Allied to *M. crebrispìna*, and is perhaps *M. cónica*, Haw. Flowers of a reddish-violaceous colour, few in number, rising near the top of the stem.

Conoid Mammillaria. Pl. $\frac{1}{4}$ foot.

23 M. COMPRE'SSA (D. C. l. c.) plant simple, cylindrically-clavate; axils when young woolly and bristly; mammæ ovate, short, angular at the base, and as if they were compressed beneath, with the areolæ rather tomentose; prickles 4-5 in each fascicle, unequal, white, lower one the longest. ħ. D. S. Native of Mexico. Coulter. Plant 5 inches high, an inch broad at the base, and $1\frac{1}{2}$ inch in diameter at the top.

Compressed Mammillaria. Pl. $\frac{1}{2}$ foot.

24 M. CORNÍFERA (D. C. l. c.) plant simple, globose, with naked axils; mammæ ovate, thick, crowded, with the areolæ smoothish; outer prickles 16-17, radiating grey, with a strong, longer, erect, rather incurved one in the middle of each fascicle. ħ. D. S. Native of Mexico. Coulter. Plant 3 inches in diameter, $2\frac{1}{2}$ broad. Ray prickles 5-6 lines long, and the central one 7-8 lines long.

Horn-bearing Mammillaria. Pl. $\frac{1}{4}$ foot.

25 M. CRINÌTA (D. C. l. c.) plant globose, depressed, multiple at the base; axils naked; mammæ ovate, thick, with the areolæ smoothish; bristles 15-20 in each fascicle, white, elongated, rather radiating: central prickles yellow, stiff, hooked at the apex, length of the bristles that surround them. ħ. D. S. Native of Mexico. Coulter, no. 28. Plant 1 inch high, $1\frac{1}{2}$ inch in diameter. Bristles 8-9 lines long.

Var. β, *paucisètæ* (D. C. l. c.) axils woolly; bristles 8-10 in a fascicle. Sometimes the bristles are nearly all deciduous. Coulter, no. 29.

Hairy Mammillaria. Pl. 1 inch.

26 M. CÆSPITÍTIA (D. C. l. c.) plant multiple at the base, tufted, aggregate, globose; axils naked; mammæ few, ovate, with the areolæ smoothish; prickles straight, stiff, when young whitish-yellow, but in the adult state greyish: outer ones 9-11 in each fascicle, radiating, with 1-2 longer, erect, central ones. ħ. D. S. Native of Mexico. Coulter. Tufts 4 inches broad. Offsets an inch in diameter.

Tufted Mammillaria. Pl. $\frac{1}{4}$ foot.

27 M. SUBANGULA'RIS (D. C. l. c.) plant simple or multiple at the base, nearly globose, depressed; axils for the most part woolly; mammæ ovate, thick, short, angularly tetragonal from pressing so close against each other, with the areolæ of the young ones tomentose; prickles 6-8 in each fascicle, erectly diverging, unequal, of a pale grey colour. ħ. D. S. Native of Mexico. Coulter. Plant nearly 3 inches high and $1\frac{1}{2}$ broad. Prickles 3-10 lines long.

Subangular-teated Mammillaria. Clt. 1830. Pl. $\frac{1}{4}$ foot.

28 M. MACRACA'NTHA (D. C. l. c. p. 113.) plant simple, globose, depressed, with some of the axils naked, and some of them bearded with wool; mammæ ovate, rather tetragonal, with the areolæ of the young ones rather tomentose; prickles 1-2, very long, pungent, white, or brownish. ħ. D. S. Native of Mexico. Coulter, no. 44. Perhaps the same as *M. magnimámma*, Haw.? Prickles 2 inches long. Plant $1\frac{1}{2}$-2 inches high, and 3-6 inches in diameter. Prickles rather angular.

Long-spined Mammillaria. Pl. $\frac{1}{8}$ foot.

29 M. LONGIMA'MMA (D. C. l. c.) plant simple, or rather multiple at the base, ovate, or nearly cylindrical; axils woolly; mammæ ovate-oblong, dense, with the areolæ tomentose; prickles 9-10 in each fascicle, pungent, of a greenish brown colour. ħ. D. S. Native of Mexico. Coulter, no. 30. Plant 3-4 inches high, and 2 inches broad. Prickles 6-9 lines long.

Long-teated Mammillaria. Pl. $\frac{1}{3}$ foot.

30 M. OCTACA'NTHA (D. C. l. c.) plant simple, ovate-oblong, nearly cylindrical; axils naked; mammæ oblong, rather tetragonal, with the areolæ of the young ones rather tomentose; prickles stiff, the outer 7 in each fascicle radiating and white, with a central one, which is stiffer, longer, and of a fuscescent-colour. ħ. D. S. Native of Mexico. Coulter, no. 39. Plant 3 inches high, 2 inches broad. Outer prickles 3-4 lines long; central one 6 lines long.

Eight-spined Mammillaria. Pl. $\frac{1}{4}$ foot.

31 M. LEUCACA'NTHA (D. C. l. c.) plant multiple at the base, ovate; axils naked; mammæ few, ovate-tetragonal, with the areolæ of the young ones glabrous; prickles 6-7 in each fascicle, stiff, white, sometimes all radiating, and sometimes the one in the centre is erect. ħ. D. S. Native of Mexico, Coulter. Plant an inch and a half high, and hardly an inch broad. Prickles 4 lines long.

White-spined Mammillaria. Pl. $\frac{1}{8}$ foot.

32 M. DIVE'RGENS (D. C. l. c.) plant multiple at the base, nearly globose, depressed; axils woolly and bristly; mammæ ovate, crowded, with the areolæ of the young ones woolly; prickles 5-6 in each fascicle, unequal, pungent, white, but brownish at the apex, diverging, and somewhat tetragonal. ħ. D. S. Native of Mexico, Coulter. Perhaps only a variety of *M. macracántha*. Tufts 6-7 inches broad, and 2 inches high.

Diverging-spined Mammillaria. Pl. $\frac{1}{8}$ foot.

33 M. TRIACA'NTHA (D. C. l. c.) plant simple, obovate, nearly cylindrical, bluntly truncate; axils hardly woolly, but with a few bristles; mammæ ovate, much crowded, with the areolæ of the young ones tomentose; prickles 3 in each fascicle, erect, white, lower one the longest, tending downwards, 2 lateral ones very short. ħ. D. S. Native of Mexico, Coulter, no. 46. Plant 3 inches high, and $1\frac{1}{2}$ inch broad. Sometimes there is a fourth prickle in each bundle, but when this is present it is very short.

Three-spined Mammillaria. Pl. $\frac{1}{4}$ foot.

34 M. SEMPERVÌVI (D. C. l. c. p. 114.) plant simple, attenuated at the base, depressed at the apex, disk-formed; axils woolly; mammæ erect, ovate-tetragonal, with the areolæ smoothish; bristles 3-4 in each fascicle, stiff, short, and white, and 2 thick, short, diverging prickles. ħ. D. S. Native of Mexico. Coulter, no. 57. Plant $2\frac{1}{2}$ inches broad, and $1\frac{1}{2}$ high.

Var. β, *tetracántha* (D. C. l. c.) plant densely bearded in the axils; bristles none; prickles 4, short, diverging. ħ. D. S. Native of Mexico.

Sempervivum-like Mammillaria. Pl. $\frac{1}{8}$ foot.

35 M. DISCIFO'RMIS (D. C. l. c.) plant simple, depressed, disk-formed; axils naked; mammæ crowded, short, depressed, tetragonal, with the areolæ of the young ones rather tomentose, and of the adult ones somewhat unarmed; prickles 5, in each central mamma, stiff, white, erect. ħ. D. S. Native of Mexico. Coulter, no. 50. Plant 3 inches broad, and hardly an inch high.

Disk-formed Mammillaria. Pl. 1 inch.

36 M. LATIMA'MMA (D. C. l. c.) plant simple, depressed, somewhat discoid: with the younger axils woolly; mammæ short, broadly ovate, at length depressed, transversely oblong, with the areolæ of the young ones woolly; prickles 16-17 in each fascicle, stiff, yellowish, rather fuscescent at the apex, diverging, unequal. ħ. D. S. Native of Mexico. Coulter, no. 54. Plant 5 and a half inches in diameter, and hardly an inch and a half high.

Broad-teated Mammillaria. Pl. 1 inch.

37 M. GEMINISPÌNA (Haw. in phil. mag. 63. p. 42. D. C. diss. t. 3.) plant simple, cylindrically columnar; axils very woolly; tubercles or mammæ small, very numerous; spines small, white, interwoven, 2 of which in each fascicle are much longer than the rest. ħ. D. S. Native of Mexico. Cáctus columnàris, Moc. et Sesse, fl. mex. icon. ined. Plant half a foot high. Flowers

red, a little longer than the tubercles. Haworth's plant appears to be different from that of De Candolle.

Twin-spined Mammillaria. Clt. 1823. Shrub ½ foot.

38 M. vivi'para (Haw. suppl. p. 72.) plant multiple; offsets nearly globose; tubercles or mammæ cylindrically ovate, bearded, marked by a proliferous furrow above; flowers central, large, exserted. ♄. D. F. Native of Louisiana, on high hills about the river Missouri. Cáctus vivíparus, Nutt. gen. amer. 1. p. 295. Spreng. syst. 2. p. 494. exclusive of Haw. syn. Each tuft of the plant in its native place of growth is 2 or 3 feet in diameter. Flowers deep red, almost like those of *Cèreus flagelliformis*. Outer lobes of calyx ciliated. Berries about the size of grapes, fusiform, greenish.

Viviparous Mammillaria. Fl. June, Aug. Clt. 1811. Pl. ½ ft.

39 M. glomera'ta (D. C. prod. 3. p. 459.) plant tufted; tubercles or mammæ clavate, glaucous, tomentose, furnished with a stellate bunch of spines each at the apex. ♄. D. S. Native of St. Domingo, in marshes. Plum. ed. Burm. 201. f. 1. Cáctus glomeràtus, Lam. dict. 1. p. 257. Spreng. syst. 2. p. 494. exclusive of the synonyme of Haworth. Flowers red.

Glomerate Mammillaria. Shrub ½ foot.

40 M. pusi'lla (D. C. diss. t. 2. f. 1.) plant multiple, roundish; axils a little bearded; tubercles or mammæ ovate, bearing radiating spines at the apex, outer spines hair-formed and white, inner ones stiff and pale yellow, pubescent when examined under a lens. ♄. D. S. Native of South America. Mill. dict. no. 6. Cáctus pusíllus, D. C. cat. hort. monsp. p. 185.—Pluk. phyt. t. 29. f. 2.? Plant very small, rather glaucescent, hardly 2 inches high. The tubercles or mammæ are disposed in 5 or 7 series, which wind to the left. Flowers large, white or pale red, with the backs of the petals reddish.

Small Mammillaria. Fl. June, Aug. Clt. 1820. Pl. ⅛ foot.

41 M. stella'ta (Haw. in phil. mag. Feb. 1830.) plant irregularly tufted, beset with radiating fascicles of white pubescent spines; the lower ones of which are hair-formed, with a few of the upper ones much stronger and more horizontal, and straw-coloured at the apex. ♄. D. S. Native of South America. Cáctus stellàris, Willd. enum. p. 30. M. stellàris, Haw. suppl. p. 72. Lodd. bot. cab. 79. but not M. pusílla, D. C.

Starry Mammillaria. Fl. June, Aug. Clt. 1815. Pl. ⅛ foot.

42 M. Missourie'nsis (Sweet, hort. brit. p. 171.) mammæ or tubercles ovate, terete, bearded; flowers hardly exserted; berries scarlet, about equal with the mammæ. ♄. D. F. Native of Louisiana, on the high mountains about the Missouri. Cáctus mammillàris, Nutt. gen. amer. 1. p. 295. Flowers white. Berries scarlet. This is a much smaller plant than *M. simplex*, to which it is nearly allied.

Missouri Mammillaria. Fl. June, Aug. Clt. 1818. Shrub ¼ to ½ foot.

† *Species not sufficiently known.*

43 M. Heli'cteres (D. C. diss. t. 5.) plant simple, obovate, glabrous; tubercles or mammæ disposed in numerous, nearly vertical, regularly spiral series, bearing spreading, straight, spines at the apex. ♄. D. S. Native of Mexico. Cáctus Helícteres, Moc. et Sesse, fl. mex. icon. ined. Plant 3-4 inches high. Flowers rose-coloured, a little longer than the mammæ.

Screw Mammillaria. Pl. ¼ to ⅓ foot.

44 M. nu'da (D. C. prod. 3. p. 460.) plant simple, cylindrical, ascending, glabrous; tubercles or mammæ unarmed. ♄. D. S. Native of Mexico. Cáctus nùdus, Moc. et Sesse, fl. mex. icon. ined. Flowers rose-coloured.

Naked Mammillaria. Pl. ¼ to ½ foot.

‡ *The following species are hardly known unless by name; some of these names may, however, be referrible to those described above.*

1 *M. mìtis*, Mill. dict. 2 *M. cónica*, Haw. suppl. 3 *M. cæspitòsa*, Hort. berol. 4 *M. canéscens*, Hort. berol. 5 *M. angulàris*, Hort. berol. 6 *M. chrysántha*, Hort. berol. 7 *M. auràta*, Hort. berol. 8 *M. fuscàta*, Hort. berol. 9 *M. atràta*, Hort. berol.

‖ *The following species were raised in the gardens in 1827 from seeds brought from Chili by Dr. Gillies, but have not yet been described. The species we have referred to this genus only from their seedling state, without any knowledge of them when full grown. The names are under the genus Cáctus in Gillies's mss.*

1 *M. spinòsa*, Gill. 2 *M. quadràta*, Gill. 3 *M. caudàta*, Gill. 4 *M. coccínea*, Gill. 5 *M. solitària*, Gill.

Cult. Mammillària is a genus of small singular grotesque succulent plants. A mixture of sand, loam, and peat, or loam mixed with brick rubbish, is a good soil for them. The pots in which the species are grown should be as small as the plants will allow, and they should be well drained with sherds; they require very little water. The pots should be placed on shelves erected for the purpose in a stove, should there be no house for the purpose of growing succulent plants, called a dry stove. The plants are increased by offsets.

II. MELOCA'CTUS (from μηλον, *melon*, a melon, and κακτος, *cactos*, a name applied to a spiny plant by Theophrastus; the plants are in the form of a melon, and the angles are beset with tufts of spines). C. Bauh. pin. 384. D. C. diss. 1826. Link et Otto, diss. 1827. p. 8. D. C. prod. 3. p. 460.—Cáctus, Haw. syn. 172. exclusive of some species. Cáctus, sect. B, Link, enum. 2. p. 21.

Lin. syst. *Icosándria*, *Monogýnia*. Tube of calyx adhering to the ovarium; lobes 5-6, petaloid, crowning the young fruit. Petals 5-6, united into a long cylindrical tube with the sepals. Stamens filiform, disposed in many series. Style filiform; stigmas 5, radiating. Berry smooth, crowned by the dry lobes of the corolla and calyx. Seeds imbedded in the pulp. Cotyledons small. Plumule large, nearly globose (D. C. Organogr. t. 48. f. 3.) Fleshy globose simple roundish shrubs, with deep furrows, alternating with vertical ribs, which are ornamented with confluent tubercles, each tubercle furnished with a starry fascicle of prickles or spines. Spadix or flowering head terminal, cylindrical, composed of mammæform, much crowded tomentose or setiferous tubercles. Flowers immersed in the wool of the head under its apex.

1 M. commu'nis (Link et Otto, l. c. diss. p. 8. t. 11. D. C. diss. t. 6.) plant ovate-roundish, deep green, with 11 or 18 angles; ribs straight; spines strong, pale brown, unequal, 9 in each fascicle: lower one the longest: middle one erect. ♄. D. S. Native of the West India Islands, in salt marshy places near the sea; and probably on the main land of South America. Cáctus Melocáctus, Lin. spec. 666. D. C. pl. grass. t. 112. Cáctus Melocáctus, and C. coronàtus, Lam. dict. 1. p. 537.—Bradl. succ. t. 32. Ribs 12-18. Flowers tubular, red. Fruit red, nearly like those of *Mammillària*, but larger, oblong, and deciduous, protruding from the wool on the head.

Var. β, oblóngus (Link et Otto, l. c.) plant smaller; prickles weaker, and more red. Stem 6 inches high, and 3⅓ thick.

Var. γ, macrocéphalus (Link et Otto, l. c.) plant thicker, 14 inches high, and 9 inches broad.

Common Melon-thistle, or Turk's-cap. Fl. July, Aug. Clt. 1688. Shrub 1 foot.

2 M. Lama'rckii; plant ovate, flattish at the base, with 14-20 angles at the top, which are rather oblique and bluntish

on the back; spines red, stiff, rather incurved, disposed in approximate fascicles, which are very woolly towards the tops of the angles; cap roundish, furnished with a few red setaceous spines; flowers red. ♄. D. S. Native of South America. Cáctus Lamárckii, Coll. hort. ripul. append. 3. t. 7.

Lamarck's Melon-thistle. Pl. ¾ foot.

3 M. macraca'nthus (Link et Otto, diss. p. 9. t. 12.) plant roundish, light green, with 14 angles; ribs straight; spines in fascicles, very thick, whitish, but of a brownish red-colour at the apex: outer 12 radiating, central, 4 large and straight. ♄. D. S. Native of St. Domingo. Cáctus macracánthos, Salm-Dyck, obs. 1820. p. 1. Haw. rev. p. 69. Flowers unknown, but the spadix or woolly head is depressed at the top.

Long-spined Melon-thistle. Clt. 1820. Shrub 1 foot.

4 M. pyramida'lis (Link et Otto, diss. p. 10. t. 25.) plant conical or pyramidal, with 17 angles; ribs rather oblique, crenated; spines very long, in fascicles, of a brownish red colour: outer 14 radiating in 2 series, with 2 or 3 straight and very long. ♄. D. S. Native of Curassoa. Cáctus pyramidàlis, Salm-Dyck, obs. 1820. p. 4. Stem when young crowded with spines. Spadix or woolly head cylindrical, depressed at the apex.

Pyramidal Melon-thistle. Shrub 1 foot.

5 M placentifórmis (D. C. prod. 3. p. 460.) plant hemispherical, depressed, green, with 12 or 14 angles; ribs very blunt; prickles 8-12 in a fascicle, unequal, recurved, strong. ♄. D. S. Native of Brazil. Cáctus Melocáctus, Besl. hort. eystet. 4. ord. f. 1. but not of Lin. C. placentifórmis, Lehm. ind. sem. hort. hamb. (1826). Melocáctus Beslèri, Link et Otto, diss. (1827). p. 11. t. 21. Lehman's name being older than Link's has been here adopted, as being more apt; but Link's figure and description are far better. Spadix or woolly head nearly globose, impressed in the vertex. Flowers reddish. Prickles blackish.

Placenta-formed Melon-thistle. Shrub 1 foot.

6 M. Langsdo'rfii (D. C. prod. 3. p. 461.) plant oblong, with 17 angles; spines slender, stiff, spreading: top of plant floriferous, very villous and very spiny. ♄. D. S. Native of Brazil? Cáctus Langsdórfii, Lehm. in sem. hort. hamb. (1826). Flowers yellow. Stamens purple. The rest unknown.

Langsdorf's Melon-thistle. Shrub 1 foot.

† *Species not sufficiently known.*

7 M. Sellòwii (D. C. prod. 3. p. 461.) plant globose, depressed, glaucescent, woolly and flat in the vertex, with 10 arched ribs; prickles 7 in each fascicle, recurved: the central 5 much the largest. ♄. D. S. Native of Monte Video. Echinocáctus Sellòwii, Link et Otto, diss. p. 16. t. 22. Melocáctus species secundum Salm-Dyck, who confirms that the plant is woolly at the top, and is analogous to *M. placentifórmis*. Plant 2 inches high, and 4½ inches thick. Prickles 8-10 lines long, fuscescent. Flowers unknown.

Sello's Melon-thistle. Pl. ⅛ foot.

8 M. polyaca'nthus (D. C. prod. 3. p 461.) plant oval, glaucescent, with a flat woolly apex, and with 21 blunt vertical ribs; prickles 8 in each fascicle: the upper 2 of these smaller than the others. ♄. D. S. Native of Brazil in the province of Rio Grande. Echinocáctus polyacánthus, Link et Otto, diss. p. 13. t. 16. f. 1. Stem 4 inches high, and 3 inches thick, attenuated at the base, with narrow furrows; prickles cinereous. Flowers unknown.

Many-spined Melon-thistle. Shrub ¼ foot.

9 M.? melocactoìdes (D. C. prod. 3. p. 461.) plant globose, with 10 angles, having the tops of the angles beset with a series of woolly tubercles; prickles 7 or 8 in a fascicle, rather recurved, pale, but becoming gradually brownish towards the apex. ♄. D. S. Native of Brazil. Cáctus melocactoìdes, Hoffms. verz. 2.? (1826) 3. p. 24. Habit of *M. commùnis*.

Melocactus-like Melon-thistle. Pl. ½ foot.

Cult. A grotesque and singular genus like the last, but of larger growth, and beset with stronger spines, without teats. The culture, propagation, and treatment of the species are the same as that recommended for the last genus.

III. ECHINOCA'CTUS (from εχινος, *echinos*, a hedgehog, and κακτος, *cactos*, a name given by Theophrastus to the spiny plant; plants beset with spines like the hedgehog). Link et Otto, diss. p. 11. Salm-Dyck, in litt. D. C. prod. 3. p. 461.—Cáctus species of Haw.

Lin. syst. *Icosándria*, *Monogýnia*. Sepals numerous, imbricate, adnate to the base of the ovarium, united into a short tube at the base: outer ones in the form of an involucrum: inner ones petal-formed. Stamens numerous. Style filiform, multifid at the apex. Berry scaly from the permanent remains of the sepals. Cotyledons wanting?—Simple, grotesque, fleshy, ovate or globose, ribbed, leafless shrubs, with the habit of *Melocáctus;* ribs as if they were formed from confluent tubercles, bearing on their back fascicles of prickles. The woolly head or spadix, which is present in *Melocáctus* is wanting in this genus. Flowers rising from the fascicles of spines at the tops of the ribs very like those of the genus *Cèreus*, but the tube is almost wanting.

1 E. gibbo'sus (D. C. prod. 3. p. 461.) plant ovate or nearly oblong, obtuse; ribs interrupted by tubercles; some of the tubercles rather tomentose at the apex, and tipped with fascicles of stiff straight needle-formed prickles; others in the outer series naked, elongated, and mammæform, and a little compressed. ♄. D. S. Native of Jamaica. Cáctus gibbòsus, Haw. syn. p. 173. bot. reg. 137. Plant nearly like that of *Mammillària tuberculòsa*, but is not lactescent? Flowers 2, larger than any other of the genus, quite at the apex of the plant, which is depressed. The tube of the flower is greenish, and the sepals distant, with a white expanded limb: lobes obovate, rather mucronate, disposed in 4 series. Genitals yellow.

Gibbous Hedgehog-thistle. Fl. July, Aug. Clt. 1808. Pl. ½ foot.

2 E. subgibbòsus (Haw. in phil. mag. Oct. 1831. p. 418.) plant roundish-oblong, very spiny, with the spines interwoven; angles or ribs about 16 in number, and are, as well as the recesses, profound and acute; fascicles of spines distant. ♄. D. S. Native near Valparaiso. Plant 5 inches high, and 3 inches broad, woolly at the base of the fascicles of spines. Spines straight, 12-13 in each fascicle: the lower ones of these are whitish or pale, bristle-formed, nearly half an inch long, horizontal: the 6 upper ones prickle-formed, much larger, nearly an inch long, bulbous, and yellowish at the base, and rufescent at the apex; the middle spine of the ultimate fascicles compared with the rest is straight.

Sub-gibbous Hedgehog-thistle. Clt. 1830. Pl. ½ foot.

3 E. no'bilis (Haw. in phil. mag. Feb. 1830. p. 114.) plant erect, oblong: with many ribs, beset with numerous, strong, straight, black fascicles of spines. ♄. D. S. Native of Mexico. Cáctus nóbilis, Haw. syn. p. 174. but not of others. Cáctus redúctus, Link, enum. 2. p. 21. Cèreus redúctus, D. C. prod. 3. p. 463. Plant 3 feet high. Fascicles of spines interwoven, imbricating.

Noble Hedgehog-thistle. Clt. 1796. Shrub 3 feet.

4 E. corni'gerus (D. C. diss. t. 7.) plant subglobose, very obtuse; ribs almost vertical, interrupted by tubercles, somewhat depressed: all prickly at the top; prickles unequal, straight, and needle-shaped: the lower one broad, thick, and a little recurved at the apex. ♄. D. S. Native of Mexico.

Cáctus latispìnus, Haw. in phil. mag. vol. 63. p. 41. Echinocáctus platycánthus, Link et Otto, diss. p. 14. t. 14. without a flower. Cáctus cornígerus, Moc. et Sesse, fl. mex. icon. ined. Flowers 2-3 at the top of the plant ex fl. mex. an inch long, with a short thick tube, and brownish imbricating sepals, with a purplish limb; lobes nearly linear, acute, disposed in one series.

Horn-bearing Hedgehog-thistle. Clt. 1823. Pl. $\frac{1}{2}$ foot.

5 E. crispa'tus (D. C. diss. t. 8.) plant obovate, retuse at the apex, and rather umbilicate; ribs numerous, from 30 to 60, nearly vertical, undulately curled, and tubercular; prickles in fascicles, unequal, straightish. ♄. D. S. Native of Mexico. Cáctus crispàtus, Moc. et Sesse, fl. mex. icon. ined. Flowers smaller than any other of the genus, at the top of the plant, purple; sepals densely imbricated along the tube, oblong-linear, acute, disposed in 2 series in the limb.

Var. β, hórridus (D. C. mem. cact. in mem. mus. 17. p. 115.) fascicles of spines approximate; prickles stronger, more erect and longer, of a greyish brown-colour.

Curled Hedgehog-thistle. Pl. $\frac{1}{2}$ foot.

6 E. orna'tus (D. C. mem. cact. in mem. mus. vol. 17. p. 114.) plant nearly globose: with 8 deep compressed vertical ribs, ornamented with transverse rows of flocky down, with 3 fascicles on each rib; prickles 7 in a fascicle, straight, yellow, and one central. ♄. D. S. Native of Mexico. Coulter, no. 40. Plant 5 inches in diameter. Prickles 8-10 lines long.

Ornamented Hedgehog-thistle. Pl. $\frac{1}{2}$ foot.

7 E. tubercula'tus (Link et Otto, diss. t. 26.) plant nearly globose, with 8 nearly vertical ribs, and with the recesses narrow; crests very obtuse, tubercled at the fascicles, of which there are 8 or 10 on each rib; areolæ when young rather velvety; prickles 12-13 in each fascicle, grey, with one central straight strong one, the rest radiating. ♄. D. S. Native of Mexico. Coulter. Intervals on the ribs between the fascicles of spines 8-9 lines. Prickles an inch long.

Var. β, spiràlis (D. C. l. c.) ribs twisted spirally to the right. ♄. D. S. Native of Mexico. Coulter. Perhaps merely an older state of the species.

Tubercled Hedgehog-thistle. Pl. $\frac{1}{2}$ foot.

8 E.? cereifórmis (D. C. l. c. p. 115.) plant nearly cylindrical, green, with about 13 compressed ribs, with the recesses acute, and the crests bluntish; prickles 7 radiating, and one central, in each fascicle, greyish, stiff, slender, with 3 fascicles on each rib. ♄. D. S. Native of Mexico. Coulter. Perhaps a species of *Cèreus*.

Cereus-formed Hedgehog-thistle. Pl. $\frac{1}{2}$ foot.

9 E. glauce'scens (D. C. l. c.) plant nearly globose, depressed, glaucescent, with 11-13 vertical compressed obtuse ribs, with 6 fascicles on each rib; areolæ oval-oblong, when young velvety; prickles yellow, straight, with 6-7 radiating ones, and one central one in each fascicle. ♄. D. S. Native of Mexico. Coulter. Flowers solitary on the top of each rib, rising in the front of a fascicle. Scales of calyx imbricated, smooth, oval, acuminated, with membranous ciliated margins. Plant 3 inches high, and 5 inches in diameter. Intervals between the fascicles on the ribs half an inch. Prickles an inch long.

Glaucescent Hedgehog-thistle. Pl. $\frac{1}{4}$ foot.

10 E. Coulte'ri; plant nearly globose, depressed, green, with 13-18 vertical ribs, with both the recesses and ribs acute; fascicles 3 on each rib; areolæ oval, when young velvety; prickles yellow, stiff, with 7-8 radiating ones, and one erect central one, which is nearly twice the length of the others, in each fascicle. ♄. D. S. Native of Mexico. Coulter, no. 43. E. hýstrix, D. C. l. c. but not of Haw. Plant 5-8 inches in diameter, and 3-4 inches high. Prickles an inch long, central ones 2 inches long. Intervals between the fascicles on the ribs 12-18 lines in length.

Coulter's Hedgehog-thistle. Pl. $\frac{1}{3}$ foot.

11 E. obvalla'tus (D. C. diss. t. 9.) plant obovate-globose, depressed and umbilicate at the apex; ribs numerous, vertical; prickles in fascicles, unequal, divaricate, long; flower solitary at the top of the plant, surrounded by spines. ♄. D. S. Native of Mexico. Cáctus obvallàtus, Moc. et Sesse, fl. mex. icon. ined.—Tepenexcomitl, Hern. mex. p. 410. with a figure. Spines whitish, needle-shaped, diverging, intricate. Flower erect, purple, with the margins of the lobes of the limb white.

Environed-flowered Hedgehog-thistle. Pl. $\frac{1}{3}$ foot.

12 E. tenuispi'nus (Link et Otto, diss. p. 12. t. 19. f. 1.) plant nearly globose, umbilicately retuse at the apex; ribs 12, bluntish; prickles in fascicles, slender, recurved, 3 or 4 of which are a little larger than the rest; flowers girded by wool. ♄. D. S. Native of Brazil, in the province of Rio Grande. Plant green, 2 or 3 inches in diameter. Sides of ribs rather impressed. Flowers beyond 2 inches long, yellow; sepals lanceolate, acute; petals dilated, obtuse, each mucronated by a red bristle. Style 12-15 parted.

Var. β, mìnor (Link et Otto, l. c. f. 2.) plant smaller; spines longer and slenderer, and more bent.

Slender-spined Hedgehog-thistle. Pl. $\frac{1}{3}$ foot.

13 E. melocactifo'rmis (D. C. diss. t. 10.) plant roundish-ovate, obtuse; ribs vertical, about 30 in number; prickles in fascicles, diverging, unequal; flowers numerous, in a kind of whorl beneath the apex of the plant. ♄. D. S. Native of Mexico. Cáctus multangulàris, Moc. et Sesse, fl. mex. icon. ined. but not of Willd. Spines brownish. Flowers whitish. Sepals numerous, purplish on the outside, imbricated, and adpressed to the tube; limb expanded; lobes oblong, acute, disposed in 2 or 3 series. Stigmas long, 8-12, exserted above the stamens.

Melon-thistle-shaped Hedgehog-thistle. Pl. $\frac{1}{2}$ foot.

14 E. Langsdo'rfii (Lehm. ind. sem. hort. hamb. 1826, p. 17.) plant oblong, with 17 angles; spines slender, stiff, spreading; vertex of plant very villous and spiny, and bearing flowers. ♄. D. S. Native of Brazil. Plant green. Fascicles of spines approximating, rising from short wool, central spine in each fascicle an inch long, the 6 marginal ones unequal, reflexed, and spreading. Flowers 2-4, terminal, rising from among wool and spines. Calyx tubular. Petals about 20, yellow. Stigma many-parted, radiate, purple.

Langsdorf's Hedgehog-thistle. Shrub $\frac{1}{4}$ foot.

† *The flowers of the following species being unknown, some of them are probably referrible to the genus Melocáctus.*

15 E. tephraca'nthus (Link et Otto, diss. p. 13. t. 14. f. 2.) plant globose, glaucescent, impressed on the top, not tubercled; ribs 15, acute; prickles 10 in each fascicle, spreading: the 4 central ones the largest. ♄. D. S. Native of Brazil, in the province of Rio Grande. The plant is hardly an inch high, and hardly the same in thickness. Prickles canescent, hardly an inch long. Flowers unknown.

Ash-coloured-spined Hedgehog-thistle. Clt. 1825. Pl. $\frac{1}{8}$ to $\frac{1}{4}$ foot.

16 E. recu'rvus (D. C. prod. 3. p. 462.) plant roundish, with 15 angles; prickles broad, very numerous. ♄. D. S. Native of Mexico. Cáctus recúrvus, Mill. dict. ed. 8. no. 3. Cáctus nóbilis, Lin. mant. 243. Willd. spec. 2. p. 939. Cáctus multangulàris, Voigt. ex Steud. Prickles of two forms, outer ones expanded, central ones long, brown and recurved at the apex.

Recurved-spined Hedgehog-thistle. Clt. 1796. Pl. 1 foot.

17 E. into'rtus (D. C. l. c.) plant oblong, with 13-16 angles; angles twisted like a spire at the apex; prickles middle-sized, rather incurved. ♄. D. S. Native of Antigua. Cáctus intórtus, Mill. dict. ed. 8. no. 2. Haw. syn. p. 174.

Var. β, purpùreus (D. C. prod. 3. p. 462.) Melocáctus purpùreus, striis in spiram contortis, Plum. spec. 19. mss. vol. 3. t. 8. Cáctus nóbilis, Lam. dict. 1. p. 537. Native of St. Domingo. The whole plant is purple, with white prickles. Perhaps a proper species, or a true species of Melocáctus, ex Salm-Dyck in litt.

Intorted-spined Hedgehog-thistle. Fl. June, July. Clt. 1768. Pl. 1 foot.

18 E. Salmia'nus (Link et Otto, diss. p. 14. t. 13.) ribs 14-15, bluntish; 3 central prickles erect, ray ones 15, spreading, in each fascicle. ♄. D. S. Native of Curassoa. Plant 4 inches long, and 4½ inches thick, with the furrows narrow. Prickles reddish. Top of plant impressed. Perhaps the same as *Melocáctus pyramidàlis*, but in a young state. Flowers unknown.

Salm-Dyck's Hedgehog-thistle. Pl. ½ foot.

19 E. hy'strix (Haw. in phil. mag. Feb. 1830, p. 115.) plant roundish, usually with 12 angles; spines straight, an inch and a half long, fulvous, much longer than the wool from which they rise. ♄. D. S. Native of the West Indies. Cáctus hýstrix, Haw. suppl. p. 73. Cèreus hýstrix, Sweet. Flowers unknown. Like *E. Salmiànus*, but differs in the plant being more oblong, and in the spines being much fewer.

Porcupine Hedgehog-thistle. Clt. 1808. Pl. ½ foot.

20 E. tubercula'tus (Link et Otto, diss. p. 16. t. 26.) plant nearly globose, green, depressed at the top; ribs 8, bluntish; fascicles with 3 central straight prickles, and 7 spreading, rather recurved ray ones, which become gradually smaller from the centre. ♄. D. S. Native of Mexico. Plant 4 inches high, and 3½ inches thick, with the furrows narrow. Central prickles of the fascicle an inch long, the ray ones gradually decreasing in length. Flowers unknown.

Tuberculated Hedgehog-thistle. Pl. ¼ to ½ foot.

21 E. gladia'tus (Link et Otto, diss. p. 17. t. 17.) plant oval-oblong, glaucescent, depressed at the apex; ribs 14-22, bluntish; prickles 10 in each fascicle, 3 central ones the largest, flattened, and elongated: middle one of the 3 erect: ray ones spreading much. ♄. D. S. Native of Mexico. Plant 5 inches high, and 4 inches thick. Prickles canescent, crowded at the top, larger ones 2 inches long. Flowers unknown.

Gladiate-spined Hedgehog-thistle. Pl. ½ foot.

22 E. subuli'ferus (Link et Otto, diss. p. 16. t. 27.) plant subglobose, green, not depressed at the apex; ribs 8-10, blunt, tubercled; central prickles large, erectish, recurved, and 4-5 spreading, and the 4-6 outer ones, divaricate, and slender, in each fascicle. ♄. D. S. Native of Mexico. Plant 2½ inches high, and 2 inches thick, with the ribs evidently composed of conflated tubercles. Prickles hoary brown; the larger ones 2 inches long, and the smaller ones about 4 lines long. Flowers unknown.

Awl-bearing Hedgehog-thistle. Pl. ⅛ to ¼ foot.

23 E. depre'ssus (D. C. prod. 3. p. 463.) plant nearly globose, depressed at the apex; ribs vertical, about 20 in number, obtuse, and somewhat tubercled; fascicles of prickles crowded; prickles rising from fascicles of white tomentum, stiff, very pale brown: central ones in each fascicle 3-4, and 10-12 ray ones: the lower one of these very strong. ♄. D. S. Native of South America. Melocáctus? depréssus, Salm-Dyck in litt. Cáctus depréssus, Haw. syn. 173.?

Depressed Hedgehog-thistle. Clt. 1798. Pl. ¼ foot.

24 E. orthaca'nthus (Link et Otto, diss. p. 18. t. 18.) top of plant depressed; ribs 18, bluntish; prickles 7 in each fascicle: the central one of these strong, larger, and straight: the rest spreading. ♄. D. S. Native of Monte Video. Plant 2½ inches in diameter, with narrow furrows. Prickles canescent: the larger ones 9 lines long, and the rest about 5 lines long. Flowers unknown.

Straight-spined Hedgehog-thistle. Pl. ¼ to ½ foot.

25 E. arcua'tus (Link et Otto, diss. p. 15. t. 23.) plant subglobose, glaucescent, not depressed at the apex; ribs 20, arched; prickles 7 in each fascicle, spreading, and recurved. ♄. D. S. Native of Monte Video. Plant 3 inches high, and 2½ thick, with broad furrows. Sides of ribs not impressed. Prickles of a hoary fucescent colour, 4-6 lines long. Flowers unknown.

Arched-ribbed Hedgehog-thistle. Pl. ¼ foot.

26 E. parvispi'nus (D. C. prod. 3. p. 463. Haw. in phil. mag. Feb. 1830. p. 114.) plant nearly globose, umbilicate at the apex; ribs 15, compressed; prickles small, white, fulvous at the apex, rising from white tomentum, 7-9 in each fascicle: the central one of these straight, and the ray ones 6-8 in number, and a little recurved. ♄. D. S. Native of South America. Melocáctus parvispìnus, Haw. suppl. 73. Salm-Dyck in litt. Flowers unknown. Very like *E. meonacánthus*, Link et Otto.

Small-spined Hedgehog-thistle. Pl. ¼ foot.

27 E. intrica'tus (Link et Otto, diss. p. 19. t. 24.) plant oval, green, with a depressed tubercled top; ribs 20, bluntish; fascicles of prickles crowded, 18-20 in each fascicle: the 4 central ones of these larger and erect, the rest spreading, outermost ones divaricate. ♄. D. S. Native of Monte Video. Plant 4 inches high, and 3½ thick. Sides of ribs depressed. Prickles of a hoary-fuscescent colour: the larger ones 8 lines long. Flowers unknown.

Intricate Hedgehog-thistle. Pl. ⅓ foot.

28 E. meonaca'nthus (Link et Otto, diss. p. 19. t. 15.) plant oblong, glaucescent, with the top depressed; ribs 14, arched; prickles 9 in each fascicle, short and straight, and one central. ♄. D. S. Native of Jamaica. Plant 6½ inches high, and 4½ broad; ribs usually bent. Prickles yellowish, rising from short wool, 4 lines long. The form of the plant is elongated, and like that of a creeping *Cèreus*. Flowers unknown.

Less-spined Hedgehog-thistle. Pl. ½ foot.

29 E. denuda'tus (Link et Otto, pl. rar. hort. berol. t. 9.) plant subglobose, green, with 6-8 bluntish ribs; spines 5-8 in each fascicle, all spreading; involucrum with few leaves. ♄. D. S. Native of Brazil.

Naked Hedgehog-thistle. Pl.

30 E. tortuòsus (Link et Otto, pl. rar. hort. berol. t. 15.) plant nearly globose, depressed at the top, green, with 4 arched ribs; the 4-6 middle spines in each fascicle a little larger and thicker than the rest, which are numerous, but all are nearly equal, spreading, and twisted. ♄. D. S. Native of Brazil.

Twisted-spined Hedgehog-thistle. Pl.

31 E. erina'ceus (Haw. in phil. mag. Feb. 1830, p. 114.) plant globular, usually with 14 angles; spines inclining, 9 lines long, numerous, somewhat recurvedly divaricate, fulvous, shorter than the wool from which they originate; fascicles of spines approximate. ♄. D. S. Native of South America. Cáctus erinàceus, Haw. suppl. p. 74. Very like Melocáctus polyacánthus, Link et Otto, in form, but differs from it in the number of the angles, and in the absence of the woolly flowering top; but the fascicles of spines are nearly similar.

Erinaceous Hedgehog-thistle. Fl. June, Aug. Clt. 1818. Pl. ½ foot.

† *The two following species from their habit in a seedling state appear to belong to the present genus, but are not described; they are in the gardens of Edinburgh and Glasgow under the name of Càctus, and have been brought from Chili.*

1 *E. corrugàta*, Gill. mss. 2. *E. foliòsa*, Gill. mss.

Cult. See *Mammillària*, p. 160. for culture and propagation. Grotesque plants, with the habit of the last genus.

IV. CE'REUS (from *cereus*, pliant; in reference to the shoots of some of the species). D. C. cat. hort. monsp. 1813. Haw. syn. 173. Salm-Dyck in litt. D. C. prod. 3. p. 463.

Lin. syst. *Icosándria*, *Monogýnia*. Sepals very numerous, imbricated, adnate to the base of the ovarium, united into an elongated tube; outer sepals the shortest, forming the calyx, middle ones longer and coloured, innermost ones petal-formed. Stamens very numerous, united with the tube. Style filiform, multifid at the apex. Berry areolate, tubercular or scaly, either from the remains of the sepals, or from their cicatrices when they have fallen off. Cotyledons wanting?—Fleshy grotesque shrubs, with a woody axis, and medulliferous inside; angles vertical, bearing fascicles of spines, regularly furrowed. Angles or wings either numerous or very few. Flowers large, rising from the fascicles of spines or indentures on the angles.

§ 1. *Cereástri* (an alteration from the generic name). *Plants standing without support, never throwing out roots. Stems upright.*

* *Stems with many angles.*

1 C. multangula'ris (Haw. suppl. 75.) stem erect, with 18-20 angles; angles very close, blunt; prickles setaceous, yellow, longer than the wool from which they rise. ♄. D. S. Native country and flowers unknown. Cáctus multangulàris, Willd. enum. suppl. 33. Perhaps the same as Cáctus Kagenèkii, Gmel. ex Salm-Dyck in litt.

Many-angled Torch-thistle. Clt. 1815. Shrub 1 foot.

2 C. scòpa (Salm-Dyck in litt. ex D. C. prod. 3. p. 464.) plant erect; stem with 30 vertical tubercled angles; fascicles of prickles crowded, rising from tufts of white tomentum: ray prickles setaceous, very numerous and white: central ones 3-4, dark-purple. ♄. D. S. Native of Brazil. Cáctus scòpa, Link, enum. 2. p. 21. Spreng. syst. 2. p. 494. Plant clothed with short, stiffish, setaceous prickles.

Broom Torch-thistle. Shrub 1 foot.

3 C. seni'lis (Salm-Dyck in litt. ex D. C. prod. 3. p. 464.) plant erect, somewhat club-shaped; stem with 20-25 vertical tubercled ribs; fascicles of prickles crowded, naked at the base, each fascicle containing 15-20 radiating hair-formed curled bristles, and a straight stiff central spine. ♄. D. S. Native of Mexico. Cáctus senìlis, Haw. in phil. mag. vol. 63. p. 41. Cáctus brádypus, Lehm. ind. sem. hort. hamb. 1825. p. 17. This is a very singular plant, covered all over with dense hair-like bristles; it is of an oblong shape, about 3 inches high, of a greyish-colour, bent, and hanging, like the grey head of an old man, hence the specific name.

Old-man Torch-thistle. Clt. 1823. Shrub $\frac{1}{4}$ foot.

4 C. lana'tus (H. B. et Kunth, nov. gen. amer. 6. p. 68.) stems erect, branched, with many angles, and clothed with white wool; angles membranous, tubercled, and beset with stellate fascicles of prickles; central prickle 8-times longer than the rest. ♄. D. S. Native of Quito, near the rivers Aranza and Guamcabamba. Stem 10-12 feet high. Central prickle of each fascicle 1 or $1\frac{1}{2}$ inch long. Flowers rising from lateral and longitudinal fissures of the stem, involved in wool. Fruit obovate, red, with a whitish green-coloured pulp.

Woolly Torch-thistle. Shrub 10-15 feet.

5 C. micraca'nthus (D. C. mem. cact. in mem. mus. 17. p. 115.) plant dividing into many stems at the base, ovate-oblong, greenish, obtuse, with 13 vertical bluntish ribs, with the recesses broad, but hardly acute; fascicles of spines approximating, with tomentose areolæ; prickles 3 in each fascicle, short, setaceous, diverging. ♄. D. S. Native of Mexico. Coulter, no. 56. Perhaps a species of *Echinocáctus*. Plant hardly an inch high and the same in thickness.

Small-spined Torch-thistle. Pl. 1 inch.

6 C. polylòphus (D. C. l. c.) plant quite simple, erect, green, cylindrical, with 15-18 vertical ribs, and with the furrows acute; crests rather repand; fascicles of prickles approximating, with the young areolæ convex and tomentose; prickles 8-9 in each fascicle, yellow, straight, diverging, but the central one is long and erect. ♄. D. S. Native of Mexico. Coulter, no. 15. Plant 30-40 feet in height, without any branch, according to Coulter.

Many-crested Torch-thistle. Shrub 30 to 40 feet.

7 C. Li'nkii (Lehm. ind. sem. hort. hamb. 1827. p. 16.) plant oval, green, with 13 angles; ribs obtuse, bearing flowers at the top from the axils of the fascicles of spines; 3 central spines in each fascicle erectly spreading, and the 10 ray ones slenderer, much more spreading; stigmas 8. ♄. D. S. Native of Mexico. Calyx half an inch long, beset with greenish yellow scales, which are furnished with purple bristles and white cobwebbed wool. Petals numerous, truncate at the apex, yellow, with purple bases. Style yellow. Stigmas purple.

Link's Torch-thistle. Clt. 1828. Shrub $\frac{1}{2}$ foot.

8 C. Le'cchii (Coll. hort. ripul. append. 5. t. 2. under *Cáctus*) plant ovate, tapering to the apex, with numerous blunt angles; fascicles of spines approximate, woolly at the base; spines white: ray ones spreading: central one long and straight. ♄. D. S. Native of South America.

Lecche's Cereus. Clt.? Shrub 1 foot.

** *Stems with* 6-12 *angles.*

9 C. hexago'nus (Willd. enum. suppl. 32.) plant simple, erect, large, usually with 6 strong ribs; fascicles of spines middle-sized; prickles short, brown. ♄. D. S. Native of South America. Cáctus hexagònus, Lin. spec. 1. p. 667. Andr. bot. rep. t. 513. Cáctus Peruviànus, D. C. pl. grass. t. 58.—Bradl. succ. 1. p. 1. t. 1. The plant is about 40 feet high, usually without any branches, varying with 5-6-7 angles. Flowers solitary, 6 inches long; having the sepals along the tube greenish and irregularly imbricated; limb a little expanded, reddish outside and white inside. Stamens greenish. Fruit dark purple, according to Plumier.

Var. β, *abnórmis* (Willd. enum. suppl. 31.) stem simple, oblong, irregularly furrowed, and tubercled; tubercles oblong, compressed, unequal, bearing prickles at the apex, and rather woolly. ♄. D. S. Native of South America. C. Peruviànus β, monstròsus, D. C. cat. hort. monsp. diss. t. 11. Flowers twin, nearly as in *C. hexagònus*, but more expanded and larger, with the outer sepals reddish, but the inner ones are pure white and serrated; tube striated with green on the outside. Stigmas 9-13, greenish.

Hexagonal Torch-thistle. Fl. Jul. Aug. Clt. 1690. Tr. 40 ft.

10 C. Ottònis (Lehm. ind. sem. hort. hamb. 1827. p. 16.) plant oval, green, attenuated at the base, with 10 angles; ribs obtuse, bearing the flowers above from the fascicles of spines; 4 central spines in each fascicle, and 10-14 slender, spreading ray ones; stigmas 14. ♄. D. S. Native of Mexico. Calyx tubular; scales acute, greenish yellow, furnished with a fascicle of purple hairs, and white, cobwebbed wool. Petals numerous, erosely serrated at the apex, rather diaphanous, yellow. Style yellow. Stigmas purple.

Otto's Torch-thistle. Clt.? Shrub $\frac{1}{2}$ foot.

11 C. Peruvia'nus (Haw. syn. 171.) plant large, erect, with usually 8 angles or ribs; angles blunt, smooth, glaucous; spines whitish, rising from white tomentum, the lower one very small, and the central one very strong. ♄. D. S. Native of Peru and Curassoa. Cáctus Peruviànus, Lin. spec. 667. Willd. enum. suppl. 32. Cèreus ebúrneus, Salm-Dyck, in cat. hort. Dyck. 1822. Cáctus Coquimbànus, Molin. chil. ed. gall. p. 140. ex

Bertol. virid. bon. 1824. p. 4.— Bradl. succ. t. 12.—Lob. icon. 2. p. 25.—Mor. oxon. sect. 17. t. 37. Like *C. hexagònus*, but differs in being clothed with glaucous bloom.

Var. β, monstròsus (Salm-Dyck, l. c.) ribs nearly obliterated; fascicles of prickles spirally confluent.

Peruvian Torch-thistle. Fl. Aug. Clt. 1728. Tr. 20 feet.

12 C. HEPTAGÒNUS (Haw. syn. 178.) plant erect, oblong, 7-angled. ♄. D. S. Native of South America. Cáctus heterogònus, Lin. spec. 666. hort. cliff. 181. The plant is said by Linnæus to be 1-2 feet high. Perhaps distinct from *C. hexagònus* and *C. striàtus*. Flowers white.

Seven-angled Torch-thistle. Fl. Jul. Clt. 1728. Sh. 1 to 2 ft.

13 C. GRANDISPÌNUS (Haw. in phil. mag. feb. 1830. p. 111.) plant 8-angled; prickles nearly 3 inches long; flowers campanulate, without a tube; fruit globose, spiny. ♄. D. S. Native of St. Domingo.—Plum. amer. t. 195. f. 2. Large, bluntly angled. Spines subulate, 12-13 in a fascicle. Petals obtuse, lanceolate, serrated.

Great-spined Torch-thistle. Shrub large.

14 C. SERRULIFLÒRUS (Haw. l. c.) plant 8-angled; bristles half an inch long; petals 5-times shorter than the tube; fruit rather conical, large, scaly, unarmed. ♄. D. S. Native of St. Domingo.—Plum. amer. t. 195. f. 1. Large, bluntly angled. Bristles about 20 in each fascicle; fascicles remote. Petals narrow, lanceolate, serrulate, hardly an inch long, but the tube is $4\frac{1}{2}$ inches long, and scaly. Very like *C. hexagònus*, but the spines are more numerous, longer, and slenderer.

Serrulated-petalled Torch-thistle. Shrub large.

15 C. MONOCLÒNOS (D. C. prod. 3. p. 464.) plant tall, erect, with 8 angles; angles blunt, compressed; spines stellate, nearly equal; petals emarginate at the apex. ♄. D. S. Native of the Caribbee Islands.—Plum. ed. Burm. t. 191. exclusive of the synonymes. Plumier has himself made his plant the same as *C. Peruviànus*, but by Linnæus it has been referred to *C. hexagònus*, but it differs from both these species, in the petals being bluntly emarginate at the apex, and nearly obcordate. Limb of flower spreading. Style exserted; stigma 5-cleft. The name is derived from *μονος, monos*, alone, and *κλονος, klonos*, a noise; but the application is not evident to us.

Confused Torch-thistle. Shrub 20 feet.

16 C. FIMBRIA'TUS (Lam. dict. 1. p. 539. under *Cáctus*) plant tall, erect, bluntly 8-angled; prickles setaceous, white; flowers with a short tube; petals fringed. ♄. D. S. Native of St. Domingo, in arid woods.—Plum. ed. Burm. t. 195. f. 1. Stem the thickness of a man's leg, and about 18-25 feet high. Flowers rose-coloured, campanulate, with few petals. Stamens very numerous; stigma multifid. Fruit globose, red, size of an orange, beset with prickly tubercles; flesh red.

Fringed-petalled Torch-thistle. Shrub 18 to 25 feet.

17 C. HY'STRIX (Salm-Dyck in litt. ex D. C. prod. 3. p. 464.) plant erect, green, shining, 9-angled; ribs rather compressed; prickles rising from grey tomentum, with 9 radiating ones, 2 small upper ones, and 3-4 strong, central ones, which are painted with white and brown. ♄. D. S. Native of South America? Cáctus hýstrix, Salm-Dyck. obs. bot. 1822. Old prickles grey, blackish at the apex. This is different from *Cáctus læ'tus* of H. B. et Kunth, and from *C. hýstrix*, Haw.

Porcupine Torch-thistle. Shrub.

18 C. FE'ROX (Haw. in phil. mag. 1830. feb. p. 107.) plant oblong, nearly terete; with usually 8 ribs; spines divaricate, brown, dense. ♄. D. S. Native of Brazil. Plant firm, green, thickly beset with horned spines, and of these there are usually 6 outer radiating ones, 4-5 middle ones, and 1 long central one in each fascicle.

Fierce Torch-thistle. Clt. 1827. Shrub 1 foot.

19 C. GRÍSEUS (Haw. syn. 182.) plant erect, longish, usually 8-angled, deeply furrowed, branched at the base; prickles when old half an inch long, white, but tipped with black. ♄. D. S. Native of South America. The rest unknown.

Grey-spined Torch-thistle. Clt. 1809. Shrub 3 to 4 feet.

20 C. CRENULA'TUS (Salm-Dyck, obs. bot. 1822.) plant erect, greyish green, with 8-9 angles; ribs blunt, crenulated; prickles white, rising from grey tomentum, blackish at the apex, 9 in each fascicle, radiating and equal, and 1 long central one. ♄. D. S. Native of South America. C. Royèni, Willd. suppl. enum. p. 32. Stem rather woolly at the apex; wool grey, at length falling off.

Var. β; plant rather slenderer than the species; and the prickles are shorter. Salm-Dyck, in litt.

Crenulated Torch-thistle. Clt. 1728. Shrub 2 to 3 feet.

21 C. CINERA'SCENS (D. C. mem. cact. in mem. mus. 17. p. 116.) plant simple, erect, greyish green; with 8 blunt tubercular ribs, and narrow recesses; areolæ while young convex and velvety; prickles 14 in each fascicle, white, setaceous, stiff, outer 10 radiating, central 4 erectly diverging, and longer than the ray ones. ♄. D. S. Native of Mexico. Coulter, no. 23. Stem 6 inches high, and 2 inches in diameter. Outer prickles 6-9 lines long: central ones 12 lines long; in fascicles, which are 5-6 lines distant from each other.

Var. β, crássior (D. C. l. c.) stem thicker; fascicles of spines more distant.

Var. γ, tenùior (D. C. l. c.) stems slenderer; ribs more approximate. Very like *C. pentalòphus*, but differs in being 8-angled, not 5-angled.

Greyish Torch-thistle. Clt. 1830. Shrub $\frac{1}{2}$ foot.

22 C. CALVE'SCENS (D. C. l. c.) plant simple, or a little branched at the apex, erect, green, obtuse, and rather umbilicate at the apex, with 7-8 vertical, obtuse ribs, and acute furrows; areolæ, while young, convex and tomentose, but at length becoming nearly glabrous; prickles 8-9 in each fascicle, brown, stiff, diverging: the central ones hardly to be distinguished from the outer ones. ♄. D. S. Native of Mexico. Coulter. Very like *C. Peruviànus*. Fascicles of spines 6-9 lines distant from each other.

Calvescent Torch-thistle. Shrub 8 to 10 feet?

23 C. MARGINA'TUS (D. C. l. c.) plant simple, or a little branched at the apex, erect, green, obtuse at the tip: with 7 vertical ribs, and acute recesses; crests obtuse, woolly their whole length from white tomentum, in consequence of the oval areolæ being confluent; prickles 7-9 in a fascicle, stiff, grey, short: with the central ones hardly to be distinguished from the ray ones. ♄. D. S. Native of Mexico. Coulter, no. 13. Stem $2\frac{1}{2}$ and 3 inches in diameter. Prickles 1-2 lines long. A very distinct species.

Margined Torch-thistle. Shrub.

24 C. ALBISPI'NUS (Salm-Dyck, obs. bot. 1822.) plant erect, greyish green, with 9 or 10 angles; ribs obtuse, very prickly; prickles grey, tipped with yellow, rising from grey tomentum, 11 radiating ones and 4 central in each fascicle. ♄. D. S. Native of South America. Very like *C. crenulàtus*, but more slender and more woolly. Old plant only woolly at the apex, but the young plant all over; the wool grey. Salm-Dyck, in litt.

White-spined Torch-thistle. Shrub 2 to 3 feet.

25 C. REGA'LIS (Haw. suppl. p. 75.) plant erect, 9-angled, furrowed; spines fulvous, elongated, when young about equal in length to the wool. ♄. D. S. Native of South America. Fascicles of spines much crowded.

Royal Torch-thistle. Clt.? Shrub 10 feet.

26 C. STRÍCTUS (Willd. enum. suppl. p. 32. under *Cáctus*,) plant erect, green, shining, 7-9-angled; ribs rather compressed repand; prickles brown, rising from brown tomentum: each fascicle composed of 8 radiating ones, a small superior one, and 3 central ones, which are much longer than the rest. ♄. D. S. Native of South America. There is hardly any wool at the top of the stem; the rest unknown. Salm-Dyck. in litt.

Straight Torch-thistle. Clt. 1822. Shrub 3 to 4 feet.

27 C. Hawórthii (Spreng. syst. 2. p. 495. under *Cáctus*) plant erect, large, 5-angled, with profound furrows; spines numerous, usually an inch long, brown. ♄. D. S. Native of the West Indies. C. nóbilis. Haw. syn. 179. This species is more formidable than the rest in the prickles being very large and numerous. The rest unknown. The *Cáctus nóbilis*, Lin. Haw. and Lam. are very different from each other, and constitute 3 distinct species.

Haworth's Torch-thistle. 1811. Shrub 3 to 4 feet.

28 C. au'reus (Salm-Dyck. in litt. ex D. C. prod. 3. p. 465.) plant erect, green, 7-8-angled; ribs compressed, very prickly; prickles yellow, rising from straw-coloured tomentum, with 8 radiating ones in each fascicle, and some central longer ones. ♄. D. S. Native country and flowers unknown. Differs from *C. Hawórthii*, in the prickles being yellow, and in their fascicles being more closely crowded.

Golden-spined Torch-thistle. Shrub.

29 C. nìger (Salm-Dyck. hort. dyck. cat. 1822.) plant erect, blackish, 7-angled; ribs rather compressed; prickles slender, fulvous, rising from white tomentum: with 7 radiating ones in each fascicle, the 3 lowest of these longer than the rest, and 2 or 3 central ones, the lowest one very short. ♄. D. S. Native of South America. Cáctus nìger, Spreng. syst. 2. p. 495. Cèreus nìger, Haw. rev. 70. Said to be allied to *C. repándus*. Top rather woolly; wool grey.

Black Torch-thistle. Clt. 1820. Shrub 2 to 3 feet.

30 C. fulvispinòsus (Haw. syn. 183.) plant erect, tall, usually 9-angled, simple or branched; prickles strong, yellowish, when full grown nearly an inch long. ♄. D. S. Native of South America. Cáctus Royèni, Mill. dict. ed. 8.

Tawney-spined Torch-thistle. Clt. 1796. Shrub 3 to 4 ft.

31 C. flavispìnus (Salm-Dyck. obs. bot. 1822.) plant erect, pale green, 8-10-angled; ribs rather compressed; prickles slender, yellowish, rising from white tomentum: with 8 radiating ones in each fascicle, the upper ones of these very small, and 3-4 central ones, the upper one of these erect and very long. ♄. D. S. Native of South America. Perhaps the same as *C. flavispìnus* of Colla, hort. rip. p. 24. Stem hardly woolly at the apex; wool grey. There is a variety of this species with 6-angled stems and longer prickles. Salm-Dyck. in litt.

Yellow-spined Torch-thistle. Clt.? Shrub 2 to 3 feet.

32 C. Chiloe'nsis (Colla, pl. rar. hort. ripul. app. 2. p. 342.) plant ovate, erect, 10-angled; angles blunt; prickles pale, pellucid, middle one of each fascicle the strongest; wool very short. ♄. D. S. Native of Chili. C. Coquimbànus, Hort. but not of Molin.

Chiloe Torch-thistle. Shrub.

33 C. euphorbioìdes (Haw. suppl. p. 75.) plant erect, usually 10-angled; angles strong; spines unequal, nearly naked at the base. ♄. D. S. Native of tropical America. There are 3 middle-sized spines, 2 about 2 lines long, and 1 about 7 lines long in each fascicle.

Spurge-like Torch-thistle. Clt.? Shrub 2 to 3 feet.

34 C. Roye'ni (Haw. syn. p. 102.) plant erect, bluntly 9-angled; spines a little longer than the wool, from which they issue; floral tube unarmed: outer lobes acuminated, inner ones the shortest. ♄. D. S. Native of the West Indies. Cáctus Royèni, Lin. spec. 668.—Royen, lugd. bat. 279.—D. C. pl. grass. t. 143. C. lanuginòsus, Mill. dict. no. 7. Floral tube greenish. Calycine lobes rufescent; inner or corolline ones the longest, acuminated, and white. Stigmas 12. Fruit red, according to Herm.

Royen's Torch-thistle. Clt. 1728. Shrub 3 to 6 feet.

35 C. lanuginòsus (Haw. syn. 182.) plant erect, bluntly 8-9-angled; spines shorter than the wool from which they issue. ♄. D. S. Native of the West Indies. Herm. lugd. bat. par. t. 115. without a flower. C. repándus, Mill. dict. ed. 8. Cáctus lanuginòsus, Lin. spec. 667. The fruit, according to Herm., is red, not spiny.

Woolly Torch-thistle. Fl. Jul. Clt. 1690. Sh. 1 to 2 ft.

36 C. repa'ndus (Haw. syn. 183. D. C. diss. t. 13.) plant long, erect, with 8-9 blunt angles; angles rather undulated; spines longer than the wool from which they issue; floral tube, and consequently the fruit, is unarmed: outer lobes of calyx narrow and much acuminated, almost exceeding the inner ones in length. ♄. D. S. Native of the Caribbee Islands. Cáctus repándus, Lin. spec. 667. Ker. bot. reg. t. 336. Cèreus grà-cilis, Mill. dict. ed. 8. no. 8.—Trew. ehret. t. 14. Tube of flower green; inner calycine or corolline lobes white. Stigmas 8-10. Fruit yellow, white inside.

Repand Torch-thistle. Fl. May. Clt. 1728. Sh. 10 to 20 ft.

37 C. subrepa'ndus (Haw. suppl. 78.) plant erect, with 8 angles; angles compressed, repand; prickles strong, of a pale colour; wool very short. ♄. D. S. Native of the West Indies. Very distinct from *C. crenàtus*.

Subrepand Torch-thistle. Clt. 1817. Shrub 2 to 4 feet.

38 C. Æ'thiops (Haw. in phil. mag. feb. 1830. p. 108.) plant erect, bluntly 8-angled; angles short; fascicles of spines very black, as well as the short central wool. ♄. D. S. Native of Brazil. Very like *C. repándus*, but much more dwarf and simple, and very green; with about 12 spines in each fascicle. This is a singular plant, from its black spines and black beard-like terminal brush.

Black-spined Torch-thistle. Clt. 1829. Shrub.

39 C. polygònus (Lam. dict. 1. p. 539. under *Cáctus*) plant erect, branched, with 11 blunt angles, woolly at the apex; prickles setaceous, grey; flowers short, with the limb hardly spreading. ♄. D. S. Native of St. Domingo.—Plum. ed. Burm. t. 196. Flowers white. Fruit reddish brown, tubercled; flesh reddish. Stem 10 feet high, and 6-7 inches in diameter. This species is allied to *C. repándus*, according to Lamarck, but Spreng. has joined it with *C. gríseus*.

Many-angled Torch-thistle. Shrub 10 feet.

40 C. ma'gnus (Haw. in phil. mag. feb. 1830.) plant very strong, simple, with usually 12 deep furrows, and as many ridges; spines unequal, very stiff, dark. ♄. D. G. Native of St. Domingo. Spines about 12 in each fascicle; fascicles rather distant. Flowers large, white.

Large Torch-thistle. Clt. 1829. Shrub 3 to 4 feet.

41 C. divarica'tus (Lam. dict. 1. p. 540. under *Cáctus*) plant erect, branched, very spiny, and bluntly 10-angled; branches spreading. ♄. D. S. Native of St. Domingo.—Plum. ed. Burm. t. 193. Flowers lateral, hardly known. Fruit globose, golden yellow, warted by large points, or unarmed; pulp white and sweet.

Divaricate Torch-thistle. Shrub.

42 C. chloroca'rpus (H. B. et Kunth, nov. gen. amer. 6. p. 68.) plant erect, branched; branches fastigiate, 10-12-angled; angles tubercled; tubercles beset with starry prickles; central prickle in each fascicle 4 times longer than the rest. ♄. D. S. Native of South America.

Green-fruited Torch-thistle. Shrub 10 feet.

43 C. læ'tus (H. B. et Kunth, l. c.) plant erect, pale green, jointed; joints 7-angled; angles tubercled, each tubercle furnished with a fascicle of spines. ♄. D. S. Native of Quito, near Sondorillo. The rest unknown.

Fruitful Torch-thistle. Shrub.

* * * *Stems with 3-4 or 5 angles, very rarely with 6 angles.*

44 C. vìrens (D. C. mem. cact. in mem. mus. 17. p. 116.) plant simple, erect, pale green, with 5 vertical, obtuse ribs; fascicles of spines remote, having the areola velvety when young;

prickles 8 in each fascicle, 4 of which are stiff, conical, and greyish, or blackish, 3 very short and diverging, and 1 large and horizontal. ♄. D. S. Native of Mexico. Coulter. Largest prickle in each fascicle 8-10 lines long, smaller ones hardly 2 lines long.

Green Torch-thistle. Shrub.

45 C. ANISACA'NTHUS (D. C. l. c.) plant simple, erect, deep green; ribs 5-6, with the furrows and crests both acute; fascicles of spines crowded, having the areolæ convex and velvety while young; prickles 10-20 in each fascicle, setaceous, yellowish, stiff, very unequal, outer ones diverging. ♄. D. S. Native of Mexico. Coulter.

Var. α, ortholòpus (D. C. l. c.) stems with 6 vertical ribs; prickles 10 in each fascicle.

Var. β, subspiràlis (D. C. l. c.) stems with 5, rather spirally twisted ribs; prickles 20 in each fascicle.

Unequal-spined Torch-thistle. Shrub.

46 C. PENTALÒPHUS (D. C. l. c. p. 117.) plant erect, greyish green, obtuse; ribs 5, vertical, obtuse; fascicles of spines approximate, having the areolæ velvety when young; prickles 5-7 in a fascicle, setaceous, diverging, when young very pale yellow, but grey in the adult state. ♄. D. S. Native of Mexico. Dr. Coulter subjoins the 3 following varieties to this species, which may probably hereafter turn out as many distinct species.

Var. α, símplex (D. C. l. c.) stem simple, not rooting; ribs rather prominent; furrows broad and obtuse; prickles white.

Var. β, subarticulàtus (D. C. l. c.) stem branched, a little articulated, but not rooting; ribs irregular, rather repand; furrows narrow; prickles yellowish while young.

Var. γ, radìcans (D. C. l. c.) stems rooting; ribs broad, short; prickles yellowish while young.

Five-crested Torch-thistle. Shrub.

47 C. GRA'NDIS (Haw. suppl. p. 76.) plant large, exactly tetragonal, simple, erect; prickles usually an inch long, divaricate, almost interwoven among each other. ♄. D. S. Native of Brazil. The rest unknown.

Great-spined Torch-thistle. Clt.? Shrub 3 to 4 feet.

48 C. TETRAGÒNUS (Haw. syn. 180.) plant tall, erect, usually 4-angled; angles compressed. ♄. D. S. Native of South America. Cáctus tetragònus, Lin. spec. p. 666. Angles plaited transversely (ex Spreng). Flowers white.

Tetragonal Torch-thistle. Fl. Jul. Clt. 1710. Sh. 4 to 6 ft.

49 C. PANICULA'TUS (Lam. dict. 1. p. 540. under *Cáctus*) trunk erect; branches forming a kind of panicle at the top of the trunk, tetragonal, articulated at the base; spines short, in fascicles; petals rounded at the apex. ♄. D. S. Native of St. Domingo, in wild places.—Plum. ed. Burm. t. 192. Flowers white, lined with red. Fruit tubercled, yellow. Perhaps this species is referrible to *Jamacàru prima*, Marcgr. bras. p. 125. f. 2. but the figure given by him is too rude to determine this point.

Panicled Torch-thistle. Shrub.

50 C. PITAJA'YA (Jacq. amer. 151. under *Cáctus*) trunk erect; branches trigonal; spines in fascicles. ♄. D. S. Native of Carthagena, in bushy places by the sea-side. Flowers opening in the night, white, 8 inches long. Fruit scarlet, shining, size and form of a hen's egg; pulp white. *Pitajaya* is the vernacular name of the plant.

Pitajaya Torch-thistle. Shrub.

51 C. UNDULÒSUS (D. C. prod. 3. p. 467.) trunk erect, very spiny, and is as well as the branches trigonal; spines in fascicles, black; limb of flowers spreading. ♄. D. S. Native of St. Domingo. Plum. ed. Burm. t. 194. Cáctus Pitajàya β, Lam. dict. 1. p. 539. Prickles 2 inches long. Flowers white, beautiful. Fruit greenish yellow, about the size and form of an apple; pulp white.

Undulated Torch-thistle. Shrub.

52 C. OBTU'SUS (Haw. rev. p. 70.) plant erect, pale green, triangular; ribs blunt; fascicles of prickles very remote; prickles tawny, rising from brown tomentum: with 4 radiating ones in each fascicle, and a central, elongated erect one. ♄. D. S. Native country and flowers unknown.

Blunt-angled Torch-thistle. Clt. 1820. Shrub 4 to 6 feet.

53 C. JAMACA'RU (D. C. prod. 3. p. 467.) plant erect; branches 3-4-angled; prickles in fascicles, straight; flowers cylindrical, with an erect limb; genitals inclosed. ♄. D. S. Native of Brazil. Jamacàru, Pison, hist. nat. bras. p. 100. f. 1. Trunk triangular, beset with spines. Flowers white, scentless. Fruit red, size of a goose's egg. Perhaps *Jamacàru quárta* species Marcgr. hist. nat. bras. p. 127. f. 3. is the same or a distinct species.

Jamacaru Torch-thistle. Shrub.

54 C. VA'LIDUS (Haw. in phil. mag. sept. 1831. p. 418.) plant tetragonal, firm, glaucous at the apex, with the sides nearly flat, or rather convex at first, with the angles very blunt and spiny in the middle. ♄. D. S. Native of South America. Spines brownish.

Strong Torch-thistle. Shrub.

§ 2. *Serpentìni* (from *serpo*, to creep; stems creeping and rooting). *D. C. prod. 3. p. 467. Stems jointed, prostrate, rooting or twining.*

* *Stems with many angles.*

55 C. SERPENTÌNUS (Lag. anal. sc. nat. 1801. p. 261.) plant creeping, flexuous, and somewhat climbing, with 11-12 very blunt angles; bristles in fascicles, much longer than the wool from which they issue, but which at length falls off; floral tube very bristly at the base. ♄. D. S. Native of South America. Willd. enum. suppl. 31. Link, et Otto, abbild. t. 91. D. C. diss. t. 12. Flowers large, beautiful; lobes bluntish; outer ones greenish: middle ones purplish: inner ones white. Stigmas 7. This plant appears to hold a kind of middle station between the erect and creeping species of the genus, and rarely throws out roots from its stems. Bristles 7-8 lines long, purplish, also crowded at the base of the floral tube.

Serpentine Torch-thistle. Clt.? Shrub 3 to 4 feet.

56 C. TUNICA'TUS (Lehm. ind. sem. hort. hamb. 1827. p. 16.) plant erectish, articulately branched; joints attenuated at the base, tubercular; tubercles impressed at the apex, woolly and bearing spines; spines coated by a somewhat diaphanous, moveable membrane. ♄. D. S. Native of Brazil. Joints terete when young, 1½ inch long, furnished with fleshy, subulate leaves, which become at length deciduous.

Coated-spined Torch-thistle. Clt.? Shrub ½ to 1 foot.

57 C. AMBÍGUUS (Bonpl. nav. t. 36. under *Cáctus*) plant erect, with 9-12 blunt angles; bristles spinescent, longer than the wool from which they issue; floral tube bearing bristles at the base. ♄. D. S. Native country unknown. Flowers very like those of *C. serpentìnus*, of which it is probably only a variety, differing only in the stem being more erect, and in the bristles being shorter.

Ambiguous Torch-thistle. Shrub 2 to 3 feet.

58 C. FLAGELLIFÓRMIS (Mill. dict. ed. 8. no. 12. Haw. syn. 158.) stems prostrate, with about 10 angles: tubercles crowded, bearing bristles; style rather shorter than the petals. ♄. D. S. Native of South America, and is now to be found in the Arabian deserts, but has been probably introduced there. Cáctus flagelliformis, Lin. spec. 688. Curt. bot. mag. t. 17. D. C. pl. grass. 127. This species is very common in gardens, and has trailing stems, unless supported, which are therefore easily trained to any kind of trellissing. The flowers are so beautiful, and are produced in such profusion, that the plant is worth being conveyed

into the house whilst in flower, to adorn any of the rooms: they are red or pink.

Flagelliform Torch-thistle or Creeping Cereus. Fl. Mar. Ju. Clt. 1690. Pl. trailing.

59 C. LE'PTOPHIS (D. C. mem. cact. in mem. mus. 17. p. 117.) plant creeping a little, cylindrical, with 7-8 very blunt, rather repand ribs; areolæ velvety, but convex in the adult state; prickles 12-13 in each fascicle, stiffish, yellow, radiating, having the 2 or 3 central ones erectish. ♄. D. S. Native of Mexico. Coulter, no. 32. Habit of *C. flagellifórmis*, but 3 times slenderer.

Slender Torch-thistle or Creeping Cereus. Clt. 1830. Pl. pr.

60 C. HUMBÓLDTII (H. B. et Kunth, nov. gen. amer. 6. p. 66. under *Cáctus*) stems procumbent, with 10 or 12 ribs, glabrous; angles tubercled; tubercles bearing stiff bristles; style much exceeding the corolla. ♄. D. S. Native about Quito, in fields between Sondorillo and San Felipe. Said to be very like *C. flagellifórmis*. Flowers red.

Humboldt's Torch-thistle or Creeping Cereus. Shrub pr.

61 C. ICOSIGÒNUS (H. B. et Kunth, l. c.) stems procumbent, simple, usually with 20 angles; angles bearing fascicles of bristles: style length of petals, 8-cleft at the apex. ♄. D. S. Native of Quito, in dry places near Nabon. According to the authors, this plant is sufficiently distinct from the foregoing. Flowers white.

Twenty-angled Torch-thistle. Shrub proc.

62 C. SE'PIUM (H. B. et Kunth, l. c.) stem erect, with 11 angles; angles bearing fascicles of prickles; stamens and style about equal in length, but exceeding the corolla a little; stigma 8-parted. ♄. D. S. Native of Quito, in sandy places, near Riombamba, at the foot of Mount Chimborazo, where it is called Pitahaya by the natives. According to the authors this species is sufficiently distinct from *C. Humbóldtii*. Flowers rose-coloured. Fruit red.

Hedge Torch-thistle. Shrub 6 feet.

63 C. CARIPE'NSIS (H. B. et Kunth, l. c.) stems in fascicles, elongated, creeping, branched, somewhat tetragonal; angles tubercled; each tubercle bearing a fascicle of stellate bristles. ♄. D. S. Native of New Andalusia, near Caripe, growing on rotten wood. Very like *C. flagellifórmis* in habit, but both the flowers and fruit are unknown, and therefore the place which it should occupy in this genus is doubtful.

Caripe Torch-thistle. Shrub creeping.

** *Stems with 5 or 6 angles.*

64 C. GRANDIFLÒRUS (Mill. dict. ed. 8. no. 11. Haw. syn. 184.) stems rooting, diffuse, climbing, 5-6-angled; bristles 5-8 in each fascicle, hardly longer than the down from which they proceed. ♄. D. S. Native of the West India Islands, and in many parts of the main land of South America. Cáctus grandiflòrus, Lin. spec. p. 668. D. C. pl. grass. t. 52. Andr. bot. rep. t. 508.—Mill. fig. t. 90.—Trew. ehret. t. 31, 32.—Volk. hesp. 1. t. 234. This species, when of sufficient strength, will produce many exceeding large, beautiful, sweet-scented flowers, like those of most of the species of very short duration, hardly continuing 6 hours full blown, nor do the flowers ever open again when once closed. They begin to open between 7 and 8 o'clock, in the evening, are fully blown by 11 o'clock, and by 3 or 4 o'clock in the morning they fade, and hang down quite decayed; but during their short continuance there is hardly any flower of greater beauty, or that makes a more magnificent appearance; for the calyx of the flower, when open, is near a foot in diameter, the inside of which being of a splendid yellow colour, appears like the rays of a bright star, the outside is of a dark brown; the petals being of a pure white add to the lustre; the vast number of recurved stamens in the centre of the flower, make a fine appearance: add to all this, the fine scent, which perfumes the air to a considerable distance; there is scarcely any plant which deserves a place in the hot-house so much as this, especially as it may be trained against the wall, where it will not take up any room. The flowers make a most magnificent appearance by candle-light, sometimes there may be 6 or 8 flowers open upon one plant at the same time; and there will be a succession of them for several nights together, provided the plant is large and healthy.

Great-flowered Torch-thistle or Night-flowering Cereus. Fl. June, Aug. Clt. 1700. Shrub cl.

65 C. SPINULÒSUS (D. C. mem. cact. in mem. mus. 17. p. 117.) plant a little branched, creeping, and climbing somewhat, nearly terete, with 5-6 hardly exserted, acutish ribs, and with broad, bluntish furrows; areolæ, when young, velvety; prickles 8 in each fascicle, very short, stiff, when young yellowish, but afterwards becoming brownish, the lateral ones radiating. ♄. D. S. Native of Mexico. Coulter, no. 27. Habit of the stems like those of *C. grandiflòrus*, but the prickles are very different.

Spinulose Torch-thistle. Shrub cl.

66 C. PENTAGÒNUS (Lin. hort. cliff. p. 182.) plant erect, jointed, slender, pale green, 5-angled; ribs repand; prickles naked at the base, nearly equal, slender, straw-coloured, with 5-6 radiating ones in each fascicle, and 1 central one. ♄. D. S. Native of South America. Cáctus pentagònus, Lin. spec. 666. Haw. syn. 180. rev. 77. Salm-Dyck. in litt. C. prismáticus and C. réptans, Willd. enum. suppl. 32. This is a very polymorphous species, varying with 3-4-5 angles, sometimes much compressed, and sometimes the angles are nearly obliterated. The plant never throws out lateral roots. Flowers large, white.

Pentagonal-stemmed Torch-thistle. Fl. July. Clt. 1769. Shrub 3 feet.

67 C. RADÌCANS (D. C. prod. 3. p. 468.) plant prostrate, jointed, pale green, with 3-5 angles; prickles stiff, slender, rufous, naked at the base, with 6-9 radiating ones in each fascicle, and 1 central one, which is rather elongated. ♄. D. S. Native of South America. Cáctus réptans, Salm-Dyck. in litt. not Willd. It differs from *C. pentagònus* in the stems being prostrate and rooting, not erect.

Rooting Torch-thistle. Shrub creeping.

68 C. HU'MILIS (D. C. prod. 3. p. 468.) plant jointed, divaricate, rooting, green, with 4 or 5 angles; ribs much compressed and repand; fascicles of prickles crowded; prickles about equal in length to the white tomentum from which they arise: 8-10 radiating white bristle-formed ones in each fascicle and 3 stiffish straw-coloured, central ones. ♄. D. S. Native country and flowers unknown. C. gràcilis, Salm-Dyck. in litt. but not of Haw. Plant humble, with the joints a little elongated and divaricating, deeply furrowed.

Humble Torch-thistle. Shrub.

69 C. ALBISETÒSUS (Haw. rev. 77.) plant creeping, green, with 5 angles; prickles bristle-formed, white, stellately expanded, shorter than the rufous wool from which they arise. ♄. D. S. Native of St. Domingo. The rest unknown.

White-bristled Torch-thistle. Clt. 1816. Shrub creeping.

*** *Stems with 3-4 angles.*

70 C. QUADRANGULA'RIS (Haw. syn. p. 181.) plant creeping, 3-4-angled; angles hardly channelled; spines 5-7 in each fascicle, hardly stellate. ♄. D. S. Native of the West Indies. —Plum. ed. Burm. t. 199. f. 1. Flowers white, opening at night, beautiful, and sweet-scented.

Quadrangular Torch-thistle. Clt. 1809. Shrub creeping.

71 C. TRÍPTERIS (Salm-Dyck. in litt. ex D. C. prod. 3. p. 468.) plant jointed, erectish, rooting, green, 3-4-angled; ribs much compressed, rather repand; fascicles of spines crowded, with 8 radiating ones in each fascicle, and 3 stiffish central ones. ♄. D. S. Native country unknown. It differs from *C. gràcilis*,

to which it is nearly allied, in the stems being for the most part 3-angled, rarely 4-angled, and never 5-angled, in being more erect, and in the joints being longer and broader, as if they were winged, and also in the prickles being longer.

Three-winged Torch-thistle. Clt.? Shrub.

72 C. speciosíssimus (Desf. mem. mus. 3. p. 190. t. 9. under *Cáctus*) plant erect, 3-4-angled; angles toothed; prickles subulate, straight, rising from white tomentum; limb of flower expanded; genitals declinate. ♄. D. S. Native of Mexico. Cáctus speciòsus, Cav. hort. madr. Willd. enum. suppl. p. 31. Colla, hort. rip. t. 10. but not of Bonpl. Cáctus speciosíssimus, Ker. bot. reg. 486. herb. amat. t. 391. Flowers large, of a beautiful scarlet colour, somewhat violaceous inside. Genitals white. This is a most splendid plant when in flower, and is now very common in the gardens.

Var. β, bìfrons (Haw. suppl. p. 76.) plant dwarfer, more decumbent, and throwing out more roots.

Very showy Torch-thistle. Fl. July, Aug. Clt. 1816. Sh. 3 to 6 feet.

73 C. triangula'ris (Haw. syn. p. 180.) plant creeping, trigonal; prickles short, 4 in a fascicle, somewhat decussate. ♄. D. S. Native of Mexico. Cáctus triangulàris, Lin. spec. 666. Lam. dict. 1. p. 541. Sims, bot. mag. 1884. Cáctus triangulàris aphýllus, Jacq. amer. p. 152.—Plum. ed. Burm. t. 200. f. 1. —Bradl. succ. pl. 3. without a flower. Flowers greenish on the outside, and white inside, larger than any of the species. Fruit naked, scarlet, size and form of a goose's egg.

Var. β, màjor (D. C. prod. 8. p. 468.). Native of St. Helena.

Var. γ, pìctus (D. C. l. c.) variegated with yellow.

Triangular Torch-thistle. Fl. July, Aug. Clt. 1690. Sh. 1 to 2 feet.

74 C. unda'tus (Haw. in phil. mag. nov. 1829. p. 109.) plant large, climbing, triangularly furrowed; joints large, rather lobulately crenated, sometimes like a chain. ♄. D. S. Native of China. Very like *C. triangulàris*, but much larger; and the branches are greener and more radicant. Fascicles of spines small.

Waved Torch-thistle. Clt. 1828. Shrub cl.

75 C. se'tiger (Haw. in phil. mag. nov. 1829. p. 108.) plant erectish; branches few, quadrangular; fascicles containing about 20 spines each, 3 or 4 of which are linear, radiating, and nearly equal, pale. ♄. D. S. Native of Brazil. The habit of the plant is referrible to *Stapèlia astèrias*, but taller and the angles more concave; wool at base of spines short.

Bristle-bearing Torch-thistle. Clt. 1828. Shrub.

76 C. tríqueter (Haw. syn. 181.) plant jointed, erectish, rooting, green, triangular; angles repand, with the fascicles of prickles remote; prickles rising from fuscous tomentum, ray ones setaceous and deciduous, central 3-4, stiff, short, and fulvous. ♄. D. S. Native of South America. C. prismáticus, Desf. hort. par. Prickles dirty yellow, 2-3 lines long, rising from short tomentum. Stem 5-6 feet high, branched. Flowers unknown.

Triquetrous-stemmed Torch-thistle. Clt. 1794. Shrub 5 to 6 feet.

77 C. tenuispìnus (Haw. in phil. mag. feb. 1827. p. 125.) plant weak, branched, somewhat articulated, climbing and rooting; branches very slender and triangular; bristles very slender, bent, wool-formed. ♄. D. S. Native country unknown, but probably in some part of South America. Bristles in crowded interwoven fascicles along the angles of the stems, which they hide. Perhaps the same as *C. Myosùsus*.

Slender-spined Torch-thistle. Clt. 1826. Shrub 1 foot.

78 C. trigònus (Haw. syn. 181.) plant creeping, triquetrous; angles hardly channelled; prickles 5-7 in a fascicle, stellate. ♄. D. S. Native of the West India Islands. Cáctus tríqueter β, Haw. misc. nat. 199.—Plum. ed. Burm. t. 200. f. 2. Cáctus triangulàris foliòsus, Jacq. amer. 152. ex Lam. dict. 1. p. 541. Flowers white (ex Plum.) and the fruit of a violaceous scarlet colour; but the fruit, according to Jacquin, is of a shining scarlet colour; there are therefore probably two species confused under this name.

Trigonal-stamened Torch-thistle. Clt. 1809. Shrub cl.

79 C. prisma'ticus (Salm-Dyck. in litt. but not of Willd. ex D. C. prod. 3. p. 469.) plant articulated, erectish, rooting, green, triangular; ribs repand; fascicles of prickles crowded; prickles nearly equal, fulvous, rising from fuscous tomentum, 7 radiating ones and 2 or 3 central ones in each fascicle. ♄. D. S. Native country unknown. Plant slenderer and more humble than *C. tríqueter*; prickles smaller and more numerous; and the fascicles are more crowded.

Prismatic Torch-thistle. Clt. 1818. Shrub cr.

80 C. coccíneus (Salm-Dyck. in litt. ex D. C. prod. 3. p. 469.) plant with long joints, rooting, deep green, triangular; ribs compressed, repand; prickles rising from yellow tomentum, radiating ones few, pilose, white, and 4 rather recurved, stiff, fulvous, central ones in each fascicle. ♄. D. S. Native of Brazil, among rocks on the mountains. Flowers said to be numerous, large, and scarlet.

Scarlet-flowered Torch-thistle. Clt.? Shrub cr.

81 C. exte'nsus (Salm-Dyck. in litt. ex D. C. l. c.) plant with long joints, rooting, green, triangular; ribs repand; prickles rising from fulvous tomentum; radiating ones pilose, whitish, 10-12 in each fascicle, and 2-4 small, stiff, yellowish, central ones. ♄. D. S. Native country unknown. Perhaps only a variety of the preceding, but less spinose. Joints much extended, and while young margined with red; and with the prickles and hairs rose-coloured.

Extended Torch-thistle. Clt.? Shrub cr.

82 C. squamulòsus (Salm-Dyck. in litt. ex D. C. l. c.) plant erect, jointed, rooting a little, green, triangular; ribs much compressed, repandly crenated, furnished with an ovate acute scale, and numerous white hairs in the crenatures. ♄. D. S. Native of Brazil. This is a very singular plant, with the sides of the joints 2 inches broad, and 4-toothed at the angles, and for the most part margined with red; teeth as in *Stapèlia*, furnished each with a marcescent scale or leaf. Flowers small, solitary, when dried permanent, yellow; petals 6-8, acute. Style filiform, 8-cleft at the apex. Fruit unknown.

Scaly Torch-thistle. Clt.? Shrub 1 to 2 feet.

83 C. seta'ceus (Salm-Dyck. in litt. ex D. C. l. c.) plant jointed, erect, rooting a little, deep green, triangular; ribs rather compressed, somewhat repand; hairs rising from white tomentum, with 7-9 radiating ones in each fascicle, and in the middle of each fascicle is a central soft prickle. ♄. D. S. Native of Brazil.

Bristly Torch-thistle. Clt.? Shrub 1 to 2 feet.

84 C. myosu'rus (Salm-Dyck. in litt. ex D. C. l. c.) plant rather articulated, erect, rooting a little, slender, margined with red, 3-4-angled; ribs crenulated, furnished with pencil-like fascicles of white hairs at the crenatures. ♄. D. S. Native of Brazil. Sides of stem hardly 3 lines broad. Pili long, erect, especially on the young branches. The rest unknown.

Mouse-tail Torch-thistle. Shrub.

85 C. te'nuis (D. C. prod. 3. p. 469.) plant low, climbing, acutely trigonal, with some roots issuing from the sides; hairs in fascicles along the angles, elongated, soft and adpressed; flowers sessile, usually with 5 sepals and 5 petals. ♄. D. S. Native of Brazil. Cáctus tènuis, Schott. ined. Flowers small, rose-coloured, hardly open, rising from among the fascicles of hairs; tube very short.

Slender Torch-thistle. Clt? Shrub.

§ 3. *Opuntiàcei* (plants having the habit of *Opúntia*). *D. C. prod. 3. p. 470. Stems composed of globose joints, horrific from diverging prickles. Flowers tubular. Style much exserted, multifid at the apex. Perhaps a proper genus, intermediate between Cèreus and Opúntia?*

86 C. monilifórmis (Lin. spec. 668. under *Cáctus*) plant diffusely procumbent, much branched; joints globose; prickles strong, diverging. ♄. D. S. Native of St. Domingo. Plum. ed. Burm. t. 198. Cáctus monilifórmis, Lam. dict. 1. p. 541. Flowers and fruit red; floral tube elongated, as in *Cèreus*; limb short, spreading. Style much exserted. Stigmas 8-10, spreading.

Necklace-formed Torch-thistle. Shrub procumbent.

87 C. se'rpens (H. B. et Kunth, nov. gen. amer. 6. p. 68. under *Cáctus*) plant creeping, branched, rather angular; areolæ 6-angled, prickly at the apex; flowers tubular. ♄. D. S. Native of Quito, on dry hills on the banks of the river Guancabamba, near Sondorillo. Flowers flesh-coloured; petals 8-12, acute; stigmas 8, approximate. Perhaps a species of *Opúntia*.

Creeping Torch-thistle. Shrub cr.

88 C. na'nus (H. B. et Kunth, l. c. under *Cáctus*) plant creeping and jointed; joints terete, rather compressed, areolate, prickly, a little branched. ♃. D. S. Native of Quito, near Sondorillo, on the banks of the Guancabamba. The rest unknown.

Dwarf Torch-thistle. Shrub proc. 2 to 3 inches.

89 C. gra'cilis (Haw. in phil. mag. feb. 1827. p. 126.) plant erectish, nearly terete; old spines solitary, straight, an inch long, but at first twin or more, white. ♄. D. S. Native of South America. Plant with the habit of *Euphórbia hýstrix*, but less spiny and the spines shorter. It appears to be more nearly allied to *C. nànus* than to any other species.

Weak Torch-thistle. Clt.? Shrub.

† *The following species are in the gardens, but nothing is known of them but the names.*

1 *C. rosàceus*, Hort. berol. 2 *C. Déppii*, Hort. berol. 3 *C. incrustàtus*, Hort. berol. 4 *C. exérens*, Hort. berol. 5 *C. affìnis*, Hort. berol. 6 *C. proteifórmis*, Hort. par. 7 *C. Colvílli*, Sweet. 8 *C. ovàtus*, Gill. (under *Cáctus*). 9 *C. polymórphus*, Gill. (under *Cáctus*).

Cult. The same kind of soil recommended for *Mammillària*, p. 160. will answer the species of this genus; and they are easily propagated by cuttings, which if left to lie a few days after being separated from the mother plant, strike root readily. In order to have several species on one tree, insert them in a plant of *Peréskia*.

V. EPIPHY'LLUM (from επι, *epi*, upon, and φυλλον, *phyllon*, a leaf; flowers rising from the flat branches, which appear like leaves). Herm. par. bat. add. (ex Dill.). Haw. syn. succ. p. 197. phil. mag. aug. 1829. p. 108.—Phyllárthus, Neck. elem. 1. p. 85. Cèreus, § 3. *Alàta*, D. C. prod. 3. p. 469. Cáctus species of Lin. and others.

Lin. syst. *Icosándria, Monogýnia.* Tube of corolla very long, middle-sized, or very short, furnished with remote, unarmed scales, rising from the crenatures of the branches, among small innocuous spines. Limb of corolla fugaceous, deeply multifid, and as if it were polypetalous, rosaceous or more or less of a ringent form. Branched, slender, hardly climbing subshrubs, natives of South America, growing among rocks or on the trunks of old trees; branches much compressed, 2-edged, thin but fleshy, lobately crenated, green, smooth; with a slender, woody, central axis. Flowers solitary, usually large and showy, white, rose-coloured, or scarlet, rarely sweet-scented. The branches towards the roots are rather angular. The rest as in *Cèreus*, of which perhaps it is merely a section.

Sect. I. Noctu'rna (from *nocturnus*, nightly, or in the night; in reference to the time at which the flowers expand). Haw. in phil. mag. aug. 1829. p. 107. Corollas fugaceous, sweet-scented, white, expanding alone at night; tube very long.

1 E. phylla'nthus (Haw. syn. 197.) corolla small, much shorter than the tube, which is nearly a foot in length; stigmas 10. ♄. D. S. Native of South America, in Brazil, Guiana, Surinam, Guadaloupe, &c. Cáctus phyllánthus, Lin. spec. 670. D. C. pl. grass. t. 145. Opúntia phyllánthus, Mill. dict. no. 9. Cèreus phyllánthus, D. C. prod. 3. p. 469.—Dill. elth. t. 64. f. 74. Flowers white, 9-12 inches long, expanding at night, sweet-scented.

Leaf-flowering Epiphyllum. Fl. Ju. Clt. 1810. Sh. 1 to 3 ft.

2 E. Hooke'ri (Haw. l. c.) corolla middle-sized, much shorter than the tube, which is about half a foot long; stigmas usually 13. ♄. D. S. Native of South America. Flowers white, sweet-scented. Cáctus phyllánthus, Hook. bot. mag. 2692. Flowers white, sweet-scented.

Hooker's Epiphyllum. Fl. June, July. Clt.? Sh. 2 feet.

Sect. II. Diu'rna (from *diurnus*, belonging to the day-time; in allusion to the time of the blossoms expanding). Haw. in phil. mag. aug. 1829. Corollas scentless, open day and night; tube middle-sized or very short.

3 E. phyllanthoìdes (Haw. l. c.) corolla large, rosaceous; tube middle-sized, shorter than the oblong-lanceolate petals; stigmas 7. ♄. D. S. Native of Mexico. Cáctus phyllánthoides, D. C. cat. hort. monsp. 1813. p. 84. Sims, bot. mag. 2092. D. C. prod. 3. p. 469. Cáctus speciòsus, Ker. bot. reg. 304. Bonpl. nav. t. 3. Epiphýll. speciòsum, Haw. suppl. p. 84. Cáctus élegans, Link, enum. 2. p. 25. Cáctus alàtus, Willd. enum. suppl. 35.—Hern. mex. 292. f. 3. and t. 457.—Pluk. phyt. t. 247. f. 5. Flowers pale rose-coloured, 4 inches long, scentless. Branches flat, without any spines in the notches except when young.

Phyllanthus-like or Common Epiphyllum. Fl. June, July. Clt. 1810. Shrub 1 to 3 feet.

4 E. Vande'sii (Hortul.) branches flat or triquetrous, with no spines in the notches, except when young, when there are a few small ones at the base; branches rather convex. ♄. D. S. A hybrid raised in the garden of the Count de Vandes at Bayswater, from the seed of *E. phyllanthoides*, impregnated by the pollen of *Cèreus speciosíssimus*. The flowers are large, and of a deep red colour, and, upon the whole, it may be considered the most splendid of the genus.

Count De Vandes' Epiphyllum, or Hybrid Cactus. Fl. June, July. Hybrid shrub.

5 E. Jenkinsònii; branches round or triquetrous at the base, but always flat at the apex, with the notches more prominent and spiny than in any other species of the genus; the branches are likewise more convex and firm. ♄. D. S. A hybrid, raised from the seeds of *Cèreus speciosíssimus*, impregnated by the pollen of *Epiphýllum speciòsum*. Cáctus Jenkensònii, Hortul. The flowers of this hybrid are large, and of a deep scarlet-colour, and are said even to outvie in splendour those of *E. Vandèsii*. There are several other hybrids now in various gardens, raised from the same parents as the present plant, which may prove even superior in splendour to any of the genus, but they have not yet flowered.

Jenkinson's Epiphyllum or Hybrid Cactus. Fl. Ju. July. Hybrid. Pl. 2 to 3 feet.

6 E. oxype'talum (Haw. l. c.) tube of flower length of the acuminated lobes; flowers sessile; fruit nerved longitudinally.

♄. D. S. Native of Mexico. Cèreus oxypétalus, D. C. prod. 3. p. 470. Flowers 4 inches long, reddish brown on the outside, and white inside. Berry red, oblong, ribbed, attenuated at both ends. Branches like those of *E. phyllanthoìdes*.

Sharp-petalled Epiphyllum. Shrub 2 to 3 feet.

7 E. ala'tum (Haw. suppl. p. 84.) corolla small, greenish white; tube very short; berry blackish. ♄. D. S. Native of Jamaica, on the trunks of trees. Cèreus álatus, D. C. prod. 3. p. 470. Cáctus alàtus, Swartz. fl. ind. occ. 878. Link. enum. 2. p. 24. exclusive of the D. C. syn.

Winged Epiphyllum. Fl. June. Clt. 1810. Sh. 1 to 2 ft.

8 E. Akerma'nni (Haw. in phil. mag. Aug. 1829. p. 108.) corolla large, rather ringent, assurgent before expansion, and acute at the apex, nearly 4 times longer than the tube; stigmas 7. ♄. D. S. Native of Mexico, from whence it was brought by a Mr. Akermann. Cáctus Akermánni, Hortul. Flowers large, scarlet. Petals keeled, a little recurved at the apex. Branches flat, thin, seldom with any spines in the notches except when young.

Akermann's Epiphyllum. Fl. June, July. Clt. 1829. Shrub 1 to 3 feet.

9 E. crispa'tum (Haw. in phil. mag. Feb. 1830. p. 109.) branches cuneate-oblong, waved; margins appearing curled from large crenatures. ♄. D. S. Native of Brazil. Flowers not seen.

Curled-branched Epiphyllum. Clt. 1829. Shrub 1 to 2 ft.

10 E. trunca'tum (Haw. suppl. p. 85. et in phil. mag. vol. 4. p. 188.) corolla reflexed, ringent; tube very short; branchlets dichotomous, truncate at the apex. ♄. D. S. Native of South America. Cáctus truncàtus, Link. enum. 2. p. 24. Ker, bot. reg. 696. Sims, bot. mag. 2526. Hook. exot. fl. t. 20. Lodd. bot. cab. 1207. Cèreus truncàtus, D. C. prod. 3. p. 470. Flowers rising from the truncate tops of the branches, red or rose-coloured, hardly 3 inches long, oblique; stamens white, ascending; stigmas 7, closely conniving. Joints of stem compressed. This species appears to be an intermediate plant joining *Epiphýllum* with *Opúntia*. It is a very elegant plant when in blossom.

Truncate Epiphyllum. Fl. July, Sept. Clt. 1818. Shrub 1 foot.

Cult. The species of *Epiphýllum* are extremely showy when in flower. Their culture and propagation are the same as that recommended for the last genus. They are known at first from all the other genera of this order by their flat elongated branches.

VI. OPU'NTIA (some species grows plentiful near Opus, a city of Locris). Tourn. inst. 239. t. 122. Mill. dict. Haw. syn. 187. D. C. prod. 3. p. 471.—Tùna, Dill. hort. elth. f. 379. and 383.—Cáctus Opúntia, Willd. enum. suppl. p. 33. D. C. cat. hort. monsp. Link, enum. 2. p. 23.

Lin. syst. *Icosándria, Monogýnia*. Sepals numerous, leaf-formed, adnate to the ovarium: upper ones flat and short: inner ones petal-formed, obovate, rosaceous, expanded: without any tube above the ovarium. Stamens numerous, shorter than the petals. Style cylindrical, constricted at the base; stigmas many, thick, erect. Berry ovate, umbilicate at the apex, tubercled, and usually bearing spines. Embryo rather spiral, nearly terete. Cotyledons semi-terete (ex Gærtn. fruct. 2. t. 138.), after germination becoming foliaceous, and flat, but thickish. (see Dill. elth. f. 381.) Plumule small.—Shrubs, with the trunk at length becoming terete, but having the young branches very rarely cylindrical, but usually more or less compressed, and jointed; joints ovate or oblong, bearing fascicles of spines or bristles, which are disposed in a quincuncial or spiral order. Leaves nearly the form of those of some species of *Sèdum*, but fall off very soon, one under each fascicle of spines or bristles on the branches when young. Flowers rising from the fascicles of spines or bristles, or from the edges of the joints, either yellow or reddish. Stamens rather irritable to the touch.

Sect. I. Cylindra'ceæ (from *cylindraceus*, like a roller; in allusion to the cylindrical branches). D. C. prod. 3. p. 471. Stems cylindrical, neither jointed, nor furrowed, but bearing areolate convex tubercles, and fascicles of prickles. The species of this section are not sufficiently known, or probably they would have constituted an intermediate genus between *Cèreus* and *Opúntia*.

1 O. ròsea (D. C. diss. t. 15.) plant erect, rose-coloured; stems and branches tubercular; tubercles oblong, depressed, disposed in spiral series, bearing each at the apex a caducous leaf, and a fascicle of straight white prickles; flowers nearly rotate, usually by fours at the tops of the branches. ♄. D. S. Native of Mexico. Cáctus subquadriflòrus, Moc. et Sesse, fl. mex. icon. ined. This is an anomalous species, as from the stems it agrees with *Cèreus tuberculòsus*, and from the rotate flowers it agrees with *Opúntia*. Flowers flesh-coloured. Fruit white. Leaves terete, acute, soon falling off.

Rose-coloured Indian-fig. Shrub 2 to 3 feet.

2 O. cyli'ndrica (D. C. prod. 3. p. 471.) plant erect; stem and branches tubercular, areolate; tubercles rhomboid, bearing each a caducous leaf, and a few white prickles. ♄. D. S. Native of Peru. Flowers unknown. Cáctus cylíndricus, Lam. dict. 1. p. 539. but not of Ort. Cèreus cylíndricus, Haw. syn. 183.

Cylindrical-branched Indian-fig. Clt. 1799. Sh. 2 to 3 feet.

3 O. imbrica'ta (D. C. prod. 3. p. 471.) plant erect, terete, not furrowed, but superficially ribbed, and rather lobe-formed, somewhat imbricately tesselated in various ways. ♄. D. S. Native country and flowers unknown. Cèreus imbricàtus, Haw. rev. 70. Allied to *O. cylíndrica*, but more robust according to Haworth, but according to the Prince de Salm-Dyck it is slenderer.

Imbricate-tesseled Indian-fig. Clt. 1820. Shrub 2 to 3 feet.

4 O. stape'liæ (D. C. mem. cact. in mem. mus. 17. p. 117.) plant branched, irregularly tufted, deep green; joints ovate or oblong; areolæ small, tomentose in the axils of the tubercles; prickles 5-6 in a fascicle, stiff, straw-coloured, setaceous, when old the epidermis or coat separates from them. ♄. D. S. Native of Mexico. Coulter, no. 38. Stem hardly an inch high. Habit almost of *Stapèlia cæspitòsa*, but which is without prickles.

Stapelia-like Indian-fig. Clt. 1830. Shrub 1 to 2 inches.

5 O. exuvia'ta (D. C. l. c. p. 118.) plant branched, erect, nearly terete; branches furnished with compressed tubercles, and irregular crests, so as to make them nearly pentagonal; areolæ orbicular, velvety at the axils of the tubercles; prickles 6-12 in a fascicle, stiff, straight, when old the epidermis separates from them. ♄. D. S. Native of Mexico. Coulter, no. 18. Cáctus tunicàtus, Hort. berol. ex Salm-Dyck. Trunk a foot high, and 18 inches thick.

Var. β, angústior (D. C. l. c.) trunk slenderer; prickles fewer; areolæ narrower. Coulter, no. 17.

Var. γ, spinòsior (D. C. l. c.) stem dwarf; prickles longer and more numerous, and more spine-like.

Stripped Indian-fig. Clt. 1830. Shrub 1 foot.

6 O. deci'piens (D. C. l. c.) plant erect, branched, green; branches cylindrical, attenuated at the base; tubercles few, spirally disposed; areolæ small; prickles of two forms, the lower one large and spreadingly deflexed: the rest, 3-4 in number, bristle-formed and radiating. ♄. D. S. Native of Mexico. Coulter, no. 20. Leaves small, ovate-oblong, deciduous. Large prickle an inch long, when old the epidermis separates from it. The rest 1-2 lines long. Compare it with *O. cylíndrica*.

Deceiving Indian-fig. Clt. 1830. Shrub 2 to 3 feet.

7 O. KLEI'NIÆ (D. C. l. c.) plant erect, branched, greyish green; branches erect, cylindrical, without tubercles; fascicles disposed in a spiral manner to the left; areolæ velvety; prickles of two forms, with numerous bristle-formed whitish brown ones in each fascicle, and one large spreadingly deflexed slender white one at the lower side of the fascicle. ♄. D. S. Native of Mexico. Coulter, no. 21. Stem more than a finger in thickness, like the stem of *Cacàlia Kleìniæ*. Leaves small, oblong, deciduous. Large prickle an inch long.

Kleinia-like Indian-fig. Shrub 1 to 2 feet.

8 O. LEPTOCAU'LIS (D. C. l. c.) plant erect, branched; branches cylindrical, erect, without tubercles; fascicles disposed in spiral lines to the left; areolæ rather tomentose; prickles of two forms, the 3 lower ones in each fascicle setaceous, blackish, spreadingly deflexed, the rest bristly, crowded, and rufescent. ♄. D. S. Native of Mexico. Coulter, no. 22. Stem the thickness of the small finger. Referrible to the preceding species.

Slender-stemmed Indian-fig. Shrub 1 to 2 feet.

9 O. LEUCO'TRICHA (D. C. l. c. p. 119.) joints oblong, erect, when young velvety; areolæ when young convex, velvety; prickles of two forms, 2 or 3 of which in each fascicle are very long, setaceous, unarmed, white, and spreading, and 4-5 very small, bristle-like, straight, yellow ones. ♄. D. S. Native of Mexico. Coulter, no. 2. Larger prickles 10-12 lines long. Intervals between the fascicles of bristles distant.

White-haired Indian-fig. Shrub.

10 O. OTTÒNIS (Link et Otto, pl. rar. hort. berol. t. 16.) stem nearly cylindrical, with 12 bluntish ribs; the 3-4 middle spines in each fascicle are erectish, slender, brownish, longer than the rest, which are 10-14 in number, very slender, and spreading; petals acute, rather serrulated, cuspidate. ♄. D. S. Native of Brazil.

Otto's Indian-fig. Shrub.

11 O. PULVINA'TA (D. C. l. c.) joints oval, erect, velvety; areolæ convex, pulvinate, the whole occupied by innumerable, straight, crowded, yellow, fragile bristles, without any true prickles intermixed. ♄. D. S. Native of Mexico. Coulter. A very distinct species. O. macrodàsys, Lehm. hort. hamb. ex Salm-Dyck in litt.

Pulvinate Indian-fig. Shrub.

SECT. II. DIVARICA'TÆ (from *divaricatus*, divaricated; branches). Haw. syn. 195. Stems humble; branches diverging; joints linear-lanceolate, thick, nearly terete. Prickles strong, in fascicles.

12 O. LONGISPÌNA (Link et Otto, hort. berol. Haw. in phil. mag. Feb. 1830. p. 109.) joints compressedly terete; spines purplish, some of them small and fulvous, and a slender terete one (which is when full grown 3 inches long) in each fascicle. ♄. D. S. Native of Brazil.

Long-spined Indian-fig. Clt. 1829. Shrub.

13 O. GLOMERA'TA (Haw. in phil. mag. Feb. 1830. p. 110.) branches disposed in crowded tufts; central spines solitary in each tuft, linear, acuminated, flat on both sides, very long. ♄. D. S. Native of Brazil. Branches thick, teretely lanceolate, greenish, hardly half an inch broad.

Glomerate-branched Indian-fig. Clt. 1829. Shrub.

14 O. FOLIÒSA (Salm-Dyck in litt. ex D. C. prod. 3. p. 471.) joints compressed, branched, pale green, when young leafy, when old prickly; prickles 1-2, elongated, pale straw-coloured, rising from yellowish tomentum. ♄. D. S. Native of South America. O. pusílla, Haw. syn. 195. but not of Salm-Dyck. Cáctus foliòsus, Willd. enum. suppl. 32. Flowers almost like those of *O. vulgàris*. Calyx of 5 sepals. Petals 8-10, yellow. Stigmas 3-4, white.

Leafy Indian-fig. Fl. June. Clt. 1805. Shrub ½ to 1 foot.

15 O. CURASSA'VICA (Mill. dict. no. 7. Haw. syn. 196.) plant erect; joints brittle, cylindrically ventricose, compressed, very much divaricated, deep green; prickles 1-4 in each fascicle, whitish. ♄. D. S. Native of Curassoa. Bradl. succ. t. 4. Cáctus Curassávicus, Lin. spec. 670. Flowers yellow, an inch and a half in diameter. Stigmas 3-5.

Var. β, lónga (Haw. rev. p. 71.) branches more firm, and twice the length of those of the species. ♄. D. S. Native of Brazil. Perhaps a proper species. There are several other varieties mentioned by Haworth, but they appear to have sprung more from the state of the plants, and the manner of culture.

Curassoa Indian-fig. Fl. June, July. Clt. 1690. Shrub 4 to 6 feet.

16 O. FRA'GILIS (Nutt. gen. amer. 1. p. 296. under *Cáctus*,) joints short, oblong, nearly terete, fragile, doubly spinose; fruit dry and prickly. ♄. H. Native of North America, in sterile places about the river Missouri. Flowers small, yellow, solitary on the tops of the branches. Truly distinct from all the rest, and will perhaps form a distinct section along with two other unpublished species, which are now growing in the garden of the Prince de Salm-Dyck.

Brittle Indian-fig. Clt. 1814. Shrub ½ to 1 foot.

17 O. PUSÍLLA (Salm-Dyck, obs. bot. 1822. et in litt. 1827.) plant prostrate, divaricate, of a dirty-green colour; joints cylindrical, cucumber-formed; fascicles of prickles crowded; prickles setaceous, white, rising from white tomentum, 1 or 2 in each fascicle are more elongated than the rest. ♄. D. S. Native of South America. Joints rather attenuated at the apex.

Small Indian-fig. Clt. 1817. Shrub prostrate.

SECT. III. GRANDISPINÒSÆ (from *grandis*, great, and *spinosus*, full of spines; in reference to the prickles being large and numerous). Haw. syn. 195. Joints compressed, ovate or obovate. Prickles variable, the smaller ones setaceous, and the larger ones much longer and stronger.

18 O. MISSOURIE'NSIS (D. C. prod. 3. p. 472.) joints broad, nearly orbicular, very prickly; prickles of 2 forms, larger ones radiating and permanent; flowers numerous; fruit dry and prickly. ♄. H. Native of North America, in arid places about the Missouri, plentiful. Cáctus fèrox, Nutt. gen. amer. 1. p. 296. but not of Willd. O. polyacántha, Haw. rev. p. 82. Larger than *O. vulgàris*. Flowers pale yellow or sulphur-coloured. Stigmas 8-10, greenish. Prickles white.

Missouri Indian-fig. Fl. June, July. Clt. 1814. Sh. 1 ft.

19 O. FE'ROX (Haw. suppl. p. 82.) joints oblong, elongated; prickles strong and setaceous, numerous, whitish, in fascicles, longer than the wool from which they issue, one of which in each fascicle is longer than the rest. ♄. D. S. Native of South America. Cáctus fèrox, Willd. enum. suppl. p. 35. but not of Nutt. The rest unknown.

Fierce Indian-fig. Clt. 1817. Shrub 2 to 3 feet.

20 O. SPINOSI'SSIMA (Mill. dict. ed. 8. Haw. syn. 193.) joints oblong; prickles yellowish, setaceous, and subulate, very numerous, in fascicles, longer than the wool from which they issue. ♄. D. S. Native of Jamaica. Cáctus spinosíssimus, Lam. dict. 1. p. 537. Flowers yellow.

Very-spiny Indian-fig. Fl. July. Clt. 1732. Sh. 6 to 10 feet.

21 O. HO'RRIDA (Salm-Dyck in litt. ex D. C. prod. 3. p. 472.) plant erect; joints cuneately obovate, repand, tubercled; fascicles of prickles remote; prickles of various forms, yellow, painted with brown, rising from setaceous yellow tomentum, one in each fascicle longer than the rest, about 2 inches in length. ♄. D. S. Native of South America. O. hùmilis, Haw. syn. 189. Cáctus hùmilis, Haw. misc. 187. but the name is deceitful, the plant growing to a considerable height. Flowers yellow.

Perhaps Cáctus hùmilis, Lag. nov. spec. is different from this. The plant often occurs in the gardens under the name of *O. Tùna*.

Horrid Indian-fig. Fl. July. Clt. 1795. Shrub 1 to 3 feet.

22 O. DILLE'NII (Haw. suppl. p. 79.) plant erect; joints roundish-obovate, undulated, glaucous; prickles strong, divaricated, yellow, but the brush-like bristles by which they are surrounded are much shorter. ♄. D. S. Native of South America. —Dill. elth. f. 382. Cáctus Dillènii, Ker, bot. reg. 255. Flowers large, pale yellow. Ovarium shorter than the corolla, furnished at the summit by fascicles of bristles.

Dillenius's Indian-fig. Fl. Oct. Clt. 1810. Sh. 3 to 5 feet.

23 O. TU'NA (Mill. dict. no. 3. Haw. l. c.) plant erect; joints broadly ovate-oblong; prickles subulate, long, yellow; wool at the base of the spines short. ♄. D. S. Native of South America, at Cuenca in Quito. Cáctus Bonplándii, H. B. et Kunth, nov. gen. amer. 6. p. 69.—Dill. elth. 386. t. 295. f. 386. Flowers of an orange-colour, or iron grey-colour, or dirty red. Stigmas 8-10-cleft. This kind of Indian-fig makes strong fences. When the Island of St. Christopher was to be divided between the English and the French, three rows of the Tuna were planted by common consent between the boundaries. Sloane. Sir James Smith, in his paper upon the irritability of vegetables, informs us that the long and slender stamens of the flower are very irritable; and that if a quill or feather is thrust through them, in the space of 2 or 3 seconds they begin to lie down gently on one side, and in a short time become recumbent at the bottom of the flower. According to Humboldt and Bonpland the fine kind of cochineal is nourished by this plant.

Tuna Indian-fig. Fl. July, Aug. Clt. 1731. Sh. 3 to 6 ft.

24 O. POLYA'NTHA (Haw. syn. p. 190.) plant erect; joints oblong and ovate; prickles very different in form, yellow, larger ones setaceous, erectly spreading; flowers numerous at the tops of the branches. ♄. D. S. Native of South America. Cáctus Opúntia polyántha, D. C. pl. grass. no. 138. with a figure. Cáctus polyánthos, Sims, bot. mag t. 2691. Flowers yellow. Style full, not fistular as in the other species. Stigmas 6.

Many-flowered Indian-fig. Fl. July, Aug. Clt. 1811. Shrub 2 to 3 feet.

25 O. MONACA'NTHA (Willd. enum. suppl. under *Cáctus*, Salm-Dyck in litt. ex D. C. prod. 3. p. 723.) joints obovate-oblong; prickles solitary, subulate, strong. ♄. D. S. Native of South America. Cáctus Opúntia Tùna, D. C. pl. grass. no. 137. t. 2. Joints a foot long. Flowers yellow, verging to purple beneath.

One-spined Indian-fig. Clt. 1816. Shrub 6 to 8 feet.

26 O. ELA'TIOR (Mill. dict. no. 4. Haw. syn. 187.) plant erect; joints broadly ovate-oblong; prickles subulate, very long, blackish, with the wool from which they rise nearly obsolete. ♄. D. S. Native of South America. Cáctus Tùna β, Willd. spec. 2. p. 944.—Dill. elth. t. 294. f. 379. Flowers yellow, varying to purple. Stigma 5-cleft. Adult stem nearly terete ex Jacq.

Taller Indian-fig. Fl. July, Aug. Clt. 1731. Shrub 6 feet.

27 O. NI'GRICANS (Haw. syn. 189.) plant erect; joints oblong and lanceolate; prickles very different in form, of a blackish brown-colour, larger ones divaricate. ♄. D. S. Native of South America. Cáctus nígricans, Haw. 137. Cáctus Tùna γ, nígricans, Sims, bot. mag. 1557. Cáctus pseùdo-coccinéllifer, Bert. exc. p. 11. virid. 1824. p. 4. exclusive of the synonymes. Flowers reddish on the outside, and yellow inside. Stigmas 5, thick, greenish.

Blackish Indian-fig. Fl. Aug. Clt. 1795. Sh. 2 to 3 feet.

28 O. MA'XIMA (Mill. dict. ed. 8. no. 5.) plant erect; joints ovate-oblong, very thick; spines unequal. ♄. D. S. Native of South America. Perhaps the same as *O. Amýclea*.

Greatest Indian-fig. Shrub 6 to 8 feet.

29 O. TRIACA'NTHA (Willd. enum. suppl. under *Cáctus*,) joints ovate-oblong; prickles whitish, usually 3 together, strong, longer than the wool from which they issue. ♄. D. S. Native of South America. Very nearly allied to O. polyántha ex Salm-Dyck in litt. but the joints are a little larger, and the prickles are white. Flowers unknown.

Three-spined Indian-fig. Shrub 2 to 3 feet.

SECT. IV. PARVISPINÒSÆ (from *parvus*, small, and *spinosus*, full of spines; in reference to the spines being small, equal, and numerous). D. C. prod. 3. p. 473. Prickles uniform, hair-shaped, short or nearly wanting.

30 O. DECUMA'NA (Haw. rev. 71.) joints ovate-oblong; prickles deciduous, length of the wool from which they issue. ♄. D. S. Native of South America. Cáctus decumànus, Willd. enum. suppl. 34. O. máxima, Mill. dict. ed. 2. no. 5. Cáctus elongátus, Willd. enum. suppl. 34. There are varieties of this plant with either ovate or lanceolate-oblong joints, almost unarmed or furnished with some short white prickles. Flowers yellow. The cochineal bug thrives almost as well on this species as on the next.

Huge Indian-fig. Clt. 1768. Shrub 5 to 10 feet.

31 O. COCHINILLI'FERA (Mill. dict. ed. 8. no. 6. Haw. syn. 192.) plant erect; joints obovate, nearly unarmed; petals connivent; stamens and style exserted. ♄. D. S. Native of South America. Cáctus cochinillífera, Lin. spec. 670. Hook. in bot. mag. 2741. and 2742.—Dill. elth. t. 297. f. 383. Joints while young oblong, areolate, at length obovate-oblong. Flowers blood-coloured ex Dill. elth., small, spreading a little. Spines slender, blackish. The ripe fruit is said to check fluxes by its mild restringency. Flowers red. Perhaps Nopal de Castille Thierr-Menonville, voy. Guax. 2. p. 278. is the same as this plant.

Of the particular species of *Opúntia* which nourishes the cochineal insect much doubt has existed. There is some reason to believe that the Opúntia cochinillífera, Haw. Cáctus, Lin. is not the plant which produces the best Mexican cochineal. Tilloa, on the authority of well informed travellers, states that the cochineal Cáctus has no spines, and a fruit imbued with deep red pulp. Clavigero, however, says, "In Misteca, where I was for five years, I always saw the insect upon prickly Nopals. M. de Raynal imagines that the colour of the cochineal is to be ascribed to the red fig on which it lives; but that author has been misinformed, for neither does the cochineal feed upon the fruit, but only upon the green part of the plant; nor does that species of Nopal bear red, but white figs. Clavigero adds, "it may be reared upon the species with red fruit, but that is not the proper plant of the cochineal." M. Thierry de Menonville, who procured the cochineal insect, and the Opuntia on which it feeds from Guaxaca in Mexico, and transported them to St. Domingo, and who unquestionably had the best means of determining the kinds of Cacti cultivated for the insect, describes particularly 3 sorts on which it may be reared, and cultivated to advantage. The first is the *Cactier Nopal*, upon which alone the cochineal is reared in Mexico, both the fine and the common sorts, although there are throughout the country many other kinds of *Opúntia*. The two following, therefore, it is presumed are employed in St. Domingo. 2. The *Cactier splendide*, which may be used to equal advantage with the former; and 3. The *Cactier de Campeche*. Of these the first, as far as can be determined by description, is the Cáctus Tùna of Lin. which is the Opúntia Tùna of Mill. The second appears to be very similar to the former, but larger in its joints, and very glaucous. The third is without doubt the Cáctus cochinillífera, Lin. and which he says of it from his own experience, that it may be usefully employed for rearing the *Cochinille sylvestre*, and may even support a small quantity of the fine kind. Humboldt also, although

he allows that it is the plant upon which the cochineal has often been sent to Europe, asserts that our *Opúntia cochinillífera* is not the individual of the Mexican Nopaleries, which he makes a new species under the name of *O. Bonplándii*, and he quotes under it with a mark of doubt the *Cáctus Tùna* of Lin. At Rio Janeiro, when that place was visited by the Chinese embassy under Lord Macartney, there were considerable plantations of *Cáctus Tùna*, now *Opúntia Tùna*, for rearing the cochineal, which had sometime previously been introduced to Brazil. In St. Vincent the Rev. L. Guilding has a considerable nursery of the *Opúntia cochinillífera* inhabited by thousands of the true cochineal; and he is in expectation of sending to the Society of Arts a large quantity of the dried insects. From all that has been said we think it may be inferred with safety that in Mexico and Brazil the *Opúntia Tùna* or *Bonplándii* is the favourite food of the cochineal; and that in the West Indian Islands, where *O. Tùna* is perhaps less frequent, the *O. cochinillífera* is employed by the natives, and answers the purpose sufficiently well.

Like all the species of *Opúntia*, the plants propagate readily by having the joints stuck into the ground, and the plants love dry and barren spots. If cultivated for the purpose of rearing the cochineal, it must be defended, at least in the rainy Island of St. Vincent, from storms and winds, by sheds placed to windward.

The cochineal insect, which feeds upon the kinds of *Opúntia* just mentioned, is too well known to need a particular description here; as are also its valuable properties in producing the dye which bears its name, and carmine. It is the Cóccus cácti of Linnæus, a small insect of the order Hymenóptera, having a general appearance not very dissimilar to that of the mealy-bug of our gardens, and equally covered with a white powdery substance. The male is winged. It is originally a native of Mexico, and was cultivated for its precious dye long before the conquest of that country; and these plantations, called Nopaleros, are most extensive in the Misteca and Oaxaca; the latter district alone has exported, according to Humboldt, upon the average 32,000 arobas annually, estimated at 2,400,000 piastres, above 500,000*l.* sterling.

In Sloane's Jamaica, vol. 1. t. 9. a representation of a Mexican Nopalery is given from a drawing made at Guaxaca, by an Indian. In these small plantations or enclosures they cultivated either the fine sort (Grana fina of the Spaniards), or the common kind (Grana sylvestre), which differ by the first having a finer quality and more powdery covering; whilst the latter, less valuable in its produce, has a cottony covering; but whether these two insects be specifically distinct has not yet been determined. The placing of the females, when big with young, is called sowing. The proprietor of a Nopalery buys in April or May the branches of joints of the Tunas de Castilla (*Opúntia Tùna*), which are sold in the market of Oaxaca at about 3 franks a hundred, loaded with young cochineals (semilla). These are kept in cellars for 20 days, when they are exposed to the air, suspended under a shed. So rapid then is the growth of the insect, that by August or September the females are big with young, and ready for sowing, which is done in small nests, made of the fibrous parts of the foliage of a Tillándsia called Paxtle. In four months from the time of sowing the harvest commences. The insects are brushed off with a squirrel's or deer's tail by women, who sit during this operation, for whole hours at one Nopal plant; so that were it not for the extreme cheapness of labour in that country, Humboldt says, that the rearing of the cochineal would prove an unprofitable employment. After being gathered, the insects are killed by boiling water, or by exposing them in heaps to the sun, or by means of the vapour baths of the Mexicans (temazcalli); and when dry they are fit for exportation. By the latter method, the powdery substance is preserved, which increases the value of the insects in commerce. Dr. Bancroft has estimated the annual consumption of cochineal in Great Britain only at about 750 bags or 150,000 lbs., worth 275,000*l.* "a vast amount," as the authors of the introduction to Entomology observe, "for so small a creature, and well calculated to show us the absurdity of despising any animals, on account of their minuteness." According to the same writers, the only kind of cochineal that has been conveyed to the East Indies is the sylvestre or wild cochineal from Brazil, and the Court of Directors of the East India Company have offered a reward of 6,000*l.* to any person who should introduce the more valuable sort. The insects were introduced to the royal gardens at Kew in 1814 from Martinico, by M. Castleneau d'Auros, late superintendant of the botanic garden on that island. In 1820, the fine cochineal was introduced to the Apothecaries' botanic garden at Chelsea by W. Prinsep of Calcutta, from some of the Nopaleries of Mexico.

Cochineal-bearing Indian-fig. Fl. July, Sept. Clt. 1688. Shrub 3 to 5 feet.

32 O. FÌCUS-I'NDICA (Haw. syn. p. 191.) joints ovate-oblong, obtuse at both ends; prickles setaceous, length of the wool from which they rise. ♄. D. S. Native of South America. Cáctus Fìcus I'ndica, Lin. spec. 670. Willd. enum. suppl. 34. Joints a foot long. Prickles all setaceous, and very short. Flowers sulphur-coloured. Fruit large, edible, deep purple. This is the most common kind of Indian-fig in Jamaica, and upon the fruit of it a wild kind of cochineal feeds. The plant is to be found in many parts of Asia, but has perhaps been transplanted thither.

Common *Indian-fig*. Fl. June, July. Clt. 1731. Shrub 2 to 3 feet.

33 O. PSEU'DO-TU'NA (Salm-Dyck, obs. bot. 1822. et in litt. 1827.) plant erect, branched, light green; joints obovate, compressed, large, thick; fascicles of prickles distant; prickles yellow, setaceous, collected into brush-like heaps: lower one of each heap strong, and subulate. ♄. D. S. Native of South America. Allied to *O. Fìcus-Indica*, but more shining. This species occurs often in gardens under the name of *O. Tùna*.

False-Tuna. Shrub 2 to 3 feet.

34 O. TOMENTÒSA (Salm-Dyck, obs. bot. 1822. et in litt. 1827.) plant erect, tomentose; joints lanceolate, compressed, thick; prickles setaceous, white: lower 4 or 6 in each fascicle elongated, unarmed. ♄. D. S. Native of South America. Cáctus tomentòsus, Link. enum. 2. p. 24. Spreng. syst. 2. p. 497. Hairs of joints short, adpressed, and rather villous.

Tomentose Indian-fig. Clt. 1820. Shrub 2 to 3 feet.

35 O. LANCEOLA'TA (Haw. syn. 192.) plant erectish; joints lanceolate; spines uniform, very short. ♄. D. S. Native of South America. Cáctus lanceolàtus, Haw. misc. p. 188. Leaves larger in this species than any of its allies, generally they are more than 3 lines long. Flowers 4 inches in diameter, of a shining yellow-colour. Stigmas 5, sulphur-coloured.

Lanceolate-lobed Indian-fig. Fl. July. Clt. 1796. Shrub 2 to 3 feet.

36 O. TUBERCULA'TA (Willd. enum. suppl. p. 34. under *Cáctus*,) joints ovate-oblong, attenuated at both ends; tubercles spinose; prickles setaceous, about equal in length to the wool from which they rise. ♄. D. S. Native of tropical America. Haw. rev. p. 80. The rest unknown.

Warted Indian-fig. Clt. 1818. Shrub 1 to 2 feet.

37 O. INE'RMIS (D. C. prod. 3. p. 473.) plant strictly erect; joints fleshy, ovate-elliptic; spines uniform, very short, hair-formed, very numerous. ♄. D. S. Native of South America. Cáctus Opúntia, D. C. pl. grass. no. 138. with a figure. Cáctus stríctus, Haw. misc. 188. but not of Willd. O. stricta, Haw. syn. 191. Flowers yellow on both sides, spreading.

Unarmed Indian-fig. Fl. July, Aug. Clt. 1796. Sh. 2 to 3 ft.

38 O. Amyclæ'a (Tenore, fl. neap. append. 5. p. 15.) joints orbicular or elliptic, very broad, flat, compressed; prickles strong, diverging, white, without any wool at their base. ♄. F. Native of the kingdom of Naples, near Amyclea, and at Monticelli and Portella, on calcareous rocks. Joints 10 inches broad, and 15 inches long. Prickles 6-18 lines long, but sometimes wanting altogether. Flowers yellow. Fruit reddish yellow. Perhaps the same as O. máxima, Salm-Dyck.

Amyclea Indian-fig. Shrub 2 to 4 feet.

39 O. rube'scens (Salm-Dyck in litt. 1827. ex D. C. prod. 3. p. 474.) plant erect; joints elongated, compressed, reddish green, somewhat tuberculately areolate, unarmed; leaves small, reddish, at the base of the white tomentum. ♄. D. S. Native of Brazil. This plant is very showy when young, being of a reddish-colour, and the stem flat and elongated, nearly as in *O. spinosissima*, but absolutely without spines.

Reddish Indian-fig. Shrub 1 to 2 feet.

40 O. cra'ssa (Haw. suppl. p. 81.) plant erect; joints ovate or oblong, very thick, full of a fleshy substance; fascicles of bristles minute, unarmed, yellowish. ♄. D. S. Native of Mexico.

Thick Indian-fig. Clt. 1817. Shrub 2 to 3 feet.

41 O. vulga'ris (Mill. dict. ed. 8. no. 1. Haw. syn. 190.) plant diffusely prostrate, rooting; joints ovate; prickles unequal, very short, and very numerous. ♄. H. Native of North America, in the southern states; plentiful in the neighbourhood of New York, &c.; and now frequent in the south of Europe. Hook. bot. mag. 2393. Cáctus Opúntia, Lin. spec. 669. Cáctus Opúntia vulgàris et nàna, D. C. pl. grass. no. 138. with a table. —Mill. fig. t. 191. Flowers yellow, spreading.

Common Indian-fig or Prickly-pear. Fl. July, Aug. Clt. 1596. Shrub ½ to 1 foot, but usually prostrate and rooting.

42 O. Hernande'zii (D. C. diss. t. 16.) plant erect; joints thick, roundish-obovate, nearly unarmed; flowers expanded; stamens shorter than the style and petals. ♄. D. S. Native of Mexico. Cáctus cochinillífera, Moc. et Sesse, fl. mex. icon. ined. Nopal Nochatzli, Hern. mex. 78. with a figure, and 489. f. 1. Nopal sylvéstre, Thierry-Menonv. voy. Guax. 2. p. 277. with a figure. According to Thierry, the flowers on the same plant vary from purplish to rose-colour, and greyish lilac. The cochineal thrives well on this species.

Hernandez's Indian-fig. Clt. 1827. Shrub 1 foot.

Sect. V. Tenuílobæ (from *tenuis*, thin, and *lobus*, a lobe; lobes of plant flat and thin). D. C. prod. 3. p. 474. Stems terete, when young. Joints flat, membranous.

43 O. Brasilie'nsis (Willd. enum. suppl. 33. under *Cáctus*) stem terete: joints of branches compressed, flat, ovate; spines strong, solitary. ♄. D. S. Native of Brazil. Cáctus paradóxus, Horn. hort. hafn. 2. p. 443.—Hoffms. verz. 1826. p. 72. Pis. bras. p. 100. f. 2. Flowers yellow.

Brasilian Indian-fig. Fl. Jul. Aug. Clt. 1816. Sh. 4 to 6 ft.

† *The following species are only known by name, not having been described.*

1 *O. leucántha*, Hort. berol. 2 *O. alàta*, Hort. berol. 3 *O. myriacántha*, Hort. berol. 4 *O. subinérmis*, Link. 5 *O. sulphùrea*, Gill. (under *Cáctus*). 6 *O. sericea*, Gill. (under *Cáctus*).

Cult. The species of Indian-fig are of very easy culture: the soil recommended for *Mammillària* will suit them; and in order to propagate them, the branches should be separated at the joints, and allowed to lie a few days to dry after being so separated, and when stuck into the earth they will soon strike root.

VII. PERE'SKIA (named by Plumier in honour of Nicholus Fabr. Peiresk, senator of Aix in Provence, who collected a considerable library and herbarium, but published nothing). Plum. gen. p. 35. t. 26. Lin. gen. ed. 1. no. 402. Mill. dict. Haw. syn. 197. D. C. prod. 3. p. 474.

Lin. syst. *Icosándria*, *Monogýnia*. Sepals numerous, adnate to the ovarium, and often remaining on the fruit, leaf-formed. Corolla rotate, nearly as in *Opúntia*. Stamens numerous, much shorter than the petals. Style filiform; stigmas collected, in a spiral manner. Berry globose or ovate. Seeds imbedded in the pulp.—Shrubs or trees. Branches terete. Prickles solitary at the axils of the leaves, and in fascicles on the stem. Leaves distinct, flat, larger than those of any other genus in the present order. Flowers somewhat panicled, solitary, terminating the branches, or rather lateral.—Peréschia, Thierry Menonv. voy. guax. 2. p. 275. is probably a species of *Opúntia*.

1 P. aculea'ta (Mill. dict. Haw. syn. 198.) leaves elliptic; prickles solitary, in the axils of the leaves, but becoming at length in fascicles on the stems; flowers rather panicled; fruit globose, bearing the foliaceous sepals. ♄. D. S. Native of the West Indies, where it is called American or Barbadoes Gooseberry by the inhabitants, and by the Dutch Blood-apple. Plum. gen. t. 26.—Dill. hort. elth. t. 227. f. 294. Cáctus Peréskia, Lin. spec. 671. Prickles half an inch long. Buds rather woolly. Flowers white. Fruit yellowish, edible.

Prickly Barbadoes-gooseberry. Fl. Oct. Nov. Clt. 1696. Shrub 5 to 7 feet.

2 P. longispìna (Haw. syn. 178.) leaves elliptic; prickles twin, an inch and a half long, very woolly. ♄. D. S. Native of South America. P. aculeàta β, longispìna, D. C. prod. 3. p. 475.

Long-spined Barbadoes-gooseberry. Shrub 4 to 6 feet.

3 P. Ble'o (H. B. et Kunth, nov. gen. amer. 6. p. 69.) leaves oblong, acuminated; prickles axillary, 5-6 in a fascicle; flowers 2-4 together at the tops of the branches, each on a short peduncle; petals obovate, retuse. ♄. D. S. Native of New Granada, on the banks of the river Magdalena, near Badilla, where it is called *Bleo* by the inhabitants. Lindl. bot. reg. 1473. Flowers pale red. Stamens also red, but white at the base. Stigma 5-7-cleft.

Bleo Barbadoes-gooseberry. Fl. Oct. Jan. Clt. 1827. Pl. 8 to 10 feet.

4 P. hórrida (H. B. et Kunth, l. p. 70.) leaves oblong, acute at both ends; spines 1-3 together, subulate, in the woolly axils of the leaves; flowers 2-5 together, axillary, pedunculate, rising above the spines. ♄. D. S. Native of South America, in the province of Jaen de Bracamoros, on the banks of the Amazon. Flowers small, red. Stigma 3-4-cleft.

Horrid Barbadoes-gooseberry. Shrub or tree.

5 P. portulacæfòlia (Haw. syn. 199. in a note) leaves obovate-cuneated; prickles solitary, under the leaves, but at length coming in fascicles on the stem; flowers solitary; petals emarginate; fruit globose, retuse, naked. ♄. D. S. Native of the West Indies.—Plum. ed. Burm. 197. f. 1. Cáctus portulacifòlius, Lin. spec. 671. Lun. hort. jam. 2. p. 256. About the size of an apple-tree. Prickles blackish. Flowers terminal, purple; petals roundish. Fruit umbilicate, greenish, with white flesh, and numerous black seeds.

Purslane-leaved Barbadoes-gooseberry. Clt. 1820. Tree 20 to 30 feet.

6 P. zinniæflòra (D. C. diss. t. 17.) leaves ovate, acute, undulated; prickles axillary, twin: but at length somewhat fasciculate on the stem, about the cicatrices occasioned by the falling of the leaves; flowers solitary, terminal; petals obcordate; ovarium bearing the sepals. ♄. D. S. Native of Mexico. Cáctus zinniæflòrus, Moc. et Sesse, fl. mex. icon. ined. Flowers of a deep reddish-violet colour, greenish on the

outside, about an inch in diameter. Very like the preceding species.

Zinnia-flowered Barbadoes-gooseberry. Tree 10 feet.

7 P. LYCHNIDIFLÒRA (D. C. diss. t. 18.) leaves ovate, acute; prickles solitary in the axils of the leaves, but perhaps in fascicles on the stems; flowers solitary, terminal; petals cuneated, fringed at the apex; ovarium bearing the sepals. ♄. D. S. Native of Mexico. Cáctus fimbriàtus, Moc. et Sesse, fl. mex. icon. ined. Flowers of a coppery peach colour, about 2 inches in diameter, similar to those of *Lýchnis coronàtus*.

Lychnis-flowered Barbadoes-gooseberry. Shrub.

8 P. OPUNTIÆFLÒRA (D. C. diss. t. 19.) leaves obovate, mucronate, usually 2 together; prickles axillary, solitary, very long, but perhaps disposed in fascicles on the stem? flowers usually terminal, or nearly so, solitary; petals ovate, acutish; ovarium bearing fascicles of hairs. ♄. D. S. Native of Mexico. Cáctus opuntiæflòrus, Moc. et Sesse, fl. mex. icon. ined. Flowers of a dirty scarlet colour, an inch in diameter; petals disposed in 2 series.

Indian-fig-flowered Barbadoes-gooseberry. Shrub.

9 P. ROTUNDIFÒLIA (D. C. diss. t. 20.) leaves roundish, mucronate; prickles axillary, solitary, but perhaps disposed in fascicles on the stem; flowers solitary, lateral? petals broad, roundish, mucronate; ovarium bearing the sepals; fruit obovate, full of cicatrices. ♄. D. S. Native of Mexico. Cáctus rotundifòlius, Moc. et Sesse, fl. mex. icon. ined. Flowers yellow, variegated a little with scarlet, 15 lines in diameter. Berry red, obovate.

Round-leaved Barbadoes-gooseberry. Shrub.

10 P. GRANDIFÒLIA (Haw. suppl. p. 85.) leaves oblong-lanceolate, smooth above, beset with rough dots beneath; stem very spiny. ♄. D. S. Native of Brazil. Cáctus grandifòlius, Link. enum. 2. p. 25. Spreng. syst. 2. p. 498. Larger spines blackish, 2 inches long.

Great-leaved Barbadoes-gooseberry. Clt. 1818. Sh. 6 feet.

Cult. The species of this genus are very different in habit from the rest of the genera of the present order, from the branches being woody and furnished with proper leaves; but the flowers resemble the other genera of the order. They are of easy culture, growing freely in any light earth; and cuttings of them are readily rooted in mould or sand, under a hand-glass, in heat. A large plant of any of the species has a very grotesque and ornamental appearance, when several species of *Cèreus* and *Epiphýllum* has been grafted or inserted on it.

Tribe II.

RHIPSALI'DEÆ (this tribe only contains the genus *Rhipsalis*). D. C. prod. 3. p. 475. Ovula, and therefore the seeds are fixed to the central axis of the berry.

VIII. RHI'PSALIS (ῥιψ, *rhips*, a willow-branch; in reference to the flexible branches). Gærtn. fr. 1. p. 136. t. 28. Haw. syn. 186. D. C. prod. 3. p. 475.—Hariòta, Adans. fam. 2. p. 243.—Rhipsálides. Willd. enum. suppl. p. 33.—Cact. parasítici, D. C. cat. hort. monsp. p. 83.

LIN. SYST. *Icosándria, Monogýnia.* Tube of calyx adhering to the ovarium, smooth; limb superior, 3-6-parted, short; teeth acuminated, membranous. Petals 6, oblong, spreading, inserted in the calyx. Stamens 12-18, fixed to the base of the petals. Style filiform, crowned by 3-6 stigmas. Berry pellucid, roundish, crowned by the marcescent calyx. Seeds imbedded in the pulp, without albumen; radicle of the embryo thick; cotyledons 2, short, obtuse.—Small shrubs, growing upon trees in the West Indies, usually pendulous, branched, leafless, and terete, naked or bearing rather falcate small bristles; fascicles of bristles, when present, disposed in a quincuncial spiral order. Flowers lateral, sessile, small, white. Berries pellucid and white, nearly like that of *Víscum* or Missletoe.

1 R. CASSY'THA (Gærtn. l. c. Haw. l. c.) plant pendulous; branches verticillate, naked, glabrous; calyx 6-parted; petals 5-6. ♄. D. S. Native of Jamaica, St. Domingo, Trinidad, &c. hanging on the branches of the tallest trees. Christy, in bot. mag. 3080. Cassỳtha baccífera, Mill. fig. Cassỳtha filiformis, Mill. dict. ed. 8. Cáctus péndulus, Swartz, fl. ind. occ. p. 876. Flowers white. Berry white, about the size of those of a red currant, 12-seeded.

Var. β, Mauritiàna (D. C. prod. 3. p. 476.) plant creeping? branches crowded, jointed. ♄. D. S. Native of the Mauritius, on the rock called Lapouce. Cáctus pendulìnus, Sieb. fl. maur. 2. no. 259. Perhaps this plant has been introduced to the Mauritius from the Brazils, as all the other species of this genus are natives of America. Flowers whitish. Berries white.

Cassytha Rhipsalis. Fl. Sept. Clt. 1758. Shrub 1 foot.

2 R. HOOKERIA'NA; plant pendulous; branches verticillate, naked, glabrous; calyx 4-parted; petals 4. ♄. D. S. Native of the West Indies and Mexico. R. Cassỳtha, Hook, exot. fl. t. 21. R. Cassỳtha β, Hookeriàna, D. C. prod. 3. p. 476. Flowers white. Berries white, about the size of those of a red currant, 12-20-seeded.

Hooker's Rhipsalis. Fl. May, June. Clt.? Shrub 1 foot.

3 R. CASSYTHOÌDES; plant pendulous; branches verticillate, naked, glabrous; calyx 3-lobed: lobes broad at the base, and acuminated at the apex; petals 6. ♄. D. S. Native of Mexico. Flowers white. Berries white, about the size of red currants. Cáctus cassythoìdes, Moc. et Sesse, fl. mex. icon. ined. R. Cassỳtha γ, Mociniàna, D. C. prod. 3. p. 476. diss. t. 21.

Cassytha-like Rhipsalis. Shrub 1 foot.

4 R. DICHÓTOMA; plant pendulous; branches dichotomous; calyx 3-lobed; petals 6, disposed in 2 series. ♄. D. S. Native of New Andalusia and New Granada, growing on trees. Cáctus péndulus, H. B. et Kunth, nov. gen. amer. 6. p. 65. R. Cassỳtha δ, dichótoma, D. C. prod. 3. p. 476. Flowers white. Berries white, about the size of gooseberries, 30-40 seeded.

Dichotomous Rhipsalis. Shrub 1 foot.

5 R. GRANDIFLÒRUS (Haw. suppl. pl. succ. p. 83. rev. p. 72.) plant sparingly branched; branches nearly erect, somewhat calamiform, naked: spines very minute, solitary, pale, closely adpressed, at nearly regular distances; flowers numerous, hardly an inch in diameter. ♄. D. S. Native of Brazil. Hook. bot. mag. t. 2740. R. funàlis, D. C. prod. 3. p. 476. Cáctus funàlis, Salm-Dyck. in hort. dyck. 1822. Petals and calycine lobes 8, pale yellow inside. Filaments numerous, white; anthers yellow. Stigmas 4, rotate.

Great-flowered Rhipsalis. Fl. June, Jul. Clt. 1816. Sh. 1 ft.

6 R. FASCICULA'TA (Haw. suppl. p. 83.) pendulous; branches terete, in fascicles; fascicles of hairs disposed in a spiral quincuncial order along the younger branches. ♄. D. S. Native of the West India Islands. Christy, in bot. mag. 3079. R. parasítica, Haw. syn. p. 187. Cáctus parasíticus, Lam. dict. 1. p. 541. D. C. pl. grass. t. 59. Cáctus fasciculàtus, Willd. enum. suppl. p. 33. Flowers greenish-white, few, and confined to the main branches. Berry similar to *R. Cassỳtha*.

Fasciculate Rhipsalis. Fl. July, Aug. Clt. 1817. Sh. 1 ft.

7 R. SALICORNIOÌDES (Haw. suppl. p. 83.) plant erect, branched, proliferous at the joints; joints short, obclavate, terete, and angular, with fascicles of very minute hairs, floriferous at the apex; flowers solitary. ♄. D. S. Native of South America. Otto. et Link. abbl. t. 49. Petals 7-10, acute, yellow, longer than the stamens and style.

Salicornia-like Rhipsalis. Fl. June. Clt. 1817. Sh. 1 foot.

8 R. MESEMBRYANTHOÌDES (Haw. rev. p. 71.) plant glomerately branched; branches erect, terete, straight, bearing joints;

joints lateral, crowded, terete, attenuated at both ends, clouded, bearing the flowers in the middle; fascicles of capillaceous bristles white or pale, but when old and faded black; flowers solitary. ♄. D. S. Native of South America. Christy, in bot. mag. 3878. C. salicornioïdes β, Haw. suppl. p. 83. Joints at the sides of the branches numerous, crowded, and nearly erect. Flowers solitary, rising from the middle, not from the tops of the joints, white. Fruit a white berry, smaller than those of *R. Cassytha*.

Fig-marigold-like Rhipsalis. Fl. Ju. Jul. Clt. 1817. Sh. ½ ft.

9 R. parasítica (D. C. prod. 3. p. 476.) plant pendulous, branched, glabrous; branches striated, or undulately repand. ♄. D. S. Native of the West India Islands.—Plum. ed. Burm. t. 197. f. 2. Flowers like those of *R. dichótoma*. This species is hardly known, but distinct from the others in the stem being repand in an undulating manner.

Parasitic Rhipsalis. Shrub 1 foot.

10 R.? micra'ntha (H. B. et Kunth, nov. gen. amer. 6. p. 65. under *Cáctus*) plant glabrous, pendulous, branched; branches with 3-4 angles, or compressedly 2-edged; flowers rising from the angles. ♄. D. S. Native of Quito, in groves, near Olleros. Flowers white, minute.

Small-flowered Rhipsalis. Shrub ½ foot.

Cult. This is a genus of singular plants, but without much beauty. Being parasites, on trees, they grow best in vegetable mould, mixed with a little brick rubbish; and they are easily increased by cuttings.

Order CXVIII. GROSSULARIE'Æ (this order only contains the genus *Ribes*, or gooseberry tribe). D. C. fl. fr. (1804) 4. p. 406. H. B. et Kunth, nov. gen. amer. 6. p. 58. Berlandier, mem. soc. phys. gen. 3. pt. 2. p. 43. t. 1-3. D. C. prod. 3. p. 477.—Ribèsiæ, Ach. Rich. bot. med. (1823) 2. p. 487.—Genera of Cácteæ, Juss.—Genus of Saxifràgeæ, Vent.—Genus of Portulàceæ, Adans.

Calyx superior (f. 32. *d.* f. 33. *b.*); limb 4-5-parted (f. 33. *b.* f. 32. *a.*), regular, coloured. Petals 5, inserted in the throat of the calyx (f. 33. *c.*), and alternating with its segments, equal. Stamens 4-5 (f. 33. *c.*), very rarely 6, very short, inserted alternately with the petals, equal; filaments conical or cylindrical, distinct; anthers 2-celled, opening lengthwise on the inside; but in the varieties of *R. rùbrum* they burst laterally and transversely. Ovarium 1-celled, with 2 opposite parietal placentas; ovula numerous. Style one, 2 (f. 32. *c.* f. 33. *e.*) -3 or 4-cleft. Fruit succulent (f. 32. *e.*), nearly globose, umbilicate at the apex from the permanent calyx (f. 32. *d.*), 1-celled, many-seeded. Seeds arillate, suspended by a long filiform podosperm; outer integument gelatinous or juicy, and membranous: under one a very thin membrane, adhering closely to the albumen; bluntish at the extremity opposite the hylum. Albumen horny, conforming to the seed, white. Embryo minute, placed at the sharpest end of the seed, excentral, with a blunt radicle, which is placed next the hilum.—Unarmed or spiny shrubs. Leaves alternate, lobed or cut, plaited while in the bud. There is one bractea at the base of each pedicel, which is cut more or less, and two much smaller ones called bracteoles under each ovarium. Flowers greenish, white, yellow or red, very rarely unisexual.

This order was formerly confounded with *Cácteæ*: notwithstanding the dissimilarity of their appearance they are most closely related; the principal differences between the two orders are, that in *Cácteæ* the stamens are indefinite, the seeds without albumen, and the calyx and corolla undistinguishable; while in *Grossularièæ* the stamens are definite, the seeds albuminous, and the calyx and corolla distinct. There are spines in both orders, and some of the *Cácteæ* have distinct leaves.

The properties of the gooseberry and currant are those of the generality of the order, except that in other species a mawkish or extremely acid taste is substituted for the refreshing and agreeable flavour of the former. Some are emetic. The black currant, which is tonic and stimulant, has fragrant glands upon its leaves and flowers; these reservoirs are also found upon some other species. Malic acid exists in currants and gooseberries. Turner, 634.

I. RI'BES (the name of an acid plant mentioned by the Arabian physicians, which has been discovered to be the *Rhèum Rìbes*). Lin. gen. 281. Berlándier, mem. soc. phys. gen. 3. pt. 2. p. 43. t. 1-3. and D. C. prod. 3. p. 477.—Grossulària, Tourn. Gærtn.

Lin. syst. *Pentándria, Monogýnia*. Character the same as the order.

Sect. I. Grossula'ria (a dim. of *grossus*, thick; meaning a gooseberry bush; the species contained in this section all bear gooseberries). Ach. Rich. l. c. Berlandier, l. c. t. 1. Stems usually prickly (f. 32.). Peduncles 1-2-3-flowered. Calyx more or less campanulate (f. 32. *a.*). Leaves plicate.

* *Flowers greenish.*

1 R. oxyacanthoi'des (Lin. spec. 291.) plant prickly and bristly, nakedish; spines 1 or 3, joined at the base; leaves cordate, 5-lobed, serrated, often pubescent beneath, and on the petioles; peduncles very short, usually 2-flowered; tube of calyx glabrous, hairy inside, with a spreading limb, which is longer than the obovate petals; germs and pedicels naked. ♃. H. Native of North America throughout Canada, and as far as the Saskatchawan, and of Newfoundland. Berlandier, l. c. t. 1. f. 1. The shrub varies much in the aculei and spines, in their number and colour, and in the more or less dense ramification, and pubescence. Mr. Drummond says, the fruit of this species is much like the common gooseberry, and is equally agreeable, either of a red or green colour.

Hawthorn-like Gooseberry. Fl. May, June. Sh. 3 to 4 ft.

2 R. setòsum (Lindl. bot. reg. t. 1237. Hook. fl. bor. amer. 1. p. 230.) branches beset with dense bristles; prickles unequal, subulate; leaves roundish, cordate at the base, pubescent, 3-5-lobed, deeply crenated; peduncles 2-flowered, rather bracteate; calyx tubularly campanulate, with the segments linear, obtuse, and spreading, twice the length of the petals, which are entire; berries hispid. ♄. H. Native of North America, on the banks of the Saskatchawan.

Bristly Gooseberry. Fl. May, April. Clt. 1810. Shrub 4 to 5 feet.

3 R. triflòrum (Willd. hort. berol. t. 61.) prickles wanting; spines usually solitary; leaves cordate, 5-lobed, serrated, glabrous; peduncles elongated, 2-3-flowered; tube of calyx narrow, cylindrical, glabrous, with a spreading limb, which afterwards becomes reflexed; stamens exserted; ovarium naked. ♄. H. Native of North America, in mountainous situations to the west of the Rocky Mountains; and of Pennsylvania. Berlandier, l. c. t. 1. f. 4. R. stamíneum, Horn. hort. hafn. p. 237. Berry reddish, glabrous. The species seems to be easily distinguished from *R. Cynósbati* by the constantly smooth fruit, very narrow flowers, and exserted stamens.

Three-flowered Gooseberry. Fl. April, May. Clt. 1812. Sh. 3 to 4 feet.

4 R. Cyno'sbati (Lin. spec. 292.) stem unarmed, rarely prickly; spines usually twin; leaves cordate, 5-lobed, serrated, more or less pubescent underneath, and on the petioles; peduncles elongated, 2-3-flowered; pedicels divaricate; tube of calyx ovate-cylindrical; limb spreading, with the segments exceeding the petals, which are obovate; stamens hardly exserted; ovarium bristly. ♄. H. Native of Canada (Michx.), Japan (Thunb.), Berlandier, l. c. t. 1. f. 3. Jacq. vind. 2. t. 123. Berries bristly or prickly. It hardly differs from *R. divaricàtum*, except in the broader tube of the corolla, and the shorter stamens.

Var. β; fruit unarmed. ♄. H. Native of Hudson's Bay. R. oxyacanthoìdes, Richards in Frankl. first journ. ed. 2. append. p. 7.

Var. γ; branches prickly; peduncles shorter; flowers pubescent, purplish; fruit prickly. ♄. H. Native about Lake Huron.

Dog-bramble Gooseberry. Fl. Apr. Clt. 1759. Sh. 3 to 4 ft.

5 R. divarica'tum (Dougl. in bot. reg. 1359.) branches divaricate, bristly, at length naked; spines 1-3 together, axillary, deflexed, large; leaves roundish, 3-lobed, deeply toothed, nerved, glabrous; peduncles 3-flowered, drooping; calyx funnel-shaped: with the segments at length spreading, and twice the length of the tube; style and stamens exserted; berries glabrous. ♄. H. Native on the north-west coast of America, a common bush on the banks of streams near Indian villages. This species comes nearest to *R. triflòrum*. Berries black, smooth, and spherical, pleasant to the taste. Petals white.

Divaricate Gooseberry. Fl. April. Clt. 1826. Sh. 5 to 7 ft.

6 R. irri'guum (Doug. in hort. trans. 7. p. 516. Hook. fl. bor. amer. 1. p. 231.) prickles axillary, tern; leaves cordate, somewhat 5-lobed, toothed, ciliated, pilose on both surfaces, nerved; peduncles 3-flowered, beset with glandular pili; calyx campanulate: segments linear, about equal in length to the tube; berries glabrous. ♄. H. Native of the north-west coast of America, on moist mountain rocks near springs and streams, on the Blue Mountains, and on the banks of the Spokan river. Berries spherical, half an inch in diameter, smooth, juicy, and well flavoured. Apparently closely allied to *R. triflòrum*.

Well-watered Gooseberry. Shrub 3 to 4 feet.

7 R. saxòsum (Hook. fl. bor. amer. 1. p. 231.) stem unarmed, rarely prickly; spines wanting, solitary or twin; leaves cordate, 5-lobed, serrated, smoothish; peduncles very short, deflexed, 1-2-flowered; calyx glabrous, with a campanulate tube: segments spreading, but at length reflexed, twice the length of the corolla, and about equal in length to the stamens; ovarium naked. ♄. H. Native of the north-west coast of America, common on the undulating grounds of the interior among stones; and about Lake Huron, and on the banks of the Saskatchawan; also near Boston. R. saxátile, Dougl. mss. R. triflòrum, Bigel. fl. bost. ed. 2. p. 90. Fruit resembling a common gooseberry.

Stone Gooseberry. Shrub 3 to 4 feet.

8 R. hirte'llum (Michx. fl. bor. amer. 1. p. 479.) spinules nearly axillary; branches beset with a few short bristly hairs; leaves small, semi-trifid; lobes few-toothed; peduncles 1-flowered; berry glabrous, red. ♄. H. Native of North America, in Canada, in stony places by the river Signey; and on the mountains of Virginia.

Hairy Gooseberry. Fl. April, May. Clt. 1812. Shrub 3 to 4 feet.

9 R. lacu'stre (Poir. encycl. suppl. 2. p. 856. Pursh. fl. amer. sept. 1. p. 161.) stem very prickly; spines many-parted, slender; leaves cordate, deeply 3-5-lobed, cut; racemes 5-8-flowered, loose; calyx rotate; germs and pedicels hispid, and glandular. ♄. H. Native throughout Canada to Fort Franklin and Bear Lake, near the Arctic circle; mouth of the Columbia; mountains of the Columbia, and of North California; also of Virginia, &c. R. oxyacanthoìdes, Michx. fl. bor. amer. 1. p. 111. R. echinàtum, Dougl. mss. This has the flowers of the currant, and the prickly stems of the gooseberry. The fruit is about the size of black currants, in pendulous racemes, purplish black, shining, clothed with hairs, unpleasant to the taste.

Lake Gooseberry. Fl. April, May. Clt. 1812. Sh. 4 to 5 ft.

10 R. rotundifòlium (Michx. fl. bor. amer. 1. p. 110.) spines nearly axillary, solitary; leaves nearly orbicular, clothed with very minute down, a little lobed; lobes roundish, obtuse; peduncles 1-flowered; limb of calyx tubular. ♄. H. Native on the high mountains of Carolina. Berries glabrous.

Round-leaved Gooseberry. Shrub 3 to 4 feet.

11 R. gra'cile (Michx. fl. bor. amer. 1. p. 111.) spines nearly axillary, very short, solitary; leaves on slender petioles, lobed; lobes acute, cut; peduncles capillary, erect, usually 2-flowered; calyx glabrous, tubularly campanulate. ♄. H. Native of North America, on the mountains of Tennessee; and in mountain meadows from New York to Virginia. Berry glabrous, purple or blue, with a very pleasant taste. Leaves pubescent.

Slender Gooseberry. Fl. April, May. Clt. 1812. Shrub 3 to 4 feet.

12 R. Cauca'sicum (Adams, in reliq. Willd. ex Rœm. et Schultes, syst. 5. p. 507.) prickles stipular, tern; peduncles 1-flowered, erect; leaves 5-lobed, deeply toothed. ♄. H. Native of Caucasus. Perhaps only a variety of *R. U'va-crispa*.

Caucasian Gooseberry. Fl. May, June. Clt. 1819. Shrub 4 to 5 feet.

13 R. microphy'llum (H. B. et Kunth, nov. gen. amer. 6. p. 62.) prickles usually solitary; leaves nearly reniform, small; peduncles very short, 2-flowered; calyx campanulate: segments oblong, obtuse; petals spatulately obovate, retuse at the apex. ♄. H. Native of Mexico, in mountainous places near El Guarda, between Guchila and the city of Mexico, at the elevation of 4200 feet. Ovarium rather turbinate. Flowers red.

Small-leaved Gooseberry. Shrub 4 to 6 feet.

14 R. cuneifòlium (Ruiz et Pav. fl. per. 3. p. 233. f. c.) unarmed; leaves cuneiform, cut, trifid; petioles not half the length of the leaves; peduncles solitary, axillary, 2-3-flowered, length of the petioles; bracteas 2, at the base of each flower. ♄. G. Native of Peru, on the Andes. Berry pale red. Habit of *R. U'va-crispa*. Perhaps belonging to a separate section.

Wedge-leaved Gooseberry. Shrub 3 to 4 feet.

15 R. cuculla'tum (Hook. et Arn. in bot. misc. 3. p. 250.) unarmed; branches glabrous; leaves glabrous, somewhat 5-lobed, roundish-reniform, cucullate at the base, and cuneated; the lobes lying over each other, acutely and deeply lobed; petioles a little shorter than the leaves; racemes hardly puberulous, axillary, short, few-flowered; flowers nearly sessile, hardly exceeding the bracteas, which are roundish. ♄. G. Native of the Cordillera of Chili. Nearly allied to *R. cuneifòlium*, but apparently quite distinct.

Hooded-leaved Gooseberry. Shrub 4 to 5 feet.

16 R. acicula're (Smith in Rees' cycl.) very prickly; prickles stipular, 3-5-parted; leaves rather pubescent, nearly orbicular, 3-5-lobed; lobes bluntish, deeply serrated; peduncles usually 1-flowered, bracteolate in the middle; calyx campanulate, smoothish; berries bractless, and are, as well as the styles, quite glabrous. ♄. H. Native of Siberia, in stony rocky mountainous places. Led. fl. ross. alt. ill. t. 230. R. U'va-crispa, Sievers in Pall. nord. beytr. 7. p. 274. Pall. fl. ross. 2. p. 37.? Stem erect or procumbent. Petals white. Berries glabrous, yellowish or purplish, sweet, with a grateful taste.

Acicular-spined Gooseberry. Shrub.

17 R. GROSSULA'RIA (Lin. spec. p. 291.) prickles 2 or 3 under each bud; branches otherwise smooth, and spreading or erect; pedicels 1-2-flowered; leaves 3-5-lobed, rather villous; bracteas close together; calyx campanulate, with reflexed segments, which are shorter than the tube; petals rounded at the apex, glabrous, but bearded in the throat; style always beset with long down. ♄. H. Native of Europe and Nipaul, in woods and hedges; plentiful in some parts of Britain, in hedges, thickets, and waste ground, as the woods and hedges about Darlington; apparently wild in Hamilton wood, Scotland. Smith, eng. bot. 1292. R. U'va-crispa, Oed. fl. dan. t. 546. Grossulària hirsùta, Mill. dict. no. 2. R. U'va-crispa var. ζ satìvum, D. C. fl. fr. 4. p. 408. Plench. icon. 148. The Nipaul plant has the stem thickly beset with bristles, and the spines strong and 3-parted. It is therefore probably a proper species.

Var. β, *U'va-crispa* (Smith, engl. fl. 1. p. 333.) plant beset with spines all over; leaves small, rather villous; berries smaller, glabrous. ♄. H. R. U'va-crispa, Lin. spec. 292. Smith, eng. bot. 2057. U'va-crispa, Fuch's hist. t. 187.—U'va spìna, Math. valgr. 1. t. 151. f. 1.—Blackw. herb. 277.—Plench. icon. t. 149.—Duham. arbr. 1. t. 109. Berlandier, l. c. t. 1. f. 6. R. U'va-crispa var. α sylvéstre, Berland. l. c. mss.

Var. γ, *spinosissimum* (Berl. mss.) plant spiny all over; prickles scattered, reflexed. Native of Europe in stony places.

Var. δ, *reclinàtum* (Berl. mss.) branches rather prickly, reclinate. R. reclinàtum, Lin. spec. 291. Grossulària reclinàta, Mill. dict. no. 1.

Var. ε, *Besseriàna* (Berl. mss.) branches prickly; fruit pubescent, intermixed with glandular bristles. Native of Cracovia, in hedges. R. hýbridum, Besser. prim. fl. galic. austr. p. 186.

Var. ζ, *subenérme* (Berl. mss.) plant nearly glabrous; bark smooth, brown; prickles axillary; flowers and leaves small. Native about Geneva. Perhaps a variety of *R. reclinàtum*.

Var. η, *macrocárpum* (D. C. prod. 3. p. 478.) stigmas often longer than the petals; flowers and berries large.

Var. θ, *bracteàtum* (Berl. mss.) berries clothed with 2-4-5 straight coloured, nearly opposite, bracteas and bristles, emulating sepals, which fall off before the berry arrives at maturity.

The gooseberry is called *Groseille à maquereau*, in French; *Uva-spino* in Italian; *Stachelbeerstrauch*, in German; in Scotland it is called *Groseir*; in Piedmont, where the gooseberry is found wild, and where the Italian botanists state the berries to be eatable, but astringent and neglected, it is called *Griselle*. Some derive our name gooseberry from gorzeberry, from the resemblance of the bush to gorze; others, as Professor Martyn, from its being used as sauce with young or green geese. Gerarde says it is called feaberry (feverberry) in Cheshire; and it has the same name in Lancashire and Yorkshire. In Norfolk this term is shortened to feabes, or, as they pronounce it fapes. Carberry is another British name for this fruit.

The gooseberry is a low, branching, prickly shrub, bearing pendulous, hairy, or smooth berries, of various colours; it is a native of several parts of Europe, and abounds in the Vallais, in copsewoods, where it produces a small, green, hairy, high-flavoured fruit. In England it is naturalized in various places, as on old walls, ruins, and in the woods and hedges about Darlington. It is cultivated in greater perfection in Lancashire than in any other part of Britain; and next to Lancashire the climate and treatment of the Lothians seem to suit this fruit. In Spain and Italy the fruit is scarcely known. In France it is neglected and little esteemed. In some parts of Germany and Holland the moderate temperature and humidity of the climate seem to suit the fruit; but in no country is its size and beauty to be compared with that produced in Lancashire, or from the Lancashire varieties, cultivated with care, in the more temperate and humid districts of Britain. Neill observes, that when foreigners witness our Lancashire gooseberries, they are ready to consider them as forming quite a different kind of fruit. Happily this wholesome and useful fruit is to be found in almost every cottage-garden in Britain; and it ought to be considered a part of every gardener's duty to encourage the introduction of its most useful varieties in their humble enclosures. In Lancashire, and some parts of the adjoining counties, almost every cottager, who has a garden, cultivates the gooseberry, with a view to prizes, given at what are called Gooseberry-prize Meetings, of which there is annually published an account, with the names and weight of the successful sorts, in what is called the Manchester Gooseberry Book. The prizes vary from 1*l.* to 5*l.* or 10*l.* The second, third, to the sixth and tenth degree of merit, receiving often proportionate prizes. There are meetings held in spring, to "make up," as the term is, the sorts, the persons, and the conditions of exhibition; and in August to weigh and taste the fruit, and determine the prizes.

Use.—The fruit was formerly in little esteem; but it has received so much improvement, that it is now considered very valuable for tarts, pies, sauces, and creams, before being ripe, and when at maturity, it forms a rich dessert fruit for three months; and is preserved in sugar for the same purpose, and in water for the kitchen. Unripe gooseberries can be preserved in bottles of water against winter; the bottles are filled with berries, close corked, and well sealed; they are then placed in a cool cellar till wanted. By plunging the bottles, after being corked, into boiling water, for a few minutes (heating them gradually to prevent cracking), the berries are said to keep better." —Neill.

Varieties.—The gooseberry is mentioned by Turner, in 1573. Parkinson enumerates 8 varieties; the small, great, and long common, 3 reds, 1 blue, and 1 green. Ray mentions only the pearl gooseberry, but Rea has the blue, several sorts of yellow, the white Holland, and the green. Miller only says, there are several varieties obtained from seed, most of them named from the persons who raised them; but as there are frequently new ones obtained, it is needless to enumerate them. The present list of the London nurserymen contains from 80 to 100 names, but those of some of the Lancashire growers above 300. Forsyth, in 1800, mentions 10 sorts as common; and adds a list of 43 new sorts, grown at Manchester. The following may be considered established varieties, and such as merit cultivation.

List of gooseberries.—Those marked with a star may be considered the best; the rest only second rate.

I. *Fruit green.*

§ 1. *Branches spreading or pendulous.*

* *Berries smooth, green.*

1 *Barclay's green champagne.* Fruit roundish, middle-sized.
2 *Perring's evergreen.* Fruit large, oblong.
3 *Fame.* Fruit large, obovate. Branches pendulous.
4 *Bates's favourite.* Fruit oblong, middle-sized. Branches pendulous.
5 *Glory of Kingston.* Fruit roundish, middle-sized.
6 *Allen's glory of Ratcliff.* Fruit oblong, middle-sized.*
7 *Horsefield's green gage.* Fruit large, roundish.
8 *Green globe.* Fruit round, middle-sized.
9 *Nixon's green myrtle.* Fruit large, oblong. Branches pendulous.
10 *Berry's greenwood.* Fruit large, oblong. Branches pendulous.
11 *Massey's heart of oak.* Fruit large, oblong. Branches pendulous.*

12 *Grundy's high sheriff of Lancashire.* Fruit obovate, middle-sized. Branches pendulous.
13 *Edward's jolly tar.* Fruit large, obovate. Branches pendulous.*
14 *Minerva.* Fruit large, oblong.
15 *Taylor's no-bribery.* Fruit large, obovate. Branches pendulous.
16 *Northern hero.* Fruit large, obovate.
17 *Reformer.* Fruit large, oblong.
18 *Sabine's green.* Fruit small, round.
19 *Large smooth green.* Fruit large, obovate.*
20 *Green Walnut, Belmont's, smooth green, nonpareil.* Fruit middle-sized, obovate.*

* * *Berries green, hairy, or downy.*

21 *Colonel Anson's.* Fruit large, oblong, hairy.
22 *Holt's beauty.* Fruit large, oblong, downy.
23 *Early green hairy, early green, green Gascoigne.* Fruit small, round.*
24 *Lovart's Elija.* Fruit large, roundish, hairy.
25 *Glenton green, York seedling* Fruit middle-sized, oblong, hairy. Branches pendulous.*
26 *Green globe.* Fruit small, round, hairy.
27 *Green seedling.* Fruit small, oblong, hairy. Branches pendulous.*
28 *Hodkinson's joke.* Fruit large, roundish, downy. Branches pendulous.
29 *Lovely Anne.* Fruit large, oval, downy. Branches pendulous.
30 *Gregory's perfection.* Fruit large, roundish, downy, late. Branches pendulous.*
31 *Prophet's profit.* Fruit large, oblong, downy.
32 *Early royal George.* Fruit middle-sized, oblong, hairy, early.
33 *Ryder's triumph.* Fruit small, obovate, hairy.
34 *Moore's troubler.* Fruit large, roundish-oblong, hairy.
35 *Unicorn.* Fruit large, oval, downy.

§ 2. *Branches erect.*

* *Fruit green, smooth.*

36 *Pitmaston green-gage.* Fruit small, obovate.*
37 *Brigg's independent.* Fruit large, obovate.
38 *Merry lass.* Fruit middle-sized, obovate.
39 *Midsummer.* Fruit small, roundish.
40 *Royal George.* Fruit middle-sized, oval.

* * *Fruit green, hairy, or downy.*

41 *Monck's Charles Fox.* Fruit small, ovate, hairy.
42 *Green oak.* Fruit large, roundish, hairy.
43 *Greensmith.* Fruit middle-sized, roundish, hairy.
44 *Hebburn's prolific.* Fruit middle-sized, roundish, hairy.*
45 *Colliers's jolly angler, Lay's jolly angler, Collins's jolly angler.* Fruit large, oblong, downy.*
46 *Mills's Langley green.* Fruit large, roundish, hairy.
47 *Late green.* Fruit small, obovate, downy.
48 *Parkinson's laurel, green laurel, green willow.* Fruit large, obovate, pale green, nearly white.*
49 *Hopley's Lord Crew.* Fruit large, oblong, hairy.*
50 *Mignonette.* Fruit small, roundish, hairy.
51 *Lovart's Moses.* Fruit large, obovate, hairy.
52 *Green Rumbullion.* Fruit small, round, hairy.
53 *Small green.* Fruit small, globular, downy.
54 *Small hairy green.* Fruit small, round, hairy.
55 *Bratherston's Wistaston hero.* Fruit large, oblong.

II. *Fruit yellow.*

§ 1. *Branches spreading or pendulous.*

* *Fruit yellow, smooth.*

1 *Amber, amber yellow, smooth amber.* Fruit small, roundish.
2 *Diggles's Bonny Roger.* Fruit large, obovate.
3 *Capper's Bunker's Hill.* Fruit large, roundish.
4 *Hopley's Cheshire cheese.* Fruit large, oblong.
5 *Forbes's golden chain.* Fruit large, oblong. Branches pendulous.
6 *Bamford's golden Purse.* Fruit large, obovate. Branches pendulous.
7 *Beaumont's smiling beauty.* Fruit large, oblong. Branches pendulous.*
8 *Beardsell's smuggler.* Fruit large, roundish, oblong. Branches pendulous.
9 *Dixon's golden yellow.* Fruit middle-sized, turbinate. Branches pendulous.*
10 *Mather's victory.* Fruit large, obovate. Branches pendulous.
11 *Forester's Lord Combermere.* Fruit large, obovate.
12 *Saunder's Napoleon.* Fruit large, obovate.
13 *Costerdine's Champion Goliath.* Fruit large, oblong, smooth, golden yellow. Branches pendulous.
14 *Large yellow.* Fruit obovate, middle-sized, golden yellow, smooth. Branches pendulous.
15 *Gorton's viper.* Fruit large, obovate, golden yellow, smooth. Branches pendulous.
16 *Long yellow.* Fruit large, oblong, golden yellow.

* * *Fruit yellow, hairy, or downy.*

17 *Capper's bottom sawyer.* Fruit large, obovate, downy.
18 *Lister's Britannia.* Fruit large, obovate, downy.
19 *Hopley's globe.* Fruit large, round, hairy. Branches pendulous.
20 *Glory of England,* Fruit large, obovate, downy. Branches pendulous.
21 *Golden bees.* Fruit small, oblong. Branches pendulous.
22 *Jackson's golden orange.* Fruit large, oblong, Branches pendulous.
23 *Bratherston's golden sovereign.* Fruit large, roundish, hairy.
24 *Hill's golden gourd.* Fruit large, oblong, hairy. Branches pendulous.
25 *Hilton's Kilton, Kilton hero.* Fruit large, oblong, golden yellow, hairy. Branches pendulous.
26 *Blomerley's John Bull.* Fruit large, obovate, downy. Branches pendulous.
27 *Ranger.* Fruit small, roundish, hairy. Branches pendulous.
28 *Sparklet.* Fruit small, obovate, downy.
29 *Hallow's Trafalgar.* Fruit large, oblong, hairy. Branches pendulous.
30 *Waverham's yellow.* Fruit middle-sized, oval. Branches pendulous.
31 *Weedham's delight.* Fruit large, oblong, hairy.

§ 2. *Branches erect.*

* *Fruit yellow, smooth.*

32 *Yellow ball.* Fruit middle-sized, roundish.*
33 *Blithfield.* Fruit small, round, late.
34 *Clegg's Tim Bobbin.* Fruit middle-sized, oblong.
35 *Old dark yellow.* Fruit small, roundish.
36 *White walnut.* Fruit middle-sized, obovate, whitish yellow.

* * *Fruit yellow, hairy, or downy.*

37 *Hebburn yellow aston.* Fruit small, roundish, hairy.*
38 *Yellow champagne, hairy amber.* Fruit small, roundish, hairy.
39 *Catlow's conquering hero.* Fruit large, oblong, coarse, hairy.
40 *Heap's conquering girl.* Fruit large, oblong, hairy.
41 *Golden drop, golden lemon.*
42 *Part's golden fleece.* Fruit large, oval, hairy.
43 *Sulphur, rough yellow.* Fruit small, roundish, hairy.*
44 *Early sulphur, golden ball, golden bull.* Fruit middle-sized, roundish-oblong, hairy.
45 *Foster's husbandman.* Fruit large, obovate, downy.
46 *Heywood's invincible.* Fruit large, roundish-oblong, downy.
47 *Hardcastle's jolly gunner, royal gunner.* Fruit large, oblong, hairy.
48 *Prophet's regulator.* Fruit large, roundish, hairy.
49 *Rumbullion, yellow globe, round yellow.* Fruit small, roundish, downy.
50 *Smooth yellow.* Fruit small, roundish, downy.*
51 *Williamson's yellow hornet.* Fruit small, ovate, downy.
52 *Yellowsmith.* Fruit small, roundish-oblong, hairy.*
53 *Kelk's yellow.* Fruit middle-sized, oblong, downy.

III. *Fruit white, or greenish white.*

§ 1. *Branches erect.*

* *Fruit smooth, white.*

1 *Cranshaw's ambush.* Fruit large, obovate, white.
2 *White Damson.* Fruit small, roundish.*
3 *Honey white.* Fruit middle-sized, roundish-oblong.
4 *Hoslam's smiling yellow.* Fruit large, roundish-oblong.
5 *Cook's white eagle.* Fruit large, obovate.*
6 *Lovart's Queen Caroline.* Fruit middle-sized, obovate.

* * *Fruit greenish white, hairy, or downy.*

7 *Large early white.* Fruit large, obovate, downy.*
8 *Sampson's Queen Ann.* Fruit large, oval, downy.
9 *Peers's Queen Charlotte.* Fruit middle-sized, oblong, hairy.*
10 *Morris's Queen Mary.* Fruit middle-sized, ovate, downy.
11 *Trueman.* Fruit large, obovate, hairy.

* * * *Fruit white, hairy, or downy.*

12 *Bonny landlady, noble landlady.* Fruit large, oblong.
13 *Hopley's lady of the manor.* Fruit large, roundish-oblong, hairy.
14 *White lion.* Fruit large, obovate, hairy.
15 *Stringer's maid of the mill.* Fruit middle-sized, obovate, downy.
16 *Marchioness of Downshire.* Fruit middle-sized, oblong, hairy.
17 *Early rough white.* Fruit large, oval, hairy.
18 *Saunder's royal rock getter, Andrews's royal rock getter.* Fruit large, obovate, downy.
19 *White royal.* Fruit small, round, hairy.
20 *Compton's Sheba Queen.* Fruit large, obovate, downy.*
21 *Wellington's glory.* Fruit large, roundish-oblong, downy.*
22 *Moore's white bear.* Fruit large, obovate, hairy.*
23 *Nixon's white heart.* Fruit middle-sized, heart-shaped, hairy.
24 *White lily.* Fruit middle-sized, obovate, downy.
25 *Woodward's whitesmith, Sir Sidney Smith, Hall's seedling, Lancashire lass, Grundy's Lady Lillford.* Fruit large, roundish-oblong, downy.
26 *Taylor's bright Venus.* Fruit middle-sized, obovate, hairy.*
27 *White champagne.* Fruit small, roundish-oblong, hairy.*
28 *Saunder's Cheshire lass.* Fruit large, oblong, downy.*
29 *Hedgehog.* Fruit middle-sized, roundish, hairy.*

§ 2. *Branches spreading or pendulous.*

* *Fruit smooth, white.*

30 *Crystal.* Fruit small, roundish.*
31 *White fig.* Fruit small, obovate.*
32 *Parkinson's first rate.* Fruit large, oval.
33 *Leigh's fudler.* Fruit middle-sized, oblong. Branches pendulous.
34 *Great Britain.* Fruit large, oblong, greenish white.
35 *White rasp.* Fruit small, round.
36 *Brundrett's white rock.* Fruit large, obovate. Branches pendulous.
37 *Diggles's wanton.* Fruit middle-sized, roundish, greenish white.
38 *Denny's Victoria.* Fruit large, obovate, greenish white.

* * *Fruit greenish white, smooth.*

39 *Stringer's dusty miller.* Fruit middle-sized, obovate. Branches pendulous.
40 *Great Britain.* Fruit large, oblong. Branches pendulous.
41 *Denny's Vittoria.* Fruit large, obovate. Branches pendulous.

* * * *Fruit white, hairy, or downy.*

42 *Capper's bonny lass.* Fruit large, oblong, hairy.
43 *White crystal.* Fruit small, roundish, hairy or downy.*
44 *Early white.* Fruit middle-sized, roundish, downy.*
45 *Grundy's fowler.* Fruit middle-sized, obovate, downy.
46 *Large white.* Fruit middle-sized, oval, downy.
47 *Smith's radical.* Fruit large, roundish-oblong, hairy. Branches pendulous.
48 *Irish white raspberry.* Fruit small, round, hairy.
49 *Cleworth's white lion.* Fruit large, obovate, downy. Branches pendulous.*

* * * * *Fruit greenish white, hairy or downy.*

50 *Counsellor Brougham.* Fruit large, oblong, downy.
51 *Bratherton's governess.* Fruit large, roundish-oblong, hairy.
52 *Princess royal.* Fruit large, obovate, hairy. Branches pendulous.*
53 *Leigh's toper, Fox's toper.* Fruit large, oblong, downy. Branches pendulous.
54 *Taylor's speedwell.* Fruit large, oblong, hairy. Branches pendulous.

IV. *Fruit red.*

§ 1. *Branches spreading or pendulous.*

* *Fruit hairy or downy.*

1 *Alexander.* Fruit large, obovate, hairy.
2 *Hamlet's beauty of England.* Fruit large, oblong, hairy.
3 *Waverham's black bullfinch.* Fruit middle-sized, obovate, dark red, downy.
4 *Shipley's black prince.* Fruit middle-sized, roundish, downy, deep red.
5 *Boardman's British crown.* Fruit large, roundish, hairy.
6 *Williams's conqueror.* Fruit large, obovate, hairy.
7 *Melling's crown bob.* Fruit large, oblong, hairy.*
8 *Worthington's defiance.* Fruit large, obovate, hairy. Branches pendulous.
9 *Earl Grosvenor.* Fruit large, obovate, downy. Branches pendulous.

10 *Early black.* Fruit middle-sized, oblong, dark red. Branches pendulous.

11 *Early rough red.* Fruit small, roundish-oblong.

12 *Berry's farmer's glory.* Fruit large, obovate, downy. Branches pendulous. *

13 *Smith's favourite.* Fruit middle-sized, roundish-oblong, hairy.

14 *Glory of Oldham.* Fruit middle-sized, oblong, hairy.

15 *Ironmonger, hairy black.* Fruit small, roundish, hairy.

16 *Jackson's slim.* Fruit middle-sized, obovate, dark red, downy.

17 *Keens's seedling, Keens's seedling Warrington.* Fruit middle-sized, oblong. Branches pendulous. *

18 *Bratherton's Lord of the Manor.* Fruit large, roundish, hairy. *

19 *Knight's Marquis of Stafford.* Fruit large, roundish-oblong, hairy. *

20 *Wright's matchless.* Fruit middle-sized, oblong, dark-red, hairy.

21 *Miss Bold, pigeon's egg.* Fruit middle-sized, roundish, downy, dark red, early. *

22 *Bratherton's over-all.* Fruit large, oblong, hairy. Branches pendulous.

23 *Bratherton's pastime.* Fruit large, roundish, hairy, dark red. Branches pendulous.

24 *Raspberry, nutmeg.* Fruit small, roundish, hairy, dark red. *.

25 *Red Mogul.* Fruit small, roundish, hairy. *

26 *Large red oval.* Fruit large, oval, hairy. *

27 *Red rose.* Fruit large, oblong, downy. Branches pendulous. *

28 *Red Smith.* Fruit middle-sized, oval, downy.

29 *Acherley's Rodney.* Fruit middle-sized, obovate, downy. Branches pendulous.

30 *Rough red, little red hairy, old Scotch red, thick skinned red.* Fruit small, round, hairy. *

31 *Small dark rough red, small rough red.* Fruit small, round, hairy. *

32 *Royal oak.* Fruit middle-sized, roundish, hairy. *

33 *Small red.* Fruit small, round, hairy. *

34 *Capper's top sawyer.* Fruit large, roundish, hairy, pale red. Branches pendulous.

35 *Denny's triumphant.* Fruit large, obovate, hairy. Branches pendulous.

36 *Lomas's victory.* Fruit large, roundish, hairy. Branches pendulous.

37 *Red walnut, Murrey, Eckersley's double bearing, Ashton red.* Fruit middle-sized, obovate, downy, early.

38 *Warrington red, Aston, volunteer.* Fruit large, roundish-oblong, hairy. Branches pendulous. This is one of the best, and bangs late. *

39 *Knight's warrior.* Fruit large, ovate, downy, pale red. Branches pendulous.

40 *Wilmot's late superb.* Branches large, roundish-oblong, hairy.

** *Fruit smooth, red.*

41 *Gerard's Ajax.* Fruit large, roundish.

42 *Red ball.* Fruit small, roundish.

43 *Claret.* Fruit small, roundish.

44 *Worthington's conqueror.* Fruit large, obovate. Branches pendulous.

45 *Rival's emperor Napoleon.* Fruit large, obovate. Branches pendulous.

46 *Whitton's glory.* Fruit middle-sized, oblong, dark red.

47 *Hooper's great captain.* Fruit large, oblong.

48 *Ambersley hero.* Fruit large, oblong, dark red.

49 *Jagg's red.* Fruit large, roundish. Branches pendulous.

50 *Eckersley's jolly printer.* Fruit large, oblong, dark red.

51 *Brawnlie nutmeg.* Fruit small, obovate.

52 *Rider's Old England.* Fruit large, roundish-oblong, dark red. Branches pendulous.

53 *Boardman's Prince Regent.* Fruit large, roundish, dark red.

54 *Red Turkey, smooth red.* Fruit small, obovate. *

55 *Ward's Richmond Hill.* Fruit large, obovate, dark red. Branches pendulous.

56 *Johnson's ringleader.* Fruit large, oblong. Branches pendulous.

57 *Farrow's roaring lion, great chance.* Fruit very large, oblong. Branches pendulous.

58 *Saint John.* Fruit middle-sized, obovate.

59 *Rider's scented lemon.* Fruit large, obovate. *

60 *Greaves's Smolensko.* Fruit large, obovate. Branches pendulous.

61 *Chadwick's sportsman.* Fruit large, obovate, dark red.

62 *Bratherton's whipper-in.* Fruit large, oblong, dark red. Branches pendulous.

63 *Wilmot's early red.* Fruit large, roundish-oblong, dark red. Branches pendulous.

64 *Wilmot's seedling red.* Fruit large, oblong, dark red.

65 *Walker's Bank of England.* Fruit large, obovate. Branches pendulous.

§ 2. *Branches erect.*

* *Fruit smooth, red.*

66 *Small red globe, smooth Scotch.* Fruit small, roundish. *

** *Fruit red, hairy or downy.*

67 *Brundrett's atlas, Brundit's atlas.* Fruit large, oblong, hairy.

68 *Barton's red.* Fruit middle-sized, roundish, hairy.

69 *Red Champagne, red Turkey, countess of Errol, Ironmonger* of many. Fruit small, roundish-oblong, hairy. A fruit of unequalled richness. *

70 *Dakins's black.* Fruit middle-sized, oblong, dark red. A bad bearer.

71 *Large red globe.* Fruit large, roundish, hairy.

72 *Barton's hairy red.* Fruit small, roundish, hairy. A good bearer.

73 *Bratherton's huntsman, Speechley's rough red.* Fruit large, roundish, hairy. A good bearer.

74 *Irish plum.* Fruit middle-sized, roundish, hairy.

75 *Hopley's jubilee.* Fruit large, roundish, hairy, dark red.

76 *Allcock's king.* Fruit large, roundish, hairy, dark red.

77 *Lad Hartshorn's Lancashire.* Fruit large, roundish, hairy, dark red. A good bearer.

78 *Little John.* Fruit small, oblong, hairy, dark red.

79 *Beaumont's red.* Fruit middle-sized, roundish, hairy. *

80 *Leigh's rifleman, Allcock's Duke of York, Yates's royal Ann.* Fruit large, roundish, hairy. A good bearer, and late. *

81 *Rob Roy.* Fruit middle-sized, obovate, hairy.

82 *Scarlet transparent.* Fruit small, roundish, hairy. A bad bearer.

83 *Scotch best jam, dumpling.* Fruit small, hairy, roundish. *

84 *Denny's Shakspeare.* Fruit large, roundish, hairy.

85 *Mellor's Sir Francis Burdett.* Fruit large, obovate, pale red.

86 *Hampson's Tantarara.* Fruit middle-sized, obovate, downy. *

87 *Speechley's Yaxley hero.* Fruit large, obovate, hairy. *

Selection of sorts.—"It must be admitted," Neill observes, "that although large gooseberries make a fine appearance on the table, they are often deficient in flavour when compared with some of smaller size. Many of them have very thick strong skins, and are not eatable unless thoroughly ripened. Some of the large sorts, however, are of very good quality, such as the *red Champagne* and the *green walnut*, &c. For culinary use in the month of May, *Wilmot's early red* is larger and better than most others, the skin not being tough, and the whole berry melting to a fine consistence." Forsyth very judiciously recommends cultivating the early and late sorts, in order to prolong the season of this fruit. But the best way of selecting sorts for any particular purpose is from the list given above, where those that are of particular excellence are marked by an asterisk.

Propagation.—The gooseberry may be propagated by all the modes applicable to trees or shrubs, even by pieces of the roots; but the mode by cuttings is usually adopted for continuing varieties, and that by seeds for procuring them.

By seeds.—The scientific mode of impregnating one variety with another has, we believe, not been applied to this fruit. In general the seed of some choice variety, thoroughly ripe, is taken and sown in autumn or early in spring, in beds or pots of rich light mellow earth; when the plants are a year old, they are planted out in nursery rows, to be cultivated and trained there a year or two; in general they will bear the third year. By preparing for the best of these seedlings a very rich soil, and by watering, shading, and thinning the fruit, the largest sorts have been obtained. Not content with watering at the roots and over the top, the Lancashire connoisseur, when he is growing for exhibition, places a small saucer of water immediately under each gooseberry, only 3 or 4 of which he leaves on the tree. This is technically called suckling. He also pinches off a great part of the young wood, so as to throw all the strength he can into the fruit.

By cuttings.—Miller says, the best season for planting gooseberry cuttings is in autumn, just before their leaves begin to fall. The cuttings should be taken from bearing shoots, rather than from those that issue from the main stem. Cut them to such a length as the strength and ripeness of the wood will bear, and cut off all the buds, excepting three, or at most four at top, and train the plants with a single stem of 9 inches or a foot high, from the top of which the branches should radiate upwards at an angle of 40°, or better if 45°. Haynes advises taking off cuttings in July, when the fruit is on the bush, in order to make sure of the sorts. He says, by immediate planting, watering, and shading, as good plants are produced as from ripe wooded cuttings. Treat. of the gooseberry, &c. p. 29.

Soil and site.—Any good garden soil, on a dry bottom, and well manured, will suit the gooseberry. That which is soft and moist produces the largest fruit. The situation should not be under the drip of trees, over much shaded or confined, otherwise the fruit will be small, ill flavoured, and the plants apt to mildew. Forsyth says, gooseberries should be dunged every year, or at least have a good coat of dung once in two years. Haynes recommends a mixture of peat and loam well manured, and a shaded situation. The last he proposes to effect by planting among his quarters of gooseberries, rows of Jerusalem artichokes in the direction of east and west.

Final planting.—"The season for planting gooseberries is any time during open weather, from October till March. When trees are procured from the public nurseries, choose such as are in some advanced state, about 3 years' growth, with pretty full heads, for immediate plentiful bearers. Let the general supply be in standard bushes, and plant principally in the kitchen garden, in single rows along the boundary edges of the main quarters or outward borders, from 6 to 8 feet apart, or some may be planted in cross rows, to subdivide extensive quarters. When the object is to raise large quantities of fruit, plantations are made in continued parallel rows, 8 or 10 feet asunder, by 6 feet in the row. It would be eligible to plant a few choice sorts against south and other sunny walls or paling, for earlier and larger fruit; and on north walls to ripen late in succession." Abercrombie. Forsyth says, "The market gardeners about London plant them in rows, from 8 to 10 feet apart from row to row, and 6 feet from plant to plant in the rows. In small gardens I would recommend planting them in quarters by themselves, at the distance of 6 feet between the rows, and 4 feet from plant to plant; or you may plant them round the edges of the quarters about 3 feet from the path; you will then have the ground clear for cropping, and a man, by setting one foot on the border, can gather the gooseberries without injuring the crop." Neil says, "In some places gooseberry bushes on the sides of the borders, are trained to a single tall stem, which is tied to a stake; this, though 6 or 8 feet high, occasions scarcely any shade on the border, and it does not occupy much room, nor exclude air; while, at the same time, the stem becomes close hung with berries, and makes a pleasant appearance in that state." Edinb. encycl. art. hort. § 161. Maher observes (Hort. trans. 2. p. 146.) "that as the crop of ripe fruit is often injured by having the largest and earliest berries prematurely gathered, whilst green, for tarts, a sufficient number of trees of such varieties as are earliest should be planted in a separate quarter of the garden, and devoted exclusively to the use of the kitchen, for tarts and sauce."

Mode of bearing.—"The gooseberry produces its fruit not only on the shoots of last summer, and on shoots 2 or 3 years' old, but also on spurs or snags arising from the elder branches along the sides; but the former afford the largest fruit. The shoots retained for bearers should therefore be left at full length or nearly so." Abercrombie.

Pruning.—"The bushes will require a regular pruning twice in the year."

Summer pruning.—"Where any bushes are crowded with cross and water shoots of the same year, shading the fruit from the sun, and preventing the access of air, thin the heart of the plant and other tufted parts moderately, pinching off or cutting out close what spray is removed; but do not touch the summer shoots in general. Maher says, it will greatly contribute to the perfection of the fruit, if the very small berries are taken away with a pair of scissors about the middle or end of May; and these small berries will be found quite as good for sauce or gooseberry cream as the larger."

Winter pruning.—"You may proceed to the winter pruning any time from November until the end of February, or until the buds are so swelled, that further delay would endanger their being rubbed off in the operation. Cut out the cross-shoots and water-shoots of the preceding summer, and the superfluous among crowded branches. Prune long ramblers and low stragglers to some well placed lateral or eye; or if any under straggler spring very low, cut it away. Of last year's shoots retain a sufficiency of the best well-placed laterals and terminals in vacant parts, to form successional bearers, and to supply the places of unfruitful and decayed old-wood, which, as you proceed, should be removed. Mostly retain a leading shoot at the end of the principal branch, leaving it either naturally terminal, or, where the branch would thus be too extended, pruning in some competent lateral within bounds. The superfluous young laterals on the good main branches, instead of being taken off clean, may be cut into little stubs of one or two eyes; which will send out fruit-buds and spurs. Of the supply reserved for new bearers, a small number will probably require shortening, where too extended, or curved incommodiously; leave these from 8 to

12 inches in length, according to strength and situation; those of moderate extent and regular growth will require very little shortening, and many none at all. Observe, too close cutting or general shortening, occasions a great superfluity of wood in summer; for the multiplied laterals thus forced from the eyes of the shortened branches, increase to a thicket, so as to retard the growth, and prevent the full ripening of the fruit; on which account it is an important part of pruning to keep the middle of the head open and clear, and to let the occasional shortening of the shoot be sparing and moderate. Between the bearing branches keep a regular distance of at least 6 inches at the extremities, which will render them fertile bearers of good fruit. Some persons, not pruning the gooseberry bush on right principles, are apt to leave the shoots excessively close and tufted, while they shorten the whole promiscuously; others sometimes clip them with garden shears to close round heads; in consequence of being pruned in these methods, the bushes shoot crowdedly, full of young wood in summer, from which the fruit is always very small, and does not ripen freely with full flavour." Forsyth says, "Many of the Lancashire sorts are apt to grow horizontally, and the branches frequently trail on the ground, which renders them liable to be broken by high winds, especially when they are loaded with fruit. In that case I would recommend 2 or 3 hoops to be put round them, to which the branches may be tied to support them, and prevent their being broken by the wind." S. Jeeves has tried training gooseberries on an arched trellis in the manner of a berceau or arbour-walk. For this purpose he plants in rows, $5\frac{1}{2}$ feet apart, and the plants 3 feet distant in the row. He chooses the strongest growing kinds, and trains 4 branches at 9 inches distance from each plant, till they meet at the top. The advantages of this plan are beauty of appearance, fruit not splashed by rain, easily gathered, and the ground more readily cultivated.

Insects and diseases, &c.—The caterpillars of saw-flies (Tenthredinidæ, Leach), of butterflies (Papilia, Lin.), and of moths (Phalæna, Lin.), are well known as serious enemies to gooseberries. The larvæ of the Tenthredinidæ have from 16 to 20 feet, a round head, when touched they will roll themselves together. They feed on the leaves of the gooseberry, apple, and most fruit trees, as well as on roses, and other shrubs and plants. When full grown they make, sometimes in the earth, and sometimes between the leaves of the plants on which they feed, a net-work case, which, when complete, is strong and gummy, and in that change to the pupa incomplete, which for the most part remains during the winter in the earth. The perfect fly emerges early in the ensuing spring; its serrated sting is used by the female in the manner of a saw, to make incisions in the twigs or stems of plants, where it deposits its eggs. The Caledonian Horticultural Society having requested information respecting the best method of preventing or destroying the caterpillar on gooseberries, received various communications on the subject, and the following are extracts from such as they deemed fit for publication.

J. Gibb describes the large black, the green, and the white caterpillar, with his methods of destroying them:—

"During the winter months the large black kind may be observed lying in clusters on the under parts, and in the crevices of the bushes; and even at this season (Feb.) I find them in that state. In the course of 8 or 10 days, however, if the weather be favourable, they will creep up in the day time, feed on the buds, and return to their nest during the night. Whenever leaves appear upon the bushes they feed upon them till they arrive at maturity, which is generally in the month of June; after which they creep down upon the under sides of the branches, where they lodge till the crust or shell is formed over them. In July they become moths, and lay their eggs on the under side of the leaves and bark. The produce of these eggs, coming into life during the month of September, feed on the leaves so long as they are green, and afterwards gather together in clusters on the under side of the branches, and in the crevices of the bark, where they remain all the winter, as already said. Winter is the most proper time for attacking this sort with success, as their destruction is most effectually accomplished by the simple operation of pouring a quantity of boiling-hot water upon them from a watering-pan, while no injury is thereby done to the bushes.

"The green sort are at present (February) in the shelly state, lying about an inch under ground. In April they come out small flies, and immediately lay their eggs on the veins and under sides of the leaves. These eggs produce young caterpillars in May, which feed on the leaves till June or July, when they cast a blackish kind of skin, and afterwards crawl down from the bushes into the earth, where a crust or shell grows over them, and in that state they continue till the following April. The only method which I have hitherto found effectual for destroying these is, 1st, to dig the ground around the bushes very deep during the winter season, by which means the greater part of them are destroyed, or buried too deep ever to penetrate to the surface; 2ndly, in April, when the flies make their appearance, to pick off all the leaves on which any eggs are observable; this is a tedious operation, but may be done by children. If any of the enemy should escape both these operations, they will be discernible as soon as they come into life, by their eating holes through the leaves, and may then easily be destroyed, without the least injury to the bushes or fruit.

"The white kind, otherwise called borers, are not so numerous as the other kinds, though very destructive; they bore the berry, and cause it to drop off; they preserve themselves during the winter season in the chrysalis state, about an inch under ground, and become flies nearly at the same time with the last mentioned kind; they lay their eggs on the blossoms, and these eggs produce young caterpillars in May, which feed on the berries till they are full grown, and then creep down into the earth, where they remain for the winter in the shelly state." Caled. mem. vol. 1.

Macmurray, in autumn, pours a little cow urine around the stem of each bush, as much as suffices merely to moisten the ground. The bushes which were treated in this manner remained free of caterpillars for two years; while those that were neglected or intentionally passed over, in the same compartment, were totally destroyed by the depredations of the insects. A layer of sea-weed laid on in autumn, and dug in in the spring had the same effect for one year. Caled. mem. vol. 1. p. 95.

R. Elliot says, "take 6 pounds of black currant leaves, and as many of elder leaves, and boil them in 12 gallons of soft water; then take 14 pounds of hot lime, and put it in 12 gallons of water; mix them altogether; then wash the infested bushes with the hand engine; after that is done, take a little hot lime, and lay it at the root of each bush that has been washed, which completes the operation. By these means you completely destroy the caterpillars, without hurting the foliage. A dull day is to be preferred to any other for washing. When the foliage is all off the bushes, wash them over with the hand engine to clean them of decayed leaves; for this purpose any sort of water will do; then stir up the surface of the earth all round the roots of the bushes, and lay a little hot lime about them to destroy the eggs. This I have never found to fail of success since the first trial, 6 years ago. The above mentioned proportion of leaves, lime, and water, will serve for 2 acres of ground or more, covered with bushes or trees in the ordinary manner, and will cost very little money indeed. The same proportion is

to be observed in making a wash for the rest of the trees or bushes."

J. Machray procured some tobacco and soft or black soap, and boiled a quarter of a pound of tobacco with the one pound of soft soap in about 18 scotch pints of water; and kept stirring the liquid while boiling with a whisk, in order to dissolve the soap; this liquor, when milk-warm, or so cool as not to hurt the foliage, he applied to the bushes with a hand-squirt, in the evening, and in the morning found all the ground under the bushes covered with dead caterpillars. This practice he continued for six years, always when he saw any symptoms of the approach of caterpillars.

J. Tweedie, in the course of any of the winter months, pares all the earth from under the bushes to the depth of about 3 inches, into a flat ridge betwixt the rows; and on the first dry day following, either treads, beats, or rolls these ridges, and trenches the whole down $1\frac{1}{2}$ or 2 spades deep, observing to tread the foul earth into the bottom of the trench.

Forsyth's method is as follows: "Take some sifted quick-lime, and lay it under the bushes, but do not at first let any of it touch the branches or leaves; then shake each bush suddenly and smartly, and the caterpillars will fall into the lime; if the bush be not shaken suddenly, the caterpillars, on being a little disturbed, will take so firm a hold as not easily to be shaken off. After this is done, sift some of the lime over the bushes; this will drive down those which may have lodged on the branches. The caterpillars ought to be swept up next day, and the bushes well washed with clear lime-water mixed with urine; this will destroy any caterpillars that may still remain, and also the aphides, if there are any on the bushes."

Of all the methods for destroying caterpillars mentioned above, Gibb's appears to us the only plan on which any reliance can be placed.

Taking the crop.—"From gooseberries being useful for different purposes, both in a green and in a mature state, and from the compass of time afforded by early and late sorts, they are in season in great request 4 or 5 months in summer, from April till September. The early sorts on south walls come in for gathering in small green berries for tarts, &c. in April or early in May, and attain maturity in June. From common standard bushes an abundant supply is yielded in May and June of gooseberries in a green state; and in proportion as part is reserved to ripen, a succession, in full size and maturity, is obtained in June, July, and August. Some late kinds, either planted in shady situations, or shielded with mats from the sun in their ripening state, continue good on the bush till September."

Prolonging the crop.—In addition to planting late sorts in shady situations, the bushes, whether standards or trained, may be matted over when the fruit is ripe, and in this way some of the reds, as the *Warrington*, and the thick-skinned yellow sorts, as the *Mogul*, will keep on the trees till Christmas.

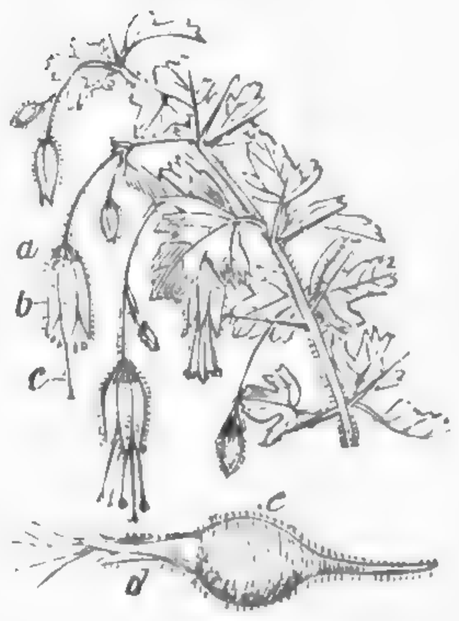
Forcing.—The gooseberry may be forced in pots or boxes placed in pits, or in the peach-house or vinery. The plants in pots or boxes, are placed in pits, or in the peach-house in January, and has ripe fruit in the end of April, which is sent to table growing on the bush.

Common *Gooseberry*. Fl. March, April. Britain. Shrub 4 to 6 feet.

* *Flowers red.*

18 R. speciòsum (Pursh. fl. amer. sept. 2. append. 731.) shrub bristly and prickly; spines tripartite; leaves roundish-oval, 3-5-lobed, obtuse; peduncles few-flowered; bracteas broadly ovate; calyx cylindrical, 4-parted, with erect glandular segments; germens and pedicels beset with glandular bristles. ♄. H. Native of North California and Monterrey, and Mexico. Sweet, fl. gard. second ser. t. 149. Lindl. bot. reg. vol. 18. with a figure. R. stamíneum, Smith in Rees' cycl. R. triacántha, Menzies. R. fuchsioìdes, Moc. et Sesse, fl. mex. icon. ined. Flowers large, scarlet, pendulous, very like those of a *Fúchsia*. Stamens much exserted; style long, entire; petals cuneate, inserted on the very short tube of the calyx, the margins involute. Fruit hispid. (f. 32.)

FIG. 32.



Showy Gooseberry. Fl. May, June. Clt. 1824. Sh. 4 to 5 ft.

19 R. Menzie'sii (Pursh. fl. amer. sept. 2. append. p. 732.) plant very prickly; spines tripartite; leaves cordate, truncate at the base, 5-lobed, serrated, wrinkled from veins, clothed with pubescence beneath; peduncles usually 1-flowered; calyx cylindrically campanulate, deeply 5-parted, glandular; stamens 5, inclosed; style a little exserted; germens and peduncles prickly. ♄. H. Native of North California, at Port Trinidad. R. fèrox, Smith in Rees' cycl. The present species and the preceding are very showy plants, from their large bright red or crimson glandular flowers, and may be considered as holding the same rank among the gooseberries as *R. sanguíneum* does among the currants.

Menzies's Gooseberry. Shrub 4 to 5 feet.

Sect. II. Botryca'rpum (from *βοτρυς, botrys*, a raceme, and *καρπος, karpos*, a fruit; fruit disposed in racemes). This is an intermediate section between sect. 1. *Grossulària*, and sect. 3. *Ribèsia*, having the prickles of the former, and racemose flowers and small fruit of the latter. *R. lacústre*, no. 9. ought probably to have been placed in this section.

20 R. Orienta'le (Poir. encycl. suppl. 2. p. 856.) plant rather prickly; leaves 3-5-lobed, orbicularly somewhat reniform, cut, hairy; lobes rather deep, obtuse; petioles hairy; racemes erectish, few-flowered; bracteas longer than the flowers; style bifid at the apex. ♄. H. Native of Syria. Desf. arb. 2. p. 88. Flowers greenish yellow. Fruit like those of the currant.

Eastern Gooseberry. Fl. April, May. Clt. 1824. Shrub 4 to 6 feet.

21 R. saxa'tile (Pall. nov. act. petr. x. p. 276.) prickles scattered; leaves roundish-cuneiform, bluntly 3-lobed; racemes erect; bracteas linear, shorter than the pedicels; calyx flat, scabrous; petals small, of a livid green colour. ♄. H. Native of Siberia. Led. fl. ross. alt. ill. t. 239. R. alpìnum, Sievers in Pall. nord. beytr. 7. p. 345. ? Flowers small, greenish purple. Petals spatulate. Berries smooth, globose, bractless, dark purple, when mature full of edible pulp, rarely so large as common currants, and like them.

Rock Gooseberry. Fl. April, May. Clt. 1819. Shrub 4 to 5 feet.

22 R. diaca'ntha (Lin. fil. suppl. p. 157.) prickles twin, stipular; leaves cuneiform, tripartite, quite glabrous, shorter than the petioles; lobes toothed; racemes long, erect; flowers on long pedicels; bracteas length of flowers; sepals roundish, yellowish; petals small, roundish. ♄. H. Native of Dahuria and Siberia. Berl. l. c. t. 2. f. 8. Pall. fl. ross. 2. p. 36. t. 66. append. no. 79. t. 2. f. 2. Berries about the size of currants, red, of a sweetish acid taste.

Two-spined Gooseberry. Fl. May, June. Clt. 1781. Shrub 4 to 5 feet.

Sect. III. Ribe'sia (an alteration from *Ribes*). Shrubs unarmed (f. 33.). Racemes for the most part many-flowered (f. 33.). Leaves plicate. Calyx campanulate (f. 33. *b.*), or cylindrical.

* *Flowers greenish or greenish-yellow.*

23 R. alpi'num (Lin. spec. 291.) leaves 3-5-lobed, obtuse, shining beneath, pilose above; racemes erect, rather crowded; bracteas lanceolate, ventricose, bearing a few glands, usually longer than the flowers; petals minute, almost abortive; anthers more or less nearly sessile; styles joined. ♄. H. Native of Europe and Siberia, on the Alps; in Britain, in woods, in the north of England; near Bradford, Yorkshire; near Ripon and in Durham; also of Scotland, but rare. Smith, engl. bot. 704. Fl. dan. t. 698. Jacq. aust. 1. t. 47. Flowers greenish-yellow. Berries red, elliptic, mucilaginous and insipid.

Var. α, stérile (Wallr. sched. p. 108.) flowers flat, destitute of the germ, fugaceous; racemes dense, many-flowered; anthers nearly sessile, bearing pollen, acute. R. dioícum, Mœnch. meth. p. 683.

Var. β, baccíferum (Wallr. l. c.) flowers somewhat hypocrateriform; racemes few-flowered; anthers distinctly pedicellate, but imperfect; style hardly semibifid; germ large. Cultivated in gardens.

Var. γ, pùmilum (Lindl. in hort. trans. 7. p. 244.) in every respect the same as the species, but not one-third the size, never exceeding 3 feet.

Alpine Currant. Fl. April, May. Britain. Shrub 3 to 6 ft.

24 R. resinòsum (Pursh, fl. amer. sept. 1. p. 163.) all parts of the shrub are full of resinous glands; leaves 3-5-lobed, roundish; racemes erect; calyx flattish; petals bluntly rhomboid; bracteas linear, longer than the pedicels. ♄. H. Native of North America, on the mountains. Sims, bot. mag. 1583. Berl. l. c. t. 2. f. 10. Flowers greenish yellow. Berry hairy, red? Perhaps the flowers are dioecious. Very like *R. alpìnum*.

Resinous Currant. Fl. April, May. Clt. 1800. Sh. 3 to 5 ft.

25 R. cilia'tum (Willd. mss. ex Rœm. et Schultes, syst. 5. p. 500.) plant beset with glands; leaves 5-lobed, deeply cordate, doubly crenate-serrated, ciliated, glabrous above, but hairy on the nerves and veins beneath; lobes acute; petioles beset with glandular hairs; racemes solitary. ♄. H. Native of Mexico, on the burning mount Jorullo, at the elevation of 1500 feet. R. Jorullénse, H. B. et Kunth, nov. gen. amer. 6. p. 61. Nearly allied to *R. macrobòtrys*.

Ciliated Currant. Shrub 3 to 4 feet.

26 R. macrobo'trys (Ruiz et Pav. fl. per. 3. p. 12. t. 202. f. a.) leaves cordate, lobed, deeply serrated; petioles ciliated at the base; racemes very long, pendulous, hairy; bracteas linear-subulate, pilose, nearly the length of the pedicels; calyxes rufescent; petals small, red. ♄. G. Native of Peru, on the Andes, in groves. Berl. l. c. t. 2. f. 17. Berries greenish, hairy.

Long-racemed Currant. Shrub 4 to 5 feet.

27 R. albifòlium (Ruiz et Pav. fl. per. 3. p. 12. t. 132. f. 6.) leaves rather cordate, deeply serrated; racemes twice the length of the leaves, pendulous; bracteas spatulate, ciliated, length of pedicels; petals roundish, purplish; anthers nearly sessile. ♄. H. Native of Peru, in groves about Munna. Berl. l. c. t. 2. f. 18. Berries globose, rather hairy. Allied to *R. macrobótrys*.

White-leaved Currant. Shrub 4 to 5 feet.

28 R. bracteòsum (Dougl. mss. ex Hook. fl. bor. amer. 1. p. 232.) leaves on long petioles, cordate, deeply 5-7-lobed; lobes acuminated, cut, doubly serrated, hispid above, but full of resinous dots beneath; racemes often terminal, at length reflexed; pedicels erectly spreading, pubescent, exceeding the spatulate bracteas; calyx rotate, glabrous; petals minute, roundish; germens and berries full of resinous dots. ♄. H. Native of the north-west coast of America, at the confluence of the Columbia with the ocean. This is a very remarkable and elegant shrub, with leaves nearly as large as, and resembling, those of the *Sycamore;* these, as well as the fructified racemes, have a very strong resemblance to *R. macrobòtrys;* but the flowers are widely different. Flowers purplish-yellow. Berries about the size of those of *R. rùbrum*.

Bracteate Currant. Shrub 5 to 8 feet.

29 R. hírtum (Humb. et Bonpl. in Willd. herb. ex Rœm. et Schultes, syst. 5. p. 501.) leaves ovate, rather cordate, 3-lobed, reticulated beneath from hairy nerves and veins, and pale, but blackish green above; lobes deeply serrated, middle one the largest; petioles pilose, glanduliferous, and somewhat tomentose; racemes reflexed; bracteas dentately ciliated; petals roundish-obovate; styles bifid. ♄. G. Native of South America, in cold places on Mount Antisana, at the elevation of 300 feet. Berl. l. c. t. 2. f. 13. R. frígidum, H. B. et Kunth, nov. gen. amer. 6. p. 62. Flowers flesh-coloured. Berries hispid.

Hairy Currant. Shrub 4 to 5 feet.

30 R. fra'grans (Pall. nov. act. pet. 5. p. 377. t. 9.) leaves glabrous, on long petioles, 3-5-lobed, greener above than below; racemes erect, stiff; flowers campanulate, white, sweet-scented; bracteas deciduous; petals lanceolate, acute, spreading. ♄. H. Native of Siberia, on the higher mountains. Berries red, of a very sweet taste. From the under surface of the leaves exudes, in very frequent little yellow drops, a very fragrant balsamic resin, having a strong smell of the black currant.

Fragrant Currant. Shrub 1 to 2 feet.

31 R. procu'mbens (Pall. fl. ross. 2. p. 35. t. 65.) leaves bluntly lobed; lobes serrated: lateral ones a little cut; racemes erect; peduncles long, setaceous; segments of the limb of the flower pubescent, acute, of a livid purplish colour; anthers hardly rising from the calyx. ♄. H. Native of Siberia, in moist shady places. Flowers flattish. Berries very grateful to the taste, rufescent when ripe. Ait. hort. kew. 2. p. 41. R. polycárpon, Gmel. syst. veg. p. 419.

Procumbent Currant. Fl. May, Ju. Clt. 1804. Shrub pr.

32 R. prostra'tum (Lher. stirp. 1. p. 3. t. 2.) leaves deeply cordate, 5-7-lobed, glabrous; lobes acute, cut, doubly serrated, naked on both surfaces; racemes erect, loose, slender; bracteas small, obtuse, much shorter than the pedicels, which are beset with glandular bristles; calyx rotate; germens and berries beset with glandular bristles. ♄. H. Native of Newfoundland; throughout Canada; and in woods on the Rocky Mountains. Berl. l. c. t. 2. f. 12. R. glandulòsum, Ait. hort. kew. ed. 1. p. 279. R. rìgens, Bigel. fl. bost. ed. 2. p. 9. R. glandulòsum, Richards. in Frankl. 1st journ. ed. 2. append. p. 7. R. laxiflòrum, Richards. in Frankl. 1st. journ. ed. 2. append. p. 7. Berries large, reddish. This is a very distinct species.

Var. β; racemes pubescent; pedicels divaricate. ♄. H. Native of the north-west coast of America. R. affìne, Dougl. mss. R. laxiflòrum, Pursh, fl. amer. sept. 2. p. 731.

Prostrate Currant. Fl. Apr. May. Clt. 1812. Shrub pr.

33 R. trífidum (Mich. fl. bor. amer. 1. p. 110.) leaves smoothish, moderately lobed; racemes loosely many-flowered, pubescent; flowers small; calycine segments rather trifid; berries hairy, red. ♄. H. Native of North America, near Quebec, and at Hudson's Bay. Lobes of leaves acutish. Racemes weak, nearly like those of *R. rùbrum*, but the flowers smaller. Petals purplish, spatulate, rounded at the apex. Perhaps this is the same as *R. prostràtum*.

Trifid-calyxed Currant. Fl. April, May. Clt. 1823. Sh. pr.

34 R. Taka're (D. Don, prod. fl. nep. p. 208.) leaves cordate, 3-lobed, acuminated, doubly serrated, pubescent on both surfaces, as well as on the branches. ♄. H. Native of Nipaul, in Sirinagur. Leaves as large as those of the *Sycamore*. Flowers unknown. The bush is called *Takare* by the Nipaulese.

Takare Currant. Shrub.

35 R. multiflòrum (Kit. in Rœm. et Schultes, syst. 5. p. 493. but not of H. B. et Kunth) leaves 5-lobed, cordate, tomentose beneath; racemes very long, pendulous, drooping; bracteas shorter than the flowers; petioles length of leaves; petals wedge-shaped; styles bifid, and sometimes distinctly trifid. ♄. H. Native of Croatia. Sims, bot. mag. 2368. Berl. l. c. t. 2. f. 11. R. spicàtum, Schultes, œstr. fl. ed. 1. p. 433.

Many-flowered Currant. Fl. April, May. Clt. 1822. Shrub 4 to 6 feet.

36 R. acumina'tum (Wall. cat. no. 6834.) branches glabrous; leaves glabrous above, but with a few scattered hairs beneath, 3-5-lobed; lobes acuminated, serrated; racemes axillary, erect; peduncles pubescent; berries nodding; calyx campanulate; petals rounded at the apex. ♄. H. Native of Nipaul, on Sirmore and Emodi. Berries red, about the size of red currants.

Acuminated-leaved Currant. Shrub 4 to 6 feet.

37 R. spica'tum (Robs. in Lin. trans. 3. p. 240. t. 21.) leaves roundish-cordate, 3-5-lobed, covered with soft pili above, and tomentum beneath; racemes erect; flowers more or less pedicellate; bracteas obtuse, tomentose, much shorter than the pedicels; sepals roundish-cuneated; petals oblong; styles bifid. ♄. H. Native of the North of England, in woods, near Richmond, in Yorkshire; and between Piersbridge and Gainford, Durham. Smith, engl. bot. 1290. Berl. l. c. t. 2. f. 16. Berries glabrous, globose, colour and taste of those of *R. rùbrum*. The tree currant affords a fruit rather smaller and more acid than the common red currant; but by crossing and cultivation might, no doubt, be greatly improved; and from its comparatively tree-like habits, might be a more convenient fruit shrub in respect to crops around it.

Spiked-flowered Currant. Fl. April, May. Engl. Sh. 4 to 6 ft.

38 R. petræ'um (Wulf. in Jacq. misc. 2. p. 36.) leaves acuminated, 3-5-lobed, rather cordate, deeply serrated, on long petioles, pilose above; racemes erect, crowded, rather pubescent; bracteas shorter than the pedicels; sepals obtuse; petals obcordate. ♄. H. Native of the Alps of Carinthia, Savoy, and on almost all the mountains of Europe. In England, near Eggleston and Conscliffe, in the county of Durham; and in Scotswood Dean, Northumberland. Berl. l. c. t. 2. f. 14. Jacq. icon. 1. t. 49. Smith, engl. bot. 705. R. alpìnum, Delarb. auvergn. p. 166. Petals small, white. Berries large, deep red, with an acid taste. Fruiting racemes pendulous. The *rock currant* is sometimes called *Woolly-leaved currant*, and *Red Marsh mallow-leaved currant*.

Rock Currant. Fl. May. England. Shrub 3 to 4 feet.

39 R. rìgens (Michx. fl. bor. amer. 1. p. 110.) branches erect; leaves glabrous above, pubescent beneath, wrinkled reticulately; lobes and teeth acute; racemes rather loose, many-flowered, when bearing the fruit stiffish and erect. ♄. H. Native of Canada, and the mountains of Pennsylvania. Pursh, fl. amer. sept. 1. p. 136. Berries red, hispid.

Stiffish-racemed Currant. Fl. April, May. Clt. 1812. Sh. 4 to 6 feet.

40 R. villòsum (Wall. cat. no. 6832.) branches pubescent; leaves nearly orbicular, cordate, bluntly 3-lobed, villous as well as the petioles; racemes erect, few-flowered. ♄. H. Native of Sirinagur.

Villous Currant. Shrub 5 to 6 feet.

41 R. albine'rvium (Michx. l. c.) leaves short, petiolate, deeply and acutely lobed, smoothish, with whitish nerves; racemes recurved. ♄. H. Native of Canada, and on the Catskill Mountains, in the state of New York. Flowers small. Berries red, glabrous.

White-nerved Currant. Fl. Apr. May. Clt.? Sh. 4 feet.

42 R. tubulòsum (Eschscholtz, pl. calif. p. 281.) leaves cordate, 3-lobed, clothed with white tomentose pubescence beneath; petioles angular, dilated at the base, and furnished with broad, dilated, jagged, membranous stipulas; racemes terminal, erect; bracteas entire, with glandular margins; calycine segments short, roundish; petals oblong. ♄. H. Native of North California. Stem strigose, dark purple, pruinose; branches angular, covered with setose, deciduous bark. Pedicels and germs dotted with white tomentum. Petals pale brown. Very nearly allied to *R. albinérvium* and *R. sanguíneum*.

Tubular-flowered Currant. Shrub 4 to 5 feet.

43 R. tubiflòrum (Meyer, in acad. Morou. vol. 7.) unarmed; hairs glandular, at length deciduous; adult leaves cordate, 5-lobed, pubescent beneath; racemes somewhat spicate, terminal, drooping; calyx tubular, pubescent, exceeding the bracteas; petals nearly orbicular. ♄. H. Native of North California.

Tube-flowered Currant. Shrub 4 to 5 feet.

44 R. Magella'nicum (Poir. suppl. 2. p. 856.) stems rather prostrate; leaves 3-lobed, crenately undulated, glabrous beneath, and paler; racemes erectish, thick; bracteas longer than the pedicels; petals reflexed at the apex. ♄. H. Native of the Straits of Magellan.

Magellan Currant. Shrub pr.

45 R. puncta'tum (Ruiz et Pav. fl. per. 3. p. 12. t. 233. f. a.) leaves 3-lobed, serrated, beset with resinous glands beneath, as well as on the bracteas; racemes longer than the leaves, either drooping or erect; bracteas cuneate-oblong, obtuse, at length reflexed; calyx campanulate, yellowish; berries oblong, hairy. ♄. F. Native of Chili, on hills. Petals small, yellow. Berries red, dotted. Berl. l. c. t. 2. f. 19. Lindl. bot. reg. 1278.

Dotted-berried Currant. Fl. April, May. Clt. 1826. Sh. 3 to 4 feet.

46 R. viscòsum (Ruiz. et Pav. fl. per. 3. p. 13.) leaves cordate, 5-lobed, crenated, rough, clammy, 5-nerved; racemes short, simple, solitary; bracteas lanceolate, length of calyx. ♄. H. Native of Peru, on rocks. Corolla yellow. Calyx nearly of the same colour. Berries small, pale purple.

Clammy Currant. Shrub 4 to 5 feet.

47 R. hetero'trichum (Meyer, in Led. fl. ross. alt. ill. t. 235. fl. alt. 1. p. 270.) stem erectish; leaves pubescent, bristly, and glandular, nearly orbicular, 3-lobed; lobes obtuse, toothed; racemes erect; pedicels equal in length to the bracteas; calyx flat, pubescent; berries puberulous, glandless, bractless. ♄. H. Native of Altaia, on rocks at the foot of the mountains, on the west of Buchtorminsk, towards the river Kurtschum; also on the mountains in the Kirghisean Steppe. Calyx of a livid purple colour; petals purple, rounded, and entire at the apex. Berries almost like those of *R. rùbrum*, but orange-coloured.

Variable-haired Currant. Fl. April, May. Shrub 2 to 3 ft.

48 R. Carpa'thicum (Kit. in Schultes, œstr. fl. 2. ed. 1. p. 432. ex Rœm. et Schultes, syst. 5. p. 493.) stem erect; leaves 5-lobed, cordate; racemes pendulous, and are as well as the calyxes pubescent; petals flattish, smaller than the calyx. ♄. H. Native of the Carpathian mountains. R. acérrimum, Rochel. ex Rœm. et Schultes, l. c. Perhaps only a variety of *R. rùbrum*.

Carpathian Currant. Shrub 4 feet.

49 R. ru'brum (Lin. spec. 290.) leaves cordate, bluntly 3-5-lobed, pubescent beneath, when young usually rather tomentose, glabrous above; racemes drooping; bracteas ovate, shorter than the pedicels; calyx flatly campanulate, spreading; sepals obtuse; petals obcordate; fruit quite glabrous. ♄. H. Native of Europe and Siberia, in woods; and throughout Canada to the mouth of the Mackenzie; in mountainous woods, especially in the north of England and in Scotland, about the banks of rivers; undoubtedly wild on the banks of the Tees: in the Isle of Isla, and in Culross woods, Scotland. Woodv. med. bot.

t. 74. Fl. dan. 967. Blackw. herb. t. 285. Smith, engl. bot. 1289. Flowers yellowish.

Var. α, *sylvéstre* (D. C. fl. fr. 4. p. 406.) leaves and berries smaller; lobes of leaves short.

Var. β, *horténse* (D. C. l. c.) leaves larger, sometimes variegated; berries sweeter and larger than in var. α. Cultivated in gardens. R. rùbrum, Lois. nouv. dict. 3.

Var. γ, *cárneum* (Berl. mss. ex D. C. prod. 3. p. 481.) leaves rather tomentose beneath; sepals red; cells of anthers distant; berries pale red. R. rùbrum domésticum β, báccis cárneis, Wallr. sched. p. 106.

Var. δ, *variegàtum* (D. C. prod. 3. p. 481.) berries variegated. Wallr. l. c.

Var. ε, *álbum* (Desf. cat. bot. p. 164.) berries white. Ait. hort. kew. 2. p. 40. Wallr. sched. p. 106. Berl. l. c. t. 2. f. 15.

The red currant is called *Groseille ordinaire à grappes*, or *d'outre mer*, in French; *Johannisbeere*, in German; and *Uvetta*, in Italian. It is a low shrub, with smooth branches, downy leaves, yellowish green flowers, disposed in pendulous racemes, which appear in May, and the fruit ripens in June and July. The berries of this shrub, in its wild state, are red; but cultivation has produced white and pale red berries. Professor Martyn observes, that "The currant does not seem to have been known to the ancient Greeks and Romans, as the southern nations of Europe have not even an appropriate name to it at this day. The old French name, *groseilles d'outre mer*, and the Dutch, *beskins overzee*, proclaim their having been strangers imported. Our English name of currant is evidently from the similitude of the fruit to that of the Corinth grape, the small grape of Zante, or the common grocers' Corinths or currants. The red currant has been long cultivated in Britain, and very much improved in the size of the bunch and berry."

Use.—The fruit is acceptable at the dessert, being of an agreeable acid taste. It is much used for jellies, jams, and wines. Forsyth says it is the most useful of all the small fruit, either for the table and kitchen, or for preserving, making wine, &c., and continues longer in succession than any other. According to Withering, the juice forms an agreeable acid to punch; and Professor Martyn says it was a common beverage in Paris in 1763. Its medicinal qualities are similar to those of other subacerb fruits, allaying thirst, lessening an increased secretion of the bile, and correcting a putrid and scorbutic state of the fluids.

Varieties.—There are as follow:

* *Red currants.*

1 *Common red, groseillier rouge à petit fruit, groseillier ordinaire à fruit rouge.*

2 *Red Dutch, large red Dutch, New red Dutch, large red, large bunched red, Morgan's red, red grape, groseillier rouge à gros fruit.* This is the best of the red currants for all purposes.

3 *Knight's large red.*

4 *Knight's sweet red currant.*

5 *Knight's early red currant.*

6 *Champagne, groseillier à fruit couleur de chair.*

7 *Striped-leaved currant, and variegated-leaved currant.*

8 *Large pale red Dutch.*

* * *White currants.*

1 *Common white currant, groseillier à fruit blanc.*

2 *White Dutch currant, new white Dutch, Morgan's white, white crystal, white Leghorn, pearl white.* This is one of the very best of the white currants.

3 *Pearl white, blanc perli.*

4 *Speary's white.*

Propagation and nursery culture.—The same as in the gooseberry. With a view to obtaining new improved varieties from seed, Mr. Knight procured cuttings, in the year 1810, of the finest varieties of the red and white currants, which he planted in pots of very rich mould, and placed under a south wall, to which the trees were subsequently trained. At the end of 3 years, within which period the pots had been as often changed, the trees were first suffered to produce blossoms. These were, with the exception of a very small number, removed from the white currant bushes, as soon as their buds unfolded; and those which remained were deprived of their stamens while immature, and subsequently fertilized by the pollen of the red variety. The seeds thus obtained were sown in pots, as soon as the fruit had become perfectly mature, and were subjected early in the following spring to the artificial heat of a forcing-house; by which means, and by proper subsequent attention, the plants grew more than a foot in height the first season. At 2 years old, in the year 1816, several of the plants, and in 1817, the greater part of them, produced fruit of great variety of character and merits; but out of about 200 varieties, only 3 red and 2 white appeared to possess greater merits than their parents.

Soil and site.—All the sorts are very hardy, will grow freely and bear plentifully almost any where, alike in open or shady situations, by which the fruit may be obtained early, in June and July, and prolonged for several months in succession till October. As to soil, the currant generally does well in any common garden-soil, well tilled and recruited: it bears the greater crop in a strong loam or improved clay, somewhat moist; the earlier in a sandy light soil, which is not poor. Previous to planting, the ground should be dug 2 feet deep.

Final planting. The season for planting, on a dry soil, is any time in open weather from the fall of the leaf till February or March. Plants expected to bear the following summer, are best moved in October, unless the ground be wet in winter. Allot a competent supply of standard bushes, to be planted chiefly in the kitchen garden, in a single row, round the main quarters, or in the outward borders, or some in cross rows, to divide extensive quarters. Plant them from 5-10 feet distance in the row. To raise large supplies, full plantations are formed in parallel rows, with intervals between the rows of 8 or 10 feet, and between the trees in each row of 6 feet. Where convenient, have also some choice sorts, trained against walls, paling, or trellis-work, of different aspects, to obtain early and late fruit in perfection; some against a south exposure for early production; others on east, west, and north walls for intermediate succession and late fruit. Plant them at 6, 8, or 10 feet distance; letting them occasionally fill up the vacant spaces between other wall-trees. The branches should be allowed to advance from near the bottom, and be trained in a nearly horizontal direction, from 3-6 inches asunder. Before nailing them, cut out superabundant and irregular growths, retaining a competency of regular shoots for orderly training, among which, if any are of very considerable length, prune them to moderate extent. Some may likewise be trained as espaliers, in a detached row in the borders or divisions of the quarters. The bushes so trained may either be left to grow without support, or be tied occasionally to stakes, and the branches thus will not overspread the ground. Being kept moderately thin and regular, they will bear fine large fruit, and make an agreeable appearance.

Mode of bearing.—Currant bushes, in general, bear the fruit both on the young wood of one, two, or three years' growth, and on the older branches from small spurs and snags along the sides, which continue for several years fruitful; but the fruit produced on the last year's shoots are always the finest, especially when the old mother bearers have borne more than 4 years.

Pruning.—The chief part of the future culture is seasonable pruning. After the plants are furnished with full heads, they produce many superfluous and disorderly shoots every summer, crowding the general bearers, so as to require retrenchment and regulation, both in the young growth of the year and older wood. The season for the capital pruning is winter; but a preparatory part is performed in summer, to thin the superfluous shoots of the year where too crowded, excluding the sun and air from the fruit. First as to standards:—

Summer pruning.—In May or June cut out close the most irregular shoots, rising in the centre of the bush with all the cross and water shoots, to admit more freely the essential influence of the air and sun, and promote the growth of the fruit and improve its flavour. Also twist off all root suckers as they appear.

Winter pruning.—This extends both to the old and young wood; the time for it is when the plant is at rest. Of the shoots of the preceding summer, cut out the cross-placed and the otherwise irregular, with those which are not wanted for vacancies; but superfluous good lateral shoots are to be cut down to short stubs or artificial spurs, about half an inch long, so as to leave an eye or two, in order that they may send out fruit-shoots and spurs. With regard to the old bearers, take away those which are naked, or getting unfruitful, or of which the fruit is declining in size; reduce any of excessive length, pruning in to some well-placed lateral young shoot, to preserve the head within some regular compass; cut out also any decayed or cankery parts; retain a competency of the finest best-placed new shoots above and below vacant parts, to come in for successional bearers, or to supply the places of defective old wood, and preserve a leading shoot to the principal branches, where within orderly limits, shortening such terminal shoots as are of greatest length to 10, 12, or 15 inches, according to their strength and the situation of the branches, and leaving those of small extent mostly entire. Take care of the small lateral fruit-spurs, and occasionally select short lateral shoots of 1, 2, or 3 inches, for bearing fruit; or similar small shoots may be cut to short snags of an inch or two long, also for fruiting. Thin out spurs of the old branches where very thick. As the old fruit branches decline bearing, or decay, cut them away, taking care to provide young ones in succession; and thus keep the bushes always furnished with full-bearing branches, and advancing young bearers, in a regular open expansion, 6, 8, or 10 inches asunder at the extremities, circumscribing the general head within the height of 3 or 4 feet, or 5 at most.

"Currants of the finest quality," Mr. Neill observes, "are raised by Macdonald, at Dalkeith House. A good deal depends upon the way in which he manages the bushes, especially during the ripening of the fruit. He prunes the bushes at the usual season of mid-winter, shortening the last year's shoots down to an inch or an inch and a half. Next summer the plants show plenty of fruit, and at the same time throw out plenty of strong shoots. As soon as the berries begin to colour, he cuts off the summer shoots to within 5 or 6 inches before the fruit. This is commonly done with the garden shears, with which a man may go over half an acre of bushes in a day. Sun and air thus get more free access, and more of the vigour of the plant is directed to the fruit; the berries are found not only to be of higher flavour, but larger than usual."—Neill, Cal. mem. vol. 2.

To wall-bushes, espaliers, and fan-standards, without support, the same course of summer and winter pruning is applicable, with the obvious variations required by their figure. In training wall-trees, 2 branches are led in an horizontal direction along the bottom of the wall or trellis, perhaps half a foot from the surface of the earth, and the growths from these of all upright shoots, which will admit of being arranged at the distance of 5 or 6 inches from each other, is encouraged. Fan standards are sometimes trained in a manner nearly similar, and sometimes with the branches radiating from the crown of the stem.

Insects, &c.—The red currant is occasionally attacked by the caterpillar, and very frequently by the àphis rìbes, Lin. which changes the colour of the leaves to red, pits and puckers them, and causes the fruit to be shrivelled and flavourless. Forsyth says, "As currants are very liable to be devoured by earwigs, which take shelter under their leaves and branches, bundles of bean-stalks should be hung up some time before the bushes are covered with mats or nets. If proper attention be not paid to this, the fruit will generally suffer very much from these insects. After the bushes are covered, take the mats off once in 3 or 4 days, and kill the earwigs that have got into the bean-stalks, which it will be necessary still to keep hung up. As there is a sweetness in the inside of bean-stalks which attracts the earwigs, they very regularly take shelter in them from rain."

Taking the crop and preserving.—The ripening fruit comes in for small gatherings in June, advances to maturity in July, and continues in perfection till the end of August; or if trees in a full exposure are timely defended from birds and the full sun, with garden mats, or protected with nets where they grow against walls, the fruit may be continued good till September or October. Gather in a dry state, as in rainy weather they lose their flavour.

Forcing.—To obtain early currants by forcing, let some good bearing trees, in pots, be placed early in January or February, in any common forcing department: they will produce ripe fruit in April or May.

Red and White Currant. Fl. April, May. Brit. Sh. 4 to 6 ft.

50 R. GLANDULÒSUM (Ruiz. et Pav. fl. per. t. 233. f. 6. but not of Ait.) leaves cordate, bluntly 3-lobed, doubly serrated, rugged; racemes short; calyx glandular, pubescent. ♄. H. Native of Chili, on wooded hills. Berl. l. c. t. 2. f. 20.

Glandular-calyxed Currant. Fl. April, May. Clt. 1820. Shrub 4 to 6 feet.

51 R. CAMPANULA'TUM (Humb. et Bonpl. in Willd. herb. ex Rœm. et Schultes, 2. p. 500.) leaves somewhat 5-lobed, doubly crenated, cordate, hairy beneath; lobes obtuse; petioles ciliated with glandular hairs; racemes pendulous; calyx campanulate; petals oblong-spatulate; styles bifid. ♄. H. Native of Mexico, near Moran, at the height of 3900 feet. R. affìne, H. B. et Kunth, nov. gen. et spec. amer. 6. p. 60. Flowers white. Hardly distinct from the following species.

Campanulate-calyxed Currant. Shrub 4 to 5 feet.

52 R. KU'NTHII (Berl. mss. ex D. C. prod. 3. p. 482.) leaves somewhat 5-lobed, doubly serrated, rather cordate at the base, pubescent; racemes solitary or numerous, crowded, erect; calyx campanulate; petals spatulate, reflexed; stamens 5-6, hardly shorter than the petals; styles 3-4-cleft; stigmas capitate. ♄. H. Native of Mexico, along with the preceding. R. multiflòrum, H. B. et Kunth, l. c. but not of Kit.

Kunth's Currant. Shrub 4 to 6 feet.

53 R. TRI'STE (Pall. nov. act. petro. 10. p. 378.) leaves 5-lobed; branches simple, twiggy, bearing leaves and racemes of flowers at the apex; racemes pendulous, both when in flower and in fruit; corollas flattish, reddish on the outside, and yellowish inside; petals revolute. ♄. H. Native of Siberia, on the Mongol Mountains. Berries small, black, insipid. Root creeping.

Dark-fruited Currant. Fl. April, May. Clt. 1820. Shrub 2 to 3 feet.

54 R. GLACIA'LE (Wall. cat. no. 6833.) branches smooth; leaves glabrous above, but with a few scattered bristly hairs beneath, cordate at the base, 3-5-lobed at the apex; lobes acute, serrated; petioles long, serrated at the base; racemes droop-

ing; calyx campanulate; petals longer than the calyx. ♄. H. Native of Nipaul, on Emodi and Gosaingsthan. Flowers white. Berries black.

Icy Currant. Fl. April, May. Clt. 1823. Sh. 4 to 6 feet.

55 R. nìgrum (Lin. spec. 291.) leaves dotted from glands beneath, 3-5-lobed; racemes loose; bracteas minute, subulate or obtuse, much shorter than the pedicels; petals oblong; calyx campanulate, with reflexed segments. ♄. H. Native of Europe and Siberia, in woods; plentiful in some parts of Britain about the banks of rivers, in the north of England and in Scotland. Berl. l. c. t. 2. f. 21. Woodv. med. bot. t. 75. Fl. dan. 556. Blackw. 285. Smith, engl. bot. 1291. R. ólidum, Mœnch. meth. 683. Flowers whitish green; calyx often of a rich brownish red-colour. Stamens sometimes more than 5, and there are fewer petals; so that when there are 10 stamens, there are no petals; this change of petals into stamens is just the reverse of the process by which single flowers become double; but it is the only fact of the kind which has hitherto been observed. Stigmas bifid. Berries globose, black, glandular. The black currant is a shrub with smoothish branches, strong smelling leaves, with a solitary 1-flowered pedicel at the base of each raceme. The flowers appear in April, and the fruit ripens in June and July, and changes from a green to a black colour. It is a native of most parts of Europe, especially the more northern parts. It abounds in the woods in the north of Russia, and the subalpine regions of Siberia, where the branches and berries are very large, and sapid. In Britain it is found in wet hedges, on the banks of rivers, in alder swamps, and sometimes in woods.

Use.—The fruit, which has a peculiar flavour, and disliked by some, is seldom brought to the dessert; but it is eaten in puddings and tarts, and made into jellies and wines. The Russians put the berries into brandy, and the Irish into whisky, in the same way as the English put cherries: the Russians also ferment the juice with honey, and so form a strong and palateable wine. Many cottagers, who cannot afford to mix green tea with black, substitute one or two dried leaves of the black currant, the flavour produced by which few are so acute as to distinguish from that of the mixture of green and black tea.

The *varieties* are as follow:

1 *Wild black.* 2 *Black grape, Ogder's black grape.* 3 *Black Naples, Cassis* of the French; this is one of the best of black currants. 4 *Green-fruited black;* fruit of a dingy colour, of no value. 5 *Russian green.*

Propagation.—By cuttings. See *gooseberry.*

Soil and site.—A moist soft soil, and shady situation; such as is afforded by borders of north exposure is preferable. Miller says, "the fruit is always best when the plants are placed in an open situation, in light loamy soil."

Final planting.—As only a few plants are in general required for private gardens, these may be placed at the distance recommended for gooseberries, in the margin of a shady border, or against a wall of a north exposure. Mr. Neill says, it produces most fruit as a standard, but the largest berries when trained to a wall.

Mode of bearing.—The black currant bears chiefly on the shoots of the preceding year, and also from snags and spurs, which, however, are less abundant, and of smaller size in the black currant than in the gooseberry or red currant.

Insects and diseases.—The black currant is seldom attacked by insects, though, like the elder tree, it has its own variegated caterpillar, which sometimes reduces it to a state of complete nudity.

Gathering the fruit.—See *red currant.*

Forcing.—The black currant may be forced in pots like the gooseberry. In Russia this is often done for the sake of the fragrance of the leaves.

Black Currant. Fl. April. Britain. Shrub 4 to 6 feet.

56 R. Biebersteìnii (Berl. mss. ex D. C. prod. 3. p. 482.) leaves cordate, acutely 3-5-lobed, sharply and doubly serrated, rather pilose above, and villously tomentose beneath; serratures numerous; racemes nodding; petals minute. ♄. H. Native of Caucasus. R. Caucásicum, Bieb. fl. taur. suppl. 160. but not of Adams. Leaves having a strong scent like those of *R. nìgrum.* Berries black.

Bieberstein's Currant. Shrub 4 to 6 feet.

57 R. Hudsonia'num (Richards in Frankl. first. journ. ed. 2. append. p. 6.) branches erect; leaves 3-lobed, quite glabrous above, full of resinous dots beneath, and are, as well as the petioles, villous; germens dotted; berries globose, glabrous, black; racemes erect, pubescent; bracteas short; segments of the calyx, which is campanulate, spreading. ♄. H. Native of North America, from Hudson's Bay to the Rocky Mountains, in the west, and as far north as lat. 57°. Flowers small; petals white. The fruit, and peculiar odour of the plant, are that of *R. nìgrum.*

Var. β; racemes longer; calyx smoothish. ♄. H. Native of the north-west coast of America, on the mountains of the Columbia, about the Kettle Falls. R. petiolàre, Doug. in hort. trans. 7. p. 514.

Hudson's Bay Currant. Shrub 3 to 4 feet.

58 R. flóridum (Lher. stirp. 1. p. 4.) leaves full of resinous glands, 3 or 5-lobed, cordate, double-serrated; racemes pendulous, pubescent; bracteas linear, longer than the pedicels; calyx tubularly campanulate, glabrous: with the segments obtuse, and at length reflexed; germens and black berries oval-globose, glabrous. ♄. H. Native throughout Canada; and of Pennsylvania. Berl. l. c. t. 2. f. 22. R. nìgrum β, Lin. spec. 291. R. Pennsylvánicum, Lam. dict. 3. p. 49. R. recurvàtum, Michx. fl. bor. amer. 1. p. 109. according to Torrey.—Ribèsium nìgrum, &c. Dill. elth. 2. t. 244. f. 315. This is in many respects allied to *R. nìgrum*, but its more copious, denser flowers, and especially the long bracteas, and more tubular calyx, will always distinguish it; the solitary pedicel too at the base of the flowers is wanting in this species. Petals oblong, rather erose at the apex.

Flowering Currant. Fl. April, May. Clt. 1729. Sh. 4 to 6 ft.

59 R. ine'brians (Lindl. in bot. reg. 1471.) leaves roundish, deeply 3-5-lobed, and deeply toothed, truncate at the base, glandular on both surfaces; petioles pubescent; peduncles 3-5-flowered, pendulous; flowers aggregate; calyx tubular, glandular, with the segments recurved. ♄. H. Native of North America. Calyx greenish white, with the tube 4 lines long. Leaves smelling like those of *R. flóridum.* The species was received from Mr. Floy of New York, under the name of intoxicating currant, but without any account of its quality. The berries probably possess some narcotic quality.

Intoxicating Currant. Clt. 1827. Fl. April. Shrub 3 to 4 ft.

60 R. ce'reum (Dougl. in hort. trans. 7. p. 512. bot. reg. 1263. Hook. fl. bor. amer. 1. p. 234.) leaves small, cordate, lobed, serrated, clothed with glandular pubescence, glabrous, glaucous, full of white glands above; racemes pendulous, rather capitate; bracteas ovate, adpressed to the germens, which are glabrous; flowers nearly sessile, cylindrical, rather angular; calycine segments small, reflexed. ♄. H. Native of North-west America, on the banks of the Columbia, and its southern tributary streams, from the Great Falls to the Rocky Mountains, in gravelly or sandy soil. In the small foliage, and few-flowered racemes, this species resembles the gooseberry tribe, but without any thorns. The flowers are rather large and white, with a slight tinge of green, rather downy. White waxy dots like scales cover the upper surface of the leaf, whence the specific name.

Waxy-leaved Currant. Fl. April. Clt. 1827. Shrub 2 to 3 ft.

61 R. viscosí'ssimum (Pursh. fl. amer. sept. 1. p. 153.) leaves cordate, obtuse, 3-5-lobed, deeply crenated, viscid from glandular pubescence: glands on both surfaces; racemes erect, corymbose; bracteas linear-obovate, rather shorter than the pedicels, which are clothed with glandular hairs; calyx tubularly campanulate, with erectly spreading obtuse segments; germens and fruit ovate-oblong, clothed with viscid hairs. ♄. H. Native of North America, on the Rocky Mountains, and in dry plains in partially shaded places towards the sources of the Columbia; also on the summits of the hills near the Spokan and Kettle Falls, at an elevation of 8000 feet above the sea. Hook. fl. bor. amer. 1. p. 234. t. 74. Berries oblong-ovate, black. Flowers large, pale yellowish green. This is a very fine and remarkable species.

Very-clammy Currant. Fl. April, May. Clt. 1826. Shrub 4 to 8 feet.

* * *Flowers deep red.*

62 R. atropurpu'reum (Meyer in Led. fl. ross. alt. ill. t. 231. fl. alt. 1. p. 268.) stem erect; leaves pubescent, nearly orbicular, cordate, 3-5-lobed; lobes acute, serrated; racemes drooping; pedicels exceeding the bracteas; calyxes campanulate, ciliated; berries glabrous, bractless. ♄. H. Native of Altaia, on mountains and subalpine places at the river Ursal, also at the river Tscharysch. Berries dark purple, size of those of the common currant.

Var. α; flowers deep purple; leaves rather pubescent beneath, but smooth and glabrous above, as well as the branches.

Var. β; leaves rather pubescent beneath, but hispid from bristles above, as well as the petioles and stems. Near the river Volschoi Ulegumen.

Var. γ; flowers paler; leaves pubescent above, but most so below; branches smooth.

Dark-purple-flowered Currant. Fl. April, May. Shrub 4 to 6 feet.

63 R. sangui'neum (Pursh. fl. amer. sept. 1. p. 164.) leaves cordate, somewhat 5-lobed, serrated, veiny, smoothish above, but clothed with villous tomentum beneath; racemes drooping, pubescent, twice the length of the leaves; calyx tubularly campanulate, with oblong obtuse spreading segments, exceeding the petals, which are red, and quite entire; bracteas obovate-spatulate; berries turbinate, hairy. ♄. H. Native of the north-west coast of America, in abundance from lat. 38° to 52°, usually growing in rocky situations by the sides of streams. Dougl. in hort. trans. 7. t. 13. bot. reg. 1349. Sweet, fl. gard. n. s. t. 109. R. malvàceum, Smith in Rees' cycl. This is perhaps the most ornamental species of the genus, bearing a profusion of large racemes of deep rose-coloured flowers, and is therefore well adapted for ornamenting shrubberies and pleasure grounds. The berries are brownish black and bitter, completely destitute of the pulpy substance common to most of the species of the tribe.

FIG. 23.

Bloody-flowered Currant. Fl. April. Clt. 1826. Shrub 4 to 8 feet.

Sect. V. Symphoca'lyx (from *συμφυω, symphuo,* to join together, and *καλυξ, calyx,* a calyx; in reference to the calyx being tubular in all the species belonging to this section). Berl. l. c. t. 2. D. C. prod. 3. p. 483. Calyx tubular, yellow. Racemes many-flowered. Leaves compassing in the bud. Unarmed shrubs.

64 R. au'reum (Pursh. fl. amer. sept. 1. p. 164.) quite glabrous; leaves 3-lobed; lobes divaricate, with a few deep teeth, shorter than the petioles, which are ciliated at the base; calyxes tubular, longer than the pedicels: tube slender: segments oblong, obtuse; petals linear, much shorter than the calycine segments; bracteas linear, length of the pedicels; style entire; berries glabrous. ♄. H. Native of North-west America, in light gravelly soils, from the Great Falls of the Columbia River to the mountains, and on the southern branches. Berl. l. c. t. 2. f. 23. Flowers golden yellow. Fruit yellow, seldom black, and of an exquisite flavour.

Var. α, præ'cox (Lindl. in hort. trans. 7. p. 242.) flowers earlier; leaves cuneated at the base, pubescent beneath; lobes deeply serrated; berries copious, earlier, turbinate; racemes bracteate. ♄. H. Native of North America.

Var. β, villòsum (D. C. prod. 3. p. 483.) leaves rather villous. R. longiflòrum, Fraser, cat. 1813.

Var. γ, serótinum (Lindl. l. c.) flowers late; leaves of various forms, smoothish beneath; lobes deeply serrated; berries few, late, round; racemes naked. ♄. H. Native of North America.

Golden-flowered Currant. Fl. April, May. Clt. 1812. Shrub 6 to 8 feet.

65 R. tenuiflòrum (Lindl. in hort. trans. 7. p. 242. bot. reg. 1274.) unarmed, quite glabrous; leaves roundish, 3-lobed, mealy; lobes bluntly toothed at the apex; racemes pendulous, many-flowered; calyx tubular, glabrous, longer than the pedicels, coloured; petals quite entire, linear, one-half shorter than the segments of the calyx, which are oblong and obtuse; bracteas linear, length of the pedicels; berries glabrous. ♄. H. Native of North America, common on the rocky tracts of the Columbia, near the head waters of the Missouri. R. aúreum, Colla, hort. rip. append. 3. t. 1. f. A. R. flàvum, Berl. in D. C. prod. 3. p. 483. R. Missouriénsis, Hort. In habit this species is more erect than *R. aúreum,* and has the young wood more thinly clothed with leaves; its whole appearance is also paler during the early part of the season. The flowers are not more than half the size of those of *R. aúreum,* and have entire, not notched petals. The fruit is the size of a red currant, of an agreeable flavour, but possessing little acidity.

Var. α, frúctu-nìgro; berries changing from yellow to red, and finally acquires a deep blackish purple-colour.

Var. β, frúctu-lùteo; fruit yellow, always retaining the same colour.

Slender-flowered Currant. Fl. April, May. Clt. 1812. Sh. 6 to 8 feet.

66 R. fla'vum (Coll. hort. ripul. append. 3. p. 4. t. 1. f. *β.*) unarmed, quite glabrous; young leaves 3-lobed: adult ones usually 5-lobed, deeply toothed, about equal in length to the ciliated petioles; racemes short, 4-5-flowered; calyx tubular, much longer than the pedicels; tube slender: segments rather spatulate, reflexed; petals one-half shorter than the calycine segments; bracteas elliptic; berries oblong, glabrous. ♄. H. Native of North America. R. aúreum *γ* sanguíneum, Lindl. in hort. trans. 7. p. 242. R. palmàtum, Desf. hort. par. R. aúreum, Ker, bot. reg. t. 125. but not of Pursh. Flowers yellow.

Yellow-flowered Currant. Fl. April, May. Clt. 1812. Shrub 6 to 8 feet.

Cult. All the species of *Ribes* grow well in any kind of soil, and all root freely from cuttings planted in autumn, or early in spring. Those species, natives of Chili, Peru, Mexico, and other parts of South America, require shelter in severe weather. Some of the species are well adapted for ornamenting shrubberies and pleasure grounds. But the most ornamental and

most worthy of cultivation are *R. speciòsum*, *R. Menzièsii*, *R. sanguíneum*, *R. atropurpùreum*, and *R. aùreum*.

Order CXIX. ESCALLO'NEÆ (plants agreeing with *Escallònia* in important characters). R. Brown, in Franklin's voy. p. 766. (1824.). Saxifràgeæ, Sect. I. Escallonièæ, D. C. prod. 4. p. 4.

Calyx superior, 5-toothed (f. 34. *b.* f. 35. *a.*). Corolla of 5 petals (f. 34. *e.* f. 35. *b.*), alternating with the calycine segments, from within which they rise, forming by their cohesion a tube (f. 34. *e.*), but finally separating from each other (f. 35. *b.*), imbricate in æstivation. Stamens arising from the calyx (f. 35. *b.*), alternating with the petals (f. 35. *b.*); anthers bursting lengthwise. Disk conical, epigynous (f. 34. *c.*), plaited, surrounding the base of the style (f. 34. *c.*). Ovarium inferior (f. 34. *a.*), 2-celled, with 2 large polypernous placentas (f. 34. *f.*) in the axis. Style simple (f. 34. *d.*). Stigma 2-lobed. Fruit capsular, 2-celled, crowned by the style and calyx (f. 34. *a. b. c. d.*), which are permanent, splitting by the separation of the cells at their base. Seeds numerous, minute, with a transparent membranous integument. Embryo minute, in the apex of an oily albumen, having the radicle pointing to the extremity opposite the hilum.—Shrubs or trees. Leaves alternate, exstipulate, simple, full of resinous glands. Flowers axillary, conspicuous, white, rarely reddish.

This order is distinguished from *Grossularièæ* by the cohering petals, and by the radicle being at the extremity of the seed, opposite the hylum; the albumen is also oily, not horny, and the placentas are not parietal; from *Philadélpheæ* they are known by their glandular leaves and minute embryo; from *Vaccinièæ*, by the final separation of the petals, and by the anthers.

Synopsis of the genera.

1 Escallònia. Limb of calyx 5-toothed or 5-lobed (f. 34. *b.*). Stigma peltate, 2-lobed (f. 34. *d.*). Capsule baccate (f. 34. *f.*), somewhat 2-celled, opening by pores at the base. Seeds scrobiculate.

2 Quintínia. Limb of calyx 5-toothed. Stigma peltately capitate, 4-5-lobed. Capsule 3-celled. Seeds compressed.

3 Forge'sia. Limb of calyx 5-parted. Style finally divisible into 2 parts; stigma 2-lobed. Capsule 2-celled, dehiscing between the parts of the style.

4 Anópterus. Calyx 6-lobed (f. 35. *a.*). Petals and stamens 6 (f. 35. *b.*). Stigma bifid (f. 35. *e.*). Capsule 1-celled, 2-valved (f. 35. *d.*). Seeds compressed, furnished with a wing at the top.

5 Ite'a. Calyx 5-cleft. Stigma capitate. Style finally divisible into 2 parts. Capsule compressed, 2-celled, separable into 2 parts.

I. ESCALLO'NIA (in honour of Escallon, a Spaniard, a traveller in South America, who found the first species of this genus in New Granada). Mutis, in Lin. fil. suppl. p. 21. Vent. choix. p. 54. Gærtn. fr. carp. 3. p. 16. t. 182. H. B. et Kunth, nov. gen. amer. 3. p. 294. D. C. prod. 4. p. 2. Stereóxylon, Ruiz. et Pav. fl. per. prod. p. 38.—Escallònia, Rœm. et Schultes, syst. 5. no. 956. exclusive of *Imbricària*.

Lin. syst. *Pentándria*, *Monogýnia*. Tube of calyx semiglobose, adnate to the ovarium (f. 34. *a.*); limb 5-toothed or 5-lobed (f. 34. *b.*). Petals 5, arising from the calyx. Stamens 5; anthers ovate-oblong. Style filiform, permanent. Stigma peltate (f. 34. *d.*), somewhat 2-lobed by a furrow. Capsule baccate (f. 34. *f.*), crowned by the calycine lobes and the style (f. 34. *b. c. d.*), somewhat 2-celled, dehiscing irregularly by pores at the base; dissepiment incomplete at the top, and therefore placentiferous. Seeds very numerous, scrobiculate.—Trees and shrubs, natives of South America, especially Chili, usually full of resinous glands. Leaves scattered, serrated, or entire. Flowers terminal, bracteate, variously disposed, white or red. In many of the species there is present a conical pervious urceolus, girding the base of the style; for this reason the species of the genus may hereafter be formed into sections.

* *Pedicels solitary, 1-flowered.*

1 E. serra'ta (Smith, icon. ined. 2. p. 31.) shrub glabrous, erectish; leaves obovate, obtuse, serrated, veinless beneath (except the middle nerve); flowers terminal, solitary; petals oblong, tongue-shaped. ♄. F. Native of the Straits of Magellan, at Terra del Fuego. Rœm. et Schultes, syst. 1. p. 326. Stereóxylon serràtum, Poir. dict. 7. p. 435. Flowers white.

Serrated-leaved Escallonia. Shrub 3 to 6 feet.

2 E. myrtilloìdes (Lin. fil. suppl. p. 156.) shrub glabrous; branches spreading much; leaves obovate-oblong, acutish, crenately serrulated, veiny; flowers terminal, solitary; petals spatulate. ♄. F. Native of New Granada, every where on the Andes, in cold places. Smith, icon. ined. 2. t. 30. H. B. et Kunth, nov. gen. amer. 3. p. 294. Stereóxylon pàtens, Ruiz. et Pav. fl. per. 3. t. 234. f. 6. but the leaves and flowers are larger.

Myrtle-like Escallonia. Shrub 6 to 10 feet.

3 E. alpìna (Pœpp. pl. exsic. no. 820.) branches glabrous; leaves obovate, narrowed into short petioles, serrated at the apex, densely clothed with fine down beneath, and with scattered down above; flowers axillary, solitary, on short pedicels; tube of calyx puberulous, with subulate teeth; petals oblong-tongue-shaped. ♄. F. Native of Chili, on the higher mountains. Flowers white.

Alpine Escallonia. Shrub 3 to 4 feet.

4 E. tortuòsa (H. B. et Kunth, nov. gen. amer. 3. p. 295.) shrub glabrous; branches spreading, twisted; leaves obovate, acute, reticulately veined, glandularly crenated, rather shining; flowers nearly terminal, solitary; lobes of calyx quite entire. ♄. F. Native in very rough mountainous places, on the Andes about Quito. Flowers white. Allied to *E. myrtilloìdes* and *E. corymbòsa*. Fruit almost the size of that of *Vaccínium myrtíllus*.

Twisted Escallonia. Shrub 3 to 6 feet.

5 E. berberifòlia (H. B. et Kunth, nov. gen. amer. 3. p. 296.) shrub glabrous; branches spreading; leaves obovate, bluntish, crenulately denticulated, reticulately veined; flowers terminal, solitary; lobes of calyx quite entire; petals rather spatulate. ♄. F. Native on the Andes, about Quito. Flowers white. Perhaps only a variety of *E. tortuòsa*, according to the authors.

Barberry-leaved Escallonia. Shrub 3 to 4 feet.

6 E. corymbòsa (Pers. ench. 1. p. 234.) shrub glabrous; branches erectish; leaves oblong, acute, serrulated; flowers terminal, solitary; lobes of calyx denticulated; petals oblong. ♄. F. Native of Peru, in cold humid places, on high hills, where it is called *Siuba* by the natives. Stereóxylon corymbòsum, Ruiz. et Pav. fl. per. 3. p. 14. t. 234. f. a. Peduncles

straight, bearing 1 leaf each, just under the calyx. Petals white, spreadingly reflexed. Stigma peltate.

Corymbose-flowered Escallonia. Shrub 6 to 10 feet.

7 E. VIRGA'TA (Pers. ench. 1. p. 234.) shrub glabrous; branches erect; leaves obovate, acute, serrulated, veinless; peduncles nearly terminal, 1-flowered; lobes of calyx denticulated; petals obovate. ♄. F. Native of South America, on mountains, and in humid woods in the province of Rere, near Nacimiento. Stereóxylon virgàtum, Ruiz. et Pav. fl. per. 3. p. 14. t. 235. f. 6. Stem much branched; branches cinereous, grey, rather spinose. Flowers white.

Twiggy Escallonia. Shrub 5 to 10 feet.

8 E. PUNCTA'TA (D. C. prod. 4. p. 3.) shrub smoothish; branches erectish; leaves obovate obtuse, or lanceolate acuminated, serrated, full of resinous dots beneath; pedicels 1-flowered, arising from the axils of the upper leaves, each bearing 2 linear bracteoles; lobes of calyx long, denticulated. ♄. F. Native of South America. Allied to *E. virgàta*, but differs in the leaves being dotted beneath; to *E. rùbra*, but the flowers are on axillary, solitary, 1-flowered pedicels. In this and in *E. rùbra* the urceolus is conical and pervious at the apex, 10-angled, and 10-toothed, girding the style at the base.

Dotted-leaved Escallonia. Shrub 5 to 8 feet.

9 E. FLÓRIDA (Pœpp. pl. exsic. no. 843. ex D. C. prod. 3. p. 666.) shrub glabrous; leaves linear-lanceolate, acuminated at both ends, with a few serratures, crowded; flowers on short pedicels, arising from the axils of the upper leaves, solitary, collected into an ovate raceme; limb of calyx 5-cleft, with obtuse recesses and acute lobes; petals obovate, on short claws. ♄. F. Native of Chili, probably on the mountains. Leaves 8-9 lines long, and 1½ line broad. Petals with obscure veins, which are pinnately disposed.

Florid Escallonia. Shrub 4 to 6 feet.

* * *Flowers disposed in terminal racemes or panicles.*

10 E. RU'BRA (Pers. ench. 2. p. 235.) shrub smoothish; branches erect, when young clothed with glandular villi; leaves obovate-oblong, acuminated, serrated, full of resinous dots beneath; peduncles 2-7-flowered, bracteate; lobes of calyx denticulated; petals spatulate. ♄. F. Native of Chili, on the mountains at Colocolo, in the fissures of rocks, and about Valparaiso. Hook. bot. mag. 2890. Stereóxylon rùbrum, Ruiz et Pav. fl. per. 3. t. 236. f. b. Petals red, conniving, but spreading a little at the apex. (f. 34. *e*.)

FIG. 34.

Var. α, glabriúscula (Hook. et Arn. in bot. misc. 3. p. 252.) branches glandular, hardly pubescent; leaves glabrous; flowers red. ♄. F. Native of Chili, near La Guardia, on the Andes of Chili, and about Valparaiso.

Var. β, albiflòra (Hook.et Arn. l. c.) flowers white. ♄. F. E. glandulòsa, Lodd. bot. cab. t. 1291. Native of Chili; and the province of Maule.

Var. γ, pubéscens (Hook. et Arn. l. c.) branches hardly glandular, but clothed with villous pubescence; leaves pubescent on both surfaces, but more so beneath; flowers red. ♄. F. Native of the Andes of Chili. The leaves of all the varieties are spotted beneath with resinous dots.

Red-flowered Escallonia. Fl. July, Sept. Clt. 1827. Shrub 3 to 6 feet.

11 E. Pœppigia'na (D. C. prod. 4. p. 3.) shrub smoothish; branchlets pubescent, rather clammy; leaves oval, acute, tapering into the petiole, serrated, full of resinous dots beneath, rather clammy above; pedicels 1-flowered, disposed in a few-flowered, terminal raceme; calyx glandular, with the tube drawn out beyond the ovarium: teeth subulate; petals erect, oblong. ♄. F. Native of Chili. E. rùbra, Pœpp. pl. exsic. no. 81. Flowers red. Like *E. rùbra*, but differs in the peduncles being 1-flowered, in the teeth of the calyx being subulate, in the urceolus not being prominent, and in the style being equal in length to the petals. There is a long-leaved variety of this, or a species, which was collected on the mountains in Chili, where it is called by the natives *Ripa*.

Pœppig's Escallonia. Shrub 4 to 6 feet.

12 E. MACRA'NTHA (Hook. et Arn. in bot. misc. 3. p. 251.) branches pubescent, glandular; leaves ovate-elliptic, bluntish, cuneated at the base, glabrous, full of resinous dots beneath, bluntly crenate-serrated; lower peduncles simple, axillary: upper ones racemose; bracteoles wanting, or very minute; calycine teeth subulate. ♄. F. Native of Chiloe. Petals connivent. The flowers are larger and the leaves broader than in *E. rùbra*.

Large-flowered Escallonia. Shrub.

13 E. MYRTOI'DEA (Bert. in litt. ex D. C. prod. 4. p. 666.) shrub glabrous; leaves lanceolate, serrated, attenuated at the base; racemes terminal, nearly simple, hardly longer than the leaves; limb of calyx campanulate, 5-cleft: lobes subulate, reflexed; petals obovate, on long claws. ♄. F. Native of Chili, at the river Cachapual near Rancagua, where it is commonly called *Lun*. The calyx agrees with that of *E. revolùta*, but differs in the whole plant being smooth, and in many other points.

Myrtle-like Escallonia. Shrub 3 to 6 feet.

14 E. ILLINI'TA (Presl, in reliq. Hænk. 2. p. 49. t. 59.) quite glabrous; branches spreading, anointed with resin; leaves petiolate, obovate or oblong, obtuse, crenulated, attenuated at the base, beset with glandular dots above, and clammy; panicle terminal, many-flowered, leafy; calycine segments acuminated, quite entire; petals on long claws; capsule turbinate, 5-nerved; style furnished with a 10-toothed, 10-angled, pervious, cylindrical urceolus at the base, as in most of the species. ♄. F. Native of the Cordillera of Chili.

Var. α; leaves beset with shining resinous dots on both surfaces, but especially beneath. ♄. F. Native of Chili, in El Arroyo de Los Lanes, Valle del Rio Tinguiririca, where it is called by the natives *Lun*.

Var. β; leaves bearing minute glands beneath. ♄. F. Native of Chili, in La Siente Vieja, and La Cuesta de Chacabuco, and La Laguna near Valparaiso, where it is called by the natives *Araca* or *Arayan*. This variety is perhaps a distinct species; the glands beneath sometimes pass into a kind of pubescence.

Anointed Escallonia. Shrub 3 to 6 feet.

15 E. ARGU'TA (Presl, reliq. Hænk. 2. p. 48. t. 58.) quite glabrous; branches erect; leaves obovate or oblong-lanceolate, mucronate, sharply serrated, attenuated into the petiole, discoloured beneath; panicle terminal, many flowered; rachis pubescent; segments of calyx acute, quite entire; petals spatulate, on long claws; capsule turbinate, 10-nerved. ♄. F. Native of Chili, at San Gabriel, La Guardia, and La Cuesta del Inga; Andes of Chili; and Valle del Rio Claro. *Lun* is its vernacular name. E. microcárpa, Gill. mss. E. refléxa, Gill. mss. E. myrtoídea, Gill. mss. hardly of Bertero. The raceme is very compact, and the flowers nearly sessile. Perhaps afterwards it may prove a mere state of *M. rùbra*.

Sharp-serrate-leaved Escallonia. Shrub 3 to 6 feet.

16 E. RESINÒSA (Pers. ench. 1. p. 235.) shrub glabrous; branches erect; branchlets anointed with resin; leaves oblong, obovate, hardly narrowed at the base, sessile, glandularly serrulated; panicles few-flowered, terminal; lobes of calyx quite entire; petals obovate-oblong. ♄. F. Native of Peru, on the cold parts of hills. H. B. et Kunth, nov. gen. amer. 3. p. 296. Stereóxylon resinòsum, Ruiz et Pav. fl. per. 3. p. 14. t. 235. f. 2. Style permanent, hardly longer than the fruit.

Resinous-branched Escallonia. Tree 10 to 20 feet.

17 E. GRAHAMIA'NA (Gill. mss. ex Hook. et Arn. in bot. misc. p. 253.) plant glabrous; branches straight, angular, rather resinous; leaves elliptic-oblong, bluntish, a little attenuated at the base, crenate-serrated, beset with a few resinous dots beneath; flowers in compact panicles, on short pedicels; fruit obconical; calycine segments subulate. ♄. F. Native of Chili, in El Valle del Rio Tinquiririca. The branches of the panicle contain each 3 or 4 flowers, on pedicels hardly a line in length. The fruit or tube of the calyx is about twice as long as it is broad, and twice or thrice the length of the pedicels.

Graham's Escallonia. Shrub.

18 E. SELLOWIA'NA (D. C. prod. 4. p. 4.) shrub glabrous; branches erect; leaves lanceolate, tapering into the petiole at the base, serrated, full of resinous dots beneath; panicles many flowered, terminal; teeth of calyx short, quite entire; petals spatulate. ♄. F. Native of Brazil. E. resinòsa var. dodonæifòlia, Cham. in Linnæa. 1. p. 545. Very like *E. resinòsa*. Style hardly longer than the fruit. Flowers white.

Var. β, spiræifòlia (D. C. prod. l. c.) leaves obovate, obtuse, tapering into the petiole at the base. ♄. S. Native of Brazil. E. resinòsa spiræifòlia, Cham. in litt.

Sello's Escallonia. Tree 10 to 20 feet.

19 E. CALLCÓTTIÆ (Hook. et Arn. in bot. misc. 3. p. 252.) branches smoothish, glandless; leaves ovate, oblong, oval or roundish, acute at both ends, petiolate, glabrous, glandless, with sharp adpressed serratures; flowers panicled; petals erect, on long claws; teeth of calyx subulate. ♄. F. Native of Juan Fernandez, where it was collected by Mrs. Callcott, late Mrs. Maria Graham. The lower peduncles of the raceme are branched, thus forming a panicle. The toothed urceolus at the base of the style is not so conspicuous in this as in other species of the genus.

Callcott's Escallonia. Shrub.

20 E. MONTEVIDE'NSIS (D. C. l. c. p. 4.) shrub glabrous; branches erect; leaves oblong, cuneated at the base, acutish, finely serrated, full of resinous dots beneath; panicle terminal, many-flowered, crowded, intermixed with foliaceous bracteas; lobes of calyx acute, rather denticulated; petals obovate-oblong. ♄. F. Native of Brazil, in many places, but especially on the sandy banks and pastures of the Uruquay. E. floribúnda var. β, Montevidénsis, Schlecht. in Linnæa. 1. p. 543. Lindl. bot. reg. 1467. E. bífida. Link et Otto, abbild. t. 23. Flowers white, very like those of the hawthorn. Style permanent, double the length of the fruit after flowering.

Monte-Video Escallonia. Fl. July, Sept. Clt. 1827. Shrub 6 to 10 feet.

21 E. FLORIBU'NDA (H. B. et Kunth, nov. gen. amer. 3. p. 297.) shrub glabrous; branches covered with clammy resin; leaves oblong, obtuse, finely crenulated or quite entire, membranous; corymbs terminal, rather panicled, much branched, leafy; teeth of calyx acute; petals obovate-spatulate. ♄. F. Native of New Granada, on the Andes. Style length of the stamens. Leaves when young clammy and shining above. Flowers white. This species is said to come near *E. cuneifòlia*.

Bundle-flowered Escallonia. Tree 10 to 20 feet.

22 E. CARACASA'NA (H. B. et Kunth, nov. gen. amer. 3. p. 297.) shrub glabrous; branches scattered, somewhat trigonal; leaves oblong, acute, cuneated at the base, petiolate, finely crenulated, membranous; panicle terminal, many-flowered, leafy; teeth of calyx acute; petals obovately spatulate. ♄. G. Native of South America, in temperate places near Caraccas. Flowers white. Style shorter than the stamens. Very like *E. floribúnda*.

Caraccas Escallonia. Tree 12 to 20 feet.

23 E. SPECTA'BILIS (Hort. monac. ex D. C. prod. 4. p. 4.) branchlets pubescent; leaves oblong or elliptic, somewhat cuneated at the base, obtuse at the apex, serrulated, glabrous; panicle short, thyrsoid; bracteoles and lobes of calyx acute, somewhat serrated by black glands; petals obovate-spatulate. ♄. F. Native country unknown. Flowers red. Style length of the stamens. E. glandulòsa, Lodd. bot. cab. 1291.

Showy Escallonia. Fl. July, Sept. Clt. 1827. Sh. 3 to 6 feet.

24 E. PANICULA'TA (Rœm. et Schultes, syst. 5. p. 328.) shrub glabrous; branches angular, rather clammy; leaves lanceolate-oblong, obsoletely serrulated; peduncles racemosely panicled; teeth of calyx very short; petals obovate. ♄. F. Native of Peru, in the groves of Pillao. Stereóxylon paniculàtum, Ruiz et Pav. fl. per. 3. p. 16. t. 238. f. b. Flowers white. Style very short. Calyx nearly entire.

Panicled-flowered Escallonia. Shrub 5 to 8 feet.

25 E. ANGUSTIFÒLIA (Presl, in reliq. Hænk. 2. p. 47.) glabrous; branches erect, glandular, resinous; leaves petiolate, linear-lanceolate, obtuse, dotted with glands, and glandularly serrulated, narrowed at the base; panicle terminal, many-flowered; segments of the calyx entire; style exceeding the capsule. ♄. F. Native of Peru. Style naked at the base, not furnished with an urceolus, as in those formerly named *Stereóxylon*.

Narrow-leaved Escallonia. Shrub.

26 E. MULTIFLÒRA (Presl, in Hænk. reliq. 2. p. 48. t. 57.) glabrous; branches spreading; branchlets glandular and glutinous; leaves nearly sessile, obovate, mucronate, glandularly serrulated, pale beneath, and glandularly ciliated at the base; panicles terminal, many flowered; teeth of calyx obtuse, quite entire; petals obovate; style equal in length to the ovarium, which is pubescent. ♄. F. Native of Chili and Peru. Style naked at the base, as in the last species.

Many-flowered Escallonia. Shrub.

27 E. FLAVE'SCENS (Presl, in reliq. Hænk. 2. p. 48.) quite glabrous; branches erect; leaves obovate, recurvedly acuminated, glandularly serrulated, and pinnately veined, attenuated at the base; flowers terminal and axillary, sessile; teeth of calyx acuminated, glandular; capsule turbinate, 10-nerved. ♄. F. Native of the Cordillera of Chili. Style furnished with an urceolus at the base.

Yellowish Escallonia. Shrub.

28 E. CUNEIFÒLIA (Rœm. et Schultes, syst. 5. p. 328.) branches spreading; leaves oblong-wedge-shaped, serrulated, nearly sessile, whitish beneath; panicle terminal, rather corymbose, hairy; teeth of calyx small; petals obovate, obsoletely crenulated. ♄. F. Native of Peru, in woods on the Andes, at Chincao. Stereóxylon cuneifòlium, Ruiz et Pav. fl. per. 3. p. 16. t. 238. f. a.

Wedge-leaved Escallonia. Shrub 5 to 8 feet.

29 E. DI'SCOLOR (Vent. choix. t. 54.) branchlets rather pubescent; leaves cuneiformly lanceolate, somewhat crenulated, or quite entire, of a different colour beneath, having the middle nerve hairy; panicles terminal, many flowered; calyx puberulous; petals obovate. ♄. F. Native of New Granada, on the Andes. Stereóxylon díscolor, Poir. dict. 5. p. 246. E. Tùbar Mútis ex Humb. tabl. nat. 1. p. 113. Kunth, nov. gen. amer. 3. p. 299. Flowers white. Style length of the petals, shorter than in any other species, rather conical at the base, striated.

Discoloured-leaved Escallonia. Clt. 1820. Shrub 6 to 8 ft.

30 E. REVOLU'TA (Pers. ench. 1. p. 235.) shrub hairy in every part; branches erect, very hairy, but smoothish in the adult state; leaves obovate, denticulated, revolute; raceme thyrsoid; teeth of calyx subulate; petals linear-spatulate. ♄. F. Native of Chili, in shady moist places, and on the banks of rivulets about Conception, Valparaiso and Quillota, where it is called *Liun* or *Lun* by the inhabitants, and *Siete Camisas*. Stereóxylon revolùtum, Ruiz et Pav. fl. per. 3. p. 15. t. 236. f. a. Flowers white?

Revolute-leaved Escallonia. Tree 10 to 20 feet.

31 E. PULVERULE'NTA (Pers. ench. 1. p. 235.) shrub hairy in every part; branches rather erect, somewhat trigonal; leaves elliptic, obtuse, on short petioles, serrulated, rather clammy above when young; racemes terminal, spike-formed, erect; teeth of calyx spreading; petals obovate. ♄. F. Native of Chili, between Conception and the tract of Carcano, where it is called *Mardogno* by the natives, and about Valparaiso. Poepp. pl. exsic. no. 79. Cham. et Schlecht. in Linnæa. 1. p. 541. Stereóxylon pulveruléntum, Ruiz et Pav. fl. per. 3. p. 15. t. 237. a. Flowers white, nearly globose, when in the bud. The style is shorter in this than in any other species.

Powdered Escallonia. Shrub 6 to 10 feet.

32 E. BERTERIA'NA (D. C. prod. 4. p. 666.) shrub glabrous, clammy from resin; leaves elliptic, petiolate, serrated, shining above; racemes spicate, terminal, simple, twice the length of the leaves; calyxes shining and clammy, 5-cleft; petals elliptic-oblong, sessile. ♄. F. Native of Chili, on the banks of rivers, and in valleys on the mountains, as at La Guardia del Maypu, banks of Rio Maule, Valle del Rio Tinquiririca, and Causa Blanca, and in woods near Rancagua. E. resinòsum, Bertero in litt. Leaves $2\frac{1}{2}$ to 3 inches long, and $1\frac{1}{2}$ broad. Petioles 3 lines long. Vernacular name of the shrub *Corantillo*.

Bertero's Escallonia. Shrub 5 to 6 feet.

33 E. CHLOROPHY'LLA (Cham. et Schlecht. in Linnæa. 1. p. 542.) shrub glabrous; branches rather angular; leaves obovate-cuneated, mucronulate, quite entire, of a greyish white colour; racemes terminal, clothed with powdery down; bracteas about equal in length to the peduncles; petals obovately spatulate. ♄. F. Native of Brazil. Flowers white?

Green-leaved Escallonia. Shrub.

34 E. PE'NDULA (Pers. ench. 1. p. 235.) branches erectly spreading, rather clammy when young; leaves oblong-lanceolate, acute, finely crenulated, hairy beneath, but especially on the nerves; racemes terminal, spike-formed, pendulous; calyx hairy, with the teeth acute; petals linear-spatulate. ♄. F. Native of Peru, in groves; and on the Andes about Loxa, near Gonzanama. Stereóxylon péndulum, Ruiz et Pav. fl. per. 3. p. 16. t. 237. f. b. E. péndula, H. B. et Kunth, nov. gen. amer. 3. p. 298. Perhaps the plant from Loxa is the same as that from Peru. Flowers white.

Pendulous-racemed Escallonia. Tree 10 to 14 feet.

35 E. HI'RTA (Willd. in Rœm. et Schultes, syst. 3. p. 329.) leaves obovate-oblong, almost quite entire, glabrous; panicle terminal; peduncles hairy. ♄. H. Native of South America, where it is said to have been gathered by Humboldt and Bonpland, but it is not mentioned in the nov. gen. amer.

Hairy Escallonia. Shrub.

Cult. All the species of *Escallònia* are very fine ever-green shrubs; they grow best in a mixture of peat, sand, and loam; and cuttings strike readily in mould or sand under a hand glass. Most of the species will probably be found sufficiently hardy to stand in the open air in our climate, provided they are planted in a warm sheltered situation, particularly against a south wall or hot-house; and in winter they may be protected by throwing a mat over them.

II. QUINTI'NIA (in memory of La Quintinie, who has written on gardening). Alph. D. C. in monog. campan. Paris, 1830, p. 92. D. C. prod. 4. p. 5.

LIN. SYST. *Pentándria, Monogýnia.* Tube of calyx adhering to the ovarium, marked by 10 nerves; limb 5-toothed, permanent. Petals 5, obovate. Stamens 5. Style columnar, filiform; stigma peltately capitate, 4-5-lobed. Capsule crowned by the style and calycine teeth, 3-celled, with the dissepiments hardly complete; cells many-seeded. Seeds small, ovate, compressed.—Shrub smooth. Leaves alternate, petiolate, oval, acuminated at the apex, attenuated at the base, quite entire, coriaceous. Panicles terminal, composed of spreading racemose branches. Pedicels spreading, shorter than the fruit.

1 Q. SIEBE'RI (Alph. D. C. l. c.) ♄. F. Native of New Holland.—Sieb. pl. exsic. nov. holl. no. 261.

Sieber's Quintinia. Shrub.

Cult. See *Escallònia* above for culture and propagation.

III. FORGE'SIA (in honour of M. Desforges, Governor of the Isle of Bourbon, when Commerson investigated the vegetation of that country). Comm. in Juss. gen. p. 164. D. C. prod. 4. p. 5.—Deffórgia, Lam. ill. t. 125.

LIN. SYST. *Pentándria, Monogýnia.* Tube of calyx turbinate, adnate to the ovarium; limb 5-parted: lobes lanceolate. Petals 5, inserted in the calyx, linear-lanceolate, approximate at the very base, hardly longer than the calyx, somewhat valvate in æstivation. Stamens 5, erect; anthers ovate. Style filiform, finally separable into 2 parts; stigma 2-lobed. Capsule half adnate, crowned by the erect separated styles, 2-celled, many-seeded, opening between the styles.—Tree small, quite glabrous. Leaves alternate, coriaceous, lanceolate, attenuated at both ends, on short petioles, serrated. Racemes terminal, few-flowered, bracteate at the base of the pedicels.

1 F. BORBO'NICA (Pers. ench. 1. p. 194.) ♄. G. Native of the Island of Bourbon, in the high woods above the plains of the Caffres. Deffórgia Borbónica, Lam. ill. p. 59. t. 125. Poir. suppl. 2. p. 460. Forgèsia racemòsa, Gmel. syst. veg. 1. p. 353.

Bourbon Forgesia. Tree 20 feet.

Cult. For culture and propagation see *Escallònia* above.

IV. ANO'PTERUS (from *ανω, ano*, upwards, and *πτερον, pteron*, a wing; in reference to the seeds, which are winged at the apex). Labill. nov. holl. 1. p. 86. t. 112. R. Br. in Frankl. narr. journ. 756. verm. schrift. 1. p. 545.

LIN. SYST. *Hexándria, Digýnia.* Tube of calyx turbinate (f. 35. *a.*), adnate to the ovarium at the base; lobes 6, short, acute, permanent. Petals 6 (f. 35. *b.*), alternating with the calycine lobes, and inserted in the calyx. Stamens 6 (f. 35. *b.*), inserted with the petals, shorter, and alternating with them. Style short; stigma bifid (f. 35. *c.*). Capsule oblong, 1-celled, 2-valved (f. 35. *d.*); valves opening from the apex to the base, with the placentas at the margins (f. 35. *e.*). Seed ovate, compressed, furnished with a wing at the top.—Tree, quite glabrous. Leaves alternate, rarely nearly opposite, ovate-oblong, attenuated at both ends, nearly sessile, coriaceous, callously toothed. Racemes simple, terminal. Flowers sometimes 7-cleft.

FIG. 35.

1 A. GLANDULÒSA (Labill. l. c.) ♄. F. Native of Van Diemen's Land. Flowers white. (f. 35.)

Glandular Anopterus. Tree 25 feet.

Cult. See *Escallònia*, p. 195. for culture and propagation.

V. I'TEA (ιτεα, *itea*, is the Greek name of the willow; given to this genus on account of the quick growth of the *I. Virgínica*). Lin. gen. 275. Rich. in Michx. fl. bor. amer. 1. p. 156. Gærtn. fruct. 3. p. 142. t. 209. f. 4. D. C. prod. 4. p. 6. —Diconángia, Michx. gen. p. 5. Adans. fam. 2. p. 165.—Cedrèla, Lour. but not of Lin.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx regular, permanent, campanulate, 5-cleft, with the recesses obtuse, and the teeth subulate. Petals 5, lanceolate-linear, inserted in the upper part of the tube of the calyx, and alternating with its lobes, valvate in æstivation. Stamens 5, alternating with the petals, and shorter than them; anthers oblong, rather bifid at the base, 2-celled, bursting lengthwise. Ovarium oblong, free. Style 1, but at length separating into 2 parts: stigma capitate, usually divisible in the furrow. Carpels 2, joined into a 2-celled compressed bisulcate capsule, which separate at length from each other from the base to the apex. Seeds numerous, disposed in 2 rows along the inflexed margins of the carpels.—Shrubs, with alternate simple exstipulate leaves. Flowers racemose, as in *Weinmánnia*, but pentandrous, and as it were single styled. The character of the genus is alone taken from *I. Virgínica*.

1 I. Virgi'nica (Lin. spec. 289.) leaves lanceolate, acutely toothed; racemes simple, terminal. ♄. H. Native of North America, from Pennsylvania to Carolina. Lam. ill. 1. t. 147. f. 1. Lher. stirp. 1. p. 138. Lois. in Duham. abr. ed. 2. vol. 6. t. 9. Sims, bot. mag. 2409.—Trew. ehret. t. 98. When this shrub is in vigour it is entirely covered with racemes of white flowers in July and August, and then makes a fine appearance.

Virginian Itea. Fl. June, Aug. Clt. 1744. Sh. 6 to 7 feet.

† *Asiatic shrubs related to I'tea, and referred to the genus by the authors, but will probably constitute 2 or 4 different genera when the parts of fructification are properly examined.*

* *Leaves alternate.*

2 I.? umbella'ta (Roxb. fl. ind. 2. p. 419.) leaves alternate, broadly lanceolate, entire, smooth; panicles axillary and terminal, composed of simple umbels, on long peduncles. ♄. S. Native of the Malay Islands. Capsule 1-celled, 2-valved, with 2 parietal placentas on each side. Flowers white.

Umbellate-flowered Itea. Shrub 6 to 8 feet.

3 I.? macrophy'lla (Wall. in Roxb. fl. ind. 2. p. 419.) leaves alternate, elliptic-ovate, acuminated, callously serrated; racemes axillary, fasciculate, erect, equal in length to the leaves. ♄. G. Native of the East Indies, on the Khasee mountains bordering on the province of Silhet. Flowers yellow, fragrant, when young conical, and valvate in æstivation. Ovarium half adhering to the calyx, 2-celled. Style columnar.

Long-leaved Itea. Tree 20 feet.

** *Leaves opposite.*

4 I.? fra'grans (Wall. in Roxb. fl. ind. 2. p. 420.) leaves opposite, cuneate-lanceolate, entire; racemes terminal; flowers in sessile fascicles, tetrandrous, and pentandrous. ♄. G. Native of the East Indies, in the Island of Singapore. Flowers yellow, fragrant. Calyx cup-shaped, 4-5-toothed. Petals 4-5, linear, valvate in æstivation, longer than the stamens. Ovarium adnate to the calyx, 2-celled. Style columnar. This species, with the preceding, will perhaps form a new genus nearly allied to *Escallònia*.

Fragrant-flowered Itea. Shrub 5 to 6 feet.

5 I.? Rosmari'nus (Rœm. et Schultes, syst. 5. p. 408.) leaves opposite, filiform, glabrous, hardish; peduncles axillary, 1-flowered. ♄. F. Native of the north of Cochin-china, in sandy places, and in China about Macao. Cedrèla Rosmarìnus, Lour. coch. p. 160. Calyx somewhat campanulate, 5-toothed, with the base permanent, and the teeth deciduous. Petals 5, obtuse. Stamens 5, equal in length to the petals. Style 1. Capsule 3-celled, 3-valved, dehiscing at the apex, many-seeded. Leaves odoriferous, from containing a quantity of essential cephalic oil. This plant hardly belongs to the order.

Rosmary-like Itea. Shrub 5 to 6 feet.

Cult. Itea Virgínica is a very pretty hardy shrub, well adapted for decorating the front of a shrubbery. It is increased by layers put down in the autumn. The rest of the species should be grown in pots, in order that they may be protected by a frame in winter, or to be grown against a south wall, where they may be easily preserved from the frost by mats; a light soil is best suited for them, and they may be either increased by layers put down in the autumn, or by cuttings.

Order CXX. CUNONIA'CEÆ (plants agreeing with *Cunònia* in important characters). R. Br. gen. rem. p. 16. D. Don in edinb. phil. journ. April, 1830.—Saxifragàceæ, Tribe II. Cunonièæ, D. C. prod. 4. p. 7.

Calyx of many divisions (f. 36. *a*. f. 37. *a*. f. 38. *a*. f. 39. *a*.), valvate in æstivation. Petals equal in number to the divisions of the calyx (f. 36. *b*. f. 38. *b*. f. 39. *c*.), and alternating with them, imbricate in æstivation, sometimes wanting. Stamens inserted in a perigynous disk, definite (f. 37. *b*.), rarely indefinite; anthers peltate, 2-celled (f. 38. *c*. f. 39. *d*.), bursting lengthwise by a double fissure. Ovarium 2-celled: ovula usually indefinite; styles 2 (f. 36. *e*. f. 37. *d*. f. 38. *e*. f. 39. *b*.), rarely connate: stigmas 2, simple, obtuse, pruinose. Capsule composed of 2 conflated follicles, which are applied to each other, rarely confluent, 2-celled, 2-valved; for the most part furnished with 2 beaks, and many-seeded; dissepiments double, from the inflexed edges of the valves. Placenta central, composed of fascicles of umbilical vessels. Seeds pendulous, sometimes winged; testa crustaceous or membranaceous. Albumen copious, fleshy. Embryo slender, straight, with the radicle turned towards the umbilicus, usually rather long.—Trees or shrubs, for the most part natives of the southern hemisphere. Leaves usually opposite, but sometimes verticillate, simple or compound. Stipulas interpetiolar, rarely wanting. Flowers usually disposed in spicate racemes or panicles.

The *Cunoniàceæ* were first proposed by Dr. R. Brown as a separate family from *Saxifragàceæ*, to which they had been referred by Jussieu, and to which they are intimately related, being chiefly distinguished by habit alone. M. Kunth considers them merely as a section of *Saxifragàceæ*, but it appears preferable to regard them as a distinct family; for the advantages arising from dividing extensive families and genera are, that the individuals composing these become better understood, and their characters more accurately investigated. The *Saxifragàceæ* are almost exclusively confined to the northern, as *Cunoniàceæ* are to the southern hemisphere. Some pass beyond these limits, but their number is very small. Both families agree in having entire

and divided petals, and a superior and inferior ovarium. In the series of natural affinities the *Philadélpheæ* clearly follow the *Cunoniàceæ*, with which they correspond in habit; and in *Bauèra* and *Belangèra* the stamens are indefinite, and the seeds of *Caldclùvia* have a striking analogy to those of *Philadélphus*. The styles both in *Saxifragàceæ* and *Cunoniàceæ* are often 3, and in *Cornìdia* of the *Flora Peruviana* that number is always constant.

A species of *Weinmánnia* is used in Peru for tanning leather, and its astringent bark is employed to adulterate the Peruvian bark. The Indian *Weinmánnias* appear to possess similar astringent qualities.

Synopsis of the genera.

TRIBE I.

CUNONIE'Æ. *Stamens definite. Ovarium distinct.*

1 WEINMA'NNIA. Calyx 4-parted, permanent (f. 36. *a.*). Petals 4 (f. 36. *b.*). Stamens 8. Hypogynous disk urceolate (f. 36. *d.*). Styles 2. Capsule opening at the apex at the dissepiments; cells many seeded. Seeds reniform, hairy. Leaves simple or compound, with 3-5 leaflets.

2 LEIOSPE'RMUM. Calyx 4-parted, deciduous. Petals 4. Stamens 8. Hypogynous disk flat, entire. Styles 2. Capsule opening in the manner of *Weinmánnia*; cells many-seeded. Seeds smooth. Leaves simple.

3 CALDCLU'VIA. Calyx membranous, 4-parted, deciduous. Petals 4, unguiculate. Stamens 8. Hypogynous glands 8. Styles 2. Capsule opening in the manner of *Weinmánnia*; cells 5-10-seeded. Seeds fusiform; with the testa membranous, and larger than the nucleus. Leaves simple.

4 PLATY'LOPHUS. Calyx 4-cleft, sometímes 5-cleft, permanent. Petals 4, rarely 5, trifid. Stamens 8 or 10. Hypogynous disk urceolate, entire. Styles 2. Capsule membranous, 2-celled at the base, and ending in a flat bifid wing at the apex; cells 1-seeded. Seeds large, arched. Leaves compound, with 3 leaflets.

5 CUNÒNIA. Calyx 5-cleft; segments deciduous. Petals 5. Stamens 10. Hypogynous disk small. Styles 2. Capsule opening like that of *Weinmánnia*; cells many seeded. Seeds oblong, compressed, smooth, winged on one side. Leaves impari-pinnate.

6 ARNO'LDIA. Calyx 4-parted. Petals 4. Stamens 8. Hypogynous glands 8. Styles 2. Ovarium didymous, biovulate. Carpels 2, connate at the base, solitary from abortion, beaked by the styles, opening on the inside, 1-seeded. Leaves impari-pinnate.

7 PTEROPHY'LLA. Calyx 4-cleft, deciduous. Petals 4. Stamens 8. Styles 2, very short. Ovarium 2-celled. Capsule unknown. Leaves impari-pinnate.

8 CALY'COMIS. Calyx 5-parted, permanent. Petals 5. Stamens 10. Hypogynous disk small. Styles 2, setaceous. Capsule globose, 2-celled, opening at the apex; cells many seeded. Seeds minute, smooth. Leaves simple.

9 CALLI'COMA. Calyx 4-parted, rarely 5-parted (f. 37. *a.*), permanent. Petals wanting. Stamens 8, rarely 10 (f. 37. *b.*). Hypogynous disk small. Styles 2 (f. 37. *d.*), setaceous. Capsule inclosed in the calyx, dehiscing at the dissepiments; cells ventricose, 1-2-seeded from abortion. Seeds rough from papillæ. Leaves simple.

10 CERATOPE'TALUM. Limb of calyx 5-parted (f. 38. *a.*), permanent. Petals 5 (f. 38. *b.*), linearly multifid, permanent or wanting. Stamens 10; anthers beaked (f. 38. *c.*). Styles 2, short (f. 38. *e.*). Capsule 1-seeded from abortion, dehiscing at the apex. Leaves simple or ternate.

11 SCHIZOME'RIA. Calyx 5-cleft, permanent. Petals 5, jagged, deciduous. Stamens 10. Ovarium 2-celled; ovula many. Styles 2, short. Capsule baccate, closed at the apex. Leaves simple.

TRIBE II.

CODIE'Æ. *Stamens definite. Ovarium inferior.*

12 CÒDIA. Limb of calyx 4-5-parted, permanent. Petals 4-5. Stamens 8-10. Styles pubescent. Capsule closed at the apex, usually 1-seeded from abortion. Seeds roundish, smooth. Leaves simple.

TRIBE III.

BAUE'REÆ. *Stamens indefinite. Ovarium free.*

13 BELANGE'RA. Calyx deeply 6-parted; segments deciduous. Petals wanting. Stamens numerous. Styles 2. Capsule superior, 2-celled, 2-beaked, opening at the dissepiments; cells many-seeded. Seeds compressed, winged at the apex. Leaves compound, with 3-5 leaflets.

14 BAUE'RA. Calyx 6-10 parted (f. 39. *a.*). Petals 6-10 (f. 39. *c.*). Styles 2 (f. 39. *b.*), glabrous. Capsule superior, 2-celled, 2-valved at the apex, opening by a transverse chink; cells few-seeded. Seeds scabrous from resinous dots. Leaves in whorles.

TRIBE IV.

SYMPHYOGY'NEÆ. *Stamens definite. Ovarium free. Styles connate.*

15 GEÍSSOIS. Calyx 4-parted, deciduous. Petals wanting. Stamens 8. Style 1; stigmas 2. Capsule compressed, 2-celled, 2-valved; cells many seeded. Seeds compressed, winged. Leaves compound, with 5 leaflets.

Tribe I.

CUNONIE'Æ (plants agreeing with *Cunònia* in having definite stamens). Stamens definite. Ovarium distinct from the calyx.

1. WEINMA'NNIA (in honour of John William Weinmann, apothecary at Ratisbon, author of Phytanthoza Iconographica, in 4 vol. fol. Ratisbon, vol. 1. in 1737., vol. 2. in 1739., vol. 3. in 1742., vol. 4. in 1745.) Lin. gen. no. 493. Juss. gen. p. 309. H. B. et Kunth, 6. p. 49. D. Don, in edinb. phil. April, 1830.—Windmánnia, P. Brown, jam. ed. 2. p. 212.

LIN. SYST. *Octándria, Digýnia.* Calyx permanent, 4-parted (f. 36. *a.*). Petals 4 (f. 36. *b.*). Stamens 8. Disk hypogynous, urceolate (f. 36. *d.*). Capsule opening at the dissepiments from the apex; cells many seeded. Seeds roundish-reniform. —Trees, natives of South America and the Mauritius. Leaves compound or simple; petioles articulated. Stipulas undivided, caducous.

Flowers hermaphrodite, racemose, usually white; pedicels in fascicles.

* *Leaves simple.*

1 W. OVA'TA (Cav. icon. 6. p. 45. t. 566.) leaves elliptic-oblong, bluntish, crenated, glabrous on both surfaces, as well as the branches, acute at the base. ♄. S. Native of Peru, at the town of San Buenaventura. Leaves 2-3 inches long, and an inch or an inch and a half broad. Racemes 3 inches long, loose. Hypogynous disk with 8 glands (f. 36. *d*.).

FIG. 36.

Ovate-leaved Weinmannia. Fl. May, June. Clt 1824. Tree 12 to 20 feet.

2 W. KUNTHIA'NA (D. Don in edinb. phil. journ. April, 1830.) leaves elliptic, crenated, cuneated at the base, membranous, glabrous; racemes elongated; fascicles many flowered. ♄. S. Native of New Granada, near Santa Fe de Bogota. W. ovàta, H. B. et Kunth, 6. p. 52. exclusive of the synonyme of Cav. Leaves with the nerves and veins beneath, rather pilose, 3-4 inches long, and an inch and a half or 2 inches broad. Racemes a span long; fascicles 3-10-flowered.

Kunth's Weinmannia. Tree 10 to 15 feet.

3 W. BALBISIA'NA (H. B. et Kunth, nov. gen. amer. 6. p. 51. t. 520.) leaves nearly sessile, ovate-lanceolate, rather acuminated, serrated, glabrous, attenuated at the base; fascicles of racemes many-flowered. ♄. S. Native of Quito, in woods near Loxa. Leaves 1½ inch or 3 inches long. Racemes loose, 2 inches long. Capsule ovate, glabrous.

Balbis's Weinmannia. Tree or shrub.

4 W. LAU'RINA (H. B. et Kunth, l. c. 6. p. 51.) leaves oblong, acute, crenated, glabrous, attenuated at the base; fascicles of racemes many flowered. ♄. S. Native of South America. Leaves 3 inches long or more, puberulous on the veins beneath. Racemes 2 inches long.

Laurel-like Weinmannia. Tree.

5 W. MACROPHY'LLA (H. B. et Kunth, l. c. p. 52. t. 521.) leaves nearly sessile, ovate, acuminated, serrated, glabrous on both surfaces, as well as on the branches, rounded at the base; fascicles of racemes many flowered. ♄. S. Native of the Andes of Quito, between Loxa and Nabon. Leaves 2-5 inches long, and 2-3 inches broad, shining above. Racemes rather loose. Capsule terete, oblong, glabrous.

Long-leaved Weinmannia. Tree or shrub.

6 W. LATIFÒLIA (Presl, in Hænke, reliq. 2. p. 51.) leaves ovate-elliptic, obtuse, acute at the base, crenately serrated, coriaceous, quite glabrous above, hairy beneath; racemes longer than the leaves; stipulas oblong, obtuse, silky outside; urceolus entire. ♄. G. Native of Peru, in mountain woods.

Broad-leaved Weinmannia. Tree.

7 W. ELLI'PTICA (H. B. et Kunth, l. c. p. 50.) leaves petiolate, elliptic, obtuse, crenated, glabrous on both surfaces, acutish at the base; racemes loose. ♄. S. Native of Quito, near Loxa. Leaves an inch or an inch and a half long, coriaceous. Racemes 1½ or 2 inches long. Capsule ovate, glabrous. Flowers purplish.

Elliptic-leaved Weinmannia. Fl. May, June. Clt. 1824. Tr.

8 W. OVA'LIS (Ruiz et Pav. fl. per. 4. t. 333. f. a. ined.) leaves petiolate, oval, crenated, quite glabrous on both surfaces, as well as the branches, shining, acute at the base; fascicles of racemes many flowered. ♄. S. Native of Peru, on the Andes, in groves at Pillao. Leaves coriaceous, 2 or 3 inches long. Racemes loose, a hand long. Capsule ovate, quite smooth.

Oval-leaved Weinmannia. Tree.

9 W. CRASSIFÒLIA (Ruiz et Pav. fl. per. 4. t. 331. f. a. ined.) leaves nearly sessile, oval, coarsely crenated, rather pilose as well as the branches, rounded at the base; fascicles of racemes many flowered. ♄. S. Native of Peru. Leaves 2 inches long, coriaceous, thick, pilose on the rib and veins beneath. Racemes 2-3 inches long. Capsule ovate-oblong, smooth.

Thick-leaved Weinmannia. Tree.

10 W. SUBCORDA'TA (Moricand, herb. ex D. C. prod. 3. p. 8.) leaves oval, obtuse, somewhat cordate at the base, dentately crenated, coriaceous, glabrous, shining above; racemes when in flower exceeding the leaves a little. ♄. S. Native of Peru. Flowers on very short pedicels. Leaves 24-30 lines long, and 16-18 lines broad.

Subcordate-leaved Weinmannia. Tree.

** *Leaves simple and ternate.*

11 W. HETEROPHY'LLA (H. B. et Kunth, nov. gen. amer. 6. p. 52. t. 522.) leaves simple and ternate, ovate-oblong, acutely and coarsely serrated, rather pilose beneath; fascicles of racemes many flowered. ♄. S. Native of New Granada, near Santa Fe de Bogota. Leaves for the most part simple, glabrous above, pilose beneath, particularly at the ribs, 3-5 inches long, and 1½ or 2 inches broad. Petioles half an inch long. Racemes loose, 4 inches long. Capsule ovate, smooth.

Variable-leaved Weinmannia. Tree.

12 W. CORDA'TA (D. Don in edinb. phil. journ. April, 1830.) leaves nearly sessile, cordate-ovate, bluntish, coarsely serrated, rather pilose beneath, and on the branches; fascicles of racemes many flowered. ♄. S. Native of Peru. W. heterophýlla, Ruiz et Pav. fl. per. 4. t. 331. f. b. Leaves simple or ternate, 2 inches long. Racemes loose, 3 inches long.

Cordate-leaved Weinmannia. Tree.

13 W. AURICULA'TA (D. Don, in edinb. phil. journ. April, 1830.) leaves elliptic, with revolute, serrated margins, rounded at the base, hairy beneath and on the branches; fascicles of racemes crowded. ♄. S. Native of Peru, in groves at Pillao. W. ovàta, Ruiz et Pav. fl. per. 4. t. 333. f. b. ined. W. dryadifòlia, D. C. prod. 4. p. 9. Leaves shining and glabrous above, but densely clothed with fulvous hairs beneath, an inch or an inch and a half long, 1-lobed at the base, and sometimes trifoliate. Racemes dense, spicate, 2-3 inches long. Capsule roundish-ovate, and are as well as the styles rather hairy.

Auricled-leaved Weinmannia. Tree.

14 W. AUSTRA'LIS (Cunning. in Field's new south wales, p. 353.) leaves trifoliate; leaflets ovate-lanceolate, deeply and equally serrated, sessile; flowers terminal. ♄. G. Native of New Holland, on moist shady rocks, at Springwood.

Southern Weinmannia. Shrub.

*** *Leaves ternate and quinate.*

15 W. PENTAPHY'LLA (Ruiz et Pav. fl. per. 4. t. 330. f. a.) leaves ternate and quinate; leaflets 3-5, ovate-lanceolate, acute, serrated, glabrous on both surfaces; racemes loose. ♄. S. Native of Peru. Branchlets pubescent. Leaflets coriaceous, shining above, 2-3 inches long: lateral ones unequal-sided at the base. Racemes loose, a hand long; pedicels longish. Capsule ovate, smooth. Styles sometimes 3, when this is the case the capsule is 3-celled.

Five-leaved Weinmannia. Tree.

16 W. CRENA'TA (Presl, in reliq. Hænk. 2. p. 51.) leaves of the branches with 2 pairs of leaflets and an odd one, those of the branchlets ternate; leaflets oblong, obtuse, broadly crenated, quite glabrous, coriaceous, terminal one oblong-lanceolate, attenuated at the base; wings of the rachis and petiole semi-obovate; racemes longer than the leaves, and are as well as the branches pubescent; flowers glomerate; segments of the calyx

ciliated; urceolus crenated. ♄. G. Native of Peru, in mountain woods.

Crenated Weinmannia. Tree.

17 W. MAURITIA'NA (D. Don, in edinb. phil. journ. April 1830.) leaves ternate and quinate; leaflets 3-5, obovate, or elliptic, obtuse, crenated, smoothish; racemes loose. ♄. S. Native of the Mauritius, where it is called *La Lou.* W. trifoliàta, Lam. dict. 7. p. 579. ill. t. 313. f. 2. exclusive of the synonyme. Smith, in Rees' cycl. exclusive of the synonymes of Lin. Thunb. and Willd. W. Madagascariénsis, D. C. prod. 4. p. 9. Leaflets coriaceous, pubescent beneath, ½ or 1 inch long. Racemes loose, 2 inches long; fascicles few-flowered.

Mauritian Weinmannia. Tree.

18 W. MARGINA'TA (Moricand, mss. ex D. C. prod. 4. p. 10.) leaves with 3-5 leaflets; leaflets ovate-lanceolate, acute, serrated, attenuated at both ends: extreme one the largest; petiole margined; capsule glabrous. ♄. S. Native of Peru. Branchlets villous, by threes at the tops of the branches. Racemes exceeding the leaves. Leaflets 2-3 inches long, and 8-14 lines broad.

Marginate-petioled Weinmannia. Tree.

19 W. MICROPHY'LLA (H. B. et Kunth, nov. gen. amer. 6. p. 54. t. 523.) leaves ternate and quinate; leaflets 3-5, obovate, crenated, glabrous; racemes very short, somewhat corymbose. ♄. S. Native of Quito, near Loxa. Leaves with sometimes only 2 leaflets; leaflets small, cuneate-obovate, crenated, quite glabrous, shining, 3 lines long. Capsule ovate, glabrous.

Small-leaved Weinmannia. Shrub.

* * * * *Leaves impari-pinnate.*

20 W. GLA'BRA (Lin. fil. suppl. p. 228.) leaves with many pairs of leaflets; leaflets obovate or oblong, crenated, rather pilose beneath; rachis with rhomboid joints; racemes loose. ♄. S. Native of the Islands of Santa Cruz and Martinique; and of Mexico, near San Salvador and Chiconquiera. Willd. spec. 2. p. 436. exclusive of the synonyme of Lam. W. pinnàta, Lin. spec. 1. p. 515. exclusive of the synonyme of Browne, jam. Flowers numerous, white.

Glabrous Weinmannia. Fl. May, June. Clt. 1815. Sh. 6 ft.

21 W. TRICHOSPE'RMA (Cav. icon. 6. p. 45. t. 567.) leaves with many pairs of leaflets; leaflets oblong, acutely toothed, rather pilose beneath; joints of rachis exactly rhomboid. ♄. S. Native of the Island of San Carlos de Chiloe; and of Peru. W. dentàta, Ruiz et Pav. fl. per. 4. t. 334. f. c. W. pinnàta, Lin. and Cav. mss. Leaflets obliquely cuneated at the base, naked and shining above, but rather pilose on the nerves and veins beneath. Racemes loose. Capsule roundish-ovate, ribbed, glabrous.

Hair-seeded Weinmannia. Shrub.

22 W. HÍRTA (Swartz, prod. p. 63. fl. ind. occid. 2. p. 691.) leaves with 3 pairs of leaflets; leaflets elliptic, serrated, hairy beneath as well as the branches; joints of rachis cuneated. ♄. S. Native of Jamaica, St. Domingo, and Brazil. Windmánnia fruticòsa, &c. Browne, jam. p. 212. Leaflets hairy, at length smoothish above, coriaceous. Racemes loose, very copious, 2 inches long.

Rough Weinmannia. Fl. May, Jul. Clt. 1820. Tr. 10 to 20 ft.

23 W. NÍTIDA (D. Don, in edinb. phil. journ. April, 1830.) leaves with usually 3 pairs of leaflets; leaflets obovate, crenated, glabrous, and shining on both surfaces; joints of rachis cuneated. ♄. S. Native of Jamaica. Weinmánnia hírta, var. Smith, herb.

Shining-leaved Weinmannia. Tree.

24 W. GLOMERA'TA (Presl, in reliq. Hænk. 2. p. 52.) leaves with 4-6 pairs of leaflets; leaflets oblong, obtuse, coriaceous, toothed towards the apex, hairy on the middle nerve beneath: terminal leaflet oblong-lanceolate, acute at both ends; wings of rachis semi-obovate; racemes spicate, longer than the leaves, and are as well as the branchlets and petioles very hairy; flowers glomerate, sessile; calyx smoothish; urceolus entire. ♄. G. Native of Peru, on the mountains.

Glomerate-flowered Weinmannia. Tree.

25 W. TINCTÒRIA (Smith, in Rees' cycl.) leaves with many pairs of leaflets; leaflets oblong, serrated, smoothish; joints of rachis spatulate; fascicles of racemes many-flowered. ♄. S. Native of the Island of Bourbon. W. glàbra, Lam. dict. 7. p. 578. ill. t. 313. f. 1. W. macrostàchya, D. C. prod. 4. p. 10. The tree is called *Tan rouge* by the inhabitants of Bourbon, where it is used for dying red.

Dyers' Weinmannia. Tree.

26 W. FAGAROÌDES (H. B. et Kunth, nov. gen. amer. 6. p. 54. t. 524.) leaves with many pairs of leaflets; leaflets obovate or elliptic, crenated, glabrous on both surfaces, shining above; joints of rachis obcordate. ♄. S. Native of Peru, at Pillao, and at Loxa. Branchlets with annular chinks, pubescent. Leaflets from 5-15, coriaceous, pilose on the joints beneath, 3 lines long. Racemes 2 inches long; fascicles many-flowered. Capsule ovate-oblong, glabrous.

Fagara-like Weinmannia. Tree.

27 W. PARVIFÒLIA (Ruiz, mss. ex D. Don, in edinb. phil. journ. April, 1830.) leaves with many pairs of leaflets; leaflets oblong, serrated, pilose beneath; joints of rachis obovate; racemes short. ♄. S. Native of Peru, at Pillao, where it is commonly called *Mucho* and *Arbol del Peregil* by the inhabitants. W. microphýlla, Ruiz et Pav. fl. per. 4. t. 334. f. a. Branchlets densely pilose. Leaflets from 9-15, contiguous, naked and opaque above; 3-5 lines long. Racemes dense, cylindrical, hardly an inch long; fascicles many-flowered, crowded. Capsule roundish, ovate, glabrous.

Small-leaved Weinmannia. Tree.

28 W. RETICULA'TA (Ruiz et Pav. fl. per. 4. t. 332.) leaves with many pairs of leaflets; leaflets elliptic, crenated, clothed with rusty tomentum beneath; joints of rachis obovate-oblong; fascicles of racemes crowded. ♄. S. Native of Peru, at Pillao and Acomaya. W. pubéscens, Ruiz, mss. Branchlets densely clothed with rusty tomentum, usually with annular chinks. Leaflets 9-17, pilose above and shining, reticulately veined, half an inch long. Racemes dense, cylindrical, 2 or 3 inches long; fascicles many-flowered, very pilose. Styles rather pilose at the base. Capsule ovate, smooth.

Reticulated-leaved Weinmannia. Tree.

29 W. LENTISCIFÒLIA (Presl, in reliq. Hænk. 2. p. 52.) leaves with 3-5 pairs of leaflets; leaflets oblong, obtuse, toothed, coriaceous, hairy on the nerves, racemes, and petioles: terminal one oblong-lanceolate, acuminated at both ends; wings of petiole and rachis semi-obovate; flowers on long pedicels; segments of the calyx ciliated; urceolus angular and crenated. ♄. G. Native of Peru, on the mountains.

Lentiscus-leaved Weinmannia. Tree.

30 W. TOMENTÒSA (Lin. fil. suppl. p. 277.) leaves with many pairs of leaflets; leaflets oval, with revolute margins, quite entire, clothed with hoary tomentum beneath; spikes cylindrical, much crowded. ♄. S. Native of New Granada. H. B. et Kunth, nov. gen. amer. 6. p. 55. t. 525. Leaflets size of those of box leaves, 9-15, approximate, very blunt, convex and pubescent above, but at length green. Joints of rachis obovate, with revolute margins. Spikes cylindrical, obtuse, an inch long; fascicles many-flowered, much crowded; peduncles short, densely clothed with tomentum.

Tomentose Weinmannia. Tree.

31 W. CINE'REA (Ruiz et Pav. fl. per. 4. t. 332. f. b.) leaves with usually 3 pairs of leaflets; leaflets elliptic, serrated, reticulated, smoothish; joints of rachis cuneate-oblong; racemes

loose. ♄. S. Native of Peru, in groves, at Pillao, where it is called *Arbol del Peregil*. W. sambúcuna, Ruiz, mss. W. diversifòlia, Moricand, mss. ex D. C. prod. 4. p. 10. Leaflets 7-9, elliptic, coriaceous, stiff, an inch long. Peduncles very hairy. Racemes loose, 2-3 inches long. Fascicles few-flowered. Capsule ovate, glabrous.

Cinereous Weinmannia. Tree.

32 W. subsessiliflòra (Ruiz et Pav. fl. per. 4. t. 334. f. b.) leaves with many pairs of leaflets; leaflets oval or oblong, serrated, smoothish; spikes elongated, cylindrical; styles puberulous; capsule silky. ♄. S. Native of Peru, on the Andes, at Pillao. W. polystàchya, Ruiz, mss. Leaflets 11-15, ½ or 1 inch long, while young canescent on both surfaces. Joints of rachis obovate. Spike narrow, 3-4 inches long; fascicles crowded, many-flowered. Pedicels and calyxes silky.

Subsessile-flowered Weinmannia. Tree.

33 W. hirte'lla (H. B. et Kunth, nov. gen. amer. 6. p. 56.) leaves with many pairs of leaflets; leaflets oblong, serrulated, pubescent beneath; racemes loose. ♄. S. Native of New Granada, near Santa Fe de Bogota. Branchlets tomentose. Leaflets 4-7 pairs, 8-9 lines long. Racemes loose, 2-3 inches long. Ovarium ovatè, glabrous.

Hairy Weinmannia. Tree.

34 W. pube'scens (H. B. et Kunth, nov. gen. amer. 6. p. 56.) leaves with many pairs of leaflets; leaflets elliptic-oblong, serrated, pilose on both surfaces; capsule ovate, tomentose. ♄. S. Native of New Spain, on Mount Avila, near Caraccas. Leaflets 4-6 pairs, 6-13 lines long. Racemes loose, 3-4 inches long.

Pubescent Weinmannia. Tree.

35 W. sorbifòlia (H. B. et Kunth, l. c. p. 57.) leaves with usually 4 pairs of leaflets; leaflets oblong, acutish, serrated, rather pilose beneath; racemes loose; ovaries glabrous. ♄. S. Native of New Granada. Branches glabrous. Leaflets oblong, acutish, glabrous above, 19-20 lines long and 6-7 broad, obliquely cuneated at the base. Racemes loose, 3-5 inches long; fascicles remote.

Sorbus-leaved Weinmannia. Tree.

36 W. Caripe'nsis (H. B. et Kunth, l. c. p. 58.) leaves with usually 5 pairs of leaflets; leaflets oblong, bluntish, serrated, membranous, glabrous. ♄. S. Native of New Andalusia, near the convent of Caripe. Branches pubescent. Leaflets 10-15 lines long, and 4-5 broad, membranous. Racemes loose, 4-5 inches long. Ovarium ovate, glabrous.

Caripe Weinmannia. Tree.

37 W. polyphy'lla (Moricand, mss. ex D. C. prod. 4. p. 11.) leaves with 8-12 pairs of leaflets; leaflets elliptic, obtuse, serrated, glabrous: outer one lanceolate; joints of rachis triangular; branchlets, petioles, and the nerves on the under side of the leaves pilose; racemes exceeding the leaves. ♄. S. Native of Peru, near Guayaquil. Leaves 4 inches long; leaflets 4-8 lines long, and 2-4 lines broad.

Many-leaved Weinmannia. Tree.

38 W. paullinieæfòlia (Pohl, in litt. ex D. C. prod. 4. p. 11.) leaves glabrous, except the rachis, which is hairy; leaflets 7-9, oblong, cuneated at the base, serrately toothed at the apex; joints of rachis oblong; racemes length of leaves. ♄. S. Native of Brazil.

Paullinia-leaved Weinmannia. Tree.

39 W. produ'cta (Moricand, mss. in D. C. prod. 4. p. 10.) leaves with 6-7 pairs of leaflets; leaflets small, ovate, coarsely toothed, rather coriaceous, glabrous on both surfaces: outer one elongated, acute, cuneated at the base; joints of rachis semi-obovate; racemes dense, much longer than the leaves. ♄. S. Native of Peru. W. sessiliflòra, Pav. in herb. Moricand. Branches pubescent. Extreme leaflet an inch and more long, the rest 4-5 lines long, but the lower 2 are hardly 2 lines long. Flowers white. Pedicels length of flowers, and exceeding the bracteas.

Drawn-out-leaved Weinmannia. Tree.

Cult. The species of *Weinmánnia* will grow in any light rich soil; and cuttings will strike root in the same kind of soil, under a hand-glass, in heat. None of the species are worth cultivating for ornament.

II. LEIOSPE'RMUM (from λειος, *leios*, smooth, and σπερμα, *sperma*, a seed; in reference to the seeds being smooth). D. Don, in edinb. phil. journ. april, 1830.—Weinmánnia, species of authors.

Lin. syst. *Octándria*, *Digýnia*. Calyx 4-cleft, deciduous. Petals 4. Stamens 8. Disk hypogynous, flat, entire. Styles 2. Capsule opening at the top at the dissepiments; cells many-seeded. Seeds oblong, glabrous.—Trees, natives of New Zealand, with simple crenated leaves, jointed petioles, caducous stipulas, and racemose flowers; with the pedicels scattered, not in fascicles.

1 L. racemòsum (D. Don, l. c.) petioles jointed at the apex; racemes usually solitary. ♄. G. Native of New Zealand. Weinmánnia racemòsa, Murr. syst. veg. p 376. Lin. suppl. p. 227. Leaves elliptic, beautifully veined beneath, 2-3 inches long. Racemes terminal, usually twin, 3-4 inches long.

Racemose-flowered Leiospermum. Tree.

2 L. parviflòrum (D. Don, l. c.) petioles jointed at the base; racemes corymbose. ♄. G. Native of New Zealand. Weinmánnia parviflòra, Forst. prod. p. 29. Leaves elliptic, recurved at the apex, an inch and a half long. Racemes numerous, 1½ or 2 inches long. Flowers 3 times smaller than those of the first species.

Small-flowered Leiospermum. Tree.

Cult. For culture and propagation see *Callicoma*, p. 201. Not worth growing, unless in botanic gardens.

III. CALDCLU'VIA (named after Alexander Caldcleugh, F.R.S. F.L.S. who has collected and sent home many dried plants from Chili). D. Don, in edinb. phil. journ. April, 1830.—Dietérica, Ser. mss. in D. C. prod. 4. p. 8.

Lin. syst. *Octándria*, *Dygýnia*. Calyx membranous, 4-parted, deciduous. Petals 4, unguiculate. Stamens 8. Hypogynous glands 8, alternating with the stamens; cells of ovarium many-ovulate, 20-30. Styles 2, rarely 3, thickish. Capsule opening from the top at the dissepiments; cells many seeded, usually 5-10. Placenta tetragonal. Seeds fusiform, glabrous; testa larger than the nucleus, membranous, loose, elongated, and subarillate at the base.—A tree, native of Chili, with simple, serrated, glabrous leaves; jointless pedicels; twin, subfalcate, toothed, caducous stipulas; terminal panicled flowers; woody capsule, and the seeds nearly as in *Philadélphus*.

1 C. paniculà'ta (D. Don, l. c.) ♄. G. Native of Chili, near Talcahuano, and in moist places at Conception. Weinmánnia paniculàta, Cav. icon. 6. p. 44. t. 565. Weinm. corymbòsa, Ruiz et Pav. fl. per. 4. t. 330. f. b. ined. Weinmánnia Chilénsis, D. C. prod. 4. p. 665. Dietérica paniculàta, Ser. in D. C. prod. 4. p. 8.

Panicled-flowered Caldcluvia. Tree.

Cult. For culture and propagation see *Callicoma*, p. 201.

IV. PLATY'LOPHUS (from πλατυς, *platys*, broad, and λοφος, *lophos*, a crest; the capsule is so much compressed at the apex as to appear winged). D. Don, in edinb. phil. journ. April, 1830.—Weinmánnia species of Lin.

Lin. syst. *Octo-Decándria*, *Digýnia*. Calyx 4, but sometimes 5-cleft, permanent. Petals 4, rarely 5, permanent, trifid;

segments linear, acute, sometimes unidentate. Stamens 8 or 10. Disk hypogynous, urceolate, entire; cells of ovarium biovulate. Styles very short. Capsule membranous, reticulated, flattened into a bifid wing at the apex, ventricose at the base, 2-celled; cells 1-seeded. Seed large, arched, with a smooth coriaceous testa.—An elegant tree, native of the Cape of Good Hope. Leaves petiolate, ternate; leaflets sessile, lanceolate, acuminated, sharply serrated, coriaceous, glabrous, reticulated with many veins. Flowers terminal, panicled.

1 P. trifolia'tus (D. Don, l. c.) ♄. G. Native of the Cape of Good Hope, where the tree is called *white ash* by the English colonists. Weinmánnia trifoliàta, Lin. fil. suppl. 227. Thunb. prod. p. 77. exclusive of the synonyme of Lamark.

Trifoliate Platylophus. Clt. 1820. Tree.

Cult. For culture and propagation see *Callícoma*, below.

V. CUNO'NIA (dedicated by Linnæus to John Christian Cuno, of Amsterdam, who described his own garden in verse in 1750). Lin. gen. 556. ed. Schreb. 761. Juss. gen. p. 310. Gærtn. fruct. p. 344. t. 225. D. Don in edinb. phil. journ. 1830. April.—Osterdýkia, Burm. afr. 259. t. 96.

Lin. syst. *Decándria, Digýnia.* Calyx 5-cleft; segments deciduous. Petals 5, entire. Stamens 10. Disk hypogynous, small. Capsule opening from the base at the dissepiments; cells many seeded. Seeds oblong, compressed, smooth, winged, with a rather loose membranous testa. Cotyledons somewhat foliaceous.—Smooth trees, with impari-pinnate leaves, serrated coriaceous leaflets, large caducous interpetiolar stipulas, and with the flowers disposed in axillary racemes or panicles.

1 C. Cape'nsis (Lin. spec. p. 569.) shrubby; leaflets 5-7, lanceolate, coriaceous, serrated; racemes spicate, opposite; pedicels numerous, in fascicles. ♄. G. Native of the Cape of Good Hope. Lam. ill. t. 371. Lodd. bot. cab. t. 826. Flowers white.

Cape Cunonia. Fl. Aug. Clt. 1816. Shrub 6 feet.

2 C. I'ndica (Blum. bijdr. p. 867.) shrubby; leaves somewhat ternately pinnate; leaflets ovate-oblong, acuminated, obliquely subcordate at the base, doubly serrated; panicles axillary, clothed with rusty tomentum. ♄. S. Native of Java, in woods on the higher mountains.

Indian Cunonia. Shrub 6 to 8 feet.

3 C. Cele'bica (Blum. l. c.) arboreous; leaflets ovate-oblong, acuminated, serrated: lateral ones oblique at the base; panicles corymbose, axillary. ♄. S. Native of the Celebes, on the mountains.

Celebes Cunonia. Tree 20 to 30 feet.

Cult. See *Callícoma* for culture and propagation.

VI. ARNO'LDIA (named in memory of Joseph Arnold, M.D. who accompanied Sir Stamford Raffles to the East Indies, where he collected many plants; and the discoverer of the gigantic flower *Rafflèsia Arnóldi* in the Island of Sumatra). Blum. bijdr. p. 868. D. C. prod. 4. p. 12.

Lin. syst. *Octándria, Digýnia.* Calyx 4-parted. Petals 4. Stamens 8, interposed by glands. Ovarium didymous, biovulate. Styles 2, incurved: stigmas simple. Carpels 2, connate at the base, solitary from abortion, beaked by the styles, 1-seeded, opening lengthwise on the inside.—Indian shrubs, with opposite branches and leaves. Leaves impari-pinnate, glabrous. Stipulas interpetiolar, orbicular, deciduous. Racemes axillary and terminal, twin or tern.

1 A. pinna'ta (Blum. l. c.) leaves with 4-5 pairs of lanceolate, bluntly serrated coriaceous leaflets; stipulas deciduous; racemes usually twin. ♄. S. Native of Java, in mountain woods, where it is called *Kiringit*. Spiræ'a pinnàta, Blume, cat. hort. buit. p. 76.

Pinnate-leaved Arnoldia. Shrub.

2 A. heterophy'lla (Blum. l. c.) lower leaves with two pairs of leaflets, and an odd one: upper ones ternate or simple; leaflets lanceolate, distantly serrulated; racemes twin or tern. ♄. S. Native of Java, in mountain woods in the province of Bamtam.

Variable-leaved Arnoldia. Shrub.

Cult. For culture and propagation see *Weinmánnia*, p. 200.

VII. PTEROPHY'LLA (from πτερον, *pteron*, a wing, and φυλλον, *phyllon*, a leaf; so called in reference to the large foliaceous stipulas). D. Don, in edinb. phil. journ. April, 1830.

Lin. syst. *Octándria, Digýnia.* Calyx 4-cleft, deciduous. Petals 4. Stamens 8. Styles 2, very short, incurved. Ovarium 2-celled. Capsule?—A tree, native of the Moluccas. Leaves impari-pinnate; leaflets lanceolate, bluntly acuminated, crenated, glabrous, glaucous beneath, oblique at the base, 3 inches long: the odd or terminal one on a longer petiole than the others. Stipulas large, foliaceous, reniform, quite entire, deciduous. Flowers minute, polygamous, in spicate racemes. Racemes erect, terminal, aggregate, rather panicled, a hand long. Ovarium densely clothed with wool.

1 P. fraxi'nea (D. Don, l. c.) ♄. S. Native of the Island of Honimao, one of the Moluccas. Weinmánnia? fraxínea, Smith, herb.

Ash-like Pterophylla. Tree.

Cult. See *Weinmánnia*, p. 200. for culture and propagation.

VIII. CALY'COMIS (from καλυξ, *kalyx*, a calyx, and κομη, *kome*, hair; in allusion to the tufts of flowers). R. Br. in gen. rem. p. 17. D. Don in edinb. phil. journ April, 1830.

Lin. syst. *Decándria, Digýnia.* Calyx 5-parted, permanent. Petals 5. Stamens 10. Disk hypogynous, very small. Styles setaceous. Capsule globose, 2-celled, opening at the apex; cells many seeded. Seeds minute, smooth.—An Australian, erect, evergreen, branched shrub. Leaves simple, nearly sessile, 3 in a whorl, oblongly cordate, acute, coarsely serrated, coriaceous, glabrous, glaucous beneath. Stipulas peleaceous, permanent. Flowers small, white, copious, in whorles, pedicellate. Capsule membranous, gaping at the apex nearly as in *Heuchèra*.

1 C. verticilla'ta (D. Don, l. c.) ♄. G. Native of New Holland, among the mountains on moist rocks.

Whorled-flowered Calycomis. Shrub.

Cult. For culture and propagation see *Callicoma*.

IX. CALLI'COMA (from καλος, *kalos*, beautiful, and κομη, *kome*, hair; appearance of tufted heads of flowers). Andr. bot. rep. t. 566.

Lin. syst. *Octo-Decándria, Digýnia.* Calyx 4-parted, rarely 5-parted (f. 37. *a.*), permanent. Petals wanting. Stamens 8, rarely 10 (f. 37. *b.*). Disk hypogynous, small. Ovarium distinct; cells many-ovulate. Styles 2, setaceous (f. 37. *d.*). Capsule inclosed in the calyx, which is permanent, dehiscing at the dissepiments; cells ventricose, 1-2-seeded from abortion. Seeds ovate, scabrous from minute papillæ on every side, like those of *Saxífraga*; with a crustaceous testa.—Trees, natives of Australia. Leaves simple, petiolate, serrated; petioles jointless. Stipulas membranous, bidentate, caducous. Flowers capitate; heads terminating the tops of the branchlets, pedunculate, globose.

1 C. serratifòlia (Andr. l. c.) leaves lanceolate, acuminated, hoary beneath, attenuated at the base. ♄. G. Native of New Holland, where the tree is called *black wattle* by the English colonists. Delaun, herb. amat. t. 299. Sims, bot. mag. 1811. Còdia serratifòlia, Ser. mss. ex D. C. prod. 4. p. 7.

Flowers yellow. The twigs are used for making baskets in New Holland. Perhaps the flowers are dioecious. (f. 37.)

FIG. 37.

Saw-leaved Callicoma. Fl. May, Aug. Clt. 1793. Shrub.

2 C. ferrugínea (D. Don, in edinb. phil. journ. April, 1830.) leaves oblong, acute, cuneated at the base, clothed with rusty tomentum beneath, and on the branchlets. ♄. G. Native of New Holland, on the banks of rivers.

Rusty Callicoma. Shrub.

3 C. Billardie`ri (D. Don, l. c.) leaves 3 in a whorl, nearly sessile, elliptic, retuse, crenulated, glabrous. ♄. G. Native of New Holland? Còdia montàna, Labill. mss. in herb. Lamb.

La Billardier's Callicoma. Shrub.

Cult. A genus of very pretty shrubs; they will thrive well in a mixture of loam and peat; and ripened cuttings root readily in sand under a hand-glass.

X. CERATOPE'TALUM (from κερας, *keras*, a horn, and πεταλον, *petalon*, a petal; the petals are jagged so as to resemble a stag's horn). Smith, nov. holl. 1. p. 9. t. 3.

Lin. syst. *Decándria, Digýnia.* Calyx with a 5-parted permanent limb (f. 38. *a.*). Petals 5 (f. 38. *b.*), linear, multifid, stiff, permanent, or wanting. Stamens 10; anthers cordate, terminated by a beak-formed process (f. 38. *c.*). Ovarium half inferior, 2-celled, few-ovulate. Capsule 1-seeded from abortion, dehiscing at the apex. Seed round, with a thick crustaceous testa.—Trees, natives of New Holland, with ternate or simple serrated glabrous leaves, standing on petioles, which are jointed at the apex. Stipulas undivided, rather foliaceous, caducous. Flowers terminal, panicled.

* *Leaves ternate; flowers with petals.*

1 C. gummi'ferum (Smith, nov. holl. t. 3.) ♄. G. Native of New Holland, where it is called *red gum-tree* by the English colonists. (f. 38.)

FIG. 38.

Gum-bearing Ceratopetalum. Clt. 1820. Tree 50 feet.

** *Leaves simple; flowers apetalous.*

2 C. ape'talum (D. Don, in edinb. phil. journ. April, 1830.) leaves lanceolate. ♄. G. Native of New Holland. Ceratopétalum monopétalum, Caley, mss. Perhaps the flowers are sometimes furnished with one petal?

Apetalous Ceratopetalum. Tree.

3 C. monta`num (D. Don, l. c.) leaves linear-lanceolate. ♄. G. Native of New Holland, on the mountains.

Mountain Ceratopetalum. Tree.

Cult. For culture and propagation see *Callicoma* above.

XI. SCHIZOME'RIA (from σχιζω, *schizo*, to cut, and μερις, *meris*, a part; in reference to the cut petals). D. Don, in edinb. phil. journ. April, 1830.

Lin. syst. *Decándria, Digýnia.* Calyx 5-cleft, permanent. Petals 5, jagged, deciduous. Stamens 10; anthers cordate, awnless. Ovarium superior, 2-celled; ovula many. Styles 2, very short, recurved. Capsule baccate? closed at the apex. Seeds unknown.—A tree, native of New Holland. Leaves simple, petiolate, elliptic-oblong, acute, serrated, coriaceous, glabrous, with the veins numerous and reticulated beneath: petioles articulated at the base. Stipulas undivided, caducous. Flowers small, white, panicled. Panicle terminal, much branched.

1 S. ova`ta (D. Don, l. c.) ♄. G. Native of New Holland. Ceratopétalum ovàtum, Caley, mss.

Ovate-leaved Schizomeria. Clt. 1825. Shrub 8 to 10 feet.

Cult. For culture and propagation see *Callicoma* above.

Tribe II.

CODIE`Æ. Stamens definite. Ovarium inferior.

XII. CO`DIA (from κωδεια, *kodeia*, a little ball, in reference to the flowers, which grow in little round heads). Forst. gen. p. 59. t. 50. Labill. sert. caled. p. 45. t. 46.

Lin. syst. *Octo-Decándria, Digýnia.* Calyx permanent, with a 4-5-parted limb. Petals 4-5. Stamens 8-10. Ovarium 2-celled? adhering to the tube of the calyx. Styles densely pubescent. Capsule closed at the apex, usually 1-seeded from abortion. Seed roundish, smooth, with a bony testa; albumen very sparing; cotyledons rather foliaceous; radicle very short. —A shrub, with simple, elliptic, obtuse, quite entire, glabrous, coriaceous leaves; jointless petioles; caducous stipulas; and small, white, capitate flowers. Heads of flowers globose, pedunculate, axillary. Ovarium densely woolly. Stigmas simple, obtuse.

1 C. monta`na (Forst. gen. l. c. icon. ined. t. 35. Labill. sert. l. c.). ♄. G. Native of New Caledonia. Flowers yellow?

Mountain Codia. Shrub 6 to 8 feet?

Cult. For culture and propagation see *Callicoma* above.

Tribe III.

BAUE`REÆ (plants agreeing with *Bauèra* in having indefinite stamens). Stamens indefinite. Ovarium distinct.

XIII. BELANGE`RA (in honour of — Belanger, Director of the Royal Garden at Pondicherry, who has travelled in many parts of Persia and India, where he collected a copious herbarium). Cambess. in St. Hil. fl. bras. 2. p. 203.—Polystèmon, D. Don, in edinb. phil. journ. April, 1830.

Lin. syst. *Icosándria, Digýnia.* Calyx deeply 6-parted; segments reflexed, deciduous, valvate in æstivation. Petals wanting. Stamens indefinite, disposed in many series; filaments subulate, glabrous; anthers 2-celled, bursting lengthwise. Disk girding the base of the ovarium. Ovarium 2-celled; cells many-ovulate; ovula flattened, fixed to the middle of the dissepiment in 2 rows. Capsule superior, 2-celled, 2-valved, 2-beaked; valves at length bifid; cells many-seeded. Seeds compressed, ending in a wing at the apex.—Small, Brazilian trees, with opposite branches, and opposite stalked leaves. Leaves with 3 or 5 leaflets. Stipulas interpetiolar, foliaceous, deciduous. Flowers racemose; racemes simple, axillary. Ovarium densely tomentose. Capsule coriaceous. Stamens erect in the bud.

1 B. gla`bra (Cambess. in St. Hil. fl. bras. 2. p. 204. t. 115.) leaves trifoliate; leaflets oblong, narrow at the base, serrated, glabrous; capsule smoothish. ♄. S. Native of Brazil, on Serra Negra, in the province of Minas Geraes.

Glabrous Belangera. Tree.

2 B. cunea`ta (Cambess. l. c. p. 204.) leaves trifoliate; leaflets oblong-cuneated, sharply serrated, puberulous beneath; capsule clothed with hairy tomentum: hairs rufescent. ♄. S. Native of Brazil, in the province of Minas Geraes.

Cuneate-leafletted Belangera. Tree.

3 B. tomentòsa (Cambess. l. c. p. 205. t. 116.) leaves trifoliate; leaflets oblong, acuminated, sharply serrated, tomentose beneath; capsule clothed with white tomentum. ♄. S. Native of Brazil, in the province of Minas Geraes, near Tejuco, Barbacena, &c., and near the town of St. Paul. Polystèmon triphýllus, D. Don, in edinb. phil. journ. April, 1830.

Tomentose Belangera. Tree.

4 B. speciòsa (Cambess. l. c. p. 206. t. 117.) leaves of 5 leaflets; leaflets ovate-elliptic or lanceolate, acute, sharply serrated, glabrous. ♄. S. Native of Brazil, in that part of the province of Minas Geraes called Minas Novas. Polystèmon pentaphýllus, D. Don, in edinb. phil. mag. April, 1830.

Beautiful Belangera. Tree.

Cult. See *Weinmánnia*, p. 200., for culture and propagation.

XIV. BAUE'RA (named in honour of Francis and Ferdinand Bauer, two celebrated German draughtsmen). Salisb. in ann. bot. p. 512. t. 10.

Lin. syst. *Icosándria, Trigýnia.* Calyx 6-10-parted (f. 39. *a.*). Petals 6-10 (f. 39. *c.*). Stamens numerous, disposed in a double order; anthers peltate (f. 39. *d.*); cells connate, bursting lengthwise. Styles 2 (f. 39. *b.*), glabrous; stigmas simple, obtuse. Capsule superior, 2-celled, 2-valved, opening at the apex by a transverse chink; cells few-seeded; dissepiment placentiferous. Seeds oblong-cylindrical, erect, branched, leafy, roughish from resinous atoms.—Small shrubs, natives of New Holland. Leaves 6 in a whorl, approximating by threes, and therefore as it were opposite and ternate, exstipulate. Flowers rosaceous, axillary, solitary, pedunculate.

1 B. rubiæfòlia (Salisb. in ann. bot. 1. p. 514. t. 10.) leaves lanceolate, crenated; flowers polypetalous. ♄. G. Native of New Holland. B. rubioìdes, Andr. bot. rep. t. 198. Sims, bot. mag. 715. Vent. malm. t. 96. Calyx 8-10-cleft. Corolla 8-10-petalled, pale red, or pink.

Rubia-leaved Bauera. Fl. Jul. Dec. Clt. 1793. Sh. 1 to 2 ft.

FIG. 39.

2 B. hu'milis (Sweet, hort. suburb. p. 124.) leaves oblong, crenated; flowers polypetalous. ♄. G. Native of New Holland. Lodd. bot. 1197. Calyx 8-10-cleft. Corolla 8-10-petalled, red, one half smaller than those of *B. rubiæfòlia*, and the plant is altogether much smaller.

Humble Bauera. Fl. July, Dec. Clt. 1804. Shrub 1 foot.

3 B. Billardie'ri (D. Don, in edinb. phil. journ. April, 1830.) leaves lanceolate, nearly quite entire; flowers with 6 petals. ♄. G. Native of Van Diemen's Land. B. rubioìdes, Labill. mss. Habit of the rest.

La Billardier's Bauera. Shrub 1 to 2 feet.

4 B. microphy'lla (Sieb. pl. exsic. nov. holl. no. 289. D. Don, in edinb. phil. journ. April, 1830.) leaves elliptic-oblong, quite entire; flowers with 6 petals. ♄. G. Native of New Holland. Leaves like those of *Thỳmus serpýllum*. Flowers smaller than those of *B. rubiæfòlia*, red.

Small-leaved Bauera. Shrub 1 to 2 feet.

5 B. capita'ta (Ser. mss. in D. C. prod. 4. p. 13.) leaves oblong, 3-lobed at the apex; flowers terminal, capitate, sessile. ♄. G. Native of New Holland, on the western coast.

Capitate-flowered Bauera. Shrub.

Cult. The species of this genus are very pretty little shrubs, which flower nearly the whole year through; they are therefore very desirable plants for a greenhouse or conservatory. They are rather hardy, and easily cultivated. An equal mixture of sandy loam and peat is the best soil for them; and young cuttings root freely in the same kind of soil, under a bell glass.

Tribe IV.

SYMPHYO'GYNEÆ (from *συμφυω, symphyo*, to join, and *γυνη, gyne*, a style; styles joined). Stamens definite. Ovarium free. Styles connate.

XV. GEI'SSOIS (from *γεισσον, geisson*, the house-eaves; seeds imbricated like the tiles on a house). Labill. sert. cal. p. 50. t. 50. D. Don, in edinb. phil. journ. April, 1830.

Lin. syst. *Octándria, Monogýnia.* Calyx deciduous. Petals wanting. Stamens 8. Style 1, with the base remaining; stigmas 2, simple. Capsule compressed, 2-celled, 2-valved; cells many-seeded. Seeds compressed, winged, with a membranous testa.—A tree, with opposite, petiolate, quinate leaves; elliptic, obtuse, quite entire leaflets, which are pubescent beneath; oblong, ribbed, undivided, caducous stipulas; and axillary, many-flowered racemes, which are either solitary or by threes.

1 G. racemòsa (Labill. sert. caled. p. 50. t. 50.). ♄. G. Native of New Caledonia.

Racemose Geissois. Tree.

Cult. For culture and propagation see *Callicoma*, p 202.

Order CXXI. GALACI'NÆ (plants agreeing with *Galax* in important characters). D. Don, in edinb. phil. journ. Oct. 1828.—Francoàceæ, Adr. de Juss. in ann. des scien. vol. 25. p. 7.

Calyx 4-5-parted, permanent. Petals 4-5, hypogynous, caducous, alternating with the calycine segments; stamens 8-10-16, hypogynous, joined into a tube, which is toothed at the apex, or distinct; filaments or alternate teeth antheriferous. Ovarium composed of 3 or 4 follicles, which are joined, therefore 3-4-celled; ovula indefinite; stigma composed of 3-4 joined ones, undivided or 4-lobed. Capsule 3-4-celled, 3-4-valved; valves bearing the dissepiments in the middle. Central placenta none. Seeds numerous, minute, scobiform, inserted in the inner angle of the cells; outer testa loose, membranous, cellular: inner one very thin, closely adhering to the albumen. Albumen copious, fleshy. Embryo erect, terete, with short cotyledons, and a long cylindrical centripetal radicle.—Perennial American herbs. Leaves radical, simple, lyrate, pinnatifid or serrated; the teeth tipped each by a gland. Flowers terminal, copious, disposed in spicate racemes; pedicels 1-flowered, propped each by a permanent bracteole.

This order differs from *Saxifragàceæ* by the presence of sterile stamens, alternating with the fertile ones; in the absence of a central placenta; and in the frequent quaternary arrangement, in the parts of the calyx and corolla.

Synopsis of the genera.

1 Ga'lax. Calyx 5-parted. Petals 5. Stamens joined into a tube, which is 10-toothed: the alternate teeth antheriferous; anthers 1-celled. Stigma entire. Capsule 3-celled.

2 Francòa. Calyx 4-parted. Petals 4. Stamens distinct,

16, 8 of which are fertile; anthers 2-celled. Stigma 4-lobed. Capsule tetragonal, 4-celled.

3 Teti'lla. Calyx 4-parted. Petals 4, unequal. Stamens 8. Styles 2, very short. Capsule 2-celled.

I. GA'LAX (from γαλα, *gala*, milk; in reference to the whiteness of the flowers). Lin. gen. 276. Juss. gen. 420.—Blandfórdia, Andr. bot. rep. t. 343.—Viticélla, Mitch. gen. 24.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Petals 5. Stamens joined into a tube, which is 10-toothed at the apex: the alternate teeth bearing anthers; anthers 1-celled: cell transverse. Stigma of 3 joined ones, therefore trigonal, 3-furrowed. Ovarium villous. Capsule 3-celled, destitute of any central column. Seeds mucronate at both ends, as in *Acispóra* of De Candolle.—A small herbaceous plant; with radical cordate stiff crenated leaves; and naked scapes (f. 40. *c.*), bearing a loose, spicate raceme of small white flowers at the apex.

1 G. aphy'lla (Lin. spec. 289.). ↄ. H. Native of Virginia. Sims, bot. mag. 754. Anonymus or Belvedere. Clayt. no. 4. Gron. virg. 25.—Blandfórdia cordàta, Andr. bot. rep. t. 343.

FIG. 40.

Leafless Galax. Fl. Ju. July. Clt. 1786. Pl. ¼ to ½ foot.

Cult. This is a pretty little plant; succeeds best in peat soil, and if planted out in a moist situation, will grow and flower freely. It is increased by dividing at the roots.

II. FRANCO'A (to the memory of F. Franco, M.D. of Valentia, a promoter of botany in the 16th century). Cav. in ann. sc. nat. matr. 4. p. 237. icon. 4. p. 76. t. 596. D. Don, in edinb. phil. journ. Oct. 1826. Adr. de Juss. l. c. p. 6.

Lin. syst. *Octándria, Tetragýnia.* Calyx 4-parted. Petals 4, spatulate, with their nerves pinnate and branched towards the apex. Stamens 16, only 8 of which are antheriferous, these are subulate or setaceous, and tapering at the apex; the 8 sterile ones are flattened, obtuse, shorter and broader; anthers cordate, 2-celled, 2-lobed at the base: cells confluent at the apex. Ovarium bluntly 4-sided, 4-celled, with 4 furrows, which are opposite the dissepiments. Style very short, or wanting; stigma 4-lobed: lobes dilated, obtuse, and pruinose. Capsule tetragonal, having the angles drawn out a little at the apex into 4 tubercles, 4-celled, 4-valved; cells prominent, dehiscing by a longitudinal suture, many-seeded; dissepiments formed from a double lamina. Seeds ovate-oblong, fuscescent, smooth, mutic.—Perennial herbs, natives of Chili, beset with simple, deciduous hairs. Leaves lyrate, nearly like those of the turnip, reticulately veined; lobes roundish, toothed: terminal one large, cordate, obtuse, sinuately toothed; teeth terminated each by a gland. Flowers red, terminal, copious, in spicate racemes, which are disposed in a panicle; pedicels 1-flowered.

1 F. appendicula'ta (Cav. in ann. sc. nat. matr. 4. p. 273. icon. 4. p. 76. t. 596.) stemless; leaves petiolate; racemes loose, secund; calycine segments lanceolate, acute; lobes of stigma cuneated, emarginate. ↄ. F. Native of the island of San Carlos de Chiloe. D. Don, in Sweet, fl. gard. new ser. t. 151.—Herb hairy. Leaves petiolate, lyrate. Scape nearly simple. Petals pale red, marked each by a deeper spot in the middle. Fertile filaments 3 times longer than the sterile ones.

Appendiculated Francoa. Fl. Jul. Aug. Clt. 1830. Pl. 2 ft.

2 F. sonchifòlia (Cav. icon. 4. in a note. D. Don, in edinb. phil. journ. Oct. 1826.) plant caulescent; leaves sessile; racemes loose, nodding; calycine segments dilated; petals with involute margins; stigmas elliptic, entire. ↄ. F. Native of Chili. D. Don, in Sweet, fl. gard. new ser. t. 169. Pánke sonchifòlia, Willd. spec. 2. p. 487. Herb hairy. Leaves sessile, lyrate, at length naked. Racemes nodding at the apex. Flowers secund, drooping. Flowers scarlet, marked with a deeper spot in the middle of each petal. Fertile filaments hardly 3 times longer than the more slender sterile ones.

Sow-thistle-leaved Francoa. Fl. July, Aug. Clt. 1830. Pl. 2 to 3 feet.

3 F. ramòsa (D. Don, in edinb. phil. journ. Oct. 1826.) plant caulescent; leaves petiolate; racemes spicate, erect; calycine segments lanceolate, obtuse, nerveless; lobes of stigma cuneated. ↄ. F. Native of Chili, near Santiago. Herb erect, branched, hairy. Stem furnished with small, petiolate, simple, deeply-toothed leaves. Radical leaves not seen, but they are probably lyrate. Flowers smaller and more numerous than in the rest of the species, neither are they secund, but disposed on every side of the racemes, erect; petals obovate, obtuse. Fertile filaments 4 times longer than the flattened, obtuse, sterile ones. Style distinct, but very short; stigma 4-lobed; lobes cuneated, emarginate, or 2-lobed, thick, with revolute margins.

Branched Francoa. Fl. Jul. Aug. Clt. 1831. Pl. 2 to 3 ft.

Obs.—The *Panketinctòria* of Molina belongs to a very distinct genus from *Francòa.*

Cult. The species of *Francòa* are beautiful plants when in flower, and deserve a place in every garden. A mixture of peat and sand is the best soil for them; they should be grown in pots, well drained with sherds, to prevent their rotting. The protection of a frame is sufficient for them in winter; or they may be planted out in the open ground, in a warm sheltered situation, where they will probably survive the winter by a little protection. They are only to be increased by seeds.

III. TETI'LLA (the Chili name of the plant). D. C. prod. 4. p. 667. Adr. de Juss. in ann. scienc. p. 7.

Lin. syst. *Octándria, Digýnia.* Calyx 4-parted; lobes oval, equal. Petals 4, the 2 superior ones roundish-ovate, large; the 2 inferior ones small, oblong. Stamens 8. Ovarium ovate, clothed with glandular pubescence. Styles 2, very short, smoothish, slender. Capsule 2-celled, dehiscing at the apex at the dissepiments, many-seeded.—A smoothish slender herb. Radical leaves on long petioles, orbicular, profoundly cordate, with the recess closed, palmately 3-nerved, sinuately toothed; recesses broad, obtuse, mucronulate. Scape erect, naked, simple. Racemes elongated; pedicels short, 1-flowered, longer than the bracteas; larger petals cream-coloured, red at the base, smaller ones red.

1 T. hydrocotylæfòlia (D. C. l. c.). ↄ. F. Native of Chili, at Concon, in the mountains of Leone, where it is called *Tetilla* by the natives.

Hodrocotyle-leaved Tetilla. Pl. 1 to 2 feet.

Cult. This is a curious and beautiful plant. Its culture and propagation are the same as that recommended for the species of the genus *Francòa.*

Order CXXII. SAXIFRAGA'CEÆ (plants agreeing with *Saxífraga* in important characters). D. C. prod. 4. p. 1.—Saxífragæ, Juss. gen. p. 308.—Saxifràgeæ, Vent. tabl. 3. p. 277. D. C. fl. franc. 4. p. 358.

Calyx either superior or inferior, of 4 or 5 sepals (f. 42. *a.* f. 43. *a.*), which cohere more or less at their base. Petals 5 (f. 42. *b.* f. 45. *d.*) or wanting, inserted between the lobes of the calyx. Stamens 5-10, inserted either into the calyx or beneath the ovarium; therefore they are either perigynous or hypogynous; anthers 2-celled, bursting lengthwise. Disk either hypogynous or perigynous, sometimes obsolete, sometimes annular and notched, rarely consisting of 5 scales. Ovarium inferior, or nearly superior, usually consisting of 2 or 5 carpels (f. 42. *d.* f. 46. *e.* f. 48. *e.*) or follicles, cohering more or less on the inner side, but distinct at the apex; sometimes 2-celled, with a central placenta; sometimes 1-celled, with parietal placentas, rarely 4-5-celled. Styles none; stigmas sessile on the tips of the lobes of the ovarium (f. 42. *e.* f. 52. *c.*). Fruit generally a membranous 1-2-celled capsule, with 2 bracteas, rarely a 4-5-celled 4-5-valved capsule, and sometimes a 4-celled berry. Seeds numerous, very minute, usually with long hexagonal reticulations on the side of a transparent testa. Embryo terete, in the axis of a fleshy albumen, with the radicle next the hylum.—Shrubs or herbs, variable in habit. Leaves simple, either divided or entire, alternate, without stipulas. Flower-stems simple, often naked.

The plants of this order agree in some respects with the herbaceous part of *Rosàceæ*, with which they agree in habit, and from which they differ in their polyspermous partially concrete carpella, albuminous seeds, and want of stipulas. From *Cunoniàceæ* they are divided by their habit, and by the want of stipulas. To *Caryophýlleæ* their habit allies them; but they differ in the insertion of their stamens, the situation of the embryo, and otherwise. *Grossularièæ* agree very much in the structure of the flowers, but differ from them in the capsular fruit, usually 2-celled ovarium, in the seeds being without aril, furnished with a short podosperm, not gelatinous on the outside, and in the more fleshy albumen and habit. From *Crassulàceæ* they differ in the fewer carpella, which are joined together, and usually with the calyx; and in having no glands on the inner side of the carpella. From *Umbellíferæ* they are easily distinguished in the carpella or cells of the ovarium being dehiscent and many seeded, not indehiscent and 1-seeded, in the form of the petals, in the absence of vittæ, and in habit. From *Vibúrneæ*, to which the tribe *Hydrángeæ* comes very near, in the fruit being capsular, not baccate, and in the styles being exserted, not wanting, &c. From *Vaccinièæ*, *Campanulàceæ*, *Ericeæ*, *Gentiàneæ*, in the corolla being polypetalous, not gamopetalous. The genus *Drummóndia* has the stamens equal in number to the petals, and opposite them; thus indicating some analogy to the monopetalous *Primulàceæ*.

According to De Candolle the whole order is more or less astringent. The root of *Heuchèra Americàna* is a powerful astringent, whence it is called in North America *alum-root*, Barton, 2. p. 162. Otherwise they possess no known properties; for the old idea of their being lithontriptic appears to have been derived from their name, rather than their virtues.

Synopsis of the genera.

Tribe I.

Saxifra'geæ (plants agreeing with *Saxífraga* in being herbaceous). *D. C. prod.* 4. *p.* 17.—*Saxifràgeæ, R. Br. gen. rem. exclusive of Hydrángeæ.*

§ 1. *Stamens twice the number of the petals or sepals.*

1 Saxi'fraga. Calyx 5-parted (f. 41. *a.* f. 42. *a.*). Petals 5 (f. 41. *b.* f. 42. *b.* f. 46. *c.*), on short claws, entire. Stamens 10 (f. 42. *c.* f. 46. *d.*). Capsule adnate to the calyx or free, composed of 2 carpella (f. 42. *d.*), which are usually joined even to the style, many seeded (f. 42. *f.*).

2 Eriogy'nia. Calyx 5-cleft. Petals 5, hardly unguiculate. Stamens 20, monadelphous at the base. Ovaries 4-6, free, connected together by dense wool. Carpels distinct, 4-6, free from the calyx, many seeded.

3 Leptarrhe'na. Calyx 5-parted (f. 47. *a.*). Petals 5 (f. 47. *b.*), entire, on short claws. Stamens 10; anthers (f. 47. *c.*), 1-celled, 2-valved. Capsule composed of 2 carpels (f. 47. *e.*), which are joined at the base, many seeded.

4 Chrysosple'nium. Tube of calyx adhering to the ovarium; limb 4-5-lobed. Petals wanting. Stamens 8-10. Styles 2. Capsule 2-valved and 2-beaked, at length 1-celled and many seeded.

5 Mite'lla. Calyx 5-lobed. Petals 5, jagged or toothed. Stamens 10. Styles 2, joined. Capsule 1-celled, 2-valved, many seeded.

6 Te'llima. Free part of the calyx inflated, 5-toothed (f. 49. *b.*), the adhering part conical. Petals 5 (f. 49. *c.*), jagged. Stamens 10 (f. 49. *a.*). Styles 2-3, distinct. Capsule (f. 49. *f.*), 1-celled, 2-valved at the apex.

7 Drummóndia. Calyx with an obconical tube (f. 50. *b.*), and a 5-cleft limb. Petals 5 (f. 50. *c.*), pinnatifid. Stamens 5. Stigmas 2, spreading, 2-lobed. Capsule 1-celled, 2-valved, many seeded (f. 50. *d.*).

8 Tiare'lla. Calyx 5-parted. Petals 5, unguiculate, entire. Stamens 10. Styles 2. Capsule 1-celled, 2-valved, adnate to the bottom of the calyx; valves unequal, dehiscing between the styles. Seeds numerous.

9 Asti'lbe. Calyx deeply 4-5-parted, coloured. Petals wanting. Stamens 8-10. Styles 2; stigmas truncate. Capsule 2-celled, 2-beaked, many seeded.

§ 2. *Stamens equal in number to the petals, or fewer, and alternating with them.*

10 Heuche'ra. Calyx 5-cleft (f. 51. *b.*). Petals 5 (f. 51. *a.*), undivided. Stamens 5. Styles 2 (f. 51. *c.*), very long, distinct. Capsule crowned by the dead flower, 1-celled, dehiscing between the styles (f. 51. *d.*). Seeds rough.

11 Dona'tia. Tube of calyx turbinate; limb truncate, with 2 opposite acuminated triangular teeth. Petals 9 (8-10, Forst.), narrow. Stamens 3. Styles 3-5. Ovarium 2-3-celled; ovula numerous. Fruit capsular.

12 Lepurope'talum. Calyx 5-parted. Petals 5, scale-formed. Stamens 5. Styles 3, somewhat concrete at the base. Capsule 1-celled, 3-valved at the apex, many seeded.

13 Va'hlia. Limb of calyx 5-parted. Petals 5, spreading, undivided. Stamens 5. Styles 2, capitate at the apex. Capsule 1-celled, 2-valved at the apex, 5-furrowed, crowned by the lobes of the calyx. Seeds convex on the outside.

14 Cryptope'talum. Calyx turbinate, 5-cleft. Petals 5, minute, spatulate. Stamens 5. Styles 3. Capsule 1-celled, 3-valved, opening at the cells in the free part, with a parietal placenta in the middle of each valve.

Tribe II.

Hydrange'æ (plants agreeing with *Hydrángea* in being shrubby). *D. C. prod.* 4. *p.* 13.

15 Hydra'ngea. Flowers usually of two forms, one fertile and hermaphrodite. Calyx globose, 10-ribbed, rather truncate; limb 5-toothed. Petals 5. Stamens 10. Styles 2, distinct. Capsule 2-celled, with bent-in valves, dehiscing by a hole between the styles.

16 Cornìdia. Tube of calyx globose; limb 4-toothed. Petals 4. Stamens 8. Styles 3-4, thick, fleshy. Fruit 4-celled, many seeded.

17 Cianìtis. Limb of calyx 5-toothed. Petals 5, rather fleshy. Stamens 10. Styles 3-5; stigmas obtuse. Berry crowned by the teeth of the calyx, somewhat 3-5-celled, many seeded.

18 Ada'mia. Limb of calyx with 5 short teeth. Petals 5. Stamens 10. Styles 5, ending in rather club-shaped 2-lobed stigmas. Berry crowned by the teeth of the calyx, somewhat 5-celled, many seeded.

19 Broussai'sia. Calyx 5-parted, hemispherical, free from the ovarium. Petals 5, oblong, acuminated, with the acumen reflexed as in umbelliferous plants. Stamens 10, hypogynous. Ovarium roundish, crowned by the short style and truncate stigma, 5-celled; cells many seeded.

Tribe I.

SAXIFRA'GEÆ (plants agreeing with *Saxífraga* in being herbaceous). D. C. prod. 4. p. 17. Saxifràgeæ, R. Br. gen. rem. exclusive of Hydrángeæ. Herbs variable in habit, usually dwarf. Leaves exstipulate, alternate, rarely opposite. Flowers disposed in racemes or panicles, rarely solitary, all fertile.

§ 1. *Stamens twice the number of the petals and sepals.*

I. SAXI'FRAGA (from *saxum*, a stone, and *frango*, to break; supposed medical virtues in that disease). Lin. gen. 764. Juss. gen. p. 309. Lam. ill. t. 372. Gærtn. fruct. 1. p. 177. t. 36. D. Don, in Lin. trans. 13. p. 341. Sternb. enum. sax. et suppl. 1. Moretti, tent. sax. Gaudin, fl. helv. 3. p. 83. D. C. prod. 4. p. 17.

Lin. syst. *Decándria*, *Digýnia*. Calyx 5-cleft (f. 41. *a*. f. 42. *a*. f. 46. *a*.). Petals 5 (f. 42. *b*. f. 46. *c*.), entire, unguiculate. Stamens 10 (f. 42. *c*. f. 46. *d*.); anthers 2-celled. Styles 2 (f. 42. *e*.), permanent. Capsule (f. 42. *d*.) 2-celled, 2-valved, 2-beaked, opening within the beak by an orbicular hole, many seeded. Seeds minute, smooth.

Sect. I. Berge'nia (in honour of Charles Aug. Bergen, author of Flora Francofurtana, in one vol. 8vo. 1750, and other botanical works). Mœnch, meth. 664. ex D. Don, in Lin. trans. 13. p. 343. Geryònia, Schrank, Tauch, and Sternb.—Erópheron, Tauch, hort. canal. fasc. 1. Megàsea, Haw. enum. sax. 6. Calyx campanulate, 5-parted, wrinkled on the outside; segments conniving. Petals unguiculated, inserted in the calyx. Stamens inserted in the throat of the calyx; filaments subulate; anthers roundish. Styles hollow inside, full of seeds, joined at the base, at length turgid, and changing into a profoundly bipartite capsule; stigmas semiglobose, glabrous; seeds cylindrical.—Perennial herbs, with thick woody roots. Leaves large, fleshy. Petioles furnished by entire membranous stipulas along both sides at the base. Flowers red, disposed in thyrsoid panicles.

1 S. crassifòlia (Lin. spec. 573.) leaves oval or obovate, very blunt, glabrous, serrulated; petals elliptic-oblong. ♄. H. Native of Siberia, on the Alps. Curt. bot. mag. 196. Gmel. fl. sib. 4. p. 166. t. 56. Megàsea crassifòlia, Haw. enum. sax. p. 6. Flowers large, red. The root is stiptic or astringent when chewed.

Var. β, Haworthiàna (Ser. in D. C. prod. 4. p. 36.) leaves somewhat orbicularly cordate, flat, hardly crenated. ♃. H. Native of Siberia. Megàsea mèdia, Haw. enum. sax. 7.

Thick-leaved Saxifraga. Fl. March, May. Clt. 1765. Pl. 1 ft.

2 S. cordifòlia (Haw. misc. nat. 157.) leaves orbicularly cordate, serrated, glabrous; petals roundish. ♃. H. Native of Siberia, on the Alps. Megàsea cordifòlia, Haw. enum. sax. 7. Flowers large, red.

Heart-leaved Saxifraga. Fl. March, May. Clt. 1779. Pl. 1 ft.

3 S. ligula'ta (Wall. in asiat. res. 13. p. 398. with a figure) leaves obovate, subcordate, denticulated, quite glabrous on both surfaces, but ciliated on the margins; panicle dichotomous; petals broad, orbicular. ♃. F. Native of Nipaul, and the east of Bengal, on the alps. Lodd. bot. cab. 747. Sweet, fl. gard. t. 59. S. Pacúmbis, Buch. mss. Megàsea ciliàta, Haw. enum. sax. 7. Flowers very pale red, almost white.

Var. β, mìnor (Wall. mss.) leaves much smaller; flowers more loose, and distant.

Ligulate-leaved Saxifrage. Fl. Mar. May. Clt. 1821. Pl. 1 ft.

Sect. II. Gyno'pera (from γυνη, *gyne*, a style, in botanical language, and περα, *pera*, beyond; in reference to the styles being above the stamens). Díptera, Borkh. ex Tausch, l. c. Auláxis, Haw. syn. sax. p. 46. Hydática, Tausch, hort. can. Neck. elem. 2. p. 387. Robertsònia, Haw. syn. succ. p. 311. enum. sax. p. 52. Calyx 5-leaved, reflexed. Petals hypogynous, sessile. Stamens hypogynous; filaments clavate; anthers kidney-shaped. Styles conniving; stigmas simple, beardless. Capsule roundish, naked. Seeds spherical.—Perennial tufted herbs, furnished with short surculi. Leaves fleshy, undivided, for the most part cartilaginously serrated. Scapes erect, branched. Flowers small, panicled, rose-coloured or white, dotted.

4 S. ge'um (Lin. spec. 574.) leaves reniform, crenated, pilose on both surfaces, adult ones crowded and spreading; petioles very long, nearly terete, villous; calycine segments ovate, obtuse. ♃. H. Native of Siberia, Switzerland: and the hills in Ireland, especially on a mountain, near Dingle, in the county of Kerry. Sternb. rev. sax. p. 15. Lapeyr. fl. pyr. t. 24. Smith, engl. bot. 1561. S. punctàta, Sternb. sax. p. 18. S. umbròsa punctàta, Smith, engl. fl. 1. p. 263. Sax. hirsùta β, gèum, Arnott et Ser. in D. C. prod. 4. p. 42. Robertsònia gèum, Haw. enum. sax. p. 53.—Gmel. sib. 3. p. 161. t. 65. f. 1.

Petals white or pale red, furnished at the base with red and yellow spots.

Var. β, dentàta (Haw. enum. sax. p. 53.) leaves reniform, round, crenately toothed; petals marked with yellow and red dots. ♃. H. Native on the mountains of Ireland. Robertsònia dentàta, Haw. syn. p. 323. Sax. dentàta, Loud. hort. brit. p. 176.

Var. γ, crenàta (Haw. l. c.) hairy; leaves reniform, round, bluntly crenated. ♃. H. Robertsònia crenàta, Haw. l. c. S. crenàta, Loud. hort. brit. p. 53.

Var. δ, polìta (Haw. l. c.) hairy; leaves reniform, roundish, sharply toothed, with the surface naked and smooth. ♃. H. Native on the mountains of Ireland. Robertsònia polìta, Haw. l. c. S. polìta, Loud. hort. brit. p. 176.

Geum Saxifrage. Fl. May, July. Ireland. Pl. 1 foot.

5 S. HIRSU'TA (Lin. spec. 574.) leaves oval, acutely serrated, rounded at the base or cordate, pilose on both surfaces, when adult erect; petioles very long, nearly terete, villous; pedicels elongated, 1-flowered. ♃. H. Native of the Pyrenees and Ireland, on moist rocks; in Ireland on mountains in the county of Kerry. Lapeyr. fl. pyr. sax. p. 45. t. 23. Smith, engl. bot. 2322. Sternb. sax. p. 14. Robertsònia hirsùta, Haw. enum. sax. p. 54. Petals white, furnished with numerous red and yellow dots. S. hirsùta, var. α, serràta, Arnott, in D. C. prod. 4. p. 42. S. élegans and S. gràcilis, Mack. ex Hook. in litt. S. polìta, Link. et Hort.

Var. β; leaves roundish, cordate, glabrous on both surfaces.

Var. γ, sphæroídea (Haw. enum. sax. p. 54.) leaves broadly oval, somewhat cordate, bluntly crenated, with the surface naked. ♃. H. Native of the Pyrenees. Robertsònia sphæroídea, Haw. syn. 322. S. sphæroídea, Loud. hort. brit. 176.

Hairy Saxifrage. Fl. May, June. Ireland. Pl. ½ to 1 ft.

6 S. UMBRÒSA (Lin. spec. p. 574.) leaves obovate, retuse, cartilaginously crenated, quite glabrous, crowded and spreading in the adult state; petioles short, compressedly dilated; pedicels few-flowered. ♃. H. Native of the Pyrenees and Ireland, in the clefts of rocks and on the mountains. In several parts of Ireland; plentiful on a mountain called the Mangeston, county of Kerry; on the mountains of Sligo; on Croagh Patrick, near the Lake of Killarney, in great abundance; in Thorp Arch woods, near Wetherby, Yorkshire; betwixt Arncliffe and Horton, in Craven. Mill. fig. 141. f. 2. Lapeyr. pyr. sax. p. 44. t. 22. Smith, engl. bot. 633. Sternb. sax. p. 14. Robertsònia umbròsa, brévipes, et lóngipes, Haw. sax. p. 55. S. spatulàris, Brot. fl. his. 2. p. 172. Petals oval, of a reddish white colour, full of scarlet and yellow dots, with 3 conspicuous branched nerves. The plant is very variable in habit.

Var. β, punctàta (D. Don, in Lin. trans. 13. p. 352.) leaves roundish, sharply serrated: adult ones erect; petioles longer. ♃. H. Native of Siberia and Ireland, on the mountains; also of Kotzebue's Sound. S. punctàta, Lin. spec. p. 574. Sternb. suppl. f. 1. S. gràcilis, Step. in Sternb. sax. suppl. 1. p. 5. t. 5. but not of Schleich. S. gèum, herb. Patrin. S. semidecándra, Worsm. and S. æstivàlis, ex Fisch. in litt. Robertsònia punctàta, Haw. enum. sax. p. 55.—Gmel. sib. 4. p. 161. no. 71. t. 66.

Var. γ, serratifòlia (D. Don, in Lin. trans. 13. p. 352.) leaves oblong-ovate, deeply serrated: adult ones erect; petioles longer. ♃. H. Native of Ireland, on the mountains. S. serratifòlia, Mackay, in lit. Robertsònia punctàta β, serràta, Haw. enum. sax. p. 55.

Shady Saxifrage, None-so-pretty, or London-pride. Fl. April, June. Ireland. Pl. ½ to 1 foot.

7 S. CUNEIFÒLIA (Lin. spec. p. 574.) leaves cuneiform, repandly crenated, glabrous: adult ones crowded, spreading; petioles linear, very narrow, naked; calycine segments oblong, acute; petals spatulate. ♃. H. Native of the Pyrenees, Alps of Switzerland, Styria, Hungary, and Norway. Scop. carn. t. 13. Schmied. fasc. t. 12. no. 37. Waldst. et Kit. hung. 1. p. 43. t. 44. Sternb. sax. p. 14. S. punctàta, Gunn. fl. norv. no. 1076. act. hafn. 10. p. 445. t. 3. f. 10.—Gesn. fasc. 19. t. 12. f. 37. Morretti, tent. sax. p. 31. Gaudin, fl. helv. 3. p. 97. Robertsònia cuneifòlia, Haw. enum. sax. p. 56. S. cuneifòlia diversifòlia, Ser. in Meisn. anz. 1818. p. 73. Plant tufted. Petals spatulate, furnished with a solitary yellow spot.

Var. β, Davùrica (D. Don, in Lin. trans. 13. p. 354.) leaves opaque, toothed; flowers larger. ♃. H. Native of Siberia. S. Davùrica, Hort. but not of Willd. Robertsònia Daúrica, Haw. enum. sax. p. 56.

Wedge-leaved Saxifrage. Fl. May, June. Clt. 1768. Pl. ¼ to ½ foot.

8 S. PAUCIFLÒRA (Sternb. rev. sax. suppl. 1. p. 6. t. 4. f. 2.) root tufted; leaves roundish or ovate-roundish, toothed, cuneated at the base, running down the petiole, which is short; petals ovate, unguiculate, longer than the calyx. ♃. H. Native of Siberia and Kamtschatka. Petals spotted.

Few-flowered Saxifrage. Pl. ½ foot.

9 S. SPICA'TA (D. Don, in Lin. trans. 13. p. 354.) leaves on long petioles, orbicularly cordate, sharply serrated, veiny, pilose; petioles dilated at the base; raceme elongated, spike-formed; calycine segments very short. ♃. H. Native of Sledge Island, on the west coast of America. S. gèum, Pursh, fl. amer. sept. 1. p. 311. but not of Lin. Plant tufted. Petals elliptic-oblong, dotted, 3-nerved, with the nerves branched.

Spike-flowered Saxifrage. Pl. 1 foot.

10 S. NELSONIA'NA (D. Don, in Lin. trans. 13. p. 355.) leaves orbicularly-cordate, somewhat peltate, deeply serrated; petioles very long, filiform; thyrse ovate. ♃. H. Native of the north-west coast of America, at Cape Newnham, and at Kotzebue's Sound. Hook. et Arn. in Beech. bot. p. 124. t. 29. Flowers on short pedicels; petals oval, white, dotless; filaments white. A beautiful species.

Nelson's Saxifrage. Pl. ½ to 1 foot.

11 S. ARGU'TA (D. Don, in Lin. trans. 13. p. 356.) leaves roundish-reniform, deeply serrated, glabrous; petioles filiform; scape slender, smooth; calycine segments oblong, acute. ♃. H. Native of the western coast of America. Flowers white, size of those of *S. stellàris*.

Sharp-cut-leaved Saxifrage. Pl. ½ foot.

12 S. STELLA'RIS (Lin. spec. p. 572.) leaves aggregate, rhomboid-ovate, sessile, acutely toothed, but narrowed, and quite entire at the base; petals ovate, acute, equal, unguiculate; scape nearly simple. ♃. H. Native on most of the mountains of Scotland, north of England, and nearly throughout the whole of Europe, Siberia, and the western coast of America, on wet shady rocks, and by the sides of rivulets. Fl. dan. t. 23. Jacq. coll. 1. p. 202. t. 13. Scop. carn. 1. p. 292. t. 13. Smith, engl. bot. t. 167. Sternb. sax. p. 11. S. Nootkàna, Moc. icon. ined. t. 422. Spatulària stellàris, Haw. enum. sax. p. 49. Petals white, elegantly 3-nerved, furnished with 2 yellow spots at the base.

Var. β, elàta (D. Don, in Lin. trans. 13. p. 357.) scapes numerous, a foot high. ♃. H. Native of Siberia.

Var. γ, angustifòlia (D. Don, l. c.) leaves narrower and longer, with few teeth at the apex. ♃. H. Native of Siberia.

Var. δ, Schleichèri (D. Don, l. c.) leaves obovate, repandly crenated; scapes humble, flexuous. ♃. H. Native of Switzerland, on the Alps. S. stellàris, Schleich. in litt.

Var. ε, Bellárdi (D. Don, l. c.) plant stemless; leaves roundish, repand; flowers sessile. ♃. H. Native of the Alps of Piedmont. S. Bellárdi, Allion. pedem. no. 1536. t. 88. f. 1.

Var. ζ, *dissímilis*; leaves with deep broad teeth. ♃. H. Native of Scotland, on the western Highlands. S. dissímilis, G. Don, in Loud. hort. brit. p. 176.

Var. η, *uniflòra* (D. C. fl. fr. 4. p. 379. var. α.) plant very minute; scapes 1-flowered. ♃. H. Native of Switzerland, on the Alps. S. stellàris β, pùmila, Gaudin, fl. helv. 3. p. 100.

Var. ϑ, *acaúlis* (Hall. fil. in Meisn. anz. 1818. p. 76) flowers sessile, in the heart of the leaves. ♃. H.

Starry Saxifrage. Fl. June, Jul. Scotland. Pl. $\frac{1}{4}$ foot.

13 S. foliolòsa (R. Br. in Parry's 1st voy. app. p. 275.) radical leaves cuneated, a little toothed; scape divided: branches bearing 1 flower at the apex, covered below by a fascicle of small leaves; calyx inferior, obovate; segments of the petals cordate-lanceolate. ♃. H. Native of Lapland, Melville Island, and other arctic islands. S. stellàris γ, Lin. fl. lapp. ed Smith, p. 144. t. 2. f. 3. S. stellàris β, comòsa, Willd. spec. 2. p. 644.

Leafy Saxifrage. Pl. $\frac{1}{4}$ foot.

14 S. leucanthemifòlia (Michx. fl. bor. amer. 1. p. 260.) clothed with clammy pubescence; leaves crowded, lanceolate-cuneated, acutely and coarsely toothed, quite entire at the base; scape much branched, diffuse; petals ovate, acute, unguiculate: 3 outer ones the largest. ♃. H. Native of the Pyrenees; and of North America, in Behring's Straits, Nootka Sound, on the Rocky Mountains, and at Portage, near the source of the Columbia. Lapeyr. pyr. sax. p. 49. t. 25. Hook, in bot. mag. 2959. S. Clùsii, Gouan. ill. p. 28. exclusive of the synonymes. Ser. in D. C. prod. 4. p. 40. S. ferrugínea, Graham in edinb. phil. journ. 1828. p. 348. Spatulària Clùsii and S. leucanthemifòlia, Haw. enum. sax. p. 48. Petals white: 3 outer ones the largest, and with 2 spots at the base: the 2 inner ones much smaller and spotless.

Var. β; plant clothed with pubescent tomentum. ♃. H. Native of the north-west coast of America, on Dundas Island, in Queen Charlotte's Sound.

Leucanthemum-leaved Saxifrage. Fl. June. Clt. 1812. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

15 S. melaleu'ca (Fisch. in Sternb. rev. sax. suppl. 3. t. 3.) leaves roundish ovate, acutish, somewhat denticulated, tapering into the petiole, glabrous; scape few-flowered, also glabrous; flowers disposed in a somewhat panicled corymb; calycine segments ovate, acute; petals unguiculate. ♃. H. Native of Altàia, on the Alps at the river Tschulyschm, and at Lake Teletskoje Osero. S. elongàta β, glàbra, Sternb. rev. sax. p. 9. Petals obovate, pale sulphur coloured, suffused with violet on the outside; filaments of a pale violet colour. Leaves greenish yellow; upper part of plant of a deep violet colour.

Black and white Saxifrage. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

16 S. strigòsa (Wall. cat. no. 448.) lower leaves sessile, somewhat rosulate, oblong-lanceolate, few-toothed, mucronate at the apex, clothed with strigose hairs; cauline leaves lanceolate-linear, acute, entire, much smaller than the lower ones; stem simple, few-flowered, and is as well as the pedicels beset with numerous capitate hairs; sepals lanceolate, acute; petals 3-nerved, obtuse; styles very short; stigmas thickish. ♃. H. Native of Nipaul, on the Emodi mountains at Gosainsthan, and at Kamoon. Leaves almost the size and form of those of *Arabis alpìna*. Filaments flat.

Strigose Saxifrage. Pl. $\frac{1}{2}$ foot.

17 S. sarmentòsa (Lin. fil. suppl. p. 240.) stolons or runners creeping; leaves orbicularly cordate, lobately crenated, pilose, red beneath; petals unguiculate, the 2 outer ones large and flaccid. ♃. F. Native of China and Japan, in moist places on mountains, among stones. Schreb. mon. dion. p. 16. t. 2. f. 3. Curt. bot. mag. 92. S. stolonífera, Jacq. icon. rar. 1. t. 80. Ligulària sarmentòsa, Duval, pl. sec. p. 11. ex Haw. enum. sax. p. 50. Díptera sarmentòsa, Borkh. in Rœm. mag. 1. p. 29. S. ligulàta, Murr. comm. 1781. p. 26. t. 1. S. Chinénsis, Lour. coch. p. 281. Petals white: 3 inner ones cordate; of these 3 the lateral ones are marked by a yellow spot at the base; and the central one by 2 scarlet spots at the base: but the 2 outer petals are large, flaccid, and 3-nerved.

Var. β, *cuscutæfórmis* (Ser. in D. C. prod. 4. p. 43.) plant much smaller; stem usually 3-flowered; leaves ovate-roundish, coarsely and simply toothed; flowers less irregular; petals more acute. ♃. F. Native of China. S. cuscutæfórmis, Lodd. bot. cab. t. 186. Ligulària mìnor, Haw. enum. sax. p. 151. The stolons or runners resemble dodder very much.

Creeping Saxifrage. Fl. June, July. Clt. 1771; β 1815. Pl. $\frac{3}{4}$ foot.

18 S. eròsa (Pursh, fl. amer. sept. 1. p. 311.) leaves lanceolate, acute, glabrous, runcinately serrated; panicle divaricate, pyramidal; pedicels elongated, 1-flowered; petals oblong-oval, obtuse, unguiculate. ♃. H. Native of Carolina, on the higher mountains, in stony rivulets. S. Caroliniàna, gràcilis, and eròsa, Schleich. cat. 1821. p. 63. Robertsònia micranthifòlia, Haw. syn. succ. 322. Auláxis micranthifòlia, Haw. enum. sax. p. 47. Petals white, 3-nerved, with a yellow spot at the base.

Var. β; leaves hairy.

Erose-leaved Saxifrage. Fl. May, Ju. Clt. 1812. Pl. 1 to 1½ ft.

19 S.? nu'da (Haw. enum. sax. p. 47. under *Auláxis*) leaves naked, doubly and deeply toothed. ♃. H. Native country unknown.

Naked-leaved Saxifrage. Fl. May, Ju. Clt.? Pl. $\frac{1}{2}$ to 1 ft.

Sect. III. Leiógyne (from λειος, *leios*, smooth; and γυνη, *gyne*, a female; in reference to the stigmas being beardless). D. Don, in Lin. trans. 13. p. 344. Calyx deeply 5-cleft (f. 41. *a*.). Petals (f. 41. *b*.) sessile in most of the species. Stamens inserted in the throat of the calyx (f. 41. *c*.); filaments subulate. Styles straight; stigmas orbicular, flattish, beardless. Capsule free from the calyx (f. 41. *d*.). Seeds roundish. —Humble herbs, rarely subshrubs. Roots fibrous, but in many of the species they are granular. Stems flexuous, usually many-flowered and many-leaved. Leaves in all reniform and lobed. Flowers white or yellow.

20 S. rotundifòlia (Lin. spec. p. 576.) leaves reniform, unequally and coarsely toothed: cauline ones petiolate; petals lanceolate, acute. ♃. H. Native of Austria, Switzerland, and Siberia. Mill. fig. t. 141. Curt. bot. mag. t. 424. Lapeyr. pyr. sax. t. 26. Micropétalum rotundifòlium, Haw. enum. sax. p. 16-17. Petals white, marked with scarlet dots, 3-nerved.

Var. β, *repánda* (D. Don, in Lin. trans. 13. p. 361.) plant larger and more robust; leaves broader. ♃. H. Native of the Alps of Caucasus. S. repánda, Sternb. rev. sax. p. 17. t. 5. S. rotundifòlia, Bieb. fl. taur. 1. p. 315. Micropétalum màjus, Haw. enum. sax. p. 17.

Round-leaved Saxifrage. Fl. May, Ju. Clt. 1596. Pl. 1 ft.

21 S. hy'brida (Sternb. sax. p. 17. t. 8. f. 3.) radical leaves petiolate, roundish-cuneated, crenated: cauline ones minute, entire; stem panicled. ♃. H. Native of the Pyrenees. Very like *S. rotundifòlia*, but differs in the smaller stature and slenderer habit; in the leaves being acute at the base, not cordate, and in the cauline ones being minute, entire, and nearly sessile.

Hybrid Saxifrage. Pl. 1 foot.

22 S. diversifòlia (Wall. cat. no. 452.) leaves thickish, more or less pilose, of many forms; lower ones cordate, petiolate: cauline ones petiolate, or sessile and stem-clasping, entire, of a different colour beneath, reticulately veined, marked above by small depressed dots; flowers in panicled corymbs; bracteas and calyxes more or less ciliated with short, capitate

hairs; pedicels beset with glandular hairs. ♃. F. Native of Nipaul, in Emodi, Gosaingsthan and Kamaon. Root fibrous. Stem firm, leafy. Calycine lobes spreading. Petals obovate, yellow, 5-nerved. Styles diverging at maturity. Stigmas thick.

Var. α, lanceolàta (Ser. in D. C. prod. 4. p. 44.) leaves lanceolate: lower ones not seen: but the middle ones are attenuated at the base, and acutish; calycine lobes oblong, beset with glandular hairs. ♃. F. S. diversifòlia, Wall.

Var. β, parnassifòlia (Ser. l. c.) radical leaves cordate, obtuse, on long petioles: cauline ones cordate, stem-clasping, obtuse; calycine lobes oblong, beset with glandular pili. ♃. F. S. parnassifòlia, Wall. cat. no. 451.

Var. γ, Moorcroftiàna (Ser. l. c.) lower leaves elliptic: cauline ones stem-clasping, ovate-oblong, numerous; flowers larger; calycine lobes more ciliated with glands. ♃. F. S. Moorcroftiàna, Wall. cat. no. 453.

Diverse-leaved Saxifrage. Pl. 1 foot.

23 S. parviflòra (Biv. stirp. rar. fasc. 4. p. 1. t. 3.) stem branched at the base, or simple; leaves reniform, 5-lobed: superior ones 3-lobed: uppermost ones entire, lanceolate; peduncles spreading, opposite the leaves; petals obovate, longer than the calyx. ♃. F. Native of Sicily, in the mountains, on mossy rocks.—Cup. panph. 3. t. 36. Flowers white, almost like those of *Stellària mèdia*. Styles very short, diverging; stigmas spatulate, papillose. Capsule bladdery, slender.

Var. α, ramòsa (Ser. in D. C. prod. 4. p. 44.) stem branched at the base, few-flowered; lower leaves 5-lobed, crenated: superior ones 3-lobed. ♃. F. Native among rocks, on Mount Maronis, near the monastery of St. Martini de Scalis. Bernardi, l. c. t. 3.

Var. β, Bocconiàna (Ser. l. c.) stem purple, erect, 2-flowered: lower leaves 3-lobed, or lanceolate, entire. ♃. F. Native on the mountains, about Palermo. (ex Guss. Bocc. cent. 2. p. 4. t. 45. f. 2.)

Small-flowered Saxifrage. Pl. ½ foot.

24 S. cymbala'ria (Lin. spec. 579.) lower leaves reniform, on long petioles, very bluntly 5-lobed: upper ones 3-lobed or undivided; calycine segments oblong, obtuse; petals ovate, acute, with branched nerves. ♃. H. Native of the Levant, on Parnassus Delphus and other Grecian mountains. Smith, fl. græc. 378. S. hederàcea, Bieb. fl. taur. 1. p. 317. exclusive of the synonymes. Lobària cymbalària, Haw. enum. sax. p. 18. —Buxb. cent. 2. p. 40. t. 45. f. 2.—Vaill. itin. ed. gall. t. 362. Flowers small, golden yellow. Stems numerous, leafy, slender, flaccid, creeping at the base.

Cymbalaria-like Saxifrage. Pl. cr.

25 S. hedera'cea (Lin. spec. 579.) lower leaves acutely 3-lobed: upper ones ovate, entire; calycine segments ovate, acute; petals roundish, unguiculate. ⊙. H. Native of Candia and Cyprus, among humid shaded rocks. Smith, fl. græc. t. 379. Lobària hederàcea, Haw. enum. sax. 18. Plant small; stems numerous, filiform. Flowers small, white.

Ivy-like Saxifrage. Fl. July. Clt. 1752. Pl. pr.

26 S. orienta'lis (Jacq. obs. 2. p. 9. t. 34.) radical leaves roundish: cauline ones cuneated, acutely and coarsely toothed; calycine segments ovate, acute; petals oval, with simple nerves. ⊙. H. Native of the Levant; and of Caucasus, on the higher mountains of Talusch, near springs and on the banks of rivulets. S. reticulàta, Sternb. sax. p. 21. t. 18. S. paradóxa, Sternb. l. c. p. 22. t. 14.? Lobària orientàlis, paradóxa, and reticulàta, Haw. enum. sax. pp. 18. and 20. Stems erectish, branched, decumbent at the base. Petals golden yellow, size of those of *S. hederàcea*.

Oriental Saxifrage. Pl. dec.

27 S. Ru'ssi (Presl, del. prag. p. 140.) radical leaves petiolate, repandly crenated, cordate at the base, somewhat 5-lobed: cauline ones sessile: lower ones 3-lobed, middle lobe the longest; uppermost leaves lanceolate, entire; sepals ovate; petals lanceolate, 3-nerved, twice the length of the calyx. ♃. H. Native of Sicily, on rocks and among stones, about Giuliana. Plant 2-3 inches high, beset with short glandular hairs. Flowers white.

Russo's Saxifrage. Pl. ¼ foot.

FIG. 41.

28 S. Jame'sii (Torrey, in ann. lyc. new york 2. p. 204.) plant beset with glandular pubescence; lower leaves on long petioles, reniform, crenately lobed; upper leaves tapering into the petiole, cuneated, nearly sessile; lobes of calyx triangularly ovate, acute; petals spatulate, acute, on long claws; racemes secund; bracteas lanceolate; pedicels of calyxes glandular. ♃. H. Native of North America, among the Rocky Mountains. Hook, fl. bor. amer. 1. p. 247. t. 74. Flowers about the size and colour of those of *S. oppositifòlium* (fig. 41.).

James's Saxifrage. Pl. ½ foot.

29 S. Richardsònii (Hook, fl. bor. amer. 1. p. 247.) stem glandular, leafy, pubescent above; leaves on long petioles, orbicularly cordate, crenately lobed, veiny, with the margins and veins glandular beneath; glands pedicellate; racemes rather compound; bracteas lanceolate, and are as well as the pedicels glandular; petals obovate-elliptic, on short claws, very acute, nerved, about twice the length of the calycine segments, which are acuminated; stamens 5. ♃. H. Native of the Arctic Sea shore, between the Mackenzie and Coppermine rivers; and of Kotzebue's Sound. S. Nelsoniàna, Hook. et Arn. in bot. Beech. p. 124. t. 29. but not of D. Don. This and the preceding are very elegant plants.

Richardson's Saxifrage. Pl. ½ foot.

30 S. nudicau'lis (D. Don, in Lin. trans. 13. p. 366.) leaves reniform, palmate, glabrous: lobes ovate, mucronate; stem erect, naked, terete; flowers panicled; lobes of calyx triangularly ovate, acute; petals obovate, a little longer than the calyx. ♃. H. Native of the north-west coast of America, Behring's Straits. S. gràcilis, Steph. in Sternb. rev. sax. suppl. p. 7. t. 5. f. 1.? Flowers panicled, white, size of those of *S. rivulàris*.

Naked-stemmed Saxifrage. Pl. ½ foot.

31 S. hetera'ntha (Hook. fl. bor. amer. 1. p. 252. t. 78. β.) plant rather pubescent; radical leaves on long petioles, reniformly cordate, membranous, veiny, many-lobed: lobes short, somewhat tridentate: teeth acute, mutic; scape naked; flowers panicled, usually abortive; some of the filaments clavate, and others petal-formed; ovarium free; calyxes reflexed; branches of panicle sometimes bearing bulbs below. ♃. H. Native of North America, common on moist rocks of the Columbia, from its source to its confluence with the sea. The leaves resemble those of *S. rotundifòlia*, but they are furnished with a long, membranous, sheathing base, and altogether radical.

Variable-flowered Saxifrage. Pl. ½ foot.

32 S. granula'ta (Lin. spec. p. 576.) plant hairy; radical leaves reniform, crenately lobed: cauline ones petiolate; calycine segments lanceolate, obtuse; petals spatulate; root granular. ♃. H. Native of the north and middle of Europe, in dry fields and the borders of woods; plentiful in some parts of Britain. Fl. dan. t. 514. Lam. ill. t. 272. f. 1. Smith, engl. bot. t. 500. Stem leafy, many-flowered; pedicels elongated,

1-flowered, and are as well as the calyxes clothed with clammy down. Flowers snow-white; nerves of petals branched.

Var. β, plèna; flowers double. Common in gardens.

Var. γ, multicaúlis (Lapeyr. fl. pyr. t. 27.) stems numerous, short; lower leaves lobed, broadly crenated: upper ones obovate, acuminated, entire, rarely 1-2-toothed; peduncles many-flowered. ♃. H. Native of the Pyrenees. S. granulàta γ, ramosíssima, Ser. in D. C. prod. 4. p. 36.

Var. δ, Corsicàna (Ser. in Duby, bot. gall. 1. p. 211.) plant very small; stem 1-4-flowered; leaves small, crenately lobed; flowers hardly smaller than those of the species. ♃. H. Native of Corsica. S. rivulàris, Ph. Th. exsic.

Var. ε, penduliflòra (Ser. in Duby, bot. gall. 1. p. 211.) leaves reniform, broadly crenated; flowers somewhat umbellate, pendulous; peduncles 1-flowered, weak. ♃. H. Native of Auvergne. S. penduliflòra, Bast, in journ. bot. 1814. p. 17. and D. C. fl. fr. 5. p. 519.

Var. η, sessiliflòra (Ser. in D. C. prod. 4. p. 36.) stems quite simple; leaves reniform, crenated; flowers sessile, subcapitate. ♃. H. In dry places.

Var. ζ, bulbillàris (Ser. l. c.) stem more or less branched; flowers numerous, sessile, abortive, transformed into little bulbs, which rise from the axils of the leaves. ♃. H. Native of Sicily. S. granulàta gemmífera, Haw. enum. sax. p. 23.

Granular-rooted Saxifrage. Fl. May. Brit. Pl. ½ to 1 ft.

33 S. odontophy'lla (Wall. cat. no. 454.) leaves reniform, bluntly lobed, rather pubescent; stem few-leaved, many-flowered, and are as well as the pedicels and calyxes clothed with glandular pubescence; petals obovate, unguiculate; stigmas diverging, capitate. ♃. H. Native of Nipaul, in Kamaon. Roots woody, fibrous. Flowers white. Pedicels 1-flowered. Very like *S. granulàta.*

Tooth-leaved Saxifrage. Pl. ½ to ¾ foot.

34 S. bulbífera (Lin. spec. 577.) radical leaves reniform, petiolate, crenated: cauline ones sessile, deeply lobed; calycine segments triangularly ovate, acute; stem branched, many-flowered. ♃. H. Native of the south of Europe, as in Spain, in stony meadows and shady places; also of Switzerland, on dry hills. Sternb. sax. p. 15. t. 12. f. 1.—Mor. hist. 3. p. 474. sect. 12. t. 9. f. 24.—Column. ecphr. 1. p. 318. t. 317. S. vivípara, Vest, in flora, 1820. p. 405. Flowers white, smaller than those of *S. granulàta.* Peduncles elongated, 1-flowered, clothed with glutinous down as well as the calyxes. Stem beset with viscid hairs. Leaves pilose.

Var. β, veronicæfòlia (Sternb. rev. sax. 16. t. 12. f. 1. and in Sturm, deutschl. fl. 35. with a figure). ♃. H. Haw. enum. sax. 23. S. veronicæfòlia, Bertol. amœn. p. 361. There is also a variety of this with a 1-flowered stem, under the name of *S. bulbífera árctica,* Haw. enum. sax. p. 24.?

Bulb-bearing Saxifrage. Fl. Ju. Jul. Clt. 1819. Pl. ½ to 1 ft.

35 S. ce'rnua (Lin. spec. p. 577.) leaves glabrous, petiolate; radical ones reniform, deeply lobed: cauline ones palmate; calycine segments ovate, obtuse; petals spatulate, emarginate; stem quite simple, generally 1-flowered. ♃. H. Native of Lapland, Pyrenees, Switzerland, and Scotland, about alpine rills on the loftiest mountains. In North America, on the arctic shore and islands, and in Kotzebue's Sound; also of Siberia, on alpine rocks, at the rivers Ursal and Tschuja. In Scotland, on Ben Lawers and on Craigalleach. Fl. dan. t. 22. Gunn. fl. norv. no. 528. t. 9. f. 2. Sternb. sax. p. 18. t. 12. f. 2. Lobària cérnua, Haw. enum. sax. p. 20.—Lin. fl. lapp. p. 172. t. 2. f. 4. Bulbs scaly; scales fleshy, rising from the base of the petioles of the primordial leaves. Stem simple, 1-flowered, leafy, with small aggregate bulbs rising from the upper leaves. Flowers solitary, large, campanulate, drooping, white; nerves of petals branched. The specimens from the Rocky Mountains of North America are more leafy, especially on the stem amongst the bulbs, which are very numerous.

Var. β, ramòsa (Ser. in D. C. prod. 4. p. 36.) stem a little branched, few-flowered; flowers nearly all transformed into bulbs. ♃. H. Native of the Alps of Lapland and Norway.

Var. γ, Ledeboùri; stem branched; branches elongated, 1-flowered; leaves crenated: lobes acutish. ♃. H. Native of Altaia, on alpine rocks, at the rivers Tschuja and Ursal.

Var. δ, multiflòra (Hook. et Arn. in Beech. voy. pt. bot.) plant branched; each branch bearing a large flower, and no bulbs. ♃. H. Native of Kotzebue's Sound. Perhaps *S. Stephaniàna,* Sternb. sax. suppl. p. 8. t. 6. f. 2. may be correctly referred to this variety.

Drooping-flowered Saxifrage. Fl. June, July. Scotland. Pl. ¼ to ½ foot.

36 S. Sibi'rica (Lin. spec. 577.) root granular; leaves hairy, petiolate: radical ones reniform, palmately lobed: cauline ones digitate; pedicels elongated, remote, capillary; petals obovate, with simple nerves; stem much branched, filiform. ♃. H. Native of Siberia, Altaia, and the Alps of Caucasus, among rather humid shaded rocks, or among stones; also of Labrador and Newfoundland. Sternb. sax. p. 23. t. 25. f. 1. Gmel. sib. 4. p. 162. no. 74. S. granulàta β, Steven de sax. cauc. in mem. mosq. 4. p. 77. no. 3. S. grandiflòra, Sternb. sax. t. 12. f. 4.? S. cymbalària, Bieb. fl. taur. 3. p. 292. no. 780. Lobària Sibírica, Haw. enum. sax. 21. Lobes of calyx ovate-linear. Petals white. Stem beset with viscid hairs.

Siberian Saxifrage. Fl. June, July. Clt. 1802. Pl. ascend.

37 S. bractea'ta (D. Don, in Lin. trans. 13. p. 367.) radical as well as cauline leaves on long petioles, reniform, and deeply lobed; flowers in crowded corymbs, bracteate; stem leafy, flexuous, branched, ascending, clothed with viscid villi. ♃. H. Native of Eastern Siberia. Flowers white, like those of *S. cérnua,* but a little larger; calycine segments broadly ovate, obtuse. Petals obovate, a little longer than the calycine segments.

Bracteated-flowered Saxifrage. Pl. ¼ foot.

38 S. rivula'ris (Lin. spec. p. 577.) stem weak, quite simple; leaves reniform, on long petioles, glabrous; flowers usually by threes, sessile, bracteate. ⊙. H. Native of the higher Alps of Europe, as in Lapland, Norway, as well as of Siberia. It is also found in North America, as in Labrador, Arctic Sea shore and Islands, Kotzebue's Sound, and in elevated places among the Rocky Mountains. In Scotland about Alpine rivulets, and in wet fissures of rocks, as on Ben Nevis, near the lake in the ascent: also on Ben Lawers, and at Loch Rannoch. Lin. fl. lapp. no. 174. t. 2. f. 7. Fl. dan. t. 118. Smith, engl. bot. 2275. Sternb. sax. p. 19. t. 12. f. 3. Plant annual. Stem weak, ascending, few-leaved, furnished with viscid hairs above. Leaves 5-6-lobed; lobes obtuse. Flowers small, white, bracteate. Calycine segments ovate, very blunt, obtuse, conniving. Petals oval, obtuse, triple nerved.

Brook Saxifrage. Fl. June, July. Scotland. Pl. 2 inches.

39 S. hyperbòrea (R. Br. in Parry's first voy. append. p. 274.) stem woolly, 2-flowered; leaves glabrous: radical ones palmate, on long petioles; petals 1-nerved. ♃. H. Native of Ireland, and Arctic America. S. rivulàris β, Hook. fl. bor. amer. 1. p. 246. Flowers white. Perhaps only a variety of *S. rivulàris.*

Northern Saxifrage. Pl. 2 inches.

40 S. nu'tans (D. Don, in Lin. trans. 13. p. 268.) stem rather pubescent, decumbent at the base, jointed in the middle, and furnished with one leaf at the joint: raceme drooping, few-flowered: radical leaves on long petioles, reniform, deeply and coarsely toothed, with a few scattered stiff hairs on both sur-

faces: cauline one petiolate; petioles hairy. ♃. H. Native of the west coast of North America, in the Island of Unalaschka. Flowers white, size of those of *S. bulbífera;* calycine segments lanceolate, acute; petals obovate, with branched flexuous nerves. Pedicels and calyxes beset with crowded glandular hairs.

Nodding-flowered Saxifrage. Pl. $\frac{1}{4}$ foot.

41 S. ranunculifòlia (Hook. fl. bor. amer. 1. p. 246. t. 83.) plant clothed with glandular pubescence, slender: lower leaves on very long petioles, reniform, 3-parted: segments broadly cuneated, deeply lobed; cauline leaves few; flowers corymbose, pentandrous; petals obovate, twice the length of the calyx; calyx beset with glandular hairs: segments acute. ♃. H. Native of North America; common on the high grounds around the Kettle Falls of the Columbia, and on the Rocky Mountains. Flowers white, size of those of *S. stellàris*. Petals obovate, unguiculate.

Crow-foot-leaved Saxifrage. Pl. $\frac{3}{4}$ foot.

42 S. exi`lis (Steph. in Sternb. sax. suppl. p. 8. t. 3. f. 1.) root tufted; radicles capillary; radical leaves palmately 5-lobed, petiolate: cauline ones linear, entire; petals obovate-oblong, much longer than the 5-cleft calyx. ♃. H. Native of Siberia, and probably of Kotzebue's Sound. Stem weak, 2-flowered. Flowers white.

Slender Saxifrage. Pl. $\frac{1}{2}$ foot.

43 S. Laurentia`na (Ser. in D. C. prod. 4. p. 35.) plant with many stems; radical leaves on long petioles, reniform, 5-7-lobed, crenated, reticulately veined lengthwise, glabrous; stems and peduncles ornamented with long intricate hairs; flowers few, somewhat capitate, involucrated by 3-4 crenately lobed bracteas; lobes of calyx ovate, obtuse, shorter than the petals; petals 3-nerved towards the middle. ♃. H. Native of the Island of St. Laurence in Behring's Straits. S. Chamissònis, Sternb. ined. but not S. Chamissòi, Sternb. Flowers white.

St. Laurence Saxifrage. Pl. $\frac{1}{2}$ foot.

44 S. Stephania`na (Stern. suppl. sax. 1. p. 8. t. 6. f. 2.) plant tufted; stem usually 4-flowered, pilose; radical, as well as the cauline leaves, petiolate, and palmately many-lobed, pilose; bracteas nearly linear; sepals linear, obtuse; petals obovate, many nerved. ♃. H. Native of Siberia, Steph. S. palmàta, Steph. in litt. ex Sternb. l. c. Flowers white.

Stephan's Saxifrage. Pl. $\frac{1}{2}$ foot.

45 S. alti´fida (Haw. enum. sax. p. 24.) leaves deeply and palmately 3-parted: segments profoundly 3-5-cleft; peduncles subracemose, divaricate. ♃. H. Native country unknown. S. adscéndens, Haw. exclusive of all the synonymes. Very nearly allied to *S. granulàta*, but truly distinct, and differs in the fissures of the leaves, and in the more decumbent stems. Flowers white.

Deep-cleft-leaved Saxifrage. Fl. May, June. Pl. $\frac{1}{2}$ foot.

Sect. IV. Hi´rculus (a name given by the ancients to a kind of spikenard or valerian, which has nothing to do with the present plant). Tausch, hort. canal. fasc. 1. Haw. enum. sax. p. 40. Kingstònia, Gray, brit. fl. 2. p. 531. Calyx deeply 5-cleft (f. 42. *a.*), not adhering to the ovarium. Petals sessile (f. 42. *b.*) in most of the species. Stamens inserted in the throat of the calyx (f. 42. *c.*); filaments subulate. Styles straight; stigmas orbicular, flattish, beardless. Capsule free from the calyx (f. 42. *d. a.*). Seeds oblong, wrinkled from dots.—Humble herbaceous evergreen plants. Stems leafy, stoloniferous. Leaves alternate, narrow, nerved, entire, but usually ciliated with stiff hairs, marcescent. Flowers white or yellow.

46 S. hírculus (Lin. spec. 576.) leaves lanceolate, obtuse, not ciliated; calycine segments lanceolate, obtuse, usually ciliated; petals obovate, many nerved; styles almost wanting; stigmas spatulate, when young deflexed, afterwards divaricate. ♃. H. Native of Sweden, Switzerland, Lapland, Siberia, Caucasus, Germany, and in England, in boggy places. It is also found in North America, from the Saskatchawan to the Arctic sea shore and Islands, where it seems most abundant; Behring's Straits, Cape of Good Hope, Kotzebue's Sound, &c. In England in a turfy morass about the centre of Knutsford moor, Cheshire; and on Cotherstone Fell, near the junction of the Black Heath with the river Balder, Yorkshire. Fl. dan. t. 200. Smith, engl. bot. 1009. S. flàva, Lam. fl. fr. 3. p. 529. S. propínqua, R. Br. in Ross' voy. ed. 2. vol. 2. p. 192. Hírculus ranunculoìdes, Haw. enum. sax. p. 60.—Gmel. sib. 4. p. 165. t. 65. f. 3. Plant pale green, with numerous procumbent stolons. Stem from 4 inches to 1 foot high. Peduncles long, 1-flowered, covered with clammy fuscous villi. Flowers large, showy golden yellow; sepals obtuse.

Var. β, elàta; stem a foot high, many flowered; peduncles very villous. ♃. H. Native of Eastern Siberia.

Var. γ, acutàta (Ser. in D. C. prod. 4. p. 45.) segments of calyx acute; styles rather elongated.—Hall. hist. no. 972. t. 11.

Var. δ, Altàica; stem usually 1-flowered, pubescent; peduncles clothed with rufous villi. ♃. H. Native of Altaia, in humid subalpine places at the rivers Ursul and Tschuja. S. Hírculus, Ledeb. fl. alt. 2. p. 121.

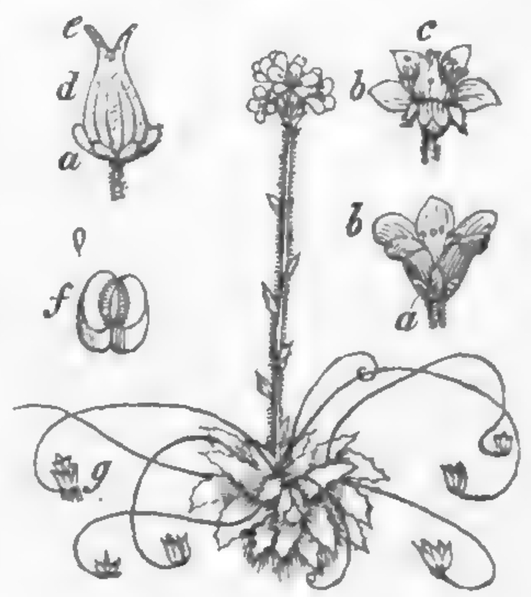
Hirculus Saxifrage. Fl. Aug. England. Pl. $\frac{1}{3}$ to 1 foot.

47 S. myosotifòlia (D. Don, in Lin. trans. 13. p. 373.) plant tufted, without any stolons or flagellæ; leaves ovate, acute, mutic, bristly; pedicels elongated, and are as well as the calyxes beset with glandular pili; stem nearly naked, usually 3-flowered; calycine segments broadly ovate, acute; petals roundish, unguiculate, 5-nerved. ♃. H. Native of Siberia. Surculi very short, erect, crowded. Stem 2-3-flowered, beset with stiff hairs. Leaves ciliated with hairs on the margins, and on both surfaces. Flowers cream-coloured; filaments compressed, yellowish. Styles short, thick.

Mouse-ear-leaved Saxifrage. Pl. 2 inches.

48 S. flagella`ris (Sternb. sax. p. 25. t. 6.) stolons or flagellæ filiform; stems erect, simple, 1-5-flowered, and are as well as the calyxes clothed with glandular pubescence; radical leaves as well as lower cauline ones obovately spatulate: superior ones rather villous; petals permanent, longer than the capsule, which is semi-superior. ♃. H. Native of the Alps of Caucasus; and of north-west America, at Cape Newnham, in Melville Island, Baffin's Bay, Behring's Straits, Arctic Islands, summits of the Rocky Mountains, Kotzebue's Sound, &c. Hook. fl. bor. amer. 1. p. 253. t. 77. S. setígera, Pursh. fl. amer. sept. 1. p. 312. S. áspera, Bieb. fl. taur. 1. p. 314. exclusive of the synonymes. Hírculus flagellàris, Haw. enum. sax. p. 41. Stem leafy, 1-5-flowered. Radical leaves crowded, all ciliated on the margins, with cartilaginous spinules: calyx and pedicels clothed with glutinous down. Flowers yellow, size of those of *S. Hirculus* (f. 42.).

FIG. 42.



Var. α; stem 1-5-flowered; ovarium free from the calyx; sepals oblong. ♃. H. S. flagellàris, Willd. ex Sternb. sax. p. 25. t. 6. Bieb. fl. taur. 3. p. 291. Ledeb. fl. ross. alt. ill. t. 321. S. áspera, Bieb. fl. taur. 1. p. 314. S. myosotidifòlia, Pall. ex Spreng. syst. 2. p. 364.

Var. β; stem 1-flowered; ovarium adhering to the calyx at

the base; calycine segments ovate. ♃. H. S. flagellàris, R. Br. in Ross' voy. ed. 2. vol. 2. p. 192. D. Don, in Lin. trans. 13. p. 373. Hook. et Arn. in bot. Beech. voy. 1. p. 124. S. setígera, Pursh, fl. amer. sept. 1. p. 312.

Flagellæ-bearing Saxifrage. Fl. May, July. Clt. 1819. Pl. $\frac{1}{4}$ foot.

49 S. Brunòniana (Wall. cat. no. 442.) tufted; stems 1-4-flowered, bearing a few glandular hairs; stolons or surculi capillary, without any tuft of leaves at the points, rising from the axils of the leaves, as in *S. flagellàris;* leaves linear, with cartilaginous ciliately serrate edges, and terminated by a stiff mucrone; cauline leaves fewer, shorter; sepals ovate, very blunt; petals obovate-oblong, 3-nerved, yellow, much longer than the calyx; stigmas small. ♃. F. Native of Nipaul, in Emodi, and Kamaon. Flowers yellow. Pedicels slender, elongated.

Brown's Saxifrage. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

50 S. brachy'poda (D. Don, in Lin. trans. 13. p. 378.) plant tufted; stems dense, simple, gemmiferous; leaves dense, linear, spreading, ciliated with bristles, 1-nerved, full of pellucid dots, of a different colour beneath; flowers solitary, terminal; pedicels clothed with unequal glandular hairs; sepals lanceolate, mucronate, ciliately serrulated, 3-nerved; petals obovate, 5-nerved, bluntish; stigmas thick, diverging. ♃. F. Native of Nipaul, in Emodi, Gosaingsthan, and Kamaon. S. glandulòsa, Wall. cat. no. 442. Pedicels nearly the length of the flowers. Leaves glaucous beneath, quite glabrous, very numerous, with revolute edges. Buds echinated. Flowers yellow.

Short-peduncled Saxifrage. Pl. $\frac{1}{4}$ foot.

51 S. fimbria'ta (Wall. cat. no. 443,) stem simple, gemmiferous, very leafy, bearing scattered glandular hairs; leaves lanceolate, very acute, of a different colour beneath, ciliated with stiff bristles, marked above with fine parallel wrinkled lines: nerves 5-7, nearly parallel, reticulated and pellucid; flowers small, subracemose, but often solitary; pedicels short, rather hispid; sepals lanceolate, rather cartilaginously serrulated, mucronate. ♃. F. Native of Nipaul, at Gosaingsthan and Kamaon.

Fringed-leaved Saxifrage. Pl. $\frac{1}{2}$ foot.

52 S. aizoìdes (Lin. spec. p. 576.) stems leafy; leaves linear, mucronate, glabrous, edged with stiff ciliæ; calycine segments broadly ovate; petals oblong-lanceolate, 3-nerved: nerves simple. ♃. H. Native on the Alps of Switzerland, Lapland, Styria, north of England and Scotland, on the borders of mountain rills, in a black boggy soil. In North America, in the barren country from lat. 64° to the Arctic sea and islands; in swamps and rivulets on the Rocky Mountains; also of Labrador and Newfoundland. Smith, engl. bot. t. 39. Sternb. sax. p. 25. t. 8. f. 1. Sturm, deutschl. fl. 35. with a figure. S. autumnàlis, Lin. spec. p. 575. Fl. dan. t. 72. Scop. carn. 1. p. 293. t. 14. Leptàsea aizoìdes, Haw. enum. sax. p. 39.—Breyn. cent. 106. t. 48.—Morls, hist. 3. p. 477. sect. 12. t. 6. f. 3. Plant green, growing in tufts. Surculi numerous, procumbent, leafy. Stems erect, leafy, many flowered, clothed with viscid down. Flowers somewhat racemose, yellow; calycine segments furnished with a membranous margin, which is jagged at the apex; petals spotted with copper-coloured dots.

Var. β, *cròcea* (Gaudin, syn. sax. in Meisn. anz. 1818. p. 66. fl. helv. 3. p. 102.) petals copper-coloured. ♃. H. S. aizoìdes β, D. C. fl. fr. 4. p. 366. Leptàsea aizoìdes cròcea, Haw. enum. sax. 40. S. atrorùbens, Bertol. in Desv. journ. bot. 4. p. 76. and amœn. acad. 1819. Sternb. rev. sax. suppl. 1. p. 10. There are varieties of this with one or many flowered stems.

Var. γ, *intègra* (Ser. in D. C. prod. 4. p. 47.) leaves not ciliated. ♃. H. S. aizoìdes, Lin. spec. 576. Leptàsea aizoìdes β intègra, Haw. enum. sax. p. 39.

Aizoon-like Saxifrage. Fl. July, Aug. Britain. Pl. $\frac{1}{4}$ foot.

53 S. bronchia'lis (Lin. spec. 572.) suffrutescent; leaves crowded, linear-subulate, triquetrous, mucronate, ciliated with stiff spinules; calycine segments ovate; petals oblong; stems few-leaved and many flowered. ♃. H. Native of Siberia; north-west coast of America, Behring's Straits, Kotzebue's Sound, height of land at the portage of the Columbia river, on the west side of the Rocky Mountains. Ciliària bronchiàlis, Haw. rev. sax. 43.—Gmel. sib. 4. p. 164. t. 65. f. 2. Surculi numerous, erect, branched. Panicle terminal, few or many flowered. Flowers small, cream-coloured; petals obovate-oblong, 3-nerved, with numerous minute copper-coloured dots; anthers copper-coloured. This is very nearly allied to *S. tricuspidàta*, but differs in the want of the lateral points to the leaves.

Var. β, *Lenénsis* (D. Don, in Lin. trans. 13. p. 377.) surculi shorter; leaves longer, spreading; panicle larger, spreading, fastigiate. ♃. H. Native of Siberia, at the river Lena.

Bronchial Saxifrage. Fl. May, June. Clt. 1819. Pl. $\frac{1}{2}$ ft.

54 S. tene'lla (Wulf. in Jacq. coll. 3. p. 144. t. 17.) plant tufted; leaves crowded, linear-subulate, flat, pungent, ciliated; stems slender, few-leaved, few-flowered; calycine segments linear-lanceolate; petals obovate. ♃. H. Native of Carinthia, on the Alps. S. nítida, Wulf. in Jacq. coll. 3. t. 10. f. 4. Surculi numerous. Stems numerous, erect. Leaves imbricated, keeled below, glabrous. Peduncles by threes, long, capillary, 1-flowered, beset with glandular hairs, as well as the calyxes. Flowers white, spotless; anthers yellow.

Delicate Saxifrage. Fl. June, Aug. Clt. 1819. Pl. $\frac{1}{8}$ to $\frac{1}{4}$ ft.

55 S. filicau'lis (Wall. cat. no. 445.) stems filiform, much branched, beset with capitate hairs; branches filiform, 1-flowered; leaves linear, sessile, full of pellucid dots, nerveless, ciliated by capitate bristles; sepals lanceolate-oblong, bluntish; petals obovate, obtuse, 3-nerved; styles much elongated; stigmas thickish, arched. ♃. F. Native of Nipaul. Branches dense. Flowers golden yellow. Perhaps distinct from *S. brachýpoda.*

Thread-stemmed Saxifrage. Pl. $\frac{1}{4}$ foot.

56 S. Kruhsia'na (Fisch. in litt. ex D. C. prod. 4. p. 46.) plant tufted; leaves dense, imbricate, ovate, ciliated, nerveless; flowers by threes; sepals lanceolate, obtuse; petals elliptic, much longer than the calyx, with pinnate nerves; capsule somewhat hemispherical; styles arched. ♃. H. Native of Siberia, near Ijiga, where it was found by Kruhs, according to Fischer. This species is very distinct from *S. áspera*, in the leaves being oval, not linear-ovate, in being nerveless, not 3-nerved, and in the petals being feather-nerved, &c. S. glandulòsa, Willd. herb. ex Stev. in litt. 1821.

Kruhs's Saxifrage. Pl. $\frac{1}{4}$ foot.

57 S. Stelleria'na (Merk ex Fisch. in litt. ex D. C. prod. 4. p. 46.) plant tufted; leaves of the surculi or sterile branches small, numerous, oblong, ciliated and mucronate, hardly petiolate: cauline ones distant: uppermost ones acute, not ciliated; stems branched, 5-7-flowered; flowers distant; pedicels and calyxes glabrous; calycine lobes oblong, acute; petals oblong, 3-nerved, exceeding the calyx; ovarium conical; styles hardly diverging, length of the petals. ♃. H. Native of Eastern Siberia.

Steller's Saxifrage. Pl. $\frac{1}{4}$ foot.

58 S. multiflòra (Ledeb. dec. pl. in mem. acad. des. scienc. petersb. 5. p. 532. no. 18. fl. ross. alt. ill. t. 335.) leaves lanceolate-linear, scattered, cuspidate, remotely and setaceously ciliated, and covered with cobwebbed villi; corymbs terminal, many flowered; calycine segments ovate, obtuse; petals elliptic, bluntish, 1-nerved, more than thrice the length of the calyx; stamens exceeding the corolla. ♃. H. Native of Altaia. It differs from *S. áspera* and *S. bronchiàlis*, and all the nearly

allied species, in the many flowered corymbs, in the surfaces of the leaves and margins, &c.

Many-flowered Saxifrage. Pl. $\frac{1}{4}$ foot.

59 S. a'spera (Lin. spec. 575.) leaves flat, lanceolate-linear, scattered, pungent, remotely ciliated with spinules, glabrous; stem branched, few-flowered; calycine segments ovate, cuspidate; petals broadly elliptic, rounded at the apex, 5-7-nerved, twice the length of the calyx, and a little longer than the stamens. ♃. H. Native of Switzerland and the Pyrenees; also of Siberia. Jacq. austr. 5. append. 31. Sternb. sax. 29. t. 8. f. 1.—Scheuch. itin. 2. p. 140. t. 20. f. 3.—Gesn. fasc. 22. t. 6. f. 27. S. áspera var. *a* elongàta, Gaudin, fl. helv. 3. p. 108. S. intermèdia, Heg. fl. helv. 1. p. 288. Ciliària áspera, Haw. enum. sax. p. 42.—Moris. hist. 3. p. 479. sect. 12. t. 10. f. 25. Plant grey: surculi elongated, decumbent, villous. Stem branched, reddish, brittle, hispid from short hairs. Peduncles longish, stiff, 1-flowered, furnished with glanduliferous hairs, as well as on the calyxes. Nerves of petals branched. Flowers large, cream-coloured.

Rough Saxifrage. Fl. Aug. Clt. 1752. Pl. $\frac{1}{4}$ foot.

60 S. bryoìdes (Lin. spec. 572.) tufts of leaves at the tops of surculi globose; leaves imbricated, subulate, mucronate, ciliated; calycine segments ovate, obtuse; petals oblong; stems few-leaved, 1-flowered. ♃. H. Native of Austria, Switzerland, and the Pyrenees. Jacq. misc. 2. p. 49. t. 5. f. 1. Scop. carn. no. 497. t. 15. Sternb. rev. sax. p. 30. t. 8. and in Sturm, deutschl. fl. p. 33. with a figure. Moretti. tent. sax. p. 32. t. 8. Ciliària bryoìdes, Haw. enum. sax. p. 42.—Scheuch. alp. 142. t. 21. f. 2.—Col. ecphr. 2. p. 66. t. 67. f. 1-2. S. áspera β bryoìdes, D. C. fl. fran. 4. p. 383. prod. 4. p. 46. Plant densely tufted, rosulate. Stem beset with glanduliferous pili. Leaves rather triangular, keeled. Flowers cream-coloured, size of those of *S. áspera;* calycine segments 5-nerved; petals 3-nerved, beset with scattered golden yellow dots; anthers copper-coloured.

Bryum-like Saxifrage. Fl. June, July. Clt. 1752. Pl. $\frac{1}{8}$ foot.

61 S. cherlerioìdes (D. Don, in Lin. trans. 13. p. 382.) tufts of leaves on the tops of the surculi globose; leaves densely imbricated, spatulate, mucronate, ciliated; calycine segments semi-ovate, obtuse; petals obovate, 3-nerved; stems filiform, many-flowered. ♃. H. Native of Kamtschatka. S. bryoìdes, Pall. mss. Plant tufted. Stems ascending, 4-5-flowered, with a few small adpressed leaves. Flowers corymbose, cream-coloured, much smaller than those of *S. bryoìdes.* Pedicels 1-flowered, furnished with a few scattered glands, as well as the calyxes.

Cherleria-like Saxifrage. Pl. $\frac{1}{8}$ foot.

62 S. hispi'dula (D. Don, in Lin. trans. 13. p. 380.) plant tufted, and hispid; stems filiform; leaves ovate, mucronate, bristly, with one tooth on each side; flower terminal, nearly sessile; calyx bristly; petals nearly orbicular, triple-nerved: nerves simple, straight. ♃. H. Native of Nipaul, on the Alps. Flowers yellow, on short pedicels, drooping in the bud. Styles incurved at the apex.

Rather-hispid Saxifrage. Pl. $\frac{1}{4}$ foot.

63 S. evolvuloìdes (Wall. cat. no. 447.) stems very simple, 1-flowered, ornamented by long capitate spreading hairs; leaves ovate-lanceolate, acute, furnished with 1 or 2 teeth, nerveless, sessile, covered with strigose pili; sepals ovate, mucronate by a bristle, and bearing strigose hairs; petals roundish-obovate, opaque, hardly longer than the calyx. ♃. F. Native of Nipaul, at Gosaingsthan and Kamaon. Perhaps distinct from *S. hispidula.* Leaves small, superior ones broadest. Pedicels filiform, nearly twice the length of the flowers. Flowers yellow.

Evolvulus-like Saxifrage. Pl. $\frac{1}{4}$ foot.

64 S. læ'vis (Bieb. fl. taur. 1. p. 314. suppl. 291. but not of Haw.) stems declinate, few-flowered; cauline leaves oblong, acutish, crowded, naked, unarmed, glaucescent; flowers terminal, sessile; petals obovate-oblong, longer than the calyx. ♃. H. Native of the Alps of Caucasus. Flowers yellow. Very nearly allied to *S. aizoìdes,* but differs in the flowers being smaller and sessile.

Smooth Saxifrage. Pl. $\frac{1}{8}$ to $\frac{1}{4}$ foot.

65 S. spinulòsa (Adams, in mem. soc. mosc. 5. ex Spreng. neue. entd. 3. p. 225.) stem nearly naked, many flowered; leaves imbricate, undivided, erect, linear-lanceolate, flat, ciliated, spiny. ♃. H. Native country unknown.

Spinulose Saxifrage. Pl. $\frac{1}{4}$ foot.

66 S. Chamissòi (Stern. rev. sax. suppl. 1. p. 12. t. 10. f. 1.) plant tufted; stem generally 4-flowered; lower leaves cuneated, cuspidately trifid, ciliated; cauline leaves linear-lanceolate, quite entire; sepals small, obtuse; petals oblong, minute, hardly longer than the sepals. ♃. H. Native of the Island of Unalaschka; and the subalpine regions of Mount Hood. S. tricuspidàta β, Hook. fl. bor. amer. 1. p. 254. Flowers minute, white.

Chamisso's Saxifrage. Pl. $\frac{1}{8}$ to $\frac{1}{4}$ foot.

67 S. tricuspida'ta (Retz. prod. fl. scand. ed. 2. no. 522.) stems straight, thick; lower leaves dense, coriaceous, cuneiform, tricuspidate, with the margins finely ciliated; flowers somewhat corymbose; peduncles short and stiff; calycine segments ovate; petals oblong or lanceolate, 3 times longer than the calyx; capsule conical, ending in diverging styles; stigmas subcapitate. ♃. H. Native of Greenland, and of North America; from Lake Winepeg in lat. 50° to the Arctic sea and islands; and from Hudson's Bay to the Rocky Mountains; Kotzebue's Sound, Newfoundland, &c. Rottb. in act. hafn. 10. p. 446. t. 6. Fl. dan. t. 976. Leptàsea tricuspidàta, Haw. enum. sax. p. 40. Plant densely tufted, glabrous: surculi very short. Stems ascending, many flowered. Superior leaves undivided. Pedicels elongated, glandular, as well as the calyxes. Flowers yellow, size of those of *S. Hírculus.* Petals spotted, triple-nerved: nerves simple.

Tricuspidate-leaved Saxifrage. Fl. May, June. Clt. 1824. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

68 S. junipe'rina (Bieb. fl. taur. 1. p. 314. suppl. p. 291.) stems suffruticose, proliferous; leaves crowded at intervals, subulate, triquetrous, stiff, pungent; flowers disposed in spikes; petals obovate, triple-nerved. ♃. H. Native of the Alps of Caucasus, at the foot of the Kaischaur Alps frequent, and nearly throughout the whole of Caucasus. Sternb. sax. p. 31. t. 10. Chondròsea junipérina, Haw. enum. sax. p. 15. Stems numerous, crowded with leaves, proliferously branched at the apex. Leaves flattish on the keel beneath, bisulcate above, furnished with an acicular spine at the apex, and finely serrulated at the base. Spike 6-10-flowered: pedicels short, beset with clammy down. Bracteas linear, obtuse, ciliated with glands. Flowers yellow, size of those of *S. áspera.*

Var. a, Steveniàna (Ser. in D. C. prod. 4. p. 23.) flowers crowded into an ovoid spike.

Var. β, Adamsiàna (Ser. l. c.) flowers disposed into a capitate corymb, emulating that of Lýchnis alpìna, Sternb. sax. p. 31. t. 10. a middle figure.

Juniper-like Saxifrage. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

Sect. V. Porphy'reon (from πορφυρεος, *porphyreos,* purple; colour of flowers). Tausch, hort. canal. fasc. f. 1. D. C. prod. 4. p. 17.—Antiphýlla species, Haw. enum. sax. p. 43.—Calliphýllum, Gaudin, fl. helv. 3. p. 94. Calyx 5-cleft, with a long, erect, permanent tube (f. 43. *a.*), joined to the ovarium or free from it. Petals sessile, perigynous. Stamens perigynous (f. 43. *b. c.*); filaments flat, gradually attenuated. Stigmas

spreading, flat, spatulate, bearded with short down (f. 43. *c*.). Capsule covered by the calyx. Seeds angular, smooth or wrinkled.—Tufted evergreen herbs, with small opposite coriaceous or thick permanent leaves. Flowers red or violaceous. Elegant little plants.

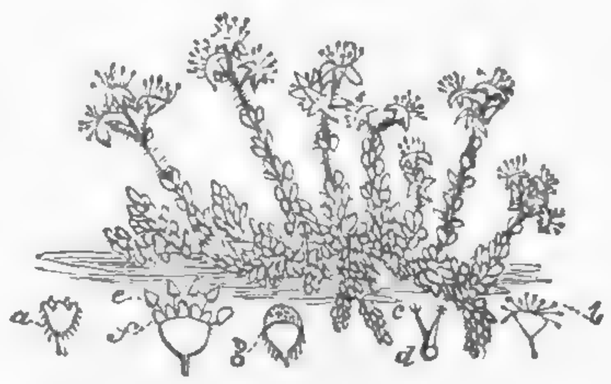
69 S. oppositifòlia (Lin. spec. 575.) stems 1-flowered; leaves imbricated, ovate or obovate, flat, obtuse, ciliated; segments of the calyx broadly ovate, obtuse; petals obovate, 5-nerved; genitals shorter than the corolla. ♃. H. Native of Lapland, Switzerland, Spitzbergen, Pyrenees, Scotland, and England, on alpine rocks and precipices; also of North America, as in Newfoundland and Labrador; Antecosti, in the Bay of St. Laurence; Rocky Mountains, near the highest summits, between lat. 52° and 56°; Arctic sea shore and islands; Bay of Eschscholtz, &c. In England on the west side of Ingleborough Hill, Yorkshire; on Snowdon plentifully; and on Ben Lomond and other Scottish mountains. Lin. fl. lapp. p. 179. t. 2. f. 1. Fl. dan. t. 34. All. pedem. 1529. t. 21. f. 3. Lapeyr. pyr. sax. p. 36. t. 16. Smith, engl. bot. t. 9. Hohenwart in Reiner. itin. 1. p. 133. t. 3. S. cœrùlea, Pers. ench. 1. p. 488. Antiphýlla cœrùlea, Haw. enum. sax. p. 43. Plant forming a broad flat tuft; surculi short, procumbent, reddish. Leaves usually perforated at the apex by 1 or 2 pores. Flowers large, of a beautiful lilac colour.

Var. β, distans (Ser. in D. C. prod. 4. p. 18.) leaves of the sterile branches loose and distant. ♃. H. Native of the Alps of Switzerland and the Pyrenees.

Opposite-leaved Saxifrage. Fl. March, April. Britain. Pl. 1 inch.

70 S. retu'sa (Gouan, ill. 28. t. 18. f. 1.) stems usually 3-flowered; leaves imbricated, oblong, trigonal, acute, full of perforated dots above; petals lanceolate, acute; styles much longer than the corolla. ♃. H. Native of Piedmont, on the tops of the Alps, as well as of Dauphiny and the Pyrenees. Lapeyr. pyr. sax. p. 38. t. 18. Sweet, fl. gard. t. 49. new ser. t. 49. S. imbricàta, Lam. fl. fr. 3. p. 531. S. purpùrea, All. pedem. 1531. t. 21. f. 2. S. oppositifòlia *γ*, Willd. spec. 2. p. 648. Antiphýlla retùsa, Haw. enum. sax. p. 44. Plant forming a very compact harsh tuft, glaucescent; surculi procumbent, densely leafy. Stems erect, few-leaved. Leaves imbricated in 4 rows, like those of the last species, trigonal, glabrous, shining, ciliated at the base. Pedicels and calyxes clothed with short glandular down. Flowers purple. Calycine segments oblong-ovate, obtuse. Petals triple-nerved, acute (f. 43.).

FIG. 43.



Retuse-leaved Saxifrage. Fl. May, June. Clt. 1826. Pl. $\frac{1}{8}$ ft.

71 S. biflòra (All. pedem. 1530. t. 21. f. 1.) stem usually 2-3-flowered; leaves flat, spatulate, ciliated, loose; petals linear-oblong; calycine lobes obtuse; genitals longer than the corolla. ♃. H. Native of the Alps of Switzerland and the Pyrenees, near the limits of perpetual snow. Lapeyr. pyr. sax. p. 37. t. 17. Hohenwart and Reiner, itin. 1. p. 138. t. 2. f. 2. Antiphýlla biflòra, Haw. enum. sax. p. 44. S. oppositifòlia *β*, Willd. spec. 2. p. 648. Plant tufted, greenish purple, like *S. oppositifòlia*, but larger and more loose in habit. Flowers purplish or lilac. Leaves imbricating in 4 rows. Seeds obovate, triquetrous, truncate at the apex.

Two-flowered Saxifrage. Fl. April, June. Clt. 1820. Pl. 1 to 2 inches.

72 S. Eschscho'ltzii (Sternb. rev. sax. suppl. p. 9. t. 10. f. 2.) plant small, densely tufted; leaves closely imbricated, obovate, concave, pectinately ciliated; flowers solitary on short peduncles; petals cochleate, ciliated; calycine segments obtuse, ciliated. ♃. H. Native of the north-west coast of America, at Cape Newnham and Behring's Straits. S. fimbriàta, D. Don, in Lin. trans. 13. p. 404. Plant canescent, forming a flat spreading tuft. Leaves glabrous, full of pitted dots. Peduncles solitary, 1-flowered. Flowers probably purple.

Eschscholtz's Saxifrage. Pl. 1 inch.

Sect. VI. Aizòonia (*αιει*, *aiei*, always, and *ζωος*, *zoos*, alive; succulent plants). Tausch, hort. canal. fasc. 1. D. C. prod. 4. p. 18.—Chondròsea, Haw. enum. sax. p. 10.—Cotylèdon, Trigonophýllum, and Porophýllum, Gaudin, fl. helv. 3. p. 86. 89. and 91. Calyx 5-cleft, with a long tube adhering to the ovarium, erect, permanent. Petals sessile, perigynous. Stamens perigynous; filaments flat, gradually attenuated. Stigmas spreading, flat, spatulate, bearded with short down. Seeds ovate, triquetrous, wrinkled. Leaves alternate, thick, sessile, coriaceous, glaucescent, permanent, cartilaginously margined, usually marked with excavated dots towards the margin: radical ones rosulate. Flowers white, yellow or red.

§ 1. *Leaves ligulate, obtuse, cartilaginously serrated.*

73 S. Cotyle'don (Lin. spec. 570.) leaves flat, spatulate, cartilaginously serrated; calyx densely beset with glands: with linear-lanceolate obtuse segments; petals oblong-spatulate. ♃. H. Native of the Alps of Lapland, Norway, Iceland, Switzerland, and the Pyrenees. Oed. fl. dan. t. 241. S. pyramidàlis, Lapeyr. pyr. sax. p. 32. Sternb. sax. p. 2. t. 2. S. pyramidàta, Mill. dict. no. 4. S. multiflòra, Ehrh. pl. sel. p. 74. Chondròsea pyramidàlis, Haw. enum. sax. p. 10.—Lin. fl. lapp. 177. t. 2. f. 2. Plant tufted. Stem erect, branched in a pyramidal form, many flowered. Leaves with silvery edges. Flowers large, white, dotless; petals conspicuously 3-nerved. Angles of seeds rough.

Cotyledon or Pyramidal Saxifrage. Fl. May, July. Clt. 1596. Pl. 1 to 2 feet.

74 S. lingula'ta (Bell. in act. taur. 5. p. 226.) leaves linear-lingulate, channelled, tubercularly crenated; calyx densely beset with glands: with semi-ovate obtuse segments; petals oval. ♃. H. Native of the tops of the Alps of Switzerland; and the Pyrenees, on the Alps by the sea side, and other alpine places about Montregal. C. Cotylèdon, Mill. dict. no. 2. S. longifòlia, Lapeyr. pyr. sax. p. 26. t. 11. Chondròsea longifòlia, Haw. enum. sax. p. 11. Plant tufted. Stem erect, flexuous, branched in a pyramidal form, leafy, beset with glandular hairs. Leaves glaucous, ciliated at the base, recurved at the apex. Panicle nodding. Peduncles many flowered, and are, as well as the calyxes, beset with rusty glandular down. Flowers flat, white, with numerous rose-coloured dots; petals conspicuously triple-nerved.

Var. β, mèdia (Sternb. sax. p. 1. t. 1. *a*. and in Sturm, deutschl. fl. 33. f. *a*.) leaves shorter; stem panicled above; panicle erect, pyramidal. ♃. H. Native of the Alps of Carinthia. Chondròsea intermèdia, Haw. enum. sax. p. 11.—Hort. eyst. ord. 5. pl. 10. f. 1.—Pluk. phyt. t. 222. f. 1. Perhaps a distinct species.

Var. γ, crustàta (D. Don, in Lin. trans. 13. p. 391.) plant 4 times smaller than the species; leaves narrower, with more crustaceously porose margins; panicle few-flowered. ♃. H. Native of the Alps of Switzerland, Carniola, Carinthia, and the Pyrenees. S. longifòlia *γ* mìnor, Sternb. sax. t. 1. f. b. S. crustàta, Vest, man. bot. p. 656. S. lingulàta, Bell. in act. acad. tur. 5. p. 226. S. callòsa, Smith in Rees' cycl. vol. 31. Panicle straight: peduncles 2-3-flowered.

Var. δ, *subnàna;* flabelliform; stem single. Lapeyr. l. c. ♃. H. Native on the tops of the Pyrenees.

Tongue-leaved Saxifrage. Fl. May, July. Clt. 1800. Pl. 1 to 1½ foot.

75 S. Aizòon (Murr. syst. ed. 14. p. 411.) leaves short, cuneated, silvery serrated; flowers corymbose; calyxes glabrous, with acute segments; petals nearly orbicular. ♃. H. Native of Austria, Switzerland, Pyrenees, and the Carpathian mountains; also of North America, in Labrador and on the Saskatchawan. Jacq. austr. 5. t. 438. Sternb. sax. p. 3. t. 3. f. *a*. Lapeyr. fl. pyr. p. 33. t. 15. S. paniculàta, Mill. dict. no. 3. Chondròsea Aizòon, Haw. enum. sax. 11.—Barrel. icon. t. 1310. —Moris. hist. sect. 12. t. 9. f. 19. Plant tufted. Stems erect, simple, leafy, shining, with a few scattered gland-bearing hairs. Radical leaves rosulate, glaucous, ciliated at the base: cauline leaves obovate-mucronate. Flowers corymbose, cream-coloured, marked with minute rose-coloured dots. Peduncles elongated, usually 2-flowered.

Var. β, *retùsa* (D. Don, in Lin. trans. 13. p. 293.) one-half smaller than the species; leaves shorter and retuse. ♃. H. Native of the Pyrenees. S. Aizòon β mìnor brevifòlia, Sternb. 401. l. c. t. 3. f. β. S. rosulàris, Schleich. cat. 1824. p. 64. Chondròsea Aizoòn γ parviflòra and C. rosulàris, Haw. enum. sax. 12. Chondròsea Aizoòn mìnor, Haw. l. c. p. 11. S. rosulénta, Ehrh. pl. sel. no. 51. There is another variety of this with still smaller leaves, in Sternb. l. c. t. 36. f. 2. S. Aizoòn mínima, Ser. anz. 1828. p. 73. S. Aizòon δ ruféscens, Gaudin, fl. helv. 3. p. 88.

Var. γ, *récta* (Ser. in D. C. prod. 4. p. 19.) stems erect, many flowered; peduncles elongated, 3-4-flowered. ♃. H. Native of the Alps of Switzerland and the Pyrenees. S. récta, Lapeyr. fl. pyr. p. 33. t. 15. D. C. fl. fr. 4. p. 361. β. S. Aizòon γ, Gaudin. Petals without any dots. Gaudin, fl. 3. p. 88.

Var. δ, *neglécta* (Ser. in D. C. l. c.) tufts of leaves globose; raceme simple, few-flowered, somewhat cylindrical; petals rose-coloured, dotted with purple. ♃. H. Native of Italy.—Sedum Barrel. icon. 1310. ex Tenore. S. neglécta, Tenore, append. prod. fl. neap. p. 19. S. Aizòon and S. érecta, Tenore, fl. neap. prod. p. 25. There is a variety of this with a sessile corymb of flowers in the tufts of leaves; peduncles and calyx are quite glabrous, and the stem 1-flowered.

Aizoon Saxifrage. Fl. May, July. Clt. 1731. Pl. ½ foot.

76 S. intà'cta (Willd. hort. berol. 2. p. 75. t. 75.) leaves linear, acute, straight, sharply and silvery serrated; calyx and pedicels sparingly glandular: with obtuse segments; petals oval. ♃. H. Native of the Alps, about Tyrol, Pyrenees, and Caucasus. S. récta, Lapeyr. pyr. sax. p. 33. t. 15. S. Cotylèdon, Bieb. fl. taur. 1. p. 313. exclusive of the synonymes. S. Aizòon, Steven, de sax. cauc. in mem. mosq. 4. p. 74. exclusive of the synonymes. S. cartilagínea, Sternb. sax. p. 5. t. 3. S. longifòlia, Moretti notiz. ed. 1. p. 11. exclusive of many synonymes. S. lingulàta, Moretti notiz. ed. 2. in mem. t. 1. p. 262. Plant growing in conical tufts. Stems erect, leafy, clothed with gland-bearing hairs. Leaves glaucous, ciliated at the base; cauline ones spatulate, rather adpressed, ciliately serrated. Flowers racemose; pedicels few-flowered. Petals cream-coloured, marked with a few rose-coloured dots.

Untouched Saxifrage. Fl. May, July. Pl. ½ to 1 foot.

77 S. austrà'lis (Moric. fl. ven. 1. p. 431.) plant quite glabrous; stem angular; leaves of the tufts oblong-spatulate, ciliated at the base, with crustaceous margins; cauline leaves oblong, somewhat denticulated, acutish; panicle branched, many-flowered; petals ovate, obtuse, much longer than the calyx; styles straight, ascending. ♃. H. Native of Virgin Mount, near Naples. S. Aizòon, Guss, in litt. S. pyramidàlis, Tenore, fl. neap. prod. 1. p. 25. Petals yellow, as seen in a dried state. Flowers very like those of *S. Cotylèdon*, and the leaves like those of *S. Aizòon*.

Southern Saxifrage. Pl. 1 foot.

78 S. cartilagi'nea (Willd. in litt. ex Sternb. sax. p. 5. t. 3. c.) leaves of the tufts and stems lanceolate, acute, cartilaginously serrated; flowers panicled, somewhat corymbose; lobes of calyx ovate, about equal in length to the campanulate tube; calyx and peduncles beset with glandular pili; petals obovate, contiguous at the base, spotless; styles diverging. ♃. H. Native of Caucasus. S. Cotylèdon, Bieb. fl. taur. 1. p. 313. 3. p. 290. Chondròsea cartilagínea, Haw. enum. sax. 12. Flowers cream-coloured, dotless. Perhaps only a variety of *S. Aizòon*.

Cartilaginous-edged-leaved Saxifrage. Pl. 1 foot.

79 S. margina'ta (Sternb. rev. sax. suppl. 1. p. 1. t. 1. f. 1.) radical leaves lingulate, ciliated at the base, having pitted dots within the edge; flowers somewhat corymbose; petals ovate, twice the size of the calyx. ♃. H. Native of Naples. S. Cotylèdon, Tenore, cat. hort. neap. append. alter. p. 86. and S. Aizòon, longifòlia, and récta, Tenore, fl. neap. prod. p. 25. ex Moretti, tent. sax. p. 35.

Marginate-leaved Saxifrage. Pl. 1 foot.

80 S. floribu'nda (Moretti, tent. sax. p. 9.) radical leaves tufted, lanceolate, mucronate, ciliated: cauline ones linear; stem fistular, bearing flowers from the base to the apex; flowers disposed in a racemose thyrse, white, or cream-coloured. ♃. H. Native on the mountains about Nice.

Bundle-flowered Saxifrage. Pl. 1 foot.

81 S. muta'ta (Lin. spec. 570.) leaves flat, spatulate, cartilaginously crenated and ciliated; calyx densely beset with glands: with broadly ovate, acute segments; petals linear-lanceolate, acuminated. ♃. H. Native of the Alps of Switzerland, Carniola, Italy, and the Pyrenees. Jacq. icon. rar. 3. t. 466. Curt. bot. mag. t. 351. Chondròsea mutàta, Haw. enum. sax. p. 13.—Hall. helv. 979. t. 16. Plant densely tufted. Stem erect, leafy, beset with glandular hairs. Leaves fringed with long villi: cauline ones obovate, ciliated at the base. Flowers panicled, copper-coloured, marked with deeper-coloured dots. Peduncles and calyxes densely clothed with rusty clammy down (f. 44.).

FIG. 44.

Var. β, *macropétala* (Ser. in D. C. prod. 4. p. 20.) petals ovate-oblong, spotted. ♃. H. Native of Switzerland. Hall. hist. no. 979. t. 16. f. 2.

Changed Saxifrage. Fl. Ju. Jul. Clt. 1779. Pl. ½ to 1 ft.

§ 2. *Leaves lingulately-spatulate, apiculated, with quite entire cartilaginous margins.*

82 S. me'dia (Gouan. ill. 27.) radical leaves rosulate, lingulate, quite entire, with cartilaginous margins, dotted above; petals obtuse, shorter than the calyx. ♃. H. Native of the Pyrenees, on calcareous rocks, and on Mount Olympus. Lam. encycl. 4. p. 675. t. 372. f. 6. Smith, fl. græc. t. 376. S. calyciflòra, Lapeyr. pyr. sax. p. 28. t. 12. S. cæ'sia, Lin. mant. 382. S. porophýlla, Bertol. in journ. bot. 4. p. 76. and amœn. ital. dec. 4. p. 98. t. 3. Chondròsea calyciflòra, Haw. enum. sax. p. 13. Plant growing in conical tufts. Stems simple, beset with viscid, rusty, twisted villi. Leaves glaucous:

radical ones rosulate, glabrous; cauline leaves cuneated, clothed with glandular hairs. Pedicels 1-flowered, and are as well as the calyxes clothed with viscid hairs. Petals obovate, dark purple. Genitals inclosed in the calyx.

Middle Saxifrage. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

83 S. Lapeyrou'sii (D. Don, in Lin. trans. 13. p. 397.) radical leaves aggregate, lingulate, quite entire, with cartilaginous margins; flowers panicled; petals obovate, quite entire, connivent, longer than the calyx. ♃. H. Native of the Pyrenees, on calcareous rocks. S. lùteo-purpùrea, Lapeyr. pyr. sax. p. 29. t. 14. S. ambígua, D. C. Peduncles and calyxes clothed with purple down. Very like *S. mèdia*, but differs in the flowers being panicled, and citron-coloured. Said to be a hybrid between *S. mèdia* and *S. aretioìdes*.

La Peyrouse's Saxifrage. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

84 S. aretioìdes (Lapeyr. pyr. sax. p. 28. t. 13.) leaves aggregate, linear-lingulate, upright, mucronulate, keeled, glaucous, with cartilaginous margins; stem clothed with clammy tomentùm; petals linear-spatulate, crenulated at the apex. ♃. H. Native of the Pyrenees, on calcareous rocks. Chondròsea aretioìdes, Haw. enum. sax. p. 14. Plant densely tufted. Leaves imbricate, ciliately toothed at the base, with a few perforated dots near the margin. Flowers by threes, golden yellow. Pedicels and calyxes clothed with clammy down Calycine segments ovate, acute. Very like the two preceding species, but the plant is much smaller.

Aretia-like Saxifrage. Fl. May, Jul. Clt. 1826. Pl. $\frac{1}{8}$ ft.

§ 3. *Leaves triquetrous, obtuse.*

85 S. diapensioi'des (Bellardi, in act. acad. taur. 5. p. 227.) stems, peduncles, and calyxes glandular; leaves linear, erect, keeled, aggregate, imbricated, cretaceously glaucous; stem many-leaved, few-flowered; calycine segments elliptic-oblong. ♃. H. Native of the Alps of Piedmont and Switzerland. Lapeyr. append. fl. pedem. p. 21. t. 3. Sternb. sax. p. 35. t. 9. Chondròsea diapensioìdes, Haw. enum. sax. p. 13. S. cæ'sia β, Lam. dict. 4. p. 676. Plant densely tufted. Leaves with cartilaginous margins, ciliated at the base, and with 1 or 2 perforated dots at the apex, which is obtuse. Flowers 3-4 or 5, campanulate, white, disposed in a terminal head. Petals narrow at the base, with an orbicular, 5-nerved limb.

Diapensia-like Saxifrage. Fl. April, Ju. Clt. 1825. Pl. $\frac{1}{8}$ ft.

86 S. squarròsa (Sieb. in fl. 1821. p. 99. and fl. austr. exsic. no. 133.) stem pubescent below, usually 3-flowered; leaves linear-elliptic, rather retuse, stiff, squarrosely imbricated, permanent, when young powdery; branches diffuse, flaccid; peduncles and stems glabrous. ♃. H. Native of the Alps of Tyrol. Flowers white, larger than those of *S. cæ'sia*. Lobes of calyx broader than in *S. cæ'sia* and *S. diapensioìdes*.

Squarrose-leaved Saxifrage. Pl. $\frac{1}{8}$ foot.

87 S. ramulòsa (Wall. cat. no. 446.) plant densely tufted; stems 1-flowered, very short; leaves of the barren stems or surculi acute and flattish at the apex, lined with rugged dots; the upper surface of the leaves have a regular marginal, double line of dots; margins of leaves thin and cartilaginous; lobes of calyx acute; styles nearly parallel, longer than the calyx; stigmas thickish, capitate. ♃. F. Native of Nipaul, at Bhuddrinath. Very nearly allied to *C. cæ'sia*, but perfectly distinct.

Branched Saxifrage. Pl. 1 inch.

88 S. cæ'sia (Lin. spec. 571.) plant greenish glaucous; stems and peduncles smoothish; leaves linear-oblong, aggregate, recurved, keeled, the upper surface with marginal dots regularly disposed; petals roundish, unguiculate; stems few-leaved, many-flowered. ♃. H. Native of the Alps of Switzerland, Austria, and the Pyrenees. Jacq. austr. t. 374. Scop. carn. ed. 2. p. 495. t. 15. Sternb. rev. sax. p. 34. t. 9. f. 1-2. and in Sturm, deutschl. fl. p. 33. n. 16. with a figure. Lodd. bot. cab. 421. S. recurvifòlia, Lapeyr. pyr. sax. p. 30. —Segu. ver. p. 449. t. 9. f. 2. Chondròsea cæ'sia, Haw. enum. sax. p. 14.—Scheuch. alp. p. 49. 141. t. 21. f. 1. Surculi short, erect, forming compact tufts. Leaves concave above and keeled beneath, perforated by numerous minute holes, ciliated: cauline ones few, scale-formed. Flowers milk-coloured, disposed in a small panicle. Pedicels and calyxes with a few short, glandular hairs. Calycine segments very blunt. Genitals shorter than the corolla.

Var. β, *pàtens* (Ser. in D. C. prod. 4. p. 22.) leaves loosely rosulate, not recurved at the apex, with a few crustaceous spots; stems short, usually 2-flowered. ♃. H. Native of Vallais, on Mount Fouly. S. pàtens, Gaudin. in Meisner, anz. 1818. p. 65. fl. helv. 3. p. 92. but not of Sternb. rev. sax. suppl. 1. t. 1. f. 2. Chondròsea pàtens, Haw. enum. sax. p. 14. There is a variety of this without any stem and with 1 sessile flower in the middle of the leaves, which is a native of Upper Styria, and is described by Vest, in flora. 1820. no. 26. p. 397.

Grey Saxifrage. Fl. May, June. Clt. 1752. Pl. $\frac{1}{8}$ to $\frac{1}{4}$ ft.

89 S. Rochelia'na (Sternb. suppl. sax. 2. ex Host, fl. austr. 1. p. 501.) flowers corymbose; sepals ovate; petals lanceolate-ovate, twice the length of the calyx; lower leaves lingulate, glabrous, ciliated at the base, disposed in tufts: cauline ones clothed with clammy villi, pale green. ♃. H. Native of Austria, in the fissures of rocks. Leaves white at the edges, and with distinct impressed dots. Flowers white. Perhaps a variety of *S. cæ'sia* or *S. Valdénsis*.

Rochel's Saxifrage. Pl. $\frac{1}{8}$ to $\frac{1}{4}$ foot.

90 S. Valde'nsis (D. C. fl. fr. 5. p. 517.) peduncles and calyxes very clammy, and beset with glandular hairs; leaves of the surculi and stems flat at the base, but more or less triquetrous at the apex, with the upper surface marked with dots, which are disposed without order. ♃. H. Native of the Alps of Lyons, on the hill called Lacroix, near Abries and Pignerol; and on Mount Cenis. S. rupéstris, Thomas, exsic. S. cæ'sia, var. Willd. spec. 2. p. 642. in a note. S. cæ'sia γ, Moretti, tent. sax. p. 12. Flowers white, corymbose; peduncles short. Leaves dense, short.

Var. β, *laxifòlia* (Ser. in D. C. prod. 4. p. 22.) leaves loose, elongated; flowers very numerous, loose, disposed in panicled corymbs. ♃. H. Native of Portugal and Italy. S. cæ'sia, var. ex alpibus Italicis, Lin. mant. p. 381. but not of his spec. S. cæ'sia β, màjor, D. Don, in Lin. trans. 13. p. 403. S. compácta, Sternb. suppl. 1. p. 9. t. 1. f. 3. under the name of *S. pàtens*.

Lyons Saxifrage. Fl. May, June. Clt.? Pl. $\frac{1}{4}$ foot.

91 S. serpyllifòlia (Pursh, fl. amer. sept. 1. p. 310.) surculi creeping; leaves rosulate, imbricately reflexed, oblong, obtuse, tapering into the petiole, coriaceous, quite glabrous; stem filiform, few-leaved, beset with glandular pubescence, 1-flowered; calycine segments obtuse, not adhering to the ovarium; petals broadly obovate, somewhat 3-nerved. ♃. H. Native of the north-west coast of America, at Cape Newnham, Behring's Straits, and Unalaschka. S. Fischèri, Ser. in D. C. prod. 4. p. 22. S. Eschchóltzii, Cham. in litt. S. planifòlia, Cham. in herb. Hook. S. diapensioìdes, Fisch. in litt. but not of Bellardi. Plant green, tufted. Flowers large for the plant, apparently yellow, solitary, on slender, few-leaved, glandular stalks. Calyx wholly inferior.

Wild-thyme-leaved Saxifrage. Pl. $\frac{1}{4}$ foot.

§ 4. *Leaves triquetrous, mucronately pungent.*

92 S. nítida (Schreb. in litt. ex Sternb. rev. sax. p. 32. t. 10.

b. f. 4.) stems nearly naked, few-flowered; leaves densely imbricated, lanceolate, spinosely mucronate, and ciliated, shining beneath; flowers usually by threes, panicled; calyx pilose: with ovate lobes, which end in a little spine each; petals obtuse, hardly longer than the calyx. ♃. H. Native country unknown. Chondròsea nítida, Haw. enum. sax. p. 16. Very nearly allied to *S. tenélla*. Flowers yellowish.

Shining Saxifrage. Fl. May, Ju. Clt.? Pl. $\frac{1}{8}$ foot.

93 S. tene'lla (Wulf. in Jacq. coll. 3. p. 144. t. 17.) leaves crowded, linear-subulate, flat, pungent, ciliated; stems slender, few-leaved, many-flowered; calycine segments linear-lanceolate; petals obovate. ♃. H. Native of the Alps of Carinthia, Carniola, and of the Carpathian mountains; also about Prague. Chondròsea tenélla, Haw. enum. sax. p. 15. Plant tufted; surculi decumbent. Leaves crowded, imbricate, deep green, keeled beneath. Flowers panicled, white. Calyx beset with glandular hairs.

Delicate Saxifrage. Fl. Ju. Aug. Clt. 1819. Pl. $\frac{1}{8}$ foot.

94 S. arenarioìdes (Brignoli, fasc. rar. pl. forogul. p. 24. Sternb. rev. sax. p. 59.) stem erect, nearly naked, branched in forks; surculi creeping, prostrate, covered with imbricated leaves; leaves linear, acuminated, ciliated at the base. ♃. H. Native of the mountains of Matajura, in the fissures of rocks. Flowers white. Perhaps not distinct from *S. tenélla*. (ex Moretti, tent. sax. p. 33.)

Sand-wort-like Saxifrage. Pl. $\frac{1}{8}$ foot.

95 S. Burseria'na (Lin. spec. 572.) stem beset with glandular hairs; leaves aggregate, subulate, pungent, smooth, glaucous; stems usually 1-flowered; segments of the calyx ovate; petals roundish, with curled edges, and branched nerves. ♃. H. Native of the Alps of Carinthia and Carniola; and in Upper Italy, on the mountains. Wulf. in Jacq. misc. 1. p. 152. t. 17. f. 3. Sternb. sax. p. 33. t. 10. f. 1-2. and in Sturm, deutschl. fasc. 33. no. 10. f. a. b. c. d.—Seguier, pl. rar. 3. p. 201. t. 5. f. 2. Chondròsea Burseriàna, Haw. enum. sax. 15. Plant densely tufted. Surculi short, erect. Leaves rosulate, triquetrous. Flowers large, beautiful, milk-coloured, lined with branched, yellowish, flexuous nerves.

Var. β, subbiflòra (Sternb. l. c. t. 10. β.) stems usually 2-flowered.

Burser's Saxifrage. Fl. Mar. Ju. Clt. 1826. Pl. $\frac{1}{8}$ foot.

96 S. Vande'llii (Sternb. rev. sax. p. 34. t. 10. b. f. 3. exclusive of the syn. of Jacq.) plant beset with glandular hairs; leaves firm, ciliated: radical ones aggregate, dense; flowers corymbose, pedunculate; lobes of calyx ovate, acutish; petals obovate, cuneated, much longer than the calyx. ♃. H. Native on Mount Corni de Canzo, and of the Pyrenees. S. Burseriàna, Lapeyr. fl. pyr. p. 35. but not of Lin. exclusive of many synonymes. S. Burseriàna β, spinòsa, Pers. ench. 1. p. 488. S. Burseriàna γ, Vandélli, D. Don, in Lin. trans. 13. p. 398. Chondròsea Vandélli, Haw. enum. sax. p. 15. Stem usually 4-flowered. Flowers milk-coloured.

Vandelli's Saxifrage. Pl. $\frac{1}{8}$ foot.

Sect. VII. Micra'nthes (from μικρος, *micros*, small, and ανθος, *anthos*, a flower; flowers small). D. Don, in Lin. trans. 13. p. 345. Tausch, hort. canal. fasc. 1. Haw. syn. succ. p. 321. and enum. sax. p. 45.—Dermàsea, Haw. enum. sax. p. 8. Calyx 5-parted (f. 45. *a*.), spreading. Petals small (f. 45. *b*.), sessile, spreading, inserted in the calyx: as also the stamens; filaments very short, subulate (f. 45. *c*.). Styles very short, thick; stigmas capitate, glabrous. Capsule depressed, free from the calyx (f. 45. *d*.). Seeds oblong, smooth.—Perennial herbs, with fibrous roots and many-flowered scapes. Leaves undivided, spreading, lanceolate or ovate, serrated or crenated. Flowers corymbose, small, white or yellowish, disposed in terminal panicles.

97 S. hieracifòlia (Waldst. et Kit. hung. 1. p. 17. t. 18.) scape erect, hairy; leaves petiolate, elliptic, acute, repandly toothed, glabrous; pedicels aggregate, 1-flowered, disposed in spikes: petals lanceolate, acute. ♃. H. Native of the Carpathian mountains, Greenland: shores of the Arctic Sea, between the Mackenzie and Coppermine rivers, Arctic Islands; and of Siberia, at the mouth of the river Lena. S. plantaginifòlia, Hook. in Parry's 2d voy. append. p. 394. S. rígida, Christ. Smith, mss. S. uliginòsa α, Fisch. in litt. 1829. S. nivàlis, var. racemòsa, Towns. itin. hung. p. 488. t. 15. S. rotundifòlia, Geners. elench. scap. no. 372. Micránthes hieracifòlia, Haw. enum. sax. p. 45. Leaves ciliated, with articulated hairs. Stem beset with glandular hairs, as well as the pedicels and calyxes. Bracteas lanceolate, obtuse, one under each fascicle of flowers. Flowers small, of a brownish-bay colour.

Var. β, capitellàta (Ser. in D. C. prod. 4. p. 39.) flowers few, somewhat capitate; leaves nearly entire; scape length of leaves. ♃. H. Native of the Carpathian mountains, and the Island of St. Lawrence. Micránthes hírta, Haw. enum. sax. p. 46.? S. uliginòsa β, atràta, Fisch. in litt.

Hawkweed-leaved Saxifrage. Fl. May, Ju. Clt. 1789. Pl. $\frac{1}{2}$ to 1 foot.

98 S. Pennsylva'nica (Lin. spec. 571.) leaves lanceolate, without petioles, sinuately denticulated, very hairy on both surfaces; scape branched; flowers disposed in corymbose heads, the whole forming a branched panicle; calycine segments ovate, acutish; petals linear, longer than the calyx. ♃. H. Native of North America, in the states of New York and Virginia, in humid meadows; also of Canada, but rare. S. Caroliniàna and S. Marylándica, Hortul. S. palústris, Hort. engl. Link, enum. 1. p. 412. Micránthes Pennsylvánica, Haw. enum. sax. p. 45.—Dill. elth. 337. t. 253. f. 328. Leaves attenuated at the base. Scape beset with viscid hairs, and the pedicels and calyxes with glandular ones. Flowers of a squalid white colour.

Var. β, corymbífera (Michx. fl. bor. amer. 1. p. 269.) panicle loose; flowers corymbose, distant.

Pennsylvanian Saxifrage. Fl. May, June. Clt. 1732. Pl. $1\frac{1}{2}$ to 2 feet.

99 S. semipube'scens (Sweet, hort. suburb. p. 97.) leaves without petioles, oval-oblong, obtuse, quite glabrous, denticulated; scape branched; flowers in capitate corymbs, the whole forming a panicle; calycine segments ovate, acute; petals oval, about equal in length to the calyx. ♃. H. Native of North America. Micránthes semipubéscens, Haw. syn. succ. append. 321. S. Marylándica, Hortul. Micránthes hírta, Haw. enum. sax. p. 46. Stem beset with glandular hairs, as well as the calyxes and pedicels. Flowers small, yellowish.

Semi-pubescent Saxifrage. Fl. May, June. Clt. 1800. Pl. 1 to $1\frac{1}{2}$ foot.

100 S. Virginie'nsis (Michx. fl. bor. amer. 1. p. 269.) leaves ovate, acute, toothed, stalked; calycine segments ovate, obtuse; petals oval, with branched nerves; scape paniculately branched. ♃. H. Native of Virginia, Carolina, and New England, on the mountains; also of Canada, near Montreal, and on the banks of the Saskatchawan. S. Virgínica, Nutt. gen. amer. 1. p. 285. S. elongàta β, subspatulàta, Sternb. append. enum. sax. p. 4. Dermàsea pilòsa, Haw. enum. sax. p. 8.—Pluk. alm. p. 331. t. 39. f. 1. and t. 222. f. 5. Leaves rather hairy on both surfaces. Scape beset with glandular hairs, naked above, dichotomously branched; branches elongated, ascending. Flowers disposed in unilateral spicate racemes, small, white. Pedicels numerous, 1-flowered, clothed with viscid down.

Virginian Saxifrage. Fl. May, Jul. Clt. 1790. Pl. $\frac{1}{2}$ foot.

101 S. verna'lis (Willd. hort. berol. t. 43.) leaves oblong or

obovate, rather membranous, nerved, deeply crenate-toothed, tapering into the broad petiole; scape naked; flowers in panicled corymbs; calycine segments erect, obtuse; petals oblong, obovate, more than twice the length of the calyx. ♃. H. Native of Canada, and to the mountains of the Columbia, and from Fort Vancouver to the Kettle Falls. S. Virginiénsis, Torrey, fl. unit. stat. 1. p. 444. Flowers small, white, forming an imperfect corymb or thyrse. This species differs from *S. Virginiénsis* in the disposition of the flowers.

Var. α; flowers loosely panicled; scape longer. ♃. H.

Var. β; flowers compact, rather thyrsoid. ♃. H. Native on the banks of the Saskatchawan. General habit of *S. nivàlis*.

Var. γ, gràcilis; corymb loose, few-flowered. ♃. H. Native of North America. S. elongàta, Sternb. sax. p. 9. t. 4. Dermàsea elongàta, Haw. enum. sax. p. 9.

Spring Saxifrage. Fl. May, June. Clt.? Pl. ½ foot.

102 S. REFLE'XA (Hook, fl. bor. amer. 1. p. 249. t. 85.) plant clothed with hoary down; leaves ovate, rather coriaceous, opaque, deeply serrated, tapering into the petiole; scape naked; panicle quite glabrous, compact, corymbose; petals obovate, bimaculate; calyx reflexed. ♃. H. Native of North America, on the shores of the Arctic Sea, between the Mackenzie and Coppermine rivers. Together with the harsh and rigid foliage of *S. nivàlis*, the present species has a panicle more resembling that of *S. vernàlis;* but the petals have 2 orange spots, similar to those of *S. leucanthemifòlia*. The pubescence gives a whitish or hoary appearance to the whole plant, the panicle excepted; but as the pubescence is very variable in all the species of the present section, it cannot be depended upon. (f. 45.)

FIG. 45.

Reflexed-calyxed Saxifrage. Pl. ½ foot.

103 S. INTEGRIFÒLIA (Hook. fl. bor. amer. 1. p. 249. t. 86.) the whole plant clothed with clammy pubescence; leaves radical, ovate, rather membranous, very blunt, quite entire, or sinuately crenated, reticulately veined; scape elongated, naked, panicled, at the apex; panicle loose, broad or contracted, bracteate; petals obovate, twice the length of the calyx, which is at first spreading, but at length reflexed; stamens short; styles diverging. ♃. H. Native of the north-west coast of America, near the mouth of the Columbia. The leaves are short, in proportion to the height of the plant.

Entire-leaved Saxifrage. Pl. ½ to 1 foot.

104 S. NIVA'LIS (Lin. spec. p. 573.) leaves ovate or obovate, coriaceous, undulately crenated, tapering into the broad petiole; scape naked, simple; flowers in crowded heads; calycine segments erect, obtuse; petals obovate, permanent, hardly one half longer than the calyx. ♃. H. Native of Scotland, north of England, Lapland, on the loftiest mountains; in North America, on the Arctic Sea-shore and islands, abundant; Labrador, Canada, Spitzbergen, and the Rocky Mountains. In Britain, upon Snowden, and on the summits of several hills about Snowden; on Ben Lawers, Clova, and other Highland mountains of Scotland; and near the top of Ben Lomond. Lightf. fl. scot. with a figure. Smith, engl. bot. t. 440. Sternb. in Sturm, deutschl. fl. with a figure. S. congèsta, Haw. Dermàsea nivàlis, Haw. syn. sax. p. 9.—Lin. fl. suec. p. 176. t. 2. f. 5, 6.—Ray. angl. 3. p. 354. t. 16. f. 1.—Oed. fl. dan. t. 28. Leaves glabrous above, villous beneath. Scape clothed with viscid hairs. Flowers disposed in crowded bracteate heads; bracteas ciliated. Pedicels and calyxes clothed with viscid down. Petals white, but becoming reddish as they fade, triple-nerved; nerves simple. The American specimens of this plant are very variable in habit, and in many instances so closely approach the varieties of some of the preceding species, as hardly to be distinguished. It is therefore most easily to be recognised by its stiff and rigid habit, by the broad permanent petals, which remaining amongst the deep purple capsules form a singular contrast with them.

Var. β, laxiflòra; heads of flowers loose, branched.

Var. γ, tènuis (Wahl. fl. lapp. p. 113. Sternb. suppl. 1. p. 6.) flowers pedunculated, umbellately panicled. ♃. H. Native of Lapland.—Lin. fl. lapp. t. 2. f. 5. S. punctàta, Rottb. act. hafn. 10. p. 445. t. 10.

Snowy Saxifrage. Fl. June, July. Britain. Pl. ¼ foot.

105 S. LONGI'SCAPA (D. Don, in Lin. trans. 13. p. 388.) leaves ovate, serrated, on long petioles; thyrse of flowers ovate; segments of the calyx ovate, acute; petals ovate, hardly longer than the calyx. ♃. H. Native of Siberia. Leaves hairy. Scape filiform, beset with glandular hairs. Pedicels and calyxes downy. Flowers white. This plant scarcely differs from *S. nivàlis var. γ, tènuis*.

Long-scaped Saxifrage. Pl. ½ foot.

106 S. PA'LLIDA (Wall. cat. no. 450.) plant quite glabrous; leaves lanceolate, obtuse, obscurely crenated, petiolate; bracteas linear; flowers few, disposed in a loose panicle; pedicels filiform, longer than the fruit; petals obovate, longer than the calyx; calycine lobes lanceolate, length of tube, each terminated by a sessile gland? filaments clavate? capsule rather bladdery, nerved, marked by minute elevated dots; stigmas sessile, thickish. ♃. F. Native of Nipaul, at Gosaingsthan, Emodi, and Kamaon.

Pale Saxifrage. Pl. ½ foot.

107 S. DAHU'RICA (Willd. spec. 3. p. 465.) plant quite glabrous; leaves cuneiform, on long petioles, attenuated at the base, coarsely and deeply serrated at the apex; flowers in loose panicles; calycine segments ovate, acute; petals elliptic, acute. ♃. H. Native of Dahuria, on the tops of the Alps, near the limits of perpetual snow. In North America, at Behring's Straits; alpine rivulets of the Rocky Mountains, Kotzebue's Sound, and Bay of St. Lawrence. Leaves said to be pubescent; the scape beset with glandular hairs, and the pedicels and calyxes clothed with clammy down. Petals white, marked with 2 yellow spots at the base. The broadly cuneate, or rather flabelliform leaves are very remarkable.

Dahurian Saxifrage. Pl. ½ foot.

SECT. VIII. SAXI'FRAGÆ-VE'RÆ (this section contains what are considered the true species of the genus). D. Don, in Lin. trans. 13. p. 345.—Dactyloìdes, Tausch, hort. canal. fasc. 1. D. C. prod. 4. p. 23.—Muscària and Saxífraga, Haw. enum. sax. p. 22-29.—Triplinérvium, Gaudin, fl. helv. 3. p. 116. Calyx 5-cleft (f. 46. *a.*), erect, permanent, with the tube adhering to and involving the ovarium (f. 46. *b.*). Petals sessile, perigynous (f. 46. *c.*). Stamens perigynous (f. 46. *d.*); filaments flat, gradually attenuated. Stigmas spreading (f. 46. *e.*), flat, spatulate, bearded with short down. Capsule covered by the calyx (f. 46. *b.*), and closely adhering to it. Seeds obovate.—Perennial rarely annual, humble, densely tufted herbs, for the most part bearing surculi. Leaves alternate, variously parted, rarely simple, usually green; with the margins neither cartilaginous nor dotted. Stems leafy, few, or many-flowered. Flowers white or yellow, rarely red.

§ 1. *Perennial. Surculi numerous. Leaves undivided, rarely tridentate at the apex.*

108 S. PARNASSIFÒLIA (D. Don, in Lin. trans. 13. p. 405.) stem erect, leafy, 3-4-flowered; leaves cordate, stem-clasping,

glabrous; calycine segments ovate, mucronate; petals obovate, 5-nerved. ♃. F. Native of Nipaul, on the Alps. Habit of plant referrible to *Parnássia palústris*. Stems numerous. Leaves ciliated with glandular hairs. Pedicels 1-flowered, and are as well as the calyxes glandular. Flowers milk-coloured. This is evidently only a small specimen of *S. diversifòlia var. β, parnassifòlia*, p. 209.

Parnassia-leaved Saxifrage. Pl. $\frac{1}{4}$ foot.

109 S. ANDROSA'CEA (Lin. spec. 571.) radical leaves crowded, elliptic or spatulate, obtuse, pilose, quite entire; calycine segments obtuse; petals spatulate; stems nearly naked, usually 2-flowered. ♃. H. Native of Switzerland, Austria, and Carniola; and on the north-west coast of America. Jacq. austr. 4. t. 389. Sternb. sax. p. 42. t. 11. f. a. S. ciliàris, Lapeyr. ex Benth. cat. pyr. p. 118.—Hall. itin. helv. no. 69. p. 292. t. 2. S. androsàcea γ, longifòlia, Gaudin, fl. helv. 3. p. 116.—Col. ecphr. 2. p. 66. and 67. Plant densely tufted. Stems beset with jointed glanduliferous hairs. Leaves hairy. Pedicels and calyxes clothed with viscid down. Flowers with white petals, and yellow filaments.

Var. β, tridentàta (Gaudin, syn. sax. in Meisner, anz. 1818. p. 67. fl. helv. 3. p. 115.) leaves cuneiform, more or less, 3-5-toothed. ♃. H. Native of the Alps, but rare. Sternb. rev. sax. t. 11. a. f. 4. and in Sturm, deutschl. fl. p. 33. no. 13. S. androsàcea trífida, Haw. enum. sax. p. 35. S. Pyrenàica, Scop. fl. carn. no. 498. t. 16. S. androsàcea trifòlia. Sternb. rev. sax. suppl. p. 11. t. 7. f. 3. S. trìdens, Jan. in litt.

Androsace-like Saxifrage. Fl. May, Ju. Clt. 1792. Pl. $\frac{1}{4}$ ft.

110 S. SPATULA'TA (Desf. fl. atl. 2. p. 342. t. 96. f. 2.) plant gemmiferous; surculi very leafy; leaves quite entire, spatulate, fringed; calycine segment ovate-oblong, obtuse; petals obovate; stem nearly naked, usually 2-flowered. ♃. H. Native of Mount Atlas, at the top near Belide. Antiphýlla spatulàta, Haw. enum. sax. p. 44. Plant densely tufted. Surculi procumbent. Stems capillary, with a few short hairs, 1-3 or many-flowered. Pedicels and calyxes downy. Flowers with milk-coloured petals and yellowish filaments.

Spatulate-leaved Saxifrage. Pl. $\frac{1}{8}$ foot.

111 S. SEDIOÌDES (Lin. spec. 572.) stems erectish; leaves linear-lanceolate, acute, glabrous; peduncles elongated, capillary, 1-flowered; calycine segments ovate, bluntish; petals linear, mucronate, equal in length to the calyx. ♃. H. Native of the Alps of Carinthia, Carniola, Salisburgh, Pyrenees, Arragon, and Mount Baldo. Jacq. misc. 2. p. 134. t. 21. f. 22. Sternb. sax. p. 27. t. 7. f. α and β, and t. 9. f. β, and in Sturm, deutschl. fl. fasc. 35. f. 10. S. trichòdes, Scop. fl. carn. n. 496. t. 15. S. Hohenwártii, West. in Sternb. rev. sax. p. 26. t. 7. middle figure, and Sturm, deutschl. fl. fasc. 33. no. 6. f. α. S. Seguièrii, Sternb. rev. sax. p. 30. t. 9. β. Spreng. cent. nov. in mant. hal. 46. no. 38. Gaudin, fl. helv. 3. p. 112. S. planifòlia γ, Seguièrii, Sternb. rev. sax. p. 30. t. 9. b. S. angustifòlia, Hall, fil. in Ser. herb. hort. no. 289. S. aphýlla, Tenore, fl. neap. pr. append. 4. p. 21. but not of Sturm. S. androsàcea, Comoll. prod. p. 78. no. 507. but not of Lin. Plant tufted, pale green. Stem with a few scattered, glanduliferous hairs. Leaves ciliated with glands. Peduncles 1-flowered, glandular. Flowers yellow.

Var. β, coloràta (D. Don, in Lin. trans. 13. p. 408.) petals and anthers purplish. ♃. H. Native of the Alps of Austria. S. Hohenwártii β, purpuráscens, Sternb. sax. p. 26. t. 9. β. S. sedioìdes β, coloràta, Sternb. rev. sax. p. 27. t. 9. β, f. 4. and in Sturm, deutschl. fl. p. 33. no. 6. b. S. sedioìdes β, Hohenwartiàna, Ser. in D. C. prod. 4. p. 23.

Stonecrop-like Saxifrage. Fl. May, Ju. Clt. 1820. Pl. $\frac{1}{8}$ ft.

112 S. TE'NERA (Sut. fl. helv. 1. p. 245.) surculi short, very leafy; leaves linear-oblong, obtuse, and are as well as the stems beset with glandular hairs; calycine segments oblong-ovate; petals obovate, retuse, exceeding the calyx. ♃. H. Native of the Alps of Switzerland, Piedmont, Pyrenees; and on Mount Cenis. Sternb. sax. p. 28. t. 9. f. 4. S. planifòlia, Lapeyr. fl. pyr. sax. p. 31. Sternb. sax. p. 28. t. 7. f. 3. S. muscoìdes, All. fl. pedem. no. 1528. t. 61. f. 2. exclusive of the synonymes. S. planifòlia cítrina, Gaudin, syn. sax. in Meisner, anz. 1818. p. 66. fl. helv. 3. p. 113. α, β. Plant densely tufted. Stems 1-3-flowered. Flowers cream-coloured, twice the size of those of *S. sedioìdes*. Easily distinguished from *S. sedioìdes* in the stems and leaves being densely beset with glandular hairs, and in the petals being obovate, retuse, and twice the length of the calyx.

Var. β, trífida (Gaudin, in Meisner, anz. p. 66. fl. helv. 3. p. 114.) some of the leaves trifid. ♃. H. Native of Vallais, in the valley called Bagnes.

Tender Saxifrage. Fl. May, Jul. Clt. 1819. Pl. $\frac{1}{8}$ foot.

113 S. DEPRE'SSA (Sternb. rev. sax. 42. t. 11. a. f. 5.) stem roughish, few-flowered, furnished with 2 leaves, one of which is a little stem-clasping; leaves spatulate, entire, and cuneately tridentate at the apex, running into the petiole at the base, rather scabrous beneath; petals hardly exceeding the calyx, which is campanulate; calycine lobes triangular, broad. ♃. H. Native of Italy, on Mount Alto. Haw. enum. sax. p. 31. It differs from *S. androsàcea*, to which it is nearly allied, in the leaves running into the petiole at the base, and in the lower surface of the leaves being roughish from short stiffish hairs, not pilose. Perhaps the same as *S. androsàcea β, tridentàta*.

Depressed Saxifrage. Fl. May, June. Clt.? Pl. $\frac{1}{8}$ foot.

114 S. ME'RKII (Fisch. in Sternb. rev. sax. 1. p. 1. f. 3.) stems tufted, usually 3-flowered; calycine segments ovate; petals obovate-roundish, longer than the calyx; capsule rather bladdery; styles parallel; radical leaves rosulate, ovate or spatulate, entire, ciliated, glabrous: cauline ones smaller, few. ♃. H. Native of Siberia, in humid places on Mount Jablonoi. Habit nearly of *S. androsàcea*, but differs in the capsule being bladdery, much longer than the calyx. Flowers white.

Merk's Saxifrage. Pl. $\frac{1}{8}$ foot.

115 S. CRÒCEA (Gaudin, syn. sax. in Meisner, anz. 1818. p. 70. fl. helv. 3. p. 133.) stems tufted, 3-5-flowered, covered with short pubescence; terminal peduncle sessile: lateral ones very long, filiform; leaves linear-oblong, obtuse, or tridentate; calycine segments oblong-narrow, bluntish, clothed with clammy pubescence, longer than the tube; petals elliptic, bluntish, hardly equal in length to the calyx. ♃. H. Native of Savoy, in the southern Alps. Muscària cròcea, Haw. enum. sax. p. 38. Flowers copper-coloured.

Copper-coloured-flowered Saxifrage. Pl. $\frac{1}{8}$ foot.

116 S. STENOPE'TALA (Gaudin, syn. sax. in Meisner, anz. p. 70. fl. helv. 3. p. 132.) smoothish; stems tufted, short; leaves cuneated and trifid, or spatulate and obtuse; calycine lobes obtuse, nerveless; petals linear. ♃. H. Native of Austria and Switzerland, about St. Gall. S. uniflòra and S. leptophýlla, Frælich. S. aphýlla, Sternb. sax. p. 40. t. 11. β, and in Sturm, deutschl. fl. p. 33. no. 11. with a figure. Muscària stenopétala, Haw. enum. sax. p. 39. S. muscoìdes, Wahl. carp. p. 122. Lower leaves usually trifid. Flowers yellow.

Narrow-petalled Saxifrage. Fl. May, June. Clt. Pl. $\frac{1}{8}$ ft.

§ 2. *Perennial. Surculi numerous. Leaves 3-5-parted, petiolate.*

117 S. GERANIOÌDES (Lin. spec. 578.) leaves reniform, 3-5-lobed, pubescent, on long petioles: segments cuneated, deeply toothed; panicle coarctate, many-flowered; calycine segments linear-lanceolate, obtuse, reflexed; petals oblong, flat. ♃. H. Native of the Pyrenees. Lapeyr. pyr. sax. p. 66. t. 43. S. paniculàta, Schleich. cat. 1821. S. quinquéfida, Lam. fl. fr. 3.

p. 533.—Gouan. ill. p. 28. t. 18. f. 2. Plant tufted. Surculi reddish, stiff. Stems red, beset with glanduliferous hairs. Bracteas lanceolate, obtuse. Flowers campanulate, white; filaments yellowish. Pedicels and calyxes clothed with clammy down.

Var. β, obtusíloba (Ser. in D. C. prod. 4. p. 30.) plant hardly pilose; lobes and lobules of leaves hardly toothed; flowers subumbellate; bracteas linear. 4. H. Native of Switzerland. S. geranioìdes, Schleich. cat. 1822. p. 63.

Geranium-like Saxifrage. Fl. Apr. May. Clt. 1770. Pl. ½ ft.

118 S. irrí'gua (Fisch. hort. gorenk. Spreng. cent. spec. min. cogn. p. 36.) radical leaves palmately 5-parted: cauline ones trifid, sessile; segments cuneate-oblong, mucronate, trifid; panicle loose, many-flowered; calycine segments linear, acute; petals spatulate. 4. or ♂. H. Native of Tauria, among rocks, at the Salghir fountains; and of Siberia, especially in boggy fields, from the Aldan to the Urak, and among rocks, on the banks of the Jaika. Bieb. cent. pl. rar. ross. 2. t. 73. Sims, bot. mag. 2207. S. petræ'a, Pall. ind. taur. Habl. taur. p. 147. S. aquática, Bieb. fl. taur. 1. p. 317. exclusive of the synonyme of Lapeyr. and Persoon. S. geranioìdes β, irrígua, Ser. in D. C. prod. 4. p. 30. Plant rather larger than the preceding, much softer and looser, without any surculi. Stems green, beset with jointed hairs. Petioles villous, viscid. Bracteas palmate. Flowers large, campanulate, white; filaments green; anthers yellow. Peduncles and calyxes clothed with viscid villi.

Plashy Saxifrage. Fl. Ju. Jul. Clt. 1817. Pl. ½ to 1 foot.

119 S. Madere'nsis (D. Don, in Lin. trans. 13. p. 414.) surculi woody; leaves crowded, cuneiform, on long petioles, acute at the base, unequally and deeply lobed at the apex; calycine segments broadly ovate, acute. 4. F. Native of Madeira. Plant densely tufted. Stems numerous, ascending, filiform, few-leaved, and few-flowered, beset with scattered glanduliferous hairs; lobes of leaves short, ovate, acute: uppermost cauline leaves undivided, acute. Petioles filiform, terete, ciliated. Pedicels and calyxes clothed with clammy down.

Madeira Saxifrage. Pl. ¼ foot.

120 S. pedati'fida (Ehrh. exsic. no. 15. Smith, in Lin. trans. 10. p. 314.) radical leaves reniform, pedatifid, clothed with clammy villi: segments linear-lanceolate, acute; panicle fastigiate; calycine segments linear-lanceolate, mucronate; petals narrow, spatulate. 4. H. Native of the Alps of Switzerland and the Pyrenees; and on rocks in the highlands of Scotland, especially on the Clova mountains, Angus-shire. Smith, engl. bot. 1278. S. quinquéfida α, Lam. fl. fr. 3. p. 533. Donn, hort. cant. ed. 5. p. 137. S. frágilis, Schrank, hort. mon. t 92. S. ladanífera β pinnatífida, Duby, in bot. gall. 1. p. 210. S. geranioìdes δ pedatífida, Ser. in D. C. prod. 4. p. 30. Plant growing in dense conical tufts. Stems erect, red, smoothish. Petioles villous, compressed, dilated at the base. Radical leaves 2-3-cleft; lateral segments 2-3-cleft: middle one cuneately trifid or entire; lobes linear-lanceolate, acute, awned. Lower cauline leaves tripartite, with linear entire lobes: upper cauline ones entire, narrow. Flowers white, smaller than those of *S. geranioìdes;* filaments yellowish green.

Pedatifid-leaved Saxifrage. Fl. May, June. Scotland. Pl. ¼ to ½ foot.

121 S. viscòsa (Haw. in misc. nat. 164. enum. sax. p. 26.) stems hairy; radical leaves pedatifid: of the surculi, which are erect, 3-5-cleft: cauline ones trifid and lanceolate, 3-nerved. 4. H. Native country unknown. Allied to *S. geranioìdes* and *S. pedatífida*, but much smaller and more clammy. Flowers white.

Clammy Saxifrage. Fl. May, June. Pl. ¼ to ½ foot.

122 S. ceratophy'lla (Dryander, in hort. kew. 3. p. 70.) surculi woody; leaves 2-3-parted, petiolate, stiff, glabrous: segments subulate, with horny mucrones; stems clammy; calyx brownish, glabrous: with ovate segments, which are furnished each with a recurved mucrone at the apex; petals oblong. 4. H. Native of Spain. Sims, bot. mag. 1651. S. trifurcàta, Schrad. hort. goett. fasc. 1. p. 13. t. 7. S. petræ'a, Pavon. herb. Plant densely tufted, quite glabrous. Stems reddish at the base, covered with viscid juice. Petioles naked, channelled above. Flowers snow white, disposed in a loose branched panicle. Pedicels and calyxes covered with clammy juice.

Horn-leaved Saxifrage. Fl. May, June. Clt. 1804. Pl. ¼ to ½ foot.

123 S. obtusi'fida (D. Don, in Lin. trans. 13. p. 416.) surculi woody; leaves 3-parted, stiff, and smooth, as well as the very narrow petioles; segments linear, very blunt; calyxes pubescent, with ovate obtuse segments; petals obovate. 4. H. Native of Spain. Plant densely tufted, quite glabrous, deep green. Stems few-leaved. Lateral segments of leaves lengthened, and usually bifid. Pedicels 1-flowered, pubescent. Flowers campanulate, white. Petals triple-nerved: nerves 2-3-forked at the apex.

Blunt-cleft-leaved Saxifrage. Pl. ⅓ foot.

124 S. ajugæfòlia (Lin. amœn. acad. 4. p. 271.) surculi procumbent; leaves 5-parted: segments lanceolate, mucronate; stem branched; calycine segments ovate, mucronate; petals flat, obovate. 4. H. Native of Provence, on the mountains, and of the Pyrenees. Lapeyr. pyr. sax. p. 56. t. 31. Sternb. sax. p. 46. Plant green, furnished with a few viscid hairs, which are more dense on the petioles: densely tufted at the time of flowering, but growing in a loose manner afterwards. Surculi long, reddish, as well as the base of the stems. Leaves glabrous, but ciliated: cauline ones undivided, lanceolate. Flowers large, campanulate, white. Calyx beset with glanduliferous hairs. Petals triple-nerved: nerves simple.

Var. β, Aitònis (Haw. enum. sax. p. 29.) leaves of the prostrate stolons 3-5-cleft, somewhat pedate; segments linear-lanceolate, awned, twice the length of the petioles. 4. H. Native of the mountains of Provence. S. ajugæfòlia, Ait. hort. kew. ed. 2. vol. 3. p. 70. S. ajugæfòlia δ lóngipes, Haw. l. c.

Var. γ, fimbriàta (Ser. in D. C. prod. 4. p. 28.) sepals and petals jagged. 4. H. Native of the Pyrenees. Ramond, in D. C. fl. fr. 4. p. 372. in a note.

Ajuga-leaved Saxifrage. Fl. May, July. Clt. 1825. Pl. ½ ft.

125 S. affi'nis (D. Don, in Lin. trans. 13. p. 418.) surculi procumbent; leaves 5-parted: segments linear, mucronate; calycine segments linear, awned; petals oblong, with inflexed edges. 4. H. Native of Ireland, as on the top of Brandon mountains, county of Kerry. Plant beautiful green, furnished with soft and viscid hairs, densely tufted before flowering, but afterwards loose. Surculi elongated, reddish. Stems shining, smooth, few-flowered. Leaves of the surculi for the most part 3-parted. Pedicels and calyxes clothed with viscid down. Flowers white, smaller than those of *S. ajugæfòlia.* Petals triple-nerved: nerves simple.

Allied Saxifrage. Fl. May, June. Pl. ⅓ foot.

126 S. capita'ta (Lapeyr. fl. pyr. p. 55. t. 30.) stems thickish, prostrate, hardly pilose; leaves cuneated, 3-5-cleft, rather fleshy, nerved, crowded towards the tops of the surculi: lobes ovate, rather parallel; calycine lobes ovate-lanceolate, bluntish, length of tube when in flower; petals obovate, much longer than the calyx; styles very long, spatulate. 4. H. Native of the Pyrenees. S. ajugæfòlia β, D. C. fl. fr. 4. p. 371. Sternb. rev. sax. p. 26. Petals white, 3-nerved above the base, lateral nerves confluent. Very like *S. ajugæfòlia*, but differs in the leaves being thicker and denser.

Capitate-flowered Saxifrage. Fl. May, June. Pl. ½ foot.

127 S. pentada'ctylis (Lapeyr. fl. pyr. sax. p. 64. t. 40.) surculi short, erect; leaves on long petioles, glabrous, 5-parted:

segments linear, obtuse, ribbed beneath; calycine segments lanceolate, acute; petals obovate, with branched nerves. ♃. H. Native of the Pyrenees. Herb glabrous, pale green, densely tufted. Stems branched, terete, glabrous, flexuous. Petioles long, compressed, glabrous. Flowers white, disposed in loose panicles.

Var. β, corymbòsa (Ser. in D. C. prod. 4. p. 30.) flowers numerous, in dense corymbs; peduncles more rigid and shorter.

Var. γ, capitellàta (Ser. l. c.) flowers somewhat capitate; peduncles very short.

Five-fingered-leaved Saxifrage. Fl. May, June. Clt. 1815. Pl. ¼ to ½ foot.

128 S. lati'fida (D. Don, in Lin. trans. 13. p. 420.) surculi erect, short; radical and surculine leaves broadly cuneated, glabrous, 3-5-lobed: lobes broadly ovate; calyx glabrous, with ovate-lanceolate mucronulate segments; petals spatulate, with simple nerves. ♃. H. Native of Spain. S. adscéndens, Pavon, herb. Plant quite glabrous, pale green, tufted. Stems many leaved, many flowered. Lower cauline leaves like the radical ones, but more profoundly lobed: lobes lanceolate; upper cauline leaves undivided. Peduncles elongated, 2-flowered. Flowers white.

Broad-cleft-leaved Saxifrage. Pl. ½ foot.

129 S. deci'piens (Ehrh. beitr. 5. p. 47.) plant very villous; leaves 5-cleft or trifid: segments ovate-oblong, obtuse, mutic; calycine segments triangularly ovate, obtuse, mutic; petals orbicular. ♃. H. Native of Germany and Bohemia, in exposed rocky places. In North Wales on the rocks of Cwn Idwell. In Ireland on the Galty mountains of Tipperary. Sternb. sax. p. 55. t. 23. S. cæspitòsa, Oed. fl. dan. t. 71. S. petræ'a, Roth. tent. 1. p. 184. With. brit. p. 890. S. palmàta, Smith, brit. 2. p. 456. engl. bot. t. 455. Lapeyr. fl. pyr. sax. p. 64. t. 41. S. villòsa, Willd. enum. 462. S. cæspitòsa, Smith, engl. fl. 2. p. 273. S. rupéstris, Schleich. cat. 1821. S. Lapeyroùsii, Sternb. rev. sax. p. 51. S. decípiens hirsùta, Haw. enum. sax. p. 31. S. decípiens canéscens, Haw. l. c. S. intermèdia, Tausch, ex Link, enum. 1. p. 415. S. Steinmánnii, Tausch, hort. canal. fasc. 1. with a figure. S. hypnoìdes villòsa, Arn. et Ser. in D. C. prod. 4. p. 32. Plant canescent, densely tufted before flowering, but afterwards becoming loose, and the surculi elongated and procumbent. Lower cauline leaves usually tripartite, upper cauline ones undivided. Stems many flowered. Flowers large, spreading, milk-coloured. Petals triple-nerved: nerves simple.

Deceiving Saxifrage. Fl. May, June. Wales. Pl. ½ foot.

130 S. hi'rta (Donn, cant. ed. 5. p. 107.) plant very villous; radical leaves 5-cleft: surculine ones trifid: segments ovate-lanceolate, acute; calycine segments triangularly ovate, acute; petals obovate. ♃. H. Native of Ireland, among alpine rocks, western highlands of Scotland, and Wales; as on the Galty mountains, Tipperary; in the west part of Scotland; near Twll du in Cwn Idwell, also on the walls of Dolwyddelan castle, betwixt Capel Cory and Llandwst, North Wales. Smith, engl. bot. 2291. Plant canescent, densely tufted before flowering, but afterwards loose, with the surculi decumbent and flexuous. Stem many leaved, few-flowered, clothed with viscid hairs. Petioles dilated. Lower cauline leaves 3-parted, with linear segments: upper ones undivided. Flowers white, smaller than those of *S. decipiens*. Pedicels and calyxes clothed with glandular hairs. Petals triple-nerved: nerves simple.

Hairy Saxifrage. Fl. May, June. Ireland. Pl. ¼ to ½ ft.

131 S. platipe'tala (Smith, in Lin. trans. 10. p. 391.) plant villous; surculi elongated, prostrate; leaves 3-5-parted: segments linear, acute, and awned; calycine segments ovate, mucronate; petals orbicular. ♃. H. Native of the Alps of Scotland and Wales; as upon Snowdon in Wales; and the Clova mountains in Angus-shire, Scotland. Smith, engl. bot. 2276. S. recúrva, Schleich. cat. 1821. S. hypnoìdes rhodopétala, Haw. enum. sax. p. 32. Plant densely tufted before flowering, but afterwards loose. Stems leafy, many flowered. Upper cauline leaves undivided. Flowers rather large, milk-coloured. Peduncles and calyxes clothed with glandular down. Petals red at the apex when in the bud, triple-nerved: lateral nerves incurved, a little branched, middle one straight and simple.

Broad-petalled Saxifrage. Fl. June. Britain. Pl. ½ foot.

132 S. incurvifòlia (D. Don, in Lin. trans. 13. p. 423.) plant smoothish; radical leaves 5-cleft, surculine ones trifid: segments lanceolate, obtuse, incurved; calycine segments ovate, acute; petals roundish, emarginate. ♃. H. Native of Ireland, on alpine rocks. S. incúrva, Mackay in litt. Plant green, densely tufted, glabrous at the time of flowering, but furnished with long viscid villi afterwards. Surculi short, erect. Stems leafy, 2-3-flowered. Radical leaves aggregate: upper cauline ones undivided. Petioles dilated. Flowers white. Pedicels and calyxes furnished with glanduliferous hairs. Petals triple-nerved: nerves simple.

Incurved-leaved Saxifrage. Fl. May, June. Ireland. Pl. ¼ ft.

133 S. denuda'ta (D. Don, in Lin. trans. 13. p. 424.) plant quite glabrous; radical leaves 5-cleft, surculine ones 3-parted: segments linear-subulate, acute, mucronate; calycine segments lanceolate, mucronulate; petals obovate, emarginate. ♃. H. Native of Scotland, on the Clova mountains in Angus-shire. Herb pale green, growing in small dense tufts. Surculi short, crowded, very leafy. Stems erect, few-leaved, 2-flowered, purplish, beset with glanduliferous hairs. Upper cauline leaves undivided. Flowers campanulate, white. Petals 3-nerved: nerves simple; filaments greenish yellow.

Naked Saxifrage. Fl. May, June. Scotland. Pl. ⅛ foot.

134 S. Sternbe'rgii (Willd. enum. p. 462.) plant glabrous; radical leaves 5-cleft, palmatifid, those of the surculi trifid or undivided: lobes ovate, acute, mutic; calycine segments ovate, mucronate; petals obovate, with branched nerves. ♃. H. Native of Germany, about Norimberg. Sternb. sax. p. 56. t. 24. S. palmàta, Pauz. in Sturm. deutschl. fl. p. 26. half. t. 10. f. 2. S. decípiens contravérsa, Haw. enum. sax. p. 32. S. contravérsa, Hortul. but not of Sternb. S. elongàta, Panz. fl. norimb. mss. S. decípiens, Sieb. exsic. S. hypnoìdes latífida, Haw. enum. sax. p. 33. S. uniflòra, Sternb. rev. sax. suppl. p. 13. t. 9. S. intermèdia α, Gaudin, fl. helv. 3. p. 121. S. hypnoìdes η Sternbérgii, Ser. in D. C. prod. 4. p. 32. Plant pale green, densely tufted. Surculi very short, crowded. Stems 2-3, rarely 4-flowered. Cauline leaves all undivided, cuneated, acute. Flowers large, white. Pedicels and calyxes beset with short glanduliferous hairs. Petals triple-nerved: nerves flexuous, much branched.

Sternberg's Saxifrage. Fl. May, June. Pl. ⅓ foot.

135 S. pulche'lla (D. Don, in Lin. trans. 13. p. 426.) plant glabrous; radical leaves 5-cleft, surculine ones trifid: segments linear, obtuse, mucronate; calycine segments broadly ovate, obtuse; petals orbicular, with branched nerves. ♃. H. Native of Germany. Herb deep green, densely tufted, furnished with a few glanduliferous hairs at the time of flowering. Surculi short, erect. Stems 2-3-flowered, beset with a few glanduliferous hairs. Lower cauline leaves digitately 5-parted: upper ones 3-parted. Flowers milk-coloured, size of those of the preceding species. Pedicels and calyxes clothed with glandular down. Petals triple-nerved.

Neat Saxifrage. Fl. May, June. Clt. 1818. Pl. ¼ foot.

136 S. tridenta'ta (D. Don, in Lin. trans. 13. p. 426.) plant glabrous; radical leaves 5-cleft, surculine ones on long petioles, acutely tridentate; calycine segments triangularly ovate, mucronate; petals spatulate. ♃. H. Native country unknown. Herb densely tufted, quite glabrous before flowering, but fur-

nished with some viscid villi afterwards. Surculi very short, very leafy. Stems erect, few-leaved, few-flowered, purplish, beset with glanduliferous hairs. Petioles slender, ciliated. Pedicels and calyxes clothed with viscid down. Petals triple-nerved: nerves simple. Flowers white; filaments green.

Tridentate-leaved Saxifrage. Fl. May, June. Pl. $\frac{1}{4}$ foot.

137 S. Andi'cola (D. Don, in Lin. trans. 13. p. 427.) plant very villous; radical leaves trifid: segments lanceolate, acute: upper surculine leaves linear, simple, acute; calycine segments ovate, acute; petals obovate-orbicular, with branched nerves. ♃. F. Native of Peru in very cold places on Mount Rucu-Pichincha, at the elevation of 4000 or 5000 feet. H. B. et Kunth, nov. gen. amer. 6. p. 48. t. 519. S. villòsa, Pavon, mss. S. Cordilleriàna, Presl, in Hænk. reliq. 2. p. 55. Plant densely tufted. Surculi short, decumbent. Stems erect, leafy, 3-4-flowered, clothed with viscid villi. Lower cauline and surculine leaves 3-parted. Flowers milk-coloured, subcorymbose. Calyx densely clothed with glandular hairs.

Andes Saxifrage. Pl. $\frac{1}{8}$ foot.

138 S. cæspitòsa (Lin. spec. 578.) radical leaves aggregate, 5-3-parted or undivided: segments linear-lanceolate, obtuse; stems few-leaved, few-flowered; calycine segments ovate, obtuse; petals obovate-roundish, connivent. ♃. H. Native of the Alps of Lapland, Sweden, Switzerland, Norway, and the Pyrenees; also of the north-west coast of America, Kotzebue's Sound, Arctic sea-shore, and of Greenland. In Wales and Ireland on the loftiest mountains; on the rocks of Troll dû Cwn Idwell, North Wales; on the lofty summits of Brandon mountains, county of Kerry. Gunn. fl. norv. no. 1047. t. 7. f. 3. Smith, engl. bot. t. 794. S. Grœnlándica, Lin. spec. p. 578. Gunn. fl. norv. p. 689. t. 7. f. 1. Lapery. pyr. sax. p. 39. t. 19.—Dill. elth. p. 337. t. 353. f. 329. Muscària cæspitòsa, Haw. enum. sax. p. 37. Plant densely tufted, beset with glanduliferous hairs. Surculi short, very leafy. Stems 1-3-flowered, but in cultivation usually 4-flowered. Lower cauline leaves palmate, upper ones for the most part 3-parted. Pedicels and calyxes clothed with viscid down. Flowers rather large, milk-coloured; filaments yellow; petals triple-nerved; nerves simple: lateral ones curved.

Tufted Saxifrage. Fl. June, July. Wales. Pl. $\frac{1}{8}$ foot.

139 S. uniflòra (R. Br. in Parry's first voy. append. p. 275. but not of Sternb.) radical leaves aggregate, trifid: cauline ones linear, undivided, distant; stem one-flowered, and is, as well as the inferior ovarium, viscid; down glandular, very short; calycine segments obtuse; petals obovate-oblong. ♃. H. Native of the Arctic Islands. S. cæspitòsa, R. Br. in Ross' voy. ed. 2. vol. 2. p. 192. S. cæspitòsa β uniflòra, Hook. fl. bor. amer. 1. p. 244. S. venòsa, Haw. enum. sax. p. 28.? Flowers milk-coloured.

One-flowered Saxifrage. Pl. $\frac{1}{8}$ foot.

140 S. stella'ta (Pavon, mss. ex D. Don, in Lin. trans. 13. p. 430.) leaves very numerous, adpressedly imbricated, 5-cleft or trifid: segments linear-oblong, obtuse; stem few-flowered; calycine segments ovate, acute; petals obovate. ♃. F. Native of Peru, on the Andes in very cold places. Plant densely tufted. Habit of *Fragòsa tomentòsa*, beset with glanduliferous hairs. Stems erect, 2-flowered. Cauline leaves simple, obtuse. Petioles dilated. Flowers largish, milk-coloured. Calyx clothed with glandular down; petals obovate, triple-nerved: nerves simple.

Stellate Saxifrage. Pl. 1 inch.

141 S. Bonpla'ndii (D. Don, in Lin. trans. 13. p. 431.) plant pubescent; leaves crowded, 5-cleft or trifid: segments linear, obtuse; calycine segments lanceolate, acute; petals obovate. ♃. H. Native of the Cordillera of Peru, in cold places. S. Peruviàna, Bonpland in Sternb. sax. p. 55. t. 22. S. Cordilleriàna β Bonplándii, Presl, in reliq. Hænk. 2. p. 55. S. alpìna, Pavon, mss. Plant densely tufted, beset with short glanduliferous hairs. Surculi short, very leafy. Stems clothed with glandular tomentum, as well as the calyxes, few-leaved. Lower cauline leaves 3-parted: upper cauline ones undivided, linear-lanceolate. Petioles narrow, short. Flowers white, terminal, nearly sessile, by threes, rarely solitary; petals triple-nerved: nerves simple.

Var. β, *Hæ'nkei*; leaves densely glandular, 3-5-lobed: lobes ovate; surculi nearly globose; corymbs 6-10-flowered. ♃. F. Native in valleys on the Cordillera of Peru. S. Cordilleriàna var. γ Hæ'nkei, Presl, in Hænk. reliq. 2. p. 55.

Var. γ, *láxa*; stems elongated; leaves densely glandular, 3-5-lobed, loosely imbricated: lobes ovate; surculi cylindrical, loose; corymbs many flowered. ♃. F. Native of the Cordillera of Peru, in valleys. Petals white. S. Cordilleriàna δ láxa, Presl, in Hænk. reliq. 2. p. 55.

Bonpland's Saxifrage. Pl. 1 inch.

142 S. magella'nica (Poir. dict. 6. p. 686.) stems tufted, procumbent; leaves linear or trifid, much crowded, glabrous; floriferous branches naked, axillary, very short, 1-flowered. ♃. F. Native of the Straits of Magellan. Muscària Magellánica, Haw. enum. sax. p. 38. Plant tufted. Stems leafy. Lower leaves trifid. Flowers solitary, on short peduncles. Segments of the calyx linear, obtuse. Petals obovate, twice the length of the calyx.

Var. α, *integrifòlia* (Ser. in D. C. prod. 4. p. 24.) leaves spatulate, usually entire: upper ones puberulous: lower ones glabrous.

Var. β, *trìloba* (Ser. l. c.) leaves all cuneated, 3-lobed at the apex, clammy. ♃. F. S. Magellánica, Sternb. rev. sax. p. 39. t. 11. f. 1.

Magellan Saxifrage. Pl. $\frac{1}{8}$ foot.

143 S. lanceola'ta (Haw. syn. succ. p. 324. enum. sax. p. 240.) leaves glabrous, ciliated; those of the surculi palmately 7-cleft: those of the stolons, which are very short and erect, 3-5-cleft: cauline leaves lanceolate; petals roundish, obovate. ♃. H. Native of the Alps of Europe. Flowers white.

Var. β, *mìnor* (Haw. enum. sax. p. 24.) leaves trifid and entire: lower cauline ones lanceolate-spatulate; petals oblong-cuneiform, distinct. ♃. H. Two or three times smaller than the species, and the leaves and petioles are very different. Haw. l. c.

Var. γ, *obtùsa* (Haw. l. c. p. 24.) leaves cuneiform at the base or obovate: those of the rosulæ deeply 1-5-toothed, and brownish: those of the stolons usually abortive: lower cauline leaves elliptic; petals orbicularly obovate. ♃. H.

Lanceolate-leaved Saxifrage. Fl. May, June. Clt. 1800. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

144 S. dicho'toma (Willd. in Sternb. sax. rev. p. 51.) radical leaves reniformly cordate, palmately parted: segments linear; cauline leaves nearly sessile, cuneated, 3-5-parted; flowers in dichotomous panicles; peduncles and calyxes pilose; calycine lobes lanceolate, acute, length of the tube. ♃. H. Native of Spain. Haw. enum. sax. p. 27. Flowers white.

Dichotomous Saxifrage. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

145 S. exara'ta (Vill. dauph. 4. p. 674. t. 45.) plant pubescent; radical leaves 5 or 3-parted: those of the surculi 3-parted: segments linear, very blunt, engraven above; stem many flowered; calycine segments ovate-oblong, obtuse; petals obovate, with simple nerves. ♃. H. Native of the Alps of Dauphiny, Savoy, Piedmont, and the higher Pyrenees; also of North America: frequent on the Rocky Mountains between lat. 52° and 56°. S. nervòsa, Lapeyr. pyr. sax. p. 63. t. 39. S. hypnoìdes, All. pedem. no. 1538. t. 21. f. 4. S. intermèdia, Gaudin, fl. helv. 3. p. 122. S. striàta, Hall. fil. in herb. Gaudin, l. c. p. 129.? Plant densely tufted before flowering, afterwards

loose and surculose, densely clothed with glandular down. Surculi stiffish. Cauline leaves profoundly 3-parted, with the lateral segments generally bifid. Petioles linear, flat. Pedicels filiform, 1-flowered, furnished each with a tripartite bractea at the base. Flowers white; filaments yellow.

Var. β, pubéscens (D. Don, in Lin. trans. 13. p. 433.) radical and surculine leaves deeply 3-parted: lateral segments bifid; flowers on long peduncles, corymbose. ♃. H. Native of the Pyrenees and Newfoundland. S. pubéscens, Poir. act. toul. 3. p. 327. D. C. prod. 4. p. 27. S. míxta α and β, Lapeyr. pyr. sax. p. 41. t. 21. S. cæspitòsa, Vill. dauph. 4. p. 672. S. moschàta, Lapeyr.

Var. γ, intricàta (D. Don, l. c.) radical leaves crowded, spreading, cuneated, 5-cleft; peduncles divaricate. ♃. H. Native of the Pyrenees. S. intricàta, Lapeyr. sax. pyr. p. 58. t. 33.

Var. δ, Prostiàna (Ser. in Benth. cat. p. 118.) stems few-flowered; leaves rosulate, short, reflexed: with short obtuse lobes, which hardly diverge; cauline leaves entire. ♃. H. Native about Melda, Alps of Dauphiny, and on the Pic St. Loup, near Montpelier. S. míxta, Lapeyr. fl. pyr. t. 20. S. pubéscens γ and δ, D. C. fl. fr. 4. p. 375.

Engraven-leaved Saxifrage. Fl. May, June. Clt. 1818. Pl. ¼ to ½ foot.

146 S. Pavònii (D. Don, in Lin. trans. 13. p. 434.) plant pubescent; leaves 3-parted: segments linear, acute, nerved; petioles linear, dilated, ribbed beneath; calycine segments linear-lanceolate, acute; petals obovate, with simple nerves. ♃. F. Native of the Andes of Peru, in very cold places. Herb growing in dense flat tufts. Surculi short. Stems few-leaved, 3-5-flowered, covered with short glandular hairs. Upper cauline leaves simple, linear, all the rest tripartite. Petioles linear, dilated. Peduncles and calyxes densely clothed with short glandular down. Flowers milk-coloured, fading to a yellowish colour.

Paron's Saxifrage. Pl. ¼ to ½ foot.

147 S. Pedemonta'na (All. ped. no. 1540. t. 21. f. 6.) plant pubescent; leaves crowded, cuneatedly spatulate, engraven above, cut in a digitate manner: segments linear-oblong, entire or tridentate; flowers corymbose; segments of the calyx linear and elongated, acute; petals oblong-spatulate, with simple nerves. ♃. H. Native of the Alps of Piedmont and Hungary. S. heterophýlla, Sternb. sax. p. 50. t. 20. f. 1. and 2. S. cervicórnis, Viv. fl. cors. prod. append. p. 2. S. cymòsa, Waldst. et Kit. hung. p. 91. t. 88. S. Pedemontàna α, β, and γ, D. C. prod. 4. p. 29. Plant densely tufted. Surculi short. Stems many flowered, clothed with clammy down. Flowers large, campanulate, white. Calyxes and pedicels clothed with short viscid down.

Piedmont Saxifrage. Fl. May, June. Pl. ¼ to ½ foot.

148 S. qui'nquedens (Haw. syn. succ. p. 325. and enum. sax. p. 30.) naked; leaves of the twiggy surculi 3-5-cleft, remote, length of the internodes; lobes subulate, awned, equal in length to the petioles, which are ciliated; petals orbicular. ♃. H. Native country unknown.

Five-toothed-leaved Saxifrage. Fl. May, June. Pl. ¼ to ½ ft.

149 S. paniculà'ta (Hort. madr. ex Horn. hort. hafn. 1. p. 402.) leaves glabrous, 3-parted: lobes trifid, linear; cauline leaves tripartite, with entire lobes; stems ascending. ♃. H. Native of Spain.

Panicled Saxifrage. Pl. ¼ foot.

150 S. moschà'ta (Wulf. in Jacq. misc. 2. p. 128. t. 21. f. 2.) plant pubescent; radical leaves trifid: surculine ones trifid or undivided, nerved; segments linear, acutish; stems filiform, somewhat racemose; petals narrow-oval, hardly exceeding the calyx. ♃. H. Native of the Alps of Carinthia, Carniola, Savoy, Salisburgh, and the Pyrenees. Lapeyr. pyr. sax. p. 61. t. 37. Sternb. sax. p. 41. t. 11. f. 3. S. cæspitòsa, Scop. carn. p. 494. t. 14. S. exaràta, All. pedem. no. 1539. f. 2. S. muscoìdes λ prostràta, Gaudin, fl. helv. 3. p. 131. and Ser. in D. C. prod. 4. p. 20. S. muscoìdes, Sternb. sax. p. 39. t. 11. f. 2. exclusive of var. β. and γ, and the synonyme of Smith. Plant densely tufted before flowering, smoothish, but afterwards loose and surculose. Surculi erect, elongated, slender. Stems filiform, 3-5-flowered, rather naked. Petioles linear, with a furrow. Flowers subracemose, on short pedicels, which are furnished each with a tripartite leaf at the base. Calyx densely clothed with glandular down: with linear obtuse segments. Petals yellow, triple-nerved: nerves simple.

Var. β, atropurpùrea (Ser. in D. C. prod. 4. p. 26.) plant hardly with any clammy hairs; leaves rather loose: upper ones entire; stem smoothish, few-flowered; petals narrow, of a purplish orange-colour, longer than the calyx. ♃. H. Native of Carniola and Switzerland. S. atropurpùrea, Sternb. rev. sax. t. 11. b. f. 2. and in Sturm, deutschl. fl. p. 33. f. 11. Muscària atropurpùrea, Haw. enum. sax. p. 28. S. ampulàcea, Tenore, append. prod. fl. neap. 4. p. 20. S. muscoìdes var. μ, Ser. in D. C. prod. 4. p. 26.

Musky Saxifrage. Fl. May, June. Pl. ¼ foot.

151 S. muscoi'des (Wulf. in Jacq. misc. 2. p. 125.) plant quite glabrous; radical leaves entire or trifid: surculine ones all linear, undivided, obtuse, nerveless; stems very slender, usually 3-flowered; calycine segments lanceolate, blunt; petals linear, a little longer than the calyx. ♃. H. Native of the Alps of Carinthia, Dauphiny, Switzerland, Caucasus, Persia, and the Pyrenees. In England on the mountains about Ambleside, in Westmoreland. S. cæspitòsa, Huds. angl. p. 181. exclusive of the synonyme of Lin. and Fl. dan. Lapeyr. pyr. sax. p. 59. t. 35. and probably 34. Sternb. sax. t. 11. f. 1. S. moschàta, With. brit. 2. p. 406. S. Pyrenàica, Vill. dauph. 3. p. 671. S. muscoìdes δ, Sternb. rev. sax. p. 40. Muscària muscoìdes β elongélla, Haw. enum. sax. 37. S. elongélla. Haw. in misc. nat. p. 161. but not engl. bot. S. muscoìdes β elàtior, Gaudin, syn. sax. and fl. helv. 3. p. 31. Ser. in D. C. prod. 4. p. 26. Plant green, densely tufted. Surculi erect, longish, slender. Stems erect, nakedish, for the most part 3-flowered, and beset with glands. Leaves rarely with glands on the edges. Nerves of petals simple. Flowers of a pale yellow-colour.

Var. β, crassifòlia (Gaudin, syn. sax. and in fl. helv. 3. p. 31.) leaves nearly sessile, fleshy, for the most part undivided; stems rather panicled. ♃. H. Native of the Alps of Savoy. S. muscoìdes γ, D. C. prod. 4. p. 26.

Var. λ, uniflòra (Gaudin, l. c.) surculi densely tufted; leaves short, rather incurved; stems rather capillary, 1-flowered, or almost wanting. ♃. H. S. cæspitòsa, Lapeyr. fl. pyr. t. 34. and 36. S. muscoìdes β, Sternb. rev. p. 40. S. moschàta, var. Lapeyr. fl. pyr. t. 38. S. acaúlis, Gaudin, syn. sax. in Miesner, anz. p. 68. fl. helv. 3. p. 127. Muscària acaúlis, Haw. enum. sax. p. 38. S. muscoìdes nàna, Sternb. rev. sax. suppl. p. 11. t. 7. f. 2. S. muscoìdes ε, D. C. prod. 4. p. 26.

Var. δ, capitàta (Gaudin, fl. helv. 3. p. 131.) surculi densely tufted; leaves short, thickish; flowers sessile, capitate, few. ♃. H. Native of Switzerland, in the grassy parts of the mountains. S. cæspitòsa, Wahlenb. helv. p. 80. exclusive of the synonymes. S. muscoìdes ζ, D. C. prod. 4. p. 26.

Moss-like Saxifrage. Fl. May, June. England. Pl. ⅛ foot.

152 S. pygmæ'a (Haw. misc. nat. p. 168.) plant quite glabrous; surculi very short, rosulate; leaves lanceolate, nerveless, glabrous, blunt, and rather cut at the apex; calycine segments broadly ovate; petals oval, hardly longer than the calyx. ♃. H. Native of the Pyrenees. S. muscoìdes γ hemisphæ'rica, Lapeyr. pyr. sax. p. 60. t. 36. S. moschàta, Smith, engl.

bot. t. 2214. exclusive of the synonymes. S. moschàta β, Lapeyr. pyr. sax. p. 62. t. 38. S. moschàta γ, Sternb. sax. t. 11. β, f. 2. S. muscoìdes lineàta, Sternb. rev. sax. suppl. 1. p. 10. t. 7. f. 1.? S. muscoìdes α microphýlla, Gaudin, syn. sax. in Meisner, anz. 1829. p. 69. fl. helv. 3. p. 131. D. C. prod. 4. p. 26. Plant densely tufted, spreading close on the ground. Surculi short, rosulate, very leafy. Stems filiform, slender, few-leaved, 3-4-flowered, beset with glands. Flowers the smallest of all the section, of a yellowish colour. Calyx and pedicels glandular. Nerves of petals simple. Filaments short, purple.

Pygmy Saxifrage. Fl. May, June. Scotland. Pl. 1 to 2 inches.

153 S. Terekte'nsis (Bunge, in Ledeb. fl. ross. alt. ill. t. 398. fl. alt. 2. p. 123.) plant small, tufted; radical leaves much crowded, cuneated, trifid: segments oblong-linear, obtuse, ciliated with a few glands; cauline leaves few, trifid or entire; stem few-flowered, glandular; petals oblong, twice the length of the calyx. ♃. H. Native of Altaia, in rough stony places on tops of mountains, between the rivers Ursul and Koksun. Flowers pale yellow. Allied to *S. moschàta*, but differs in the flowers being twice the size, and in the petals being obovate-oblong.

Terek Saxifrage. Pl. ¼ foot.

154 S. secu'nda (Moretti, tent. sax. p. 20.) plant very villous; radical leaves aggregate, cuneiform, 3-5-cleft: lobes obtuse; stems few-leaved, rather corymbose; flowers secund; lobes of calyx ovate, obtuse; petals obovate, longer than the calyx. ♃. H. Native of Italy? S. cæspitòsa, Biroli, fl. acon. 1. p. 142. Poll. veron. 2. p. 33. but not of Lin.

Secund-flowered Saxifrage. Pl. ¼ foot.

155 S. venòsa (Haw. enum. sax. p. 28.) plant almost stemless; leaves simple and trifid, nerved; scapes 1-flowered, furnished with linear entire leaves. ♃. H. Native of Melville Island. Perhaps only a variety of *S. muscoìdes*, *uniflòra*, or *cæspitòsa*.

Veiny-leaved Saxifrage. Pl. 1 to 2 inches.

156 S. glabe'lla (Bertol. virid. bonn. 1824. p. 80.) surculi densely leafy; stems few-flowered, glabrous; leaves all undivided, linear or spatulate, glabrous; peduncles and calyxes puberulous, viscid; petals obovate, obtuse, length of the calyx, triple-nerved; capsule short, somewhat globose, inclosed in the calyx; styles short, diverging; seeds obovate, echinated, dark. ♃. H. Native of Abruzzo, on humid grassy rocks. Said to be nearly allied to S. exaràta, Tenore, append. 4. fl. neap. p. 19.

Smooth Saxifrage. Fl. July, Aug. Pl. ⅛ to ¼ foot.

157 S. quinque'fida (Haw. in misc. nat. p. 163. enum. succ. p. 26.) surculi erect; leaves cleft into 5-11 parts, pedate: segments linear-lanceolate, furrowed by a line on the upper side. ♃. H. Native of Scotland, on the mountains. Perhaps the same as *S. pedatífida*.

Quinquefid-leaved Saxifrage. Fl. May, June. Scotland. Pl. ½ foot.

158 S. sileniflòra (Cham. ex Hook. fl. bor. amer. 1. p. 245.) plant tufted; surculi short; leaves stiff, rosulate, dense, 3-5-7-parted, shining, and as if they were varnished, many nerved, pubescent: segments linear, acutish; floriferous stems elongated, clothed with glandular down; flowers panicled, rather large; ovarium adhering to the tube of the calyx, which is clothed with glandular down; calycine segments obtuse; petals obovate, 3-nerved, twice the length of the calyx. ♃. H. Native of Behring's Straits. The inflorescence of this plant a good deal resembles *S. hypnoìdes*.

Var. β, *uniflòra* (Hook. l. c.) stem 1-flowered.

Catchfly-flowered Saxifrage. Pl. ¼ to ½ foot.

159 S. adsce'ndens (Vahl. in act. nat. hist. hafn. 2. 1. p. 12.) leaves deeply tripartite; segments cuneated, multifid; peduncles many-flowered; calycine segments ovate-oblong, bluntish; petals oval, entire; stem ascending, panicled. ♃. H. Native of the Pyrenees, in springs. S. petræ'a, Gouan. ill. p. 29. t. 17. f. 3. S. aquática, Lapeyr. pyr. sax. p. 53. t. 28. Sternb. sax. p. 48. t. 19. f. 1 and 2. Plant tufted. Surculi short, leafy. Stems ascending, a foot or more high, beset with glanduliferous hairs. Radical leaves 5-lobed, glabrous; lobes deeply toothed. Petioles dilated at the base. Flowers disposed in coarctate panicles, white. Peduncles many-flowered, and are as well as the calyxes clothed with glandular down. Nerves of petals simple, reddish. Filaments yellow. This is the largest species of the whole section.

Var. β, *flávida* (Ser. in D. C. prod. 4. p. 29.) stems firm, branched; flowers scattered, yellowish, large; anthers purple. ♃. H. Native of the Pyrenees. S. aquática, var. Lapeyr. fl. pyr. p. 53. t. 29. Sternb. var. β and δ, rev. sax. p. 48. t. 19. f. 2.

Var. γ, *secúnda* (Ser. l. c.) flowers secund. ♃. H. Native of the Pyrenees. S. aquática, var. γ, Lapeyr. fl. pyr. p. 53. Sternb. rev. sax. p. 48. var. γ.

Var. δ, *coronàta* (Ser. l. c.) peduncles lateral; stems leafy at the apex. ♃. H. Native of Corsica. S. adscéndens γ, D. C. fl. fr. 4. p. 370.

Var. ε, *glomeràta* (Ser. l. c.) flowers nearly sessile, sub-capitate, yellow; stems humble and weak. S. aquática β, Lapeyr. fl. pyr. p. 52.

Ascending Saxifrage. Fl. May. Clt. 1752. Pl. 1 foot.

160 S. cunea'ta (Willd. spec. 2. p. 658.) glabrous; lower leaves on long petioles, cuneated, 5-lobed: upper ones nearly sessile, lanceolate, undivided; stems ascending, panicled; calycine segments ovate, acute; petals oblong. ♃. H. Native of Spain, on the mountains near Castellfort. S. cuneifòlia, Cav. icon. 3. p. 25. t. 248. but not of Lin. Lobària cuneifòlia, Haw. enum. sax. p. 19. Stems many, ascending. Lobes of leaves acute. Flowers panicled, white. Peduncles elongated, 1-flowered, smoothish.

Cuneate-leaved Saxifrage. Pl. ¼ to ½ foot.

161 S. globuli'fera (Desf. atl. 2. p. 342. t. 96. f. 1.) plant gemmiferous; surculi short; leaves of the surculi 5-cleft or trifid, and sometimes simple, lanceolate, acute, and awned; flowers panicled; calycine segments oval-oblong, obtuse; petals obovate. ♃. H. Native on the top of Mount Atlas. Plant tufted. Stems erect, filiform, glabrous, furnished with a few leaves. Segments of divided leaves lanceolate. Petioles ciliated. Axils of leaves furnished with globular buds, which are pedunculate, and formed of simple, ciliated, imbricated leaves; these buds shoot out into surculi for the following year. Flowers white, one half smaller than those of *S. hypnoìdes*, 5-7, disposed in a panicle. Pedicels and calyxes clothed with clammy down. Nerves of petals simple.

Var. β, *Gibraltárica* (Ser. in D. C. prod. 4. p. 31.) leaves much smaller: lobes short, ovate, acutish; buds in the axils of the leaves smaller, oblong, acutish; stems few-flowered. ♃. H. Native of Gibraltar. Styles not exceeding the calyx at maturity.

Globule-bearing Saxifrage. Pl. ¼ foot.

162 S. hypnoìdes (Lin. spec. p. 579.) plant gemmiferous; surculi very long, procumbent; radical leaves 5 or 3-parted; surculine leaves simple, linear, stiff, ciliated, mucronately awned; calycine segments triangularly ovate, awned; petals roundish-obovate. ♃. H. Native of the Alps of Switzerland, Austria, Pyrenees. In Britain, in the north of England, Scotland, and North Wales, on high rocky mountains; as well as on limestone rocks, walls, and roofs in less elevated situations, abundantly. Fl. dan. t. 348. Vill. dauph. 4. p. 674. t. 45. Lapeyr.

pyr. sax. p. 57. t. 32. Smith; engl. bot. t. 454. S. elongélla, platipétala, dénsa, curvàta, densifòlia, Schleich. cat. 1821. Herb densely tufted before flowering, quite glabrous, but afterwards becoming loose, surculose, and villous. Surculi reddish as well as stems, which are erect, shining, brittle, and 2-4-flowered. Surculine leaves furnished with ovate, acute buds in the axils. Cauline leaves few, linear-lanceolate, undivided. Peduncles elongated, 1-flowered, clothed with viscid down as well as the calyxes. Petals white, triple-nerved, rose-coloured on the outside at the apex; nerves simple.

FIG. 46.

Var. β, *viscòsa* (D. Don, in Lin. trans. 13. p. 447.) plant softer and looser; flowers larger. ♃. H. Native of the Alps of Scotland. S. viscòsa, Hortul.

Var. γ, *angustifòlia* (D. Don, l. c.) surculi ascending; leaves longer. ♃. H. Native of the Alps of Scotland. S. angustifòlia, Hortul. S. hypnoìdes δ, Aitòni, Haw. enum. sax. p. 332. S. Sponhèmica, Gmel. fl. bad. 2. p. 224. ?

Var. δ, *muscòsa* (D. Don, l. c.) plant one half smaller and slenderer; segments of leaves smaller; flowers smaller. ♃. H. Native of the Alps of Scotland.

Var. ε, *pulchélla* (D. Don, l. c.) plant more robust; surculi thicker and stiffer, and more rigid; buds obtuse, more crowded; surculine leaves broader, with a furrow on the upper surface. ♃. H. Native of the Alps of Scotland.

Var. ζ, *spatulàta* (Haw. enum. sax. p. 33.) leaves of the surculi spatulate, hardly acuminated, somewhat tridentate; stem few-flowered. ♃. H. Native of Switzerland. S. spatulàta, Haw. misc. nat. p. 165. Schleich. cat. 1821. but not of Desf. S. crateriformis, hort. oxf. ex Schleich. cat. 1821. S. dùbia, Schleich. cat. 1821.

Hypnum-like Saxifrage. Fl. April, in Britain. Pl. ¼ to ½ ft.

163 S. CONDENSA'TA (Gmel. fl. bad. 2. p. 226. t. 3.) surculi procumbent, short; radical leaves 5-parted: surculine ones trifid: segments linear, glabrous, awned; calycine segments triangularly ovate, acute, mutic. ♃. H. Native of Sponhemia, among rocks, and on the Alps of Scotland; also of Kotzebue's Sound, if *S. cæspitòsa*, Cham. in litt. be the same. S. dénsa and S. læ'vis, Hortul. S. palmàta, Lejeune, fl. spa. 1. p. 194. S. Gmelìni, Host. fl. aust. 1. p. 512. S. flavéscens, Sternb. rev. sax. suppl. p. 13. t. 9. f. 2.? S. læ'vis, trífida, rupéstris, and congésta, Schleich. cat. 1821. Plant quite glabrous, shining, of a beautiful green, densely tufted before flowering, but afterwards loose and surculose. Surculi procumbent, without buds. Stems numerous, nearly naked, glabrous, 2-3-flowered. Peduncles glabrous, 1-flowered, curved when the flowers are in the bud. Calyx rather downy. Petals white, triple-nerved, rose-coloured on the outside at the apex; nerves simple.

Condensed Saxifrage. Fl. May, Ju. Scotland. Pl. ¼ foot.

164 S. ELONGE'LLA (Smith, in Lin. soc. trans. 10. p. 340. engl. bot. 2277. exclusive of the synonyme of Donn, cant.) surculi short, erect; radical leaves 5-cleft or trifid; surculine leaves for the most part tridentate: teeth mucronate; calycine segments ovate, awnless; petals obovate. ♃. H. Native of Scotland, on humid rocks near Lintrathen, in Angusshire. S. hypnoìdes α, elongélla, Ser. in D. C. prod. 4. p. 30. Herb quite glabrous, and densely tufted before flowering, but afterwards becoming loose and rather villous. Stems erect, nearly naked, 2-3-flowered, smoothish. Petioles slender, dilated. Peduncles very long, 1-flowered, beset with glanduliferous hairs. Petals white, triple-nerved; lateral nerves curved, branched: middle one simple, straight.

Longish-stalked Saxifrage. Fl. Apr. May. Scot. Pl. ¼ ft.

165 S. LEPTOPHY'LLA (Pers. syn. 1. p. 490.) surculi procumbent, very long, slender; radical leaves 5-parted: surculine ones 3-parted or undivided: segments linear-lanceolate, very acute, divaricate; calycine segments oblong-ovate; petals spatulate, quite entire. ♃. H. Native of the Alps of Switzerland, and on the mountains of Wales. S. retrofléxa, Hortul. Plant quite glabrous, and densely tufted before flowering, but afterwards loose, diffuse, and surculose, and beset with viscid villi. Stems numerous, flexuous, smoothish, shining, many-flowered. Leaves without any buds in the axils. Segments of leaves awned. Flowers drooping, white. Peduncles elongated, and are as well as the calyxes beset with glandular pili. Calycine segments ending in a reflexed mucrone each. Petals triple-nerved, with the nerves simple.

Var. β, *angustífida* (D. Don, in Lin. trans. 13. p. 450.) plant slenderer; segments of leaves narrower. ♃. H. Native of Wales, on the mountains.

Slender-leaved Saxifrage. Fl. May, Ju. Wales. Pl. ¼ ft.

166 S. LÆTEVÌRENS (D. Don, in Lin. trans. 13. p. 451.) surculi procumbent, elongated; leaves 5 or 3-parted: segments linear, acute; calycine segments lanceolate, mucronate; petals spatulate, emarginate. ♃. H. Native of the Alps of Scotland, on the loftiest rocks, in moist situations, in Angusshire and Aberdeenshire, and on the hills to the north of Loch Lomond. Herb pale green, densely tufted before flowering, and quite glabrous, but afterwards becoming loose, diffuse, and surculose, and beset with long scattered villi. Surculi destitute of buds in the axils of the leaves. Stems erect, few-leaved, usually 3-flowered, rarely 1-flowered. Radical leaves 5-parted: surculine ones 3-parted: lower cauline ones 5-parted: upper cauline ones undivided, lanceolate, and acuminated. Flowers campanulate, white, drooping while in the bud. Petals triple-nerved; nerves simple, green.

Pale green Saxifrage. Fl. May, June. Scotl. Pl. ¼ foot.

§ 3. *Annual or biennial plants, without surculi. Roots fibrous. Petals usually emarginate.*

167 S. ARACHNOÍDEA (Sternb. rev. sax. p. 23. t. 15. and in Sturm, deutschl. fl. 35. no. 7. with a figure) stems weak, diffuse, much branched, very pilose; leaves very thin, somewhat cuneated, obovate, 3-5-notched; flowers on long peduncles: peduncles divaricate; lobes of calyx ovate-lanceolate, shorter than the tube, which is rather villous; petals ovate, entire, hardly exceeding the calyx; styles much shorter than the calyx, parallel. ♃. (Sternb.) ⊙. (Ser.) H. Native of Tyrol, in shady rocky places. Moretti, sax. p. 28. Lobària arachnoídea, Haw. enum. sax. p. 20. Flowers white.

Cobwebbed Saxifrage. Fl. April, June. Clt.? Pl. ¼ to ½ ft.

168 S. PETRÆ'A (Lin. spec. p. 578.) radical leaves palmately 5-lobed: cauline ones tripartite and cut; peduncles very long, 1-flowered; calycine segments linear, acute; petals obovate, truncate at the apex and emarginate, twice the length of the calyx. ⊙. H. Native on Mount Baldo, among broken rocks, and of the Alps of Carinthia; also of North America, in alpine rivulets on the Rocky Mountains. Wulf. in Jacq. coll. 1. p. 200. Jacq. icon. rar. 1. t. 81. S. geranioìdes, Host, syn. 231. S. rupéstris, Willd. spec. 2. p. 653. S. Pònæ, Sternb. sax. p. 47. t. 18. and t. 11. f. 6. and in Sturm, deutschl. fl. p. 35. fig. 16. S. álba petræ'a, Pona, itin. p. 183. S. biánca, Calceol. itin. p. 12.—Pluk. alm. p. 331. t. 222. f. 3.—Moris. hist. 13. p. 379. sect. 12. t. 9. f. 28. S. petræ'a α, β, and γ, Ser. in D. C. prod. 4. p. 34. Tridactylites petræ'a, Haw. enum. sax. p. 22. Plant

diffusely branched, furnished with glanduliferous hairs. Stems erect, branched at the base; branches elongated, fastigiate. Radical leaves on long petioles, somewhat reniform at the base; lobes obtuse; cauline leaves all petiolate: upper cauline leaves undivided, acute at both ends: lower cauline ones tripartite; lobes acute. Peduncles and calyxes clothed with viscid down. Flowers white, much larger than those of *S. tridactylìtes*. Petals triple nerved; nerves simple.

Rock Saxifrage. Fl. April, May. Clt. 1752. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

169 S. TRIDACTYLÌTES (Lin. spec. 578.) primordial leaves entire, and spatulate: cauline ones quinquefid or trifid; calyx urn-formed: with very short, obtuse segments; petals obovate, truncate at the apex. ⊙. H. Native of Europe, in dry sandy places, and on walls and roofs of houses; plentiful in Britain. Curt. lond. fasc. 2. t. 28. Smith, engl. bot. t. 501. Sternb. sax. p. 44. t. 17. and in Sturm, deutschl. fl. 33. no. 15. S. ánnua, Lapeyr. pyr. sax. p. 53. Tridactylìtes ánnua, Haw. enum. sax. p. 21.—Moris. hist. 3. p. 478. sect. 12. t. 9. f. 31. Stems erect, branched, flexuous, many-flowered, furnished with short glanduliferous hairs. Radical leaves crowded. Petioles ciliated with glands. Peduncles and calyxes clothed with viscid down. Flowers small, white; petals with 3 simple nerves.

Var. β, exìlis (Gaudin, fl. helv. 3. p. 116.) leaves all oblong-spatulate; stem simple, few-flowered. ⊙. H. Native of Switzerland, Italy, France, &c. S. exìlis, Poll. veron. 2. p. 31.

Three-fingered-leaved or Wall Saxifrage. Fl. April, May. Britain. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

170 S. CONTRAVE'RSA (Sternb. sax. p. 43. t. 16.) plant beset with glanduliferous viscid hairs; radical leaves crowded, 3-5-toothed, or sometimes nearly entire; calycine lobes ovate, shorter than the tube at maturity; petals obcordate, larger than the calyx; styles much divaricate, longer than the calyx. ⊙. H. Native of the Alps of Lapland, Norway, Savoy, Carinthia, Piedmont, Dauphiny, Carpathian Mountains, and the Pyrenees. S. tridactylìtes *β*, Lin. spec. ed. 1. p. 404. S. adscéndens, Lin. spec. p. 579. mant. p. 884. All. pedem. p. 1537. t. 22. f. 3. Wulf. in Jacq. coll. 1. p. 197. t. 11-12. f. 1-2. S. petræ'a, Gunn. norv. p. 427. t. 9. f. 1-3. exclusive of the syn. and descript. of Lin. Fl. dan. t. 680. D. C. fl. fr. 4. p. 370. S. hypnoìdes, Scop. carn. 499. t. 16. Gaudin, fl. helv. 3. p. 117. S. Scopòlii, Vill. dauph. 4. p. 673. S. petræ'a integrifòlia, Gaudin, in Meisn. anz. 1818. p. 67. fl. helv. 3. p. 117. var. *β*. S. contravérsa *α* and *β*, Ser. in D. C. prod. 4. p. 34. S. tridáctylìtes *β*, alpícola, D. Don, in Lin. trans. 13. p. 441. Tridactylìtes petræ'a, Haw. enum. sax. p. 22. Flowers corymbose, white, twice the size of those of *S. tridactylìtes*. The plant is much larger than *S. tridactylìtes*; the radical leaves more crowded: the cauline ones more numerous, and for the most part 5-toothed.

Var. β, littoràlis (Ser. in D. C. prod. 4. p. 34.) plant small, very leafy; leaves usually quinquefid; petals entire. ⊙. H. In humid places on the banks of Lake Leman, S. petræ'a littoràlis *δ*, Gaudin. fl. helv. 3. p. 117.

Var. γ, Bellardiàna (Ser. l. c.) flowers usually twin, nearly sessile, in the heart of the crenulated leaves. ⊙. H. S. petræ'a, Bellárdi, Gaudin. in Meisn. anz. 1818. p. 67. fl. helv. 3. p. 118. S. Bellárdi, All. pedem. no. 1356. t. 88. f. 1. Sternb. rev. sax. p. 20.

Contrary-turned Saxifrage. Fl. May, Ju. Clt. 1800. Pl. $\frac{1}{2}$ ft.

Cult. *Saxífraga* is a most extensive genus of pretty alpine plants, the greater part of which are well adapted for rockwork, or to be grown on the sides of naked banks to hide the surface. Many of the more rare and tender kinds require to be grown in pots, in light sandy soil, and placed among other alpine plants, so that they may be protected by a frame in winter. The species belonging to sections *Micránthes* and *Hírculus* grow best in a peat soil, which should be kept rather moist. The species belonging to the section *Porphýreon* are so very pretty little plants as to be worth growing in pots for ornament, being clothed with elegant little red flowers early in spring: a mixture of peat and sand suits them well. *S. sarmentòsa* does best in a greenhouse. All the species are easily increased by dividing. *S. ligulàta, cordifòlia*, and *crassifòlia* are strong growing plants, well fitted for ornamenting flower-borders.

II. ERIOGY'NIA (from *εριον, erion*, wool, and *γυνη, gyne*, a female; in reference to the ovaries being woolly). Hook. in fl. bor. amer. 1. p. 255. t. 88.

LIN. SYST. *Icosándria, Tetra-Hexagýnia.* Calyx turbinate, 5-cleft. Petals 5, hardly unguiculate. Stamens 20, inserted in the mouth of the tube, monadelphous at the base; anthers 2-celled, roundish. Ovaries 4-6, distinct from the calyx, and from each other, but connected by dense wool. Styles elongated, deciduous, filiform. Carpels 4-6, distinct, oblong, acute, recurved at the apex, opening lengthwise inside. Seeds dust-formed, pendulous, inserted towards the tops of the valves at the margins. Albumen wanting.—A perennial herb, native of North America, with the habit almost of *Saxifràga cerato-phýlla;* stoloniferous. Leaves very stiff, coriaceous, 1-nerved, quite glabrous, trifid; segments trifid or quadrifid: lobules linear. Flowers white, disposed in racemes, for the most part bracteate; pedicels 1-flowered.

1 E. PECTINA'TA (Hook. l. c.). ♃. H. Native of Behring's Straits; height of land upon the Rocky Mountains, on the west side, near the sources of the Columbia. Saxífraga pectinàta, Pursh, fl. amer. sept. 1. p. 312. Sterile stems tufted, decumbent, stiff, stoloniferous. Lower leaves rosulate, with 3 trifid segments: lower cauline ones with 3 bifid segments: upper cauline ones or bracteas trifid.

Pectinated-leaved Eriogynia. Pl. $\frac{1}{2}$ foot.

Cult. This is a beautiful alpine plant. It should be grown in pots, in a mixture of peat and sand; and will be easily increased by dividing, or by cuttings.

III. LEPTARRHE'NA (from *λεπτος, leptos*, slender, and *αῤῥην, arrhen*, strong; plant strong and slender). R. Br. in chlam. melv. p. 15. append. to Parry's 1st voy. p. 273. D. C. prod. 4. p. 48. Hook. fl. bor. amer. 1. p. 256. t. 89.

LIN. SYST. *Decándria, Digýnia.* Calyx campanulate, short, 5-cleft (f. 47. *a.*), with a broad tube. Stamens 10, inserted in the throat of the tube; anthers 1-celled (f. 47. *c.*), 2-valved. Petals 5 (f. 47. *b.*), linear. Ovaries 2 (f. 47. *e.*), free, tapering into the styles, which are permanent. Stigmas obtuse. Carpella 2, opening lengthwise on the inside (f. 47. *d.*). Seeds scobiform, erect, inserted in the margins of the valves.—Herbs with a habit between *Pyròla* and those species of *Saxífraga* belonging to section *Micránthes;* inhabitants of cold places of North America. Scapes naked. Flowers disposed in racemose panicles. Leaves coriaceous, permanent, entire, coarsely serrated; petioles broad and sheathing.

FIG. 47.

1 L. PYROLIFÒLIA (R. Br. in Parry's 1st voy. append. p. 273. Hook. l. c.). ♃. H. Native of the Island of Unalaschka, Behring's Straits, height of land on the west side of the Rocky Mountains, in lat. 52°. L. amplexi-

fòlia, Ser. in D. C. prod. 4. p. 48. Saxífraga pyrolifòlia, D. Don, in Lin. trans. 13. p. 389. Saxífraga amplexifòlia, Sternb. rev. sax. suppl. p. 2. t. 2. Saxífraga micrántha and S. coriàcea, Fisch. mss. Root rather fusiform, fibrous. Stems ascending, simple, or branched at the base, leafy. Leaves elliptic, green and shining above but pale beneath; petioles channelled, a little ciliated. Scape a span to a foot high, furnished each with 2 oblong, obtuse scales, pubescent above. Racemes compound, somewhat corymbosely panicled. Flowers small, inconspicuous.

Pyrola-leaved Leptarrhena. Pl. ½ to 1 foot.

Cult. See *Eriogýnia* above for culture and propagation.

IV. CHRYSOSPLE'NIUM (from χρυσος, *chrysos*, gold, and σπλην, *splen*, the spleen; in reference to the golden colour of the flowers, and the supposed virtue of the plant in diseases of the spleen). Tourn. inst. t. 60. Lin. gen. 558. Gærtn. fruct. 1. p. 208. t. 44. f. 7. D. C. prod. 4. p. 48.

Lin. syst. *Octo-Decándria, Digýnia.* Tube of calyx adhering to the ovarium; limb 4-5-lobed (f. 48. *a.*): lobes obtuse. Stamens 8-10, alternating with the sepals, and opposite them. Styles 2. Capsule birostrate (f. 48. *c. d.*), 2-valved, at length 1-celled, many-seeded. Seeds very smooth, inserted towards the bottom of the capsule.—Perennial herbs. Leaves thickish, simple, petiolate, toothed. Flowers somewhat corymbose, yellow.

1 C. alternifòlium (Lin. spec. 569.) leaves alternate, reniformly cordate, crenately lobed; flowers corymbose, dichotomous. ♃. H. Native of Europe, in moist shady places, and by the borders of shady rivulets, in Siberia and North America; in the woody and principally the barren country of British North America; to the extreme Arctic Islands, and on the Rocky Mountains; also in Kotzebue's Sound. In many parts of the north of England, but not so common as *C. oppositifòlium*, as in Yorkshire, Portland Heath, near Norwich, in Worcestershire; and in lowlands of Scotland. Smith, engl. bot. t. 54. Fl. dan. t. 366.—Moris. hist. p. 477. sect. 12. t. 8. f. 8. Stems usually 3-cornered. Flowers yellow. Roots having offsets, but not creeping.

FIG. 48.

Var. β, *Sibíricum* (Ser. in D. C. prod. 4. p. 48.) stems and leaves smaller. ♃. H. Native of Siberia, about the Baical, and of Dahuria. C. Sibíricum, Steph.? ex Fisch. in litt.

Alternate-leaved Golden Saxifrage. Fl. April, May. Brit. Pl. ¼ foot.

2 C. ovalifòlium (Bieb. herb. ex Led. fl. ross. alt. ill. t. 404. fl. alt. 2. p. 115.) stems with many scattered leaves; leaves ovate-orbicular or elliptic, tapering into the petiole, crenately serrated or entire; corymb dichotomous, loose. ♃. H. Native of the Altaian region. Root creeping. Stem pilose below. Flowers yellow, solitary in the forks of the corymb.

Oval-leaved Golden Saxifrage. Fl. April, May. Pl. ¼ foot.

3 C. oppositifòlium (Lin. spec. p. 569.) floriferous stems erect; leaves opposite, reniformly sub-cuneated, crenated; flowers corymbose. ♃. H. Native of Europe and America, in moist shady places, and by the sides of rivulets. In Britain, in many places, in like situations. Curt. lond. 2. t. 27. Smith, engl. bot. 490. Gærtn. fruct. 1. t. 44. f. 7. Oed. fl. dan. t. 365. Root creeping. Stems quadrangular. Flowers yellow.

Var. β, *Scoulèri* (Hook. fl. bor. amer. 1. p. 242.) leaves profoundly crenately serrated. ♃. H. Native of the north-west coast of America, on the banks of the Columbia river.

Opposite-leaved Golden Saxifrage. Fl. Apr. May. Brit. Pl ¼ ft.

4 C. America'num (Schweinitz, mss. Hook. fl. bor. amer. 1. p. 242.) stems slender, decumbent, loose, dichotomous at the apex; leaves opposite, roundish-cordate, obscurely and crenately lobed; flowers axillary, distant. ♃. H. Native of Canada, Lake Huron, Saskatchawan, and other parts of North America. C. oppositifòlium, Michx. fl. bor. amer. 1. p. 269. and other American botanists. Flowering branches never forming corymbs, but lengthened out and bearing distant small leaves and solitary flowers in the axils.

American Golden Saxifrage. Fl. April, May. Clt.? Pl. pr.

5 C. du'bium (Gay, ex Gaud. in herb. D. C. and prod. 4. p. 48.) leaves opposite, ovate, bluntly serrated. ♃. H. Native of Calabria. Flowers yellow.

Doubtful Golden Saxifrage. Fl. April. Pl. ¼ foot.

6 C. Nipaule'nse (D. Don, prod. fl. nep. p. 210.) leaves opposite, orbicularly subcordate, crenately serrated, glabrous. ♃. H. Native of the Alps of Nipaul. Very nearly allied to *C. oppositifòlium*, but differs in the leaves being more reniform, less manifestly crenated, and in the seeds being opaque, not shining. Leaves like those of *Bétula nàna*, but membranous. Flowers yellow.

Nipaul Golden Saxifrage. Fl. Apr. Ma. Clt. 1820. Pl. ¼ ft.

7 C. nudicau'le (Bunge, in Led. fl. ross. alt. ill. t. 405.) cauline leaves wanting: radical ones reniformly orbicular, and are as well as the floral ones, which are reniform, petiolate, and deeply lobed; flowers densely glomerate. ♃. H. Native of Altaia, near springs at the foot of the Alps, about Chasin, near Tschetchulicha, at the river Tscharysch. Root creeping, furnished with thick brown fibres. Plant quite glabrous, except sometimes on the under side of the leaves. Flowers greenish, much larger than those of *C. alternifòlium*.

Naked-stemmed Golden Saxifrage. Pl. ¼ to ½ foot.

8 C. Kamtscha'ticum (Fisch. in litt. ex D. C. prod. 4. p. 48.) stems erect, nearly naked, 2-leaved, the rest crowded near the flowers, cuneate, obtuse, somewhat crenated, glabrous. ♃. H. Native of Kamtschatka.

Kamtschatka Golden Saxifrage. Pl. ¼ foot.

Cult. A moist shaded situation is the best for the species of *Chrysosplènium*, as under the shade of trees or bushes, or behind a north wall; and they thrive best in peat soil. Easily propagated by dividing.

V. MITE'LLA (a diminutive of *mitra*, a mitre; the form of the fruit being somewhat like a mitre). Tourn. inst. 126. Lin. gen. 561. Gærtn. fruct. 1. p. 208. t. 44. f. 6. Lam. ill. t. 373. D. C. prod. 4. p. 49.

Lin. syst. *Decándria, Digýnia.* Calyx campanulate, 5-lobed, rather adnate to the base of the ovarium. Petals 5, inserted in the calyx, jagged or toothed, longer than the calyx. Stamens 10. Styles 2, short, joined together in one; stigmas hardly distinct. Capsule 1-celled, 2-valved, adhering to the base of the calyx a little way. Seeds numerous, erect, in the bottom of the capsule.—Perennial herbs. Leaves petiolate, cordate, mostly radical. Flowers on short pedicels, disposed in loose terminal racemes, white or red.

1 M. diphy'lla (Lin. spec. p. 580.) radical leaves cordate, somewhat 3 or 5-lobed, dentately serrated, on long petioles; cauline leaves 2, opposite, smaller, and nearly sessile; capsule joined with the calyx only at the base; petals pinnatifidly fringed. ♃. H. Native of North America, in the United States; and Canada, about Quebec, Lake Huron, &c. Lam. ill. t. 373. f. 1. Gærtn. fruct. 1. t. 44. f. 6. Schkuhr, handb. t. 120. Ker. bot. reg. t. 166.—Mentz. pug. t. 10. Flowers white.

Two-leaved Mitella. Fl. Apr. May. Clt. 1731. Pl. ½ to ¾ ft.

2 M. NU'DA (Lin. spec. 580.) plant usually stoloniferous; radical leaves reniformly cordate, thin, bluntly lobed, crenated, and somewhat ciliated; scapes slender, leafless; calyx spreading: petals pectinately jagged; ovarium joined to the calyx only at the very base. ♃. H. Native of Canada, from Lake Huron to the Arctic Sea; and from Hudson's Bay to the Rocky Mountains; and of Siberia, at the river Lena. M. renifórmis, Lam. ill. t. 373. f. 2. M. cordifòlia, Lam. dict. 4. p. 196. ill. t. 373. f. 3. Michx. fl. bor. amer. 1. p. 270. M. prostràta, Michx. fl. bor. amer. 1. p. 270.—Gmel. sib. 4. t. 68. f. 2. Flowers white. The plant here characterised is the acknowledged *M. cordifòlia* of all American botanists. A comparison of it with the figure of Gmelin will show that it is the same with his species, and consequently the *M. nùda*, Lin., and among the numerous specimens gathered by travellers in North America, many throw out runners, which again bearing leaves and scapes, the plant becomes the *M. prostràta* of Michx.

Naked-stemmed Mitella. Fl. Apr. Ju. Clt. 1758. Pl. ¼ to ½ ft.

3 M. TRI'FIDA (Graham, in edinb. phil. journ. june, 1829. Hook. fl. bor. amer. 1. p. 241. t. 82.) radical leaves cordate, bluntly lobed, crenated; scapes leafless; flowers pentandrous; calyx campanulate, with a spreading limb; petals trifid; ovary adhering to the calyx only at the base. ♃. H. Native of North America, in alpine rivulets north of the Smoking River, on the east side of the Rocky Mountains, in lat. 56°, but rare. Plentiful in woody situations, on the low ridge of the Blue Mountains of Lewis and Clark's River, west of the Rocky Mountains, in lat. 46°. M. parviflòra, Dougl. mss. Flowers white. This species has the petals similar to those of *Téllima parviflòra*. Differs from the rest of the species in the petals being trifid, and in the stamens being only 5 instead of 10, opposite the lobes of the calyx. Perhaps a species of *Drummóndia*.

Trifid-petalled Mitella. Fl. May. Clt. 1829. Pl. ½ to 1 ft.

Cult. The species of *Mitélla* are pretty plants, well suited for the front of flower-borders, or to grow on rockwork. They are readily increased by dividing. Any light soil suits them, although they grow most luxuriant in a peat soil.

VI. TE'LLIMA (an anagram of *Mitélla*; separated from it). R. Br. in Frankl. narr. journ. p. 766. verm. schrift. 1. p. 545. Dougl. in bot. reg. 1178. Hook. fl. bor. amer. 1. p. 239. D. C. prod. 4. p. 49.

LIN. SYST. *Decándria, Digýnia.* Calyx adnate to the ovarium at the very base, having the free part inflated, ovate, and 5-toothed (f. 49. *b.*), and the adhering part conical. Petals 5 (f. 49. *c.*), inserted in the calyx, jagged. Stamens 10 (f. 49. *a.*). Styles 2-3, distinct from the base; stigmas subcapitate, angular. Capsule adnate to the calyx at the base: the other half superior and furnished with the permanent flower, 1-celled, 2-valved at the apex; placentas parietal, many seeded (f. 49. *f.*). This is an intermediate genus between *Heuchèra* and *Váhlia*; it differs from *Mitélla* in the styles being distinct, and the different habit. Perennial herbs. Leaves all radical, roundish, cordate, bluntly lobed, in *T. parviflòra* compound, toothed, and hispid. Flowers of a dirty red-colour, rather large, disposed in racemose spikes.

1 T. GRANDIFLÒRA (Dougl. in bot. reg. t. 1178.) leaves cordate, lobed, dentately serrated; racemes elongated; petals oblong-linear, pinnatifidly jagged; styles 2. ♃. H. Native of the north-west coast of America, in shady pine woods, near springs along the shore. Mitélla grandiflòra, Pursh. fl. amer. sept. 1. p. 314. This is a fine plant, with leaves as large as those of *Málva rotundifòlia*. Flowers reddish. Stem and petioles generally thickly clothed with fulvous hairs.

Great-flowered Tellima. Fl. April, May. Clt. 1826. Pl. 1 ft.

2 T. PARVIFLÒRA (Hook. fl. bor. amer. 1. p. 239. t. 78. A.) plant scabrous from hairs; leaves ternate; leaflets deeply pinnatifid; racemes short; petals unguiculate, trifid; styles 3. ♃. H. Native of North California. Abundant in light gravelly soils, under the shade of sappling pines, near Fort Vancouver; plentiful in low hills at the grand rapids of the Columbia; and also at Spokan river. Root small, rather fusiform, more or less fibrous, and bearing tubers; tubers granular. Racemes terminal, curved. Flowers middle-sized, red. This is a curious and distinct plant, with something of the habit of slender specimens of *Saxífraga granulàta*.

FIG. 49.

Small-flowered Tellima. Pl. 1 foot.

Cult. See *Mitélla*, p. 227. for culture and propagation.

VII. DRUMMO'NDIA (named after Thomas Drummond, who accompanied Capt. Franklin and Dr. Richardson in their last journey in North America). D. C. prod. 4. p. 49.—Mitélla species, Graham.

LIN. SYST. *Pentándria, Digýnia.* Calyx with an obconical tube (f. 50. *b.*), adhering to the capsule a considerable way: limb 5-cleft: lobes triangular, valvate in æstivation (f. 50. *a.*), and at length reflexed. Petals 5, pectinately pinnatifid (f. 50. *c.*), alternating with the calycine lobes. Stamens 5, in front of the claws of the petals, nearly sessile. Stigmas 2, spreading, 2-lobed. Capsule 1-celled, 2-valved at the apex, bursting long before the seeds are mature (f. 50. *d.*). Seeds numerous, disposed along 2 opposite placentas.—An herb, with a habit between *Mitélla* and *Heuchèra*. It differs from *Mitélla* in the capsule adhering a greater length to the calyx, in the stamens being 5, not 10, and in the stigmas being spreading, not erect, and 2-lobed, not entire; and from *Heuchèra* in the calycine lobes being valvate, not imbricate in æstivation.

1 D. MITELLOÌDES (D. C. l. c.) ♃. H. Native of North America, in moist alpine woods on the Rocky Mountains. Mitélla pentándra, Graham, in edinb. phil. journ. July, 1829. Hook. in bot. mag. t. 2933. Radical leaves on long petioles, cordate, bluntly lobed. Scape leafless. Flowers yellowish. (f. 50.)

FIG. 50.

Mitella-like Drummondia. Fl. May, June. Clt. 1827. Pl. ½ foot.

Cult. For culture and propagation see *Mitélla*, p. 228.

VIII. TIARE'LLA (a diminutive of *tiara*, a Persian diadem; in reference to the shape of the capsules). Lin. gen. no. 765. Juss. gen. p. 309. Lam. ill. t. 373. D. C. prod. 4. p. 50.

LIN. SYST. *Decándria, Digýnia.* Calyx 5-parted, permanent, adhering at the base to the ovarium: lobes obtuse. Petals 5, unguiculate, entire, inserted in the calyx, and alternating with the calycine lobes. Stamens 10. Styles 2, distinct. Ovarium 2-celled. Capsule 1-celled, adnate to the calyx at the base, mem-

branous, 2-valved; valves unequal, opening between the styles (one of the valves or carpels usually abortive). Seeds fixed to the bottom of the capsule, along the margins of the carpels or valves.—Perennial herbs, with the habit of *Mitélla*. Stems erect, naked, or few-leaved. Leaves for the most part radical, petiolate. Racemes terminal, simple; flowers distant, pedicellate: pedicels incurvedly pendulous when bearing the fruit. A very heterogeneous genus, which may probably be hereafter divided.

§ 1. *Leaves simple.*

1 T. cordifòlia (Lin. spec. p. 580.) stems leafless; stolons creeping; leaves cordate, acute, deeply lobed, serrated: teeth mucronate; racemes simple. ♃. H. Native of Canada, about Montreal; and also of the north of Asia. Sims, bot. mag. 1589. Lam. ill. t. 373. f. 1. Flowers white. Habit of *Mitélla diphýlla*.

Cordate-leaved Tiarella. Fl. April, May. Clt. 1731. Pl. ½ ft.

2 T. unifolia'ta (Hook. fl. bor. amer. 1. p. 238. t. 81.) plant smoothish; stems furnished with one leaf; leaves all petiolate, triangularly cordate, bluntly toothed: teeth mucronate; panicle loose; flowers drooping; calyx campanulate; petals abortive. ♃. H. Native of North America, on the height of land on the Rocky Mountains, near the source of the Columbia, and at Portage river. Stems rather pubescent above. Leaves 3-5-lobed; lobes acutely toothed. This species has much the habit of *Heuchèra glàbra*, and is probably a decandrous species of that genus. The petals, if any exist, must be very fugacious, as none has been seen.

One-leaved Tiarella. Pl. 1 foot.

3 T. Menzie'sii (Pursh, fl. amer. sept. 1. p. 313.) leaves oval-cordate, acute, toothed: cauline ones alternate, distant; racemes filiform, somewhat spicate; calyx tubular. ♃. H. Native of the north-west coast of America.

Menzies's Tiarella. Fl. April, May. Clt. 1812. Pl. 1 foot.

4 T. alternifòlia (Fisch. in litt. ex D. C. prod. 4. p. 59.) stem leafy; lower leaves cordate: upper ones truncate at the base, all having 5-7 short lobes, and these lobes are lobed again, sharply and coarsely toothed; lobes of calyx oblong, erect. ♃. H. Native of the north of Asia, in the island of Sitka. Radical leaves on long, upper ones on short petioles. Flowers twice the size of those of *T. polyphýlla*.

Alternate-leaved Tiarella. Pl. 1 foot.

5 T. polyphy'lla (D. Don, fl. nep. p. 210.) stem furnished with 3 leaves, beset with glandular hairs; leaves cordate, 3-5-lobed, sharply serrated, pilose on both surfaces; lobes of calyx lanceolate, mucronate, pressed to the fruit; racemes loose. ♃. F. Native of Nipaul. Habit of *T. cordifòlia* or *Mitélla diphýlla*. Racemes many flowered. Fruit pendulous.

Many-leaved Tiarella. Fl. April, May. Clt. 1820. Pl. ½ to 1 foot.

§ 2. *Leaves compound.—Blóndia, Neck. elem. 2. p.* 115.

6 T. trifolia'ta (Lin. amœn. acad. 2. p. 351. spec. p. 580.) stem furnished with 1 or 2 leaves, rarely naked; leaves all trifoliate: leaflets rhomboid-ovate, deeply toothed: teeth mucronate; panicle loose; flowers drooping; calyx small, campanulate; petals obovate, lanceolate. ♃. H. Native of the north of Asia, and the north-west coast of America; common on the coast, and on the Rocky Mountains, on the west side of the ridge. The specimens from the Rocky Mountains are glabrous, and many of those from the coast, while others are more or less pubescent. Two panicles are often produced on the same stem.

Trifoliate Tiarella. Pl. 1 foot.

7 T. lacinia'ta (Hook. fl. bor. amer. 1. p. 239. t. 77.) plant rough and hairy; stems usually furnished with 3 leaves; leaves trifoliate: middle leaflet trifid: lateral ones bifid, all broadly lanceolate, and pinnatifidly jagged; panicle loose; flowers drooping; calyx short, campanulate; petals wanting? ♃. H. Native of the north-west coast of America. Roots rather horizontal. The petals, if any, must be very fugacious, as none have been seen.

Jagged-leaved Tiarella. Pl. ½ to 1 foot.

8 T. stenope'tala (Presl, in reliq. Hænk. 2. p. 45.) stems 1-leaved, and are, as well as the branches, clothed with glandular pubescence; radical leaves unknown: cauline one trifoliate: leaflets glabrous, deeply lobed, mucronately toothed, acute: lateral leaflets obliquely ovate, middle one acute at the base; petals subulate, very narrow; capsules erect, dotted. ♃. H. Native of Nootka Sound. Panicle many flowered.

Narrow-petalled Tiarella. Pl. 1 foot?

Cult. For culture and propagation see *Mitélla*, p. 228.

IX. ASTI'LBE (*a.* priv. and *στιλβη, stilbe,* brightness; plants opaque). Hamilt. in D. Don, prod. fl. nep. p. 210. D. C. prod. 4. p. 51.

Lin. syst. *Octo-Decándria, Digýnia.* Calyx deeply 4-5-parted, coloured; segments oval, obtuse, concave. Petals wanting. Stamens 8-10, opposite the calycine lobes; filaments subulate; anthers spherical, 2-celled. Styles 2; stigmas 2, truncate, pruinose. Capsule superior, birostrate, many seeded.—Perennial robust pilose herbs, with the appearance of *Spiræ'a Arúncus*, inhabiting the banks of rivulets. Leaves large, biternate; leaflets coarsely serrated; petioles much dilated at the base. Flowers small, of a greenish yellow-colour, in spicate racemes, which are disposed in panicles.

1 A. rivula'ris (Hamilt. l. c.) flowers 4-cleft, octandrous; leaves biternate; leaflets ovate, doubly serrated, villous beneath, and on the petioles. ♃. H. Native of Nipaul, at Narainhetty. Bracteas usually jagged at the apex.

Rivulet Astilbe. Pl. 3 feet.

2 A. deca'ndra (D. Don, prod. fl. nep. p. 211.) flowers 5-cleft, decandrous; leaves biternate; leaflets cordate, deeply lobed and serrated, beset with glandular pili beneath, and on the petioles. ♃. H. Native of North America. Tiarélla biternàta, Vent. malm. t. 54. The petals are said to be 5, and linear, in this plant, not as in the first species wanting. Leaflets ovate, broadly and bluntly serrated.

Decandrous Astilbe. Fl. May, June. Clt. 1812. Pl. 2 to 3 ft.

Cult. For culture and propagation see *Heuchéra*, p. 231.

§ 2. *Stamens equal in number to the petals, or sometimes fewer, alternating with the petals.*

X. HEUCHE'RA (in honour of John Henry de Heucher, once professor of medicine at Witterberg; author of Hortus Witterbergensis, 1711-1713.). Lin. gen. p. 320. Gærtn. fruct. 1. p. 177. t. 36. f. 2. Lam. ill. t. 184. f. 3. D. C. prod. 4. p. 51. Hook. fl. bor. amer. 1. p. 235.

Lin. syst. *Pentándria, Digýnia.* Calyx permanent, 5-cleft (f. 51. *b.*), imbricate in æstivation. Petals undivided (f. 51. *a.*), nearly equal. Stamens 5. Styles 2 (f. 51. *e.*), very long, distinct, length of stamens: when young approximate and almost concrete, but afterwards diverging. Capsule crowned by the dry calyx, and adnate to it at the base, opening between the styles (f. 51. *d.*), 1-celled; placentas 2, adnate, many seeded. Seeds rough from dots or wrinkled.—Herbs. Leaves mostly radical, palmately lobed, toothed. Stems mostly leafless. Flowers panicled or racemose.

1 H. America'na (Lin. spec. 328.) plant clothed with clammy pubescence, scapes and leaves roughish; leaves on long petioles, somewhat 5-7-lobed, toothed; thyrse elongated, panicled; calycine lobes short, obtuse; petals lanceolate, length of the calyx;

stamens much exserted. ♃. H. Native of shady places from New England to Carolina, in the Illinois region; New Spain and Peru. Schkuhr, handb. t. 58. H. víscida, Pursh, fl. amer. sept. 1. p. 187. H. cortùsa, Michx. fl. bor. amer. 1. p. 171. There is a variety of this species having 2 of the petals longer than the rest. Flowers reddish. Perhaps H. renifórmis and H. glaúca, Rafin. med. fl. 1. p. 244. are not distinct from this.

Var. β, glabriúscula (Schultes, syst. 6. p. 216.) leaves smoothish; panicle rather crowded.

Var. γ, foliòsa (Moricand, mss.) scapes furnished with a few long distant leaves. Native of Peru.

American Heuchera. Fl. May, July. Clt. 1656. Pl. 1½ foot.

2 H. DIVARICA'TA (Fisch. in litt. ex D. C. prod. 4. p. 51.) scapes naked, glabrous; leaves glabrous, somewhat 5-lobed: lobes toothed: teeth mucronate; branches of panicle divaricate; teeth of calyx bluntish; petals lanceolate, acute. ♃. H. Native of the north of Asia, in the islands of Kadiak and Sitka; also in Kamtschatka.

Divaricate Heuchera. Pl. 1½ foot.

3 H. PUBE'SCENS (Pursh, fl. amer. sept. 1. p. 187.) plant covered with powdery down; lower part of scape and under side of leaves glabrous; leaves somewhat acutely lobed, toothed: teeth roundish, mucronate; branches of panicle short, crowded with flowers; calyx broad, campanulate; petals spatulate, longer than the calyx; stamens exserted. ♃. H. Native from Pennsylvania to Virginia, on the Blue Mountains. H. pulverulénta, Rafin. med. bot. 1. p. 213. Petals pale red, variegated with yellow. Flowers larger than in many other species.

Pubescent Heuchera. Fl. May, July. Clt. 1812. Pl. 1 ft.

4 H. HI'SPIDA (Pursh, fl. amer. sept. 1. p. 188.) plant hispid and scabrous; scapes, petioles, and under side of leaves glabrous; leaves acutely lobed, toothed, hispid from villi above: teeth short, rather retuse, mucronate; branches of panicle few-flowered; calyx middle-sized, with acutish lobes; petals spatulate, length of calyx; stamens exserted. ♃. H. Native of Virginia and Carolina, on high mountains. Flowers reddish.

Hispid Heuchera. Fl. May, June. Clt. 1826. Pl. 2 to 3 ft.

5 H. MICRA'NTHA (Dougl. in bot. reg. 1302.) lower part of scape and petioles beset with long fulvous hairs; leaves roundish-cordate, nearly naked, bluntly lobed, crenate: crenæ mucronate; lower bracteas foliaceous, cut: upper ones setaceous; panicle loose; petals linear, one-half shorter than the long exserted stamens. ♃. H. Native of the north-west coast of America, on the steep rocky banks of the Columbia, near the Grand Rapids. Flowers greenish-yellow.

Small-flowered Heuchera. Fl. June, July. Clt. 1827. Pl. 2 feet.

6 H. VILLÒSA (Michx. fl. bor. amer. 1. p. 172.) lower part of scape and petioles beset with deflexed soft hairs; leaves cordate, acutely lobed, mucronately serrated, a little cut, nearly naked above, but very villous on the nerves beneath; panicle loose; peduncles capillary, dichotomous; bracteas linear, ciliated; flowers small; petals very long, narrow-spatulate, and are, as well as the stamens, much exserted. ♃. H. Native of Upper Canada, and on the higher mountains of Virginia and Carolina. The leaves are very different from those of *H. Americàna*, the flowers are smaller, and the petals regularly long and narrow, white.

Villous Heuchera. Fl. May, July. Clt. 1812. Pl. 1 foot.

7 H. GLA'BRA (Willd. in Schultes, syst. 6. p. 216.) scape leafy; leaves cordate, acutely lobed, glabrous, unequally and acutely toothed; lower stem ones or bracteas toothed; panicle loose; flowers small; calyx pubescent; petals linear; stamens exserted. ♃. H. Native of the north-west coast of America; Nootka, in the vicinity of the Columbia river; Rocky Mountains, at Providence and Portage rivers. Hook. fl. bor. amer. 1. p. 236. t. 79. Tiarélla colòrans, Graham, in edinb. new. phil. journ. July, 1829. Petals white. Stipulas adnate, as in the genus *Ròsa*, but free at the top.

Glabrous Heuchera. Fl. June, July. Clt. 1827. Pl. 1 foot.

8 H. CAULE'SCENS (Pursh, fl. amer. sept. 1. p. 188.) plant suffruticose at the base; lower part of scape and petioles pilose; leaves glabrous above, but pilose at the nerves beneath, acutely lobed, ciliated, toothed: teeth acute, mucronate; calyx short, villous; petals linear, twice the length of the calyx; stamens exserted. ♃. H. Native of Carolina, on the mountains, and of Kamtschatka. Petals white.

Caulescent Heuchera. Fl. May, July. Clt. 1812. Pl. 1 ft.

9 H. BARBARÓSSA (Presl, in reliq. Hænk. 2. p. 56.) plant suffruticose at the base; floriferous stems clothed with rufous villi; petioles very villous from rufous hairs; leaves roundish-cordate, bluntly lobed, mucronately toothed, ciliated, puberulous; panicle loose, many flowered; petals linear-oblong, longer than the calyx; stamens exserted. ♃. H. Native of Nootka Sound. Plant small.

Barbarossa Heuchera. Pl. ¼ foot.

10 H. CYLI'NDRICA (Dougl. mss. ex Hook. fl. bor. amer. 1. p. 236.) scapes naked, and are, as well as the petioles, hairy; leaves cordate, deeply and roundly lobed, crenated, ciliated; truncate at the base, smoothish above, but very pilose at the veins beneath: teeth piliferous; panicle compact, cylindrical, rather spicate; flowers rather large, apetalous; stamens inclosed. ♃. H. Native of North America, on the declivities of low hills, and on the steep banks of streams on the west side of the Rocky Mountains. Like *H. Richardsònii*, but differs from it in the truncate base of the leaves, and in the spicate panicle, by having less oblique calyxes, very short stamens, and by the absence of petals.

Cylindrical-spiked Heuchera. Pl. 1 to 1½ foot.

11 H. RICHARDSÒNII (R. Br. in Franklin, 1st journ. ed. 1. append. p. 766. t. 29.) scapes and petioles rather pilose; leaves cordate, with a deep recess, bluntly lobed, ciliated, crenated, rather pilose on both surfaces: teeth piliferous; panicle loose, thyrsoid; flowers large; mouth of calyx oblique; petals obovately cuneated, hardly longer than the calyx; stamens a little exserted. ♃. H. Native of North America, on the dry banks of rivers from lat. 54° to 64°.

Richardson's Heuchera. Fl. June, July. Clt. 1827. Pl. 1 to 1½ foot.

12 H. MENZIE'SII (Hook. fl. bor. amer. 1. p. 237. t. 80.) plant hispid from pili; stems leafy; leaves cordate, acutely lobed, deeply serrated; flowers racemose, apetalous; calyx cylindrically funnel-shaped; stamens exserted; ovarium free. ♃. H. Native of the north-west coast of America; at Banks's Isles, and from the coast of Columbia to Puget's Sound. Tiarélla Menzièsii? Pursh. fl. amer. sept. 1. p. 313. Racemes terminal, elongated, solitary, many flowered. Stamens 3, exserted. Petals 5, linear, reflexed. (f. 51.)

FIG. 51.

Var. β; plant less hairy. ♃. H. Native along with the species, in shady woods. H. triándra, Doug. mss. ex Hook. l. c.

Menzies's Heuchera. Pl. 1 to 2 feet.

13 H. BRACTEA'TA (Ser. in D. C. prod. 4. p. 52.) plant pubescent; scapes racemose; leaves orbicularly cordate, serrately cut: teeth mucronate; flowers bracteate; petals narrow, hardly

longer than the calyx; stamens not exserted. ♃. H. Native of North America, on the Rocky Mountains. Tiarélla? bracteàta, Torrey in ann. lyc. 2. p. 204. Habit of a species of *Saxífraga*.

Bracteate-flowered Heuchera. Pl. 1 foot.

14 H. LONGIPE'TALA (Moc. pl. nootk. ined. with a figure, ex D. C. prod. 4. p. 52.) scape pubescent; panicle secund; petals linear, revolute at the apex, longer than the calyx. ♃. H. Native of the north-west coast of America. Lobes of leaves broad, rather distinct, acutely toothed. Petals and styles white.

Long-petalled Heuchera. Pl. 1 foot.

15 H. ACERIFÒLIA (Rafin. med. fl. 1. p. 211. t. 49.) petioles hairy; leaves smooth, glaucous beneath, acutely 5-lobed, unequally toothed: teeth mucronate; scapes smooth; panicle elongated, loose; petals short; stamens exserted. ♃. H. Native of North America, on hills and in the fissures of rocks, in Kentucky, Tennessee, and west of Virginia, Maryland, and Ohio, &c.

Maple-leaved Heuchera. Pl. 1 foot.

16 H. SQUAMÒSA (Rafin. med. fl. p. 244.) petioles pilose; leaves rather hairy, ciliated, cordate, acutely 7-lobed, denticulated, glaucous beneath; scape pilose, furnished with distant oval scales; panicle short, oval, crowded, scaly; pedicels short; lobes of calyx obtuse; stamens exserted. ♃. H. Native on the mountains of Maryland, Virginia, and Kentucky. Perhaps the same as *H. bracteàta*.

Scaly Heuchera. Pl. 1 foot.

Cult. The species of *Heuchèra* thrive in any light garden soil, and are readily increased by dividing at the roots. None of the species are showy.

XI. DONA'TIA (so named by Forster from Vitaliano Donati, of Padua, professor of botany at Turin). He travelled into Egypt and Arabia, and died on his journey). Forst. gen. t. 5. Juss. gen. p. 300. St. Hil. mem. mus. 2. p. 119. D. C. prod. 4. p. 53.

LIN. SYST. *Triándria, Trigýnia.* Tube of calyx turbinate, adnate to the ovarium; limb truncate, with 2 triangular acuminated nearly opposite teeth. Bracteoles linear, adnate to the tube of the calyx. Petals 9 (f. 52. *e.*), (8-10 ex Forst.) linear-oblong. Stamens 3 (f. 52. *f.*), short, alternating with the petals. Styles 3 (f. 52. *b.*) -5, filiform. Ovarium 2-3-celled. Ovula numerous, fixed to the top of the cells. Fruit capsular.—A nearly stemless herb, with the habit of *Saxífraga cæspitòsa*. Stems tufted. Leaves alternate, linear, obtuse, permanent, imbricated, thick, glabrous, woolly in the axils. Flowers terminal, sessile, solitary, white. Perhaps the petals are 6, and the stamens 6, 3 of them antheriferous, and the other 3 converted into petals.

FIG. 52.

1 D. MAGELLA'NICA (Forst. l. c.) ♃. F. Native of the Straits of Magellan, on humid rocks. Lam. ill. t. 51. Polycárpon Magellánicum, Lin. fil. suppl. 115.

Magellan Donatia. Pl. ¼ ft.

Cult. This plant will require to be grown in a small pot, well drained, in a mixture of sand, peat and loam; and placed among other alpine plants. It will be easily increased by dividing.

XII. LEPUROPE'TALUM (from λεπυριον, *lepurion*, a little scale, and πεταλον, *petalon*, a petal; in reference to the small scale-formed petals). Elliot, sketch 1. p. 370. D. C. prod. 4. p. 53.

LIN. SYST. *Pentándria, Trigýnia.* Calyx 5-parted, permanent: lobes ovate, obtuse. Petals 5, permanent, scale-formed, inserted in the calyx, and alternating with its segments. Stamens 5, alternating with the petals. Ovarium free at the apex. Styles 3, short, rather concrete at the base. Capsule 1-celled, 3-valved at the apex. Seeds numerous, oval, fixed to the inflexed margins of the valves.—An annual glabrous branched tufted herb. Leaves alternate, sessile, spatulately lanceolate, obtuse, entire. Flowers terminal, solitary, small, white.

1 L. SPATULA'TUM (Ell. l. c.) ♃. F. Native of North America, in Georgia, in shady places. Pyxidanthèra spatulàta, Muhl. cat.

Spatulate-leaved Lepuropetalum. Pl. ⅛ foot.

Cult. See *Donàtia* above for culture and propagation.

XIII. VA'HLIA (in honour of Martin Vahl, a pupil of Linneus, regius professor of botany at Copenhagen, and member of several academies, author of Symboliæ Botanicæ, Eclogæ Americanæ, &c. and one of the editors of Flora Danica). Thunb. gen. nov. 2. p. 36. with a figure. Juss. gen. p. 318. Poir. dict. 8. p. 284. Lam. ill. t. 183. R. Br. in Frankl. narr. journ. 766. D. C. prod. 4. p. 53.—Bistélla, Caill. and Delil. but not of Adans.—Oldenlándia species, Retz, Roth, Smith, but not of Lin.

LIN. SYST. *Pentándria, Digýnia.* Tube of calyx adhering to the ovarium: limb 5-parted, permanent, valvate in æstivation. Petals 5, spreading, undivided, shorter than the calyx. Stamens 5: anthers versatile. Styles 2, capitate at the apex. Capsule 1-celled, 2-valved, truncate at the apex, 5-furrowed, crowned by the limb of the calyx, many seeded; placentas loose, hanging from the top of the cavity of the cell. Seeds convex on the outside, and concave on the inside.—Rather villous somewhat dichotomous herbs. Leaves opposite, exstipulate, linear or lanceolate. Flowers white, axillary, pedicellate; pedicels twin, 1-flowered, short.

* *African species.*

1 V. CAPE'NSIS (Thunb. fl. cap. p. 246.) leaves linear or narrow-lanceolate; branches velvety at the top; pedicels twin, 1-flowered; styles exserted; capsules oblong. ♃. G. Native of the Cape of Good Hope. Russèlia Capénsis, Lin. fil. suppl. p. 175. Plant almost with the habit of a *Silène*, from ½ to 1 foot high. Flowers white.

Cape Vahlia. Pl. ½ to 1 foot.

2 V. WELDE'NII (Reich, hort. bot. t. 91.) leaves ovate, acute; pedicels twin, 1-flowered; capsule globose. ⊙. H. Native of Upper Egypt, of Nubia near Dongolah; and of Senegal. Bistélla geminiflòra, Caill. and Delil. pl. afr. p. 97. t. 63. f. 2. A much branched herb, beset with glandular hairs. Flowers white.

Welden's Vahlia. Pl. ¼ to ½ foot.

3 V. RAMOSÍSSIMA (Alph. D. C. diss. ined. ex D. C. prod. 4. p. 54.) stem much branched, hairy: hairs bearing viscid glands at the apex; leaves linear, pubescent; peduncles 2-flowered, shorter than the leaves; capsule ovate. ⊙. H. Native of Senegal. Flowers white. Habit of a *Silène* or *Arenària*.

Much-branched Vahlia. Pl. ¼ to ½ foot.

4 V. SILENOÌDES (Alph. D. C. diss. ined. ex D. C. prod. 4. p. 54.) stem branched, clothed with soft hairs; leaves linear, pubescent; peduncles 2-flowered, shorter than the leaves; capsule globose. ⊙. H. Native of the Cape Verd Islands. Flowers white.

Catchfly-like Vahlia. Pl. ½ foot.

5 V. TOMENTÒSA (Alph. D. C. diss. ined. ex D. C. prod. 4. p. 54.) stem branched, tomentose; leaves linear-lanceolate, rather hairy; peduncles 2-flowered, shorter than the leaves: flowers on short pedicels; capsule nearly globose. ⊙.? H. Native of the north of Africa, in the kingdom of Cayor. Flowers white.

Tomentose Vahlia. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

** *Asiatic species.*

6 V. Oldenla'ndiæ (D. C. prod. 4. p. 54.) stem erect; leaves linear, pubescent; peduncles axillary, 2-flowered, shorter than the leaves. ⊙. F. Native of Tranquebar. Oldenlándia pentándra, Rets, obs. 4. p. 22. Heuchèra dichótoma, Murr. comm. goett. 1772. p. 64. f. 1. Oldenlándia dichótoma, Spreng. pug. 2. p. 36. Flowers white. Perhaps Oldenlándia biflòra, Roth, nov. spec. 97. but not of Lin. is sufficiently distinct from this; there are varieties of it with 4-5-parted flowers.

Oldenland's Vahlia. Pl. $\frac{1}{2}$ foot.

7 V. sessiliflòra (D. C. prod. 4. p. 54.) stems decumbent; leaves lanceolate; flowers axillary, sessile. ⊙.? H. Native of Tranquebar. Oldenlándia dígyna, Retz, obs. p. 23. Oldenlándia decúmbens, Spreng. pug. 2. p. 36. Oldenlándia sessiliflòra, Smith in Rees' cycl. vol. 25. no. 2. Flowers pentapetalous, digynous, white.

Sessile-flowered Vahlia. Pl. decumbent.

Obs. The Oldenlándia depréssa of Willd. and Smith will probably make an eighth species to this genus when properly examined.

Cult. The seeds of all the species should be reared on a hot-bed; and in the month of May, when the plants will have obtained a considerable size, they may be planted out in the open border, in a warm sheltered situation. The *V. Capénsis*, being a herbaceous perennial shrub, will require the treatment of other green-house plants.

XIV. CRYPTOPE'TALUM (from κρυπτος, *cryptos*, hidden, and πεταλον, *petalon*, a petal; petals minute, inclosed in the calyx). Hook. et Arn. in bot. misc. 3. p. 254.

Lin. syst. *Pentándria*, *Trigýnia*. Calyx turbinate, 5-cleft, green: segments ovate, acute, spreading. Petals 5, inserted in the tube of the calyx, and alternating with its segments, inclosed, minute, spatulate. Stamens 5, inserted in the tube of the calyx, small, and almost inclosed, alternating with the petals; filaments filiform; anthers minute, roundish, orange-coloured, 2-celled. Ovarium subglobose, with the lower part adhering to the calyx: upper part free, 1-celled; placentas free, parietal, linear, divaricately bilamellate, many ovulate; ovula very slender, membranous. Styles 3, short, hardly united at the base; stigmas minutely papillose. Capsule globose, inclosed in the permanent calyx, 1-celled, opening at the cells, and 3-valved in the free part; each of the valves terminated by a permanent style. Seeds numerous, pale, oval, obtuse at both ends, dotted; albumen thin, fleshy. Embryo straight, central.—A small annual smooth herb, about half an inch high. Stems erect, dichotomous, branched; branches divaricate. Leaves alternate, spatulate, quite entire, fleshy, hardly nerved. Flowers terminal, large for the size of the plant, emulating those of *Chrysosplènium*.

1 C. pusi'llum (Hook. et Arn. l. c.) ⊙. H. Native of Chili, at Quintero. This curious plant is placed at the end of *Saxifragàceæ*, because it seems more nearly allied to that order than to any other; it agrees with *Chrysosplènium* in many particulars.

Small Cryptopetalum. Pl. $\frac{1}{2}$ inch.

Cult. Sow the seed in a small pot filled with a mixture of peat and sand.

Tribe II.

HYDRA'NGEÆ (plants agreeing with *Hydrángea* in being shrubby). D. C. prod. 4. p. 13. Shrubs, with opposite simple exstipulate leaves. Flowers disposed in corymbs, having 5 petals, 10 stamens, and 2-3 styles; outer ones, and sometimes all, are often sterile; these sterile ones are more ample and dilated than the fertile ones.

XV. HYDRA'NGEA (from ὑδωρ, *hydor*, water, and αγγειον, *aggeion*, a vessel; some of the species grow in water, and the capsule has been compared to a cup). Lin. gen. 557. Gærtn. fruct. 1. p. 150. t. 30. f. 7. Lam. ill. t. 370. D. C. prod. 4. p. 13.—Hydrángea and Horténsia, Juss.

Lin. syst. *Decándria*, *Di-Trigýnia*. Flowers usually difformed (f. 53. *a. b.*); but some of them are fertile and hermaphrodite (f. 53. *b.*). Tube of calyx hemispherical, 10-ribbed, rather truncate, adnate to the ovarium: limb permanent, 5-toothed (f. 53. *b.*). Petals 5, regular. Stamens 10. Styles 2 (f. 53. *c.*), distinct. Capsule 2-celled, with introflexed valves, crowned by the teeth of the calyx and styles (f. 53. *b. c.*), flattish at the top, opening by a hole between the styles. Seeds reticulated, numerous.—Shrubs, with opposite leaves. Flowers corymbose, red or yellow, but usually white: the marginal ones sterile, and large, in consequence of the teeth of the calyx being dilated into broad petal-like coloured segments, the rest of the flower having the other parts abortive.

* *Species natives of America.*

1 H. arbore'scens (Lin. spec. p. 568.) leaves ovate, rather cordate: superior ones lanceolate, coarsely toothed, pale and puberulous beneath; corymbs flattish; flowers nearly all fertile; alabastra obtuse. ♄. H. Native from Pennsylvania to Virginia. Flowers white, small, having an agreeable odour.

Var. α, vulgàris (Ser. in D. C. prod. 4. p. 14.) nerves of leaves puberulous. ♄. H. H. vulgàris, Michx. fl. bor. amer. 1. p. 268. and probably of Pursh. H. arboréscens, Curt. bot. mag. 437. Lam. ill. t. 370. f. 1. Schkuhr, handb. t. 119. Mill. fig. 251. H. frutéscens, Mœnch, meth. 1. p. 106. Du Ham. arb. 1. t. 118.

Var. β, díscolor (Ser. l. c.) leaves almost white beneath from tomentum.

Arborescent Hydrangea. Fl. Jul. Aug. Clt. 1736. Sh. 4 to 6 ft.

2 H. corda'ta (Pursh, fl. amer. sept. 1. p. 309. exclusive of the synonyme of Michx.) leaves broadly ovate, acuminated, rather cordate at the base, coarsely toothed, glabrous beneath; flowers all fertile. ♄. H. Native of Carolina, on the mountains, and on the banks of the Missouri above St. Louis. Wats. dendr. brit. t. 42. Flowers small, white, sweet-scented. According to Torrey, this is merely a variety of *H. arboréscens*.

Cordate-leaved Hydrangea. Fl. July, Aug. Clt. 1806. Sh. 6 to 8 feet.

3 H. Peruvia'na (Moric. mss. with a figure, ex D. C. prod. 4. p. 14.) leaves oval, loosely serrated, coriaceous, reticulately veined, glabrous, rusty beneath, at the nerves, and on the petioles; young branches and peduncles clothed with purplish tomentum; outer flowers of the corymb large and sterile: inner ones hermaphrodite and petandrous. ♄. G. Native of Peru, near Huyaquaquil. Perhaps a species of *Cornìdia*, and probably *C. Peruvìana*.

Peruvian Hydrangea. Shrub 4 to 6 feet.

4 H. nìvea (Michx. fl. bor. amer. 1. p. 268.) leaves cordate, oval, acuminated, sharply toothed, clothed with white tomentum beneath, or pubescence; corymbs flattish; sepals of sterile flowers entire; alabastra depressed. ♄. H. Native of North America, about the Savannah river. Wats. dend. brit. t. 43. Lam. ill. t. 307. f. 2. H. radiàta, Walt. fl. car. 251. ex Michx. but not of Smith. Flowers white, rather large.

Var. β, glabélla (Ser. in D. C. prod. 4. p. 14.) leaves nearly glabrous beneath; flowers all fertile. ♄. H. This variety has probably originated from culture.

White-leaved Hydrangea. Fl. July, Aug. Clt. 1786. Shrub 4 to 6 feet.

5 H. QUERCIFÒLIA (Bartram, trav. ed. germ. p. 336. t. 7. ex Willd. spec. 2. t. 634.) leaves large, ovate, sinuately lobed, and toothed, pilose beneath; corymbs rather panicled, flattish; sepals of sterile flowers entire; alabastra depressed. ♄. H. Native of Florida. Sims, bot. mag. t. 975. H. radiàta, Smith, icon. pict. p. 12. but not of Walt. Flowers white; sterile or outer ones of the corymb large.

Oak-leaved Hydrangea. Fl. June, Sept. Clt. 1803. Shrub 4 to 6 feet.

* * *Species natives of Asia.*

6 H. ALTÍSSIMA (Wall. tent. fl. nep. 2. t. 50.) leaves ovate, acuminated, serrated, smoothish; corymbs flattish; sterile flowers few, on pilose peduncles; alabastra of fertile flowers conical. ♄. F. Native of the mountains of Nipaul. Flowers white; sepals of sterile flowers obovate, very blunt, quite entire. Styles 2, thick, diverging.

Tallest Hydrangea. Shrub 4 to 6 feet.

7 H. VESTÌTA (Wall. tent. fl. nep. 2. t. 49.) leaves ovate-lanceolate, acuminated, sharply serrated, almost glabrous above, but clothed with white tomentum beneath, as well as on the branches; corymbs flattish, large; peduncles villous; sterile flowers few, glabrous; alabastra of fertile flowers nearly globose. ♄. F. Native of Nipaul, on the mountains. Flowers white, rather large. Sepals of sterile flowers serrated. (f. 53.)

FIG. 53.

Var. α, *integríloba* (Ser. in D. C. prod. 4. p. 14.) sepals of sterile flowers obovate, reticulated, quite entire. ♄. F. Native of Nipaul, at Kamaon.

Var. β, *fimbriàta* (Wall. l. c.) sepals of sterile flowers ovate, acuminated, serrated. ♄. F. Native of Nipaul, on he higher mountains. t

Clothed Hydrangea. Shrub 4 to 6 feet.

8 H. A'SPERA (Hamilt. ex D. Don, prod. fl. nep. p. 211.) leaves lanceolate, acuminated, sharply serrated, pubescent above, but densely clothed beneath with hoary tomentum, as well as on the branchlets; corymbs panicled, diffuse; peduncles villous; rays or sepals of sterile flowers ovate, mucronate, sharply serrated, pubescent; alabastra of fertile flowers globose. ♄. F. Native of Nipaul, in watery places at Narainhetty. Horténsia áspera, Hamilt. Leaves a hand long, and 2½ inches broad. Sterile flowers not near so large as those of the preceding species, white.

Rough Hydrangea. Fl. Aug. Sept. Shrub.

9 H. OBLONGIFÒLIA (Blum. bijdr. p. 920.) leaves oblong, acuminated, doubly toothed, glabrous above, but clothed with white tomentum beneath, as well as on the branchlets; corymbs divaricate; sepals of sterile flowers oval, glabrous, serrated; fertile flowers containing 3-4 styles. ♄. G. Native of the western parts of Java, in woods on the higher mountains. Very like the two preceding species, but differs in the teeth of the leaves being unequal, and not so sharp.

Oblong-leaved Hydrangea. Shrub 4 to 6 feet.

10 H. HETEROMA'LLA (D. Don, prod. fl. nep. p. 211.) leaves oval, acuminated, sharply serrated, tomentose beneath, and pilose; corymbs supra-decompound, diffuse, pilose; sepals of sterile flowers roundish-oval, quite entire. ♄. H. Native of Nipaul, at Gosainsthan. Leaves 5 inches long, and nearly 3 inches broad. Flowers white.

Variable-surfaced-leaved Hydrangea. Clt. 1821. Shrub 4 to 6 feet.

11 H. ANÓMALA (D. Don, prod. fl. nep. p. 211.) leaves ovate, acuminated, nearly naked, sinuately crenated; petioles and nerves pilose; cymes terminal, hairy; flowers uniform; rays or sepals of sterile flowers wanting. ♄. F. Native of Nipaul. Leaves 4 inches long, rounded at the base; petioles an inch long. Flowers small. Styles very short, thick, recurved.

Anomalous Hydrangea. Shrub 3 to 6 feet.

12 H. HORTE'NSIA (Sbld. in act. bonn. 14. p. 688. D. C. prod. 4. p. 15.) leaves broadly ovate, serrated, acuminated; flowers disposed in ample corymbs or cymes, all difformed, with 4-5 segments; segments obovate-roundish, quite entire; fertile flowers very few, containing 2-3 styles. ♄. F. Native of China and Japan, but now cultivated almost every where in gardens for the sake of its beauty. Horténsia opuloìdes, Lam. dict. 3. p. 136. Dum. Cours. bot. cult. ed. 2. vol. 4. p. 345. Duham. ed. nov. 3. p. 97. t. 24. Hydrángea horténsis, Smith, icon. pict. 1. t. 12. Curt. bot. mag. 438. Horténsia speciòsa, Pers. Prímula mutábilis, Lour. coch. p. 104. Vibúrnum serràtum, Thunb. fl. jap. p. 124. ex Rœm. et Schultes, or Vibúrnum tomentòsum, Thunb. ex Curt. but the descriptions of neither of these two plants agree with the present. The plant is called *Temerihana*, i. e. globe-flower, by the Japanese; and *Fun-Dan Kwa* by the Chinese. Flowers varying from rose-coloured to blue according to the soil in which the plant is grown; the sterile flowers are nearly always 4-cleft; but the fertile flowers are small and perfect. The plant is much valued on account of the great profusion of its very elegant flowers, which are monstrous, in the same manner as the Snow-ball Guilder Rose. It was introduced by Sir Joseph Banks in 1790. The plant was first called *Peaùtia* by Commerson, in honour of Dæ Hortense Lapeaute.

Hortensia's or Common Hydrangea. Fl. April, Sept. Clt. 1790. Shrub 2 to 3 feet.

13 H. AZISA'I (Sbld. in act. bonn. 14. p. 689.) leaves ovate, acuminated, attenuated at the base, crenately serrated; flowers disposed in cymes, difformed; corolline segments 4. ♄. F. Native of Japan, along with the preceding species. The cymes of flowers are very ample. Flowers for the most part greenish, rarely white. The plant is called *Azisai* by the Japanese, and *Zu-hats-sen* by the Chinese. There is a variety of it with variegated leaves, called *Fiuri-Azisai* by the Chinese.

Azisai Hydrangea. Shrub 2 to 3 feet.

14 H. JAPÓNICA (Sbld. l. c. p. 689.) leaves ovate-oblong, acuminated, finely and glandularly serrated, quite glabrous on both surfaces; cymes crowded; flowers difformed; corolline segments 6-10, unequal, ovate-rhomboid. ♄. F. Native of Japan, where it is called *Kakoosu*. An elegant shrub, cultivated by the Japanese, about the size of the last.

Var. α; flowers red. *Benkaku.*

Var. β; flowers grey. *Konkaku.*

Japan Hydrangea. Shrub 2 to 3 feet.

15 H. THUNBE'RGII (Sbld. l. c. p. 690.) leaves oblong, serrated, entire at the base, pale beneath; cymes crowded; flowers difformed; corolline segments 4-8, broadly obcordate, constantly of a greyish lilac-colour. ♄. F. Native of Japan, on the highest mountains. Vibúrnum serràtum, Thunb. jap. p. 124. H. serràta, D. C. prod. 4. p. 115. Shrub climbing. The plant grows in the mountains of Aiva and Sonaki, where the natives use the dried leaves instead of tea, and is called by them *Amatsja*, i. e. sweet tea; and *Do-Sioo-San* by the Chinese. According to the Japanese, there is a variety with bitter leaves, which they call *Kakossoo.*

Thunberg's Hydrangea. Shrub cl.

16 H. VI'RENS (Sbld. l. c. p. 690.) leaves ovate-oblong, acuminated, serrated at the apex, hispid above (Thunb.); cymes stinted: flowers difformed; corolline segments 2-3, unequal, white. ♄. F. Native of Japan, on the higher mountains, among Azalias, Euryas, Andromedas, &c. H. scándens, D. C. prod. 4. p. 15. Vibúrnum vìrens, Thunb. fl. jap. 123. Vibúrnum scándens, Lin. fil. suppl. 184. Shrub 2 to 6 feet high, rarely climbing. It is called by the Japanese *Janratoosin*.

Green Hydrangea. Shrub 2 to 6 feet.

17 H. PANICULA'TA (Sbld. l. c. p. 691.) leaves elliptic, acuminated, glandularly toothed, scabrous, tern on the floriferous branches; panicle branched, rather secund; flowers difformed, very numerous; corolline segments 3-4, obovate, white. ♄. F. Native of Japan. Shrub climbing, 5 feet high. The plant is called *Tsurudemari* by the Japanese, and *Too-sinkjine* by the Chinese. There is a variety with very pale red flowers, cultivated near the town of Posaka, very like the species, but does not climb, called *Jamademai* by the Japanese. Perhaps Vibúrnum plicàtum, Thunb. is only a variety of *H. paniculàta*.

Panicled-flowered Hydrangea. Shrub 5 feet.

18 H. INVOLUCRA'TA (Sbld. l. c. p. 691.) leaves ovate, acuminated, glandularly serrated, reticulately veined, hispid on both surfaces; cymes involucrated before flowering (involucrum caducous, 2-3-leaved), crowded; flowers difformed; corolline segments 8, nearly orbicular. ♄. F. Native of Japan. Plant suffruticose, hardly a foot high.

Var. α; corolla lilac. *Gimbaisoo* of the Japanese; cultivated near the town of Oosaka.

Var. β; corolla yellow. *Kinbaisoo* of the Japanese.

Involucrated Hydrangea. Shrub 1 foot.

19 H. ALTERNIFÒLIA (Sbld. l. c. p. 692.) leaves alternate; flowers cymose, polyandrous, difformed; corolline segments 2-6, 3 of which are constantly ovate and acute. ♄. F. Native of Japan, where it is called by the natives *Kusasimots-Ke*.

Alternate-leaved Hydrangea. Shrub 1 foot.

20 H. SÍTSITAN (Sbld. l. c. p. 692.) leaves ovate, acuminated, acutely serrated, with the veins pubescent beneath; flowers cymose, difformed, double; corolline segments elliptic, of a fine rose-colour. ♄. F. Native of Japan. Shrub 2 feet high. Cultivated about the town of Miako, where it is called *Sitsitan* by the natives. Perhaps only a double flowering variety of *H. Horténsia*.

Sitsitan Hydrangea. Shrub 2 to 4 feet.

† *Species natives of Japan, but hardly known.*

21 H. MACROPHY'LLA (D. C. prod. 4. p. 15.) branchlets rather pilose; leaves obovate, acuminated, sharply serrated, rather pilose on both surfaces; umbels terminal, compound, radiating. ♄. F. Native of Japan. Vibúrnum macrophýllum, Thunb. fl. jap. 125.

Long-leaved Hydrangea. Shrub.

22 H. HI'RTA (Sbld. ex flora, 1828. nov. 21.) leaves ovate, serrated, villous; petioles and peduncles hairy; umbels terminal, not radiating; stigmas 2-lobed. ♄. F. Native of Japan. Vibúrnum hírtum, Thunb. fl. jap. 124.

Hairy Hydrangea. Shrub.

Cult. The hardy species, or those natives of North America, are dwarf shrubs, and therefore proper for the front of shrubberies. *H. quercifòlia* does best against a south wall. Those species natives of Asia will require protection in winter, either by placing them in a frame or green-house. Cuttings of all the species root readily if planted under a hand-glass. *H. Horténsia* is in general cultivation for the sake of its showy flowers; the blue-flowered variety is in greatest request, which may be obtained by planting out the common pink variety in a bed of peat soil, and letting it remain there 2 or 3 years; for the longer it remains the deeper blue the flowers will become: the plants may then be potted before the buds begin to burst, and they will then flower in perfection, and the flowers will be of a beautiful blue colour.

XVI. CORNI'DIA (in honour of Joseph Cornide, a Spanish naturalist). Ruiz et Pav. fl. per. 1. p. 43.—Sarcóstyles, Presl, in reliq. Hænk. 2. p. 53. t. 6. D. C. prod. 4. p. 15.

LIN. SYST. *Octándria, Trigýnia.* Calyx superior, 4-toothed, equal, deciduous. Stamens 8; filaments linear: anthers ovate, 2-celled, dehiscing longitudinally inside. Ovarium inferior, nearly globose, 3-celled, rarely 4-celled, many ovulate. Styles 3, rarely 4, thick, fleshy, at length divaricate; stigmas obtuse, oblique. Capsule nearly globose, crowned by the permanent calyx and styles, dehiscing between the styles, 3-celled, rarely 4-celled, many seeded; dissepiments entire, placentiferous. Seeds cylindrical.—Shrubs, with glabrous opposite serrated leaves, and involucrated cymes or corymbs of white flowers, with the habit of *Hydrángea*.

1 C. PERUVIA'NA (Ruiz et Pav. fl. per. l. c..) leaves oval or obovate, acuminated or obtuse, coriaceous, serrated at the apex; corymbs terminal, many rayed, involucrated by 4 large deciduous bracteas. ♄. F. Native of Peru, on the mountains. Sarcóstyles Peruviàna, Presl, in Hænk. reliq. 2. p. 54. t. 60.

Peruvian Cornidia. Shrub.

2 C. INTEGE'RRIMA (Hook. et Arn. in bot. misc. 3. p. 254.) leaves roundish-elliptic, glabrous, hardly acute at the base and apex; corymbs numerous, disposed in a terminal raceme, which much exceeds the leaves. ♄. F. Native of Chili, about Valparaiso, and near Bustamente. Hydrángea scándens, Poepp. ex D. C. prod. 4. p. 666.

Entire-leaved Cornidea. Shrub cl.?

3 C. SERRATIFÒLIA (Hook. et Arn. l. c.) leaves obovate-oblong, acute, obtuse at the base, serrated upwards; floral ones or rameal ones smaller, ovate, with a few denticulations; corymbs numerous, disposed in a terminal raceme, which hardly exceeds the leaves. ♄. F. Native of Chiloe. Closely allied to the last species, but apparently distinct. Both, but especially the present, have several decussate, patent, concave, stiff bracteas, along the stalks of the corymbs.

Saw-leaved Cornidia. Shrub.

Cult. The culture and propagation of the species of *Cornídia* are the same as that recommended for the species of *Hydrángea*. They require to be protected in winter by placing them in a frame or green-house.

XVII. CIANI'TIS (from *κυανεος, kyaneos,* blue; colour of berries). Reinw. in Blume, bijdr. p. 921. D. C. prod. 4. p. 16.

LIN. SYST. *Decándria, Tri-Pentagýnia.* Tube of calyx adhering to the ovarium: limb 5-toothed. Petals 5, rather fleshy, inserted in an epigynous disk. Stamens 10; anthers oblong, erect, dehiscing at the sides. Styles 3-5, spreading: stigmas obtuse, adnate. Berry crowned by the teeth of the calyx, half 3-5-celled, many seeded; dissepiments incomplete, inflexed, fleshy, seminiferous.—A subshrub, with opposite, petiolate, oblong-lanceolate, smoothish leaves, which are serrated from the middle to the apex; and panicled terminal cymes of flowers, with trifid branches.

1 C. SYLVA'TICA (Reinw. l. c.) cymes nearly undivided, on short peduncles, disposed in a coarctate panicle. ♄. S. Native of Java, on the mountains, where it is called by the natives *Tisere-gil-gil*. Flowers probably white.

Var. β, paniculàta (Blum. mss.) cymes branched, on long peduncles, disposed in an elongated panicle. ♄. S. Native of Java. Perhaps distinct from the species.

Var. γ, *corymbòsa* (Blum. mss.) cymes branched, on long peduncles, disposed in somewhat fastigiate corymbs. ♄. S. Native of Java. Perhaps a proper species.

Wood Cianitis. Shrub 2 to 3 feet.

Cult. A mixture of loam, peat, and sand will suit these plants; and cuttings will root readily in the same kind of soil, under a hand-glass.

XVIII. ADA`MIA (in honour of John Adam, some time Governor-General of India; a promoter of natural history). Wall. tent. fl. nep. p. 46. t. 36. D. C. prod. 4. p. 16.

Lin. syst. *Decándria, Pentagýnia.* Tube of calyx adnate to the ovarium; limb with 5 short teeth, having the recesses between the teeth broad and obtuse. Petals 5, alternating with the teeth of the calyx, surrounding the top of the ovarium. Stamens 10. Styles 5, ending in rather clavate, somewhat 2-lobed stigmas. Berry crowned by the limb of the calyx, somewhat 5-celled, many seeded. Embryo terete, straight, in a fleshy albumen, with the radicle turned towards the hilum.—A smooth branched shrub. Leaves opposite, exstipulate, petiolate, oblong-lanceolate, serrated. Panicle corymbose, terminal, many flowered. Flowers bluish. Berries blue. Perhaps not distinct from *Cianìtis*.

1 A. cyanæ`a (Wall. l. c.) ♄. G. Native of Nipaul, in rocky places, on mountains near the Great Valley, where it is called *Bansook* by the natives. Hook. bot. mag. t. 3046. Wall. pl. rar. asiat. 3. t. 213.

Blue-berried Adamia. Fl. June, July. Clt. 1829. Shrub 4 to 6 feet.

Cult. See *Cianìtis* above for culture and propagation.

XIX. BROUSSAI`SIA (in honour of the celebrated M. Broussais, M.D. author of physiological medicine). Gaud. in Freyc. voy. t. 69. D. C. prod. 4. p. 17.

Lin. syst. *Decándria, Monogýnia.* Calyx 5-parted, hemispherical, distinct from the ovarium: lobes ovate-deltoid, bluntish, equal. Petals oblong, acuminated, with a reflexed point (nearly as in umbelliferous plants) twice the length of the calyx, valvate in æstivation. Stamens 10, hypogynous, surrounding the base of the ovarium; filaments subulate, distinct; anthers ovate. Ovarium roundish, crowned by the short style and truncate stigma, 5-celled; cells many seeded.—A shrub, with opposite oval petiolate sharply serrated leaves, and corymbs of fertile flowers. The shrub has the habit of *Hydrángea*, but differs in the ovarium being distinct from the calyx, in the style being short and solitary, not 2-3, and in the fruit being 5-celled.

1 B. argu`ta (Gaud. l. c.) ♄. G. Native of the Sandwich Islands, at the altitude of from 1200 to 1500 feet above the level of the sea. A middle-sized tree.

Sharp-serrated-leaved Broussaisia. Tree.

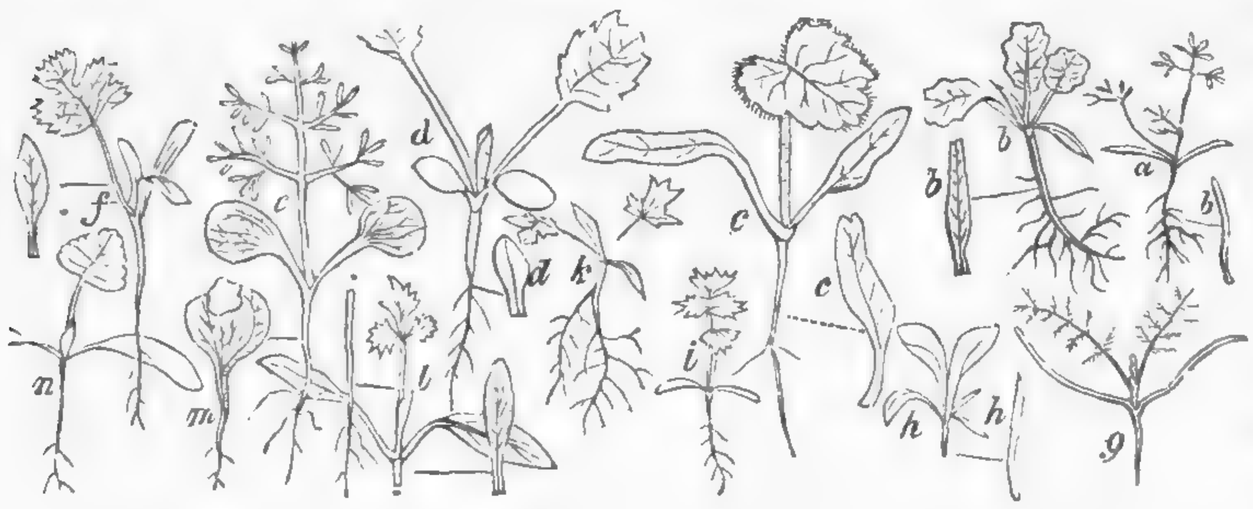
Cult. See *Cianìtis* above for culture and propagation.

Order CXXIII. UMBELLI`FERÆ (from *umbella*, an umbel, and *fero*, to bear; this order contains only umbelliferous plants, such as the parsnip, celery, parsley, hemlock, carrot, coriander, &c.). Juss. gen. 218. D. C. fl. fr. 4. p. 279. prop. med. ed. 2. p. 159. Spreng. umb. prod. 1813. and Rœm. et Schultes, syst. 6. (1820.) p. 29. Hoffm. gen. umb. ed. 1st. 1814. ed. 2d. 1816. Vela and Lag. am. nat. esp. 2. 1821. p. 61. Lag. ibid. p. 87. and obs. aparas. 1826. (in ocios.) Kock, umb. disp. in nov. act. bonn. 1824. vol. 12. p. 1. and p. 55.-156. and the same in litt. 1828. D. C. coll. diss. mem. 5. with 19 plates. D. C. prod. 4. p. 55.—Umbellàtæ, Tourn. inst. 304. Lin. præl. ed gis. p. 508. Adans. fam. pl. 2. p. 89. exclusive of some genera. Cusson, mem. soc. med. par. 1782.—Sciadophýtum, Nect. elem. 1. p. 162.

Calyx with the tube adhering to the ovarium (f. 55. *F. h.* f. 55. *C. e.*); limb 5-toothed (f. 55. *F. c.*), or entire (f. 55. *G. f.*): lobes or teeth deciduous or permanent. Petals 5 (f. 57. *c.* f. 59. *g.*), inserted in the top of the tube of the calyx, and alternating with its lobes, either entire (f. 57. *c.*), emarginate (f. 61. *b.*), or 2-lobed, sometimes plain at the apex, but usually drawn out into a replicate or involute point (f. 61. *f.* f. 63. *e.* f. 55. *C. i.*), somewhat imbricate in æstivation, rarely valvate; the outer flowers of the umbel or ray of the umbel sometimes larger than the rest, the rest equal among themselves, rarely abortive. Stamens 5 (f. 55. *C. b.* &c.), alternating with the petals, and inserted along with them, and therefore opposite the calycine teeth or lobes, always distinct, replicate in æstivation (f. 59. *g.* &c.); anthers ovate, 2-celled, somewhat didymous, opening by a double longitudinal chink. Ovarium inferior, 2-celled (f. 55. *E. c.* f. 55. *D. d.* &c.), (very rarely, and probably from abortion, 1-celled), adnate to the calyx; styles 2, distinct (f. 55. *F. i.* f. 55. *G. i.* f. 59. *e.* &c.), when young erect, but at length thickened at the base into stylopodium (f. 64. *a.*), which covers the whole disk, forming a sort of crown to the fruit, diverging more or less, usually permanent, the outer one directed to the outside of the umbel, and the inner one tending to the centre. Fruit (called *Diachæ`na, Polachæ`na,* and *Cremocarp* by many botanists) consisting of 2 carpella (called *mericarps* because (f. 55. *D. d.* f. 56. *C. h.* &c.) they adhere to the calyx the half of their length, and therefore cannot be carpella or achenia in the strict sense of those terms), separable from a common axis (called a *carpophore*), to which (f. 56. *G. a.* f. 56. *C. a. b.* &c.) they adhere by their face (called the *commissure*); the fruit or cremocarp traversed by 10 elevated primary ridges, of which the 5 that represent the middle of the sepals are called *carinal,* because they are drawn out into calycine teeth at the apex: the other 5, alternating with the first-named ones are called *sutural,* because they indicate the sutures where the divisions of the calyx are joined, and therefore tend to the recesses between the calycine teeth; besides these there are others which are apparent in some called secondary, because they alternate with the 10 primary nerves, and therefore indicate the sides of the divisions of the calyx; all the sutural, carinal, and secondary ribs are either filiform, winged, or crested; these ridges or nerves are separated by channels or furrows called valleculæ, below which, but usually in the channels, are placed in the substance of the pericarp, certain linear receptacles of coloured oily matter, called *vittæ*, which are directed from the apex to the base: they are solitary, twin, or numerous, rarely wanting, and sometimes they are inclosed in a proper membrane, which is probably a true pericarp. Seeds solitary in each carpel, hanging from the top of the axis or carpophore, inclosed in a proper membrane, the spermaderm, which is but rarely separable from the pericarp. Albumen large, fleshy, or rather horny, more or less convex on the out-

side. Embryo minute, hanging from the top of the carpophore, and therefore the radicle is superior; cotyledons 2, oblong, changing into seminal leaves through germination.—Herbs or subshrubs. Roots various, but often fusiform. Stems cylindrical or angular, simple or branched, annual or perennial, with the bark or skin usually full of aromatic resinous gum; medulla in some, as in *Férula*, large, with medullary fibres in its substance, similar to the stems of monocotyledonous plants. Leaves alternate, very rarely opposite, except the seminal ones, usually divided into various segments; petioles usually sheathing at the base: in some, as in the genus *Bupleùrum*, the petioles are changed into phyllodia, as in the section of *Acàcia* called *Phyllodíneæ*. Flowers umbellate, white, yellow, pink, or blue, often with either the styles or stamens abortive, monoecious, dioecious, or polygamous, and some of them sterile. Umbels usually perfect, both general and partial, in both the rays are numerous, the general umbel usually surrounded by an involucrum, and the partial ones by an involucel.

FIG. 54.



Umbellíferæ hardly differs from *Araliàceæ*, the next order. With *Saxifragàceæ* it agrees in habit, if *Hydrocótyle* is compared with *Chrysosplènium*, and if the sheathing and divided leaves of the two orders are considered. To *Geraniàceæ*, De Candolle remarks, that they are allied in consequence of the cohesion of the carpella around a woody axis, and of the umbellate flowers, which grow opposite the leaves, and also because the affinity of *Geraniàceæ* to *Vìtis*, and of the latter to *Araliàceæ*, is not to be doubted. The arrangement of this order has only within a few years arrived at any very definite state; the characters upon which genera and tribes could be formed, were for a long while unsettled; it is, however, now generally admitted, that the number and developement of the ribs of the fruit, the presence or absence of the reservoirs called vittæ, and the form of the albumen, are the leading peculiarities, which require to be attended to. The plants are chiefly extra-tropical, inhabiting groves, thickets, plains, marshes, and waste places.

The properties of this order require to be considered under two points of view; firstly, those of the vegetation; and secondly those of the fructification. The character of the former generally is suspicious, and often poisonous in a high degree; as in the case of *hemlock*, *fool's-parsley*, *water-hemlock*, and others, which are deadly poison. Nevertheless, the blanched petioles and stems of *celery*, the leaves of *parsley* and *samphire*, the roots of *skirret*, the *carrot*, the *parsnip*, the *arracacha*, and the tubers of *Œnánthe pimpinelloìdes*, and *Bùnium bulbocástanum*, are wholesome articles of food. The fruit, vulgarly called the seeds, is in no case dangerous, and is usually a warm and agreeable aromatic, as *caraway*, *coriander*, *dill*, *anise*, &c. From the stem, when wounded, sometimes flows a stimulant, tonic, aromatic, gum-resinous concretion, of much use in medicine; as *opopanax*, which is produced from *Opópanax Chirònium* in the Levant, and *assafœtìda* from the *Férula* of that name in Persia. *Gum ammoniac* is obtained from *Dorèma Ammoniacum*. It is a gum resin of a pale yellow colour, having a faint, but not unpleasant, smell, with a bitter nauseous taste. Internally applied, it is a valuable deobstruent, and expectorant. It is said by Dr. Paris to be, in combination with rhubarb, a useful medicine in mesenteric affections, by correcting viscid secretions. (Ainslie 1. p. 160.) The substance called *galbanum* is produced by *Gálbanum officinàle*, a plant of this order. It is a stimulant of the intestinal canal and uterus, and is found to allay that nervous irritability, which often accompanies hysteria. (Ainslie 1. p. 143.). *Æthùsa cynàpium* has been found by Professor Ficinus, of Dresden, to contain a peculiar alkali, which he calls *Cynapia*. (Turner, p. 654.) The fruit of *Ligústicum Ajawain* of Roxb. the *Ptychòtis Ajòwan* of D. C. is prescribed in India in diseases of horses and cows. (Ainslie i. p. 38.) The *Prángos pabulària* is a valuable fodder-plant in Thibet.

Synopsis of the genera.

SUBORDER I. ORTHOSPE'RMÆ. Albumen flat or flattish inside, neither involute nor convolute.

§ 1. *Umbels simple or imperfect. Fruit destitute of vittæ.*

TRIBE I.

HYDROCOTY'LEÆ. *Fruit contracted from the sides; mericarps convex or acute on the back: with the 5 primary ribs at length obsolete: lateral ones marginating or in the commissure, which is flat; intermediate usually more than carinal. Petals entire.*

1 HYDROCÓTYLE. Margin of calyx obsolete; and the tube rather compressed. Petals ovate, with a straight point. Fruit biscutate. Mericarps with 5 filiform ribs: carinal and lateral ones often obsolete: the 2 intermediate ones joined.—Involucrum few-leaved.

2 CRA'NTZIA. Tube of calyx subglobose; limb very short, hardly any. Petals roundish, obtuse. Fruit roundish. Mericarp unequal, with 3-5 filiform ribs. Vittæ 1 in each furrow and 2 in the commissure.—Involucrum 5-6-leaved.

3 DIMETÒPIA. Teeth of calyx obsolete. Petals oval-oblong. Styles short. Fruit didymous. Mericarps somewhat contracted at the commissure, unequal, one muricated with tubercles, and the other echinated with conical prickles.—Involucrum of 5 linear leaves.

4 ERIGE'NIA. Margin of calyx obsolete. Petals equal, obovate. Styles long. Fruit oval, laterally compressed. Mericarps gibbously convex, marked by 3 stripes. Commissure narrow, flat.—Umbels imperfect. True involucrum none, but in place of it there is a multifid leaf. Involucels of a few unequal leaflets.

5 Micropleu'ra. Margin of calyx obsolete. Petals equal, acute. Fruit deeply 2-lobed at the base, and emarginate at the apex; mericarps obliquely ovate, 7-ribbed; ribs curvi-linear, ventricose at the base, marginal 2 straight. Commissure narrow.

6 Didi'scus. Margin of calyx obsolete. Petals oval, bluntish, imbricate in æstivation (f. 57. *c.*). Fruit didymous, emarginate at the base. Mericarps rough from pilose strigæ, 5-ribbed: 2 middle ribs approximating the commissure.—Involucrum of many leaves which are concrete at the base (f. 57. *a.*).

7 Trachyme'ne. Margin of calyx 5-toothed. Petals elliptic, acutish, somewhat valvate in æstivation. Fruit didymous. Mericarps gibbously convex, 5-ribbed: the 3 dorsal ribs and the furrows between them muricated: and the 2 lateral ones marginating.—Umbels compound. Involucrum of many leaves.

8 Astrótricha. Margin of calyx hardly 5-toothed. Petals oval, acutish, permanent (f. 58. *b.*), velvety on the outside from stellate down. Styles thickened at the base (f. 58. *c.*). Mericarps contracted at the commissure, having 3 primary dorsal ribs, and 2 acute nearly obsolete marginating ones, and 4 secondary ones. Commissure furnished with 2 vittæ, which are covered by a spongy pellicle, but none in the furrows.—Involucrum of a few linear leaves.

9 Xanthòsia. Margin of calyx 5-lobed. Petals stipitate, oval, cuspidate and replicate at the apex. Styles filiform, rising from the base of the stylopodium on the inside. Fruit compressed. Mericarps contracted at the commissure, with 7-9 filiform ribs: 2 lateral ribs marginating.

10 Bowle'sia. Margin of calyx 5-toothed; tube compressedly somewhat tetragonal. Petals elliptic, entire, acute. Fruit ovate, much contracted at the raphis, turgid, somewhat tetragonal, flattish on both sides at the back. Mericarps marked with an oval impression on the back, having 5 obsolete ribs: 2 lateral ribs flat, seated in the commissure.

11 Fragòsa. Margin of calyx 5-toothed, permanent. Petals oval. Fruit didymous. Mericarps somewhat compressed from the back, and contracted at the commissure, having filiform ribs.—Involucrum equal in length to the pedicels.

12 Azore'lla. Margin of calyx 5-toothed, permanent. Petals oval. Fruit ovate, contracted at the raphis, and rather compressed from the back. Mericarps semi-ovate, having the ribs hardly evident.—Involucrum about equal in length to the pedicels.

13 Pectophy'tum. Margin of calyx entire. Petals unequal, with an acute inflexed point. Fruit ovate-elliptic; mericarps rather convex on the back, semi-oval, having 5 filiform ribs; commissure flattish.—Flowers in crowded fascicles at the tops of the branches, solitary in the axils of the bracteas.

Tribe II.

Mulíneæ. *Mericarps contracted at the commissure, flat or flattish on the back, without vittæ, hence the fruit is square or parallelly biscutate. Petals entire.*

14 Bòlax. Margin of calyx entire. Petals oval. Fruit tetragonal; mericarps with 5 nerve-formed ribs, 1 dorsal, and the 2 middle ones form the corners of the angles of the fruit, and the 2 inner ones are filiform; commissure very narrow.—Involucrum of 4 leaves, equal in length to the pedicels.

15 Mulìnum. Margin of calyx 5-toothed, permanent. Petals oval-oblong, acute. Fruit 4-winged; mericarps furnished with 5 ribs: middle one dorsal: 2 lateral ones nerve-formed: 2 intermediate ones expanded into lateral ample wings.—Involucrum of many leaves, shorter than the pedicels.

16 Lare'tia. Margin of calyx 5-toothed. Petals ovate, entire. Fruit elliptic, square, flatly compressed from the back; mericarps lenticular, with dorsal ribs and 2 lateral marginal ones, destitute of vittæ. Seed flat.

17 Dru'sa. Margin of calyx entire. Petals oval. Mericarps furnished with 5 ribs: the dorsal one and the 2 inner ones linear and hardly prominent: but the 2 intermediate ones are drawn out into marginal wings, which are repandly sinuated, having the angles expanding in a stellate tuft of uncinate spinules.—Involucrum wanting.

18 Huana'ca. Margin of calyx hardly 5-toothed. Petals lanceolate. Fruit ovate, acutish; mericarps flat and furrowed on the inside, but convex on the back, and furnished with 3 elevated lines. Carpophore bifid.—Involucrum of many leaves.

19 Dipòsis. Margin of calyx bluntly 5-toothed. Petals oval. Fruit orbicular, constituting 2 parallel disks (f. 55. *A. b.*); commissure narrow; mericarps having 5 ribs: dorsal one filiform: 2 lateral ones hidden: and the 2 middle ones girding the disk; furrows broad and flat.—Umbels compound.

20 Spana'nthe. Margin of calyx 5-toothed. Petals elliptic, acutish, with a straight point. Fruit ovate, much compressed at the rachis; mericarps having 5 slender equal ribs: 3 intermediate ones dorsal: and the 2 lateral ones seated in the flat commissure.—Umbels rather compound. Involucrum of many leaves.

21 Homaloca'rpus. Margin of calyx 5-toothed; teeth subulate. Petals ovate, concave. Fruit roundish-ovate; mericarps having 5 filiform ribs, hidden in the substance of the pericarp, 1 dorsal: 2 lateral ones near the rachis: 2 middle ones forming the angles.

22 Pozòa. Margin of calyx 5-toothed, permanent. Fruit prismatic, tetragonal, 5-ribbed, emarginate at the apex; mericarps concave and channelled on the back; ribs lateral, dense, straight.—Involucrum crenately lobed, obsoletely toothed.

23 Asteri'scium. Calyx 5-toothed, permanent; teeth ovate. Petals emarginate, with an inflexed point and a callous recess. Fruit compressed, tetragonally prismatic; mericarps with 5 ribs: the 2 intermediate ribs expanded into wings: the carinal one and the 2 placed near the raphis stripe-formed; commissure very narrow.—Involucrum of many leaves.

Tribe III.

Sanicu'leæ. *Fruit ovate-globose. Mericarps destitute of vittæ, with 5 primary ribs; secondary ribs wanting or obliterated by being covered with scales. Petals erect, emarginate, from being bent back from the middle by a point.*

24 Actinòtus. Tube of calyx contracted at the apex; limb 5-lobed: lobes oval-oblong. Petals wanting. Styles thickened and villous at the base. Fruit ovate, crowned by the lobes of the calyx, villous, 5-striped.—Involucrum of many radiating leaves, which are longer than the flowers.

25 Peta'gnia. Flowers dioecious, having the calyxes different in the distinct sexes. Styles filiform. Fruit ovate, compressed, 8-nerved, vacant inside, 1-seeded.—Umbellules 3-flowered: central flower hermaphrodite, sessile: lateral ones male, pedicellate; pedicels rather concrete at the base, with the calyx of the female flower.

26 Sani'cula. Tube of calyx echinated; lobes foliaceous (f. 59. *c.*), permanent. Petals connivent, obovate, emarginate, with an inflexed point (f. 59. *g.*). Fruit nearly globose, echinated; carpophore not distinct.—Umbels compound. Leaves of involucrum few, divided; of the involucel numerous, linear.

27 Hacque'tia. Tube of calyx 10-ribbed; lobes foliaceous, permanent. Petals obovate, emarginate, with a bent in point. Fruit contracted from the sides; mericarps gibbously convex; ribs 5, filiform, with a deep channel on the inside.—Involucrum of 5-6 obovate toothed leaves, which are longer than the umbel.

28 Astran'tia. Tube of calyx 10-ribbed, tuberculately plicate; lobes 5, foliaceous. Petals erect, connivent, oblong-obovate, with an infracted point. Fruit rather compressed from the back; mericarps with 5 elevated, obtuse, plicately toothed, inflated ribs, inclosing in the cavity a smaller fistular rib. Carpophore not distinct —Involucrum variable: involucel of many leaflets.

29 Alepi'dea. Tube of calyx minutely tubercular. Petals inflexed. Mericarps without ribs, and without vittæ. Carpophore adnate the whole length of the seeds.—Habit of *Eryngium*, but the umbels are like those of *Astrántia*.

30 Horsfie'ldia. Margin of calyx quite entire. Petals ovate, cuspidate, flat. Fruit compressed, villous; mericarps 3-ribbed on the back.—A prickly shrub. Umbels capitate, sessile; receptacle chaffy. Involucrum of many leaves.

31 Ery'ngium. Tube of calyx rough from scales or vesicles; lobes foliaceous. Petals erect, connivent, oblong-obovate, emarginate, with an infracted point. Fruit obovate, scaly, or tubercular; mericarps semi-terete, without ribs, and without vittæ; carpophore adnate its whole length to the seeds.—Flowers crowded into dense heads; the lower bracteas forming an involucrum to them.

32 Actina'nthus. Flowers monoecious: female ones capitate: male ones in capitate umbels, with the receptacle destitute of paleæ. Teeth of calyx permanent. Petals oblong, complicated at the apex, and rather cirrhose. Fruit compressed from the sides; mericarps with 5 alternate, stronger, sutural ribs; vittæ 1 in each furrow, and 2 in the commissure. Carpophore adnate.—Involucra wanting; involucels of many leaves.

§ 2. *Umbels compound or perfect. Vittæ on the fruit variable, rarely wanting.*

* *Fruit having only primary ribs present.*

Tribe IV.

Ammi'neæ. *Fruit compressed from the sides or didymous; mericarps with 5 filiform ribs, which at length become a little winged: lateral ones marginating, all equal. Seeds terete or gibbously convex, flattish in front.*

33 Ru'mia. Margin of calyx 5-toothed. Petals ovate, entire, with a short, coarctate, incurved point. Fruit roundish or ovate, plicately wrinkled; mericarps solid, with 5 thick, very obtuse, twisted plicate ribs, covering the furrows, which are ornamented with plicate tubercles, and furnished with 1 vittæ each. Carpophore bipartite.—Involucrum wanting or few-leaved; involucels of 3-8 leaves. Flowers yellow.

34 Cicu'ta. Margin of calyx 5-toothed, foliaceous. Petals obcordate, with an inflexed point. Fruit roundish, contracted from the sides; mericarps with 5 flattish ribs, having the furrows between the ribs furnished with 1 vittæ each, and the commissure 2 vittæ; vittæ filling the furrows, a little more elevated than the ribs, all concealed under a loose membrane. Carpophore bipartite.—Involucrum wanting, or few leaved; involucels of many leaves.

35 Zi'zia. Margin of calyx obsolete, or with 5 very short teeth. Petals elliptic, tapering into a long inflexed acumen. Fruit contracted from the sides, roundish or oval; ribs filiform, rather prominent; furrows furnished with 1 vittæ each, and the commissure with 2; carpophore bipartite.—Involucrum wanting; Involucel of few leaves, variable. Flowers yellow, rarely white or dark purple.

36 Pentacry'pta. Calyx unknown. Petals equal, lanceolate, with an inflexed point. Fruit oblong-elliptic; the 3 dorsal ribs elevated, acute; furrows furnished with 1 vitta each. Albumen with 5 roundish angles. Flowers polygamous, dark purple.

37 A'pium. Margin of calyx obsolete. Petals roundish, entire. Stylopodium depressed. Fruit roundish, contracted from the sides; ribs filiform; furrows furnished with 1 vitta: outer ones with 2-3 vittæ. Carpophore undivided.—Involucrum and involucel wanting. Flowers greenish white.

38 Petroseli'num. Margin of calyx obsolete. Petals roundish, incurved, hardly emarginate, with an inflexed point at the apex. Stylopodium short, conical, subcrenulated. Styles diverging. Fruit ovate, contracted from the sides; ribs filiform; furrows furnished with 1 vitta each, and the commissure with 2. Carpophore bipartite.—Involucrum few-leaved, and the involucel of many leaves. Flowers white or greenish.

39 Weydle'ria. Margin of calyx obsolete (f. 60. *a.*). Petals ovate-lanceolate, entire, with an incurved point (f. 60. *c.*). Fruit ovate, crowned by the short stylopodium and reflexed styles (f. 60. *b.*). Mericarps somewhat semi-terete, with contracted margins; ribs filiform, bluntish; furrows broad, furnished with 1 vitta each, and the commissure with 2.—Involucrum wanting, or of 1 leaf; involucel of many leaves. Flowers white.

40 Tri'nia. Margin of calyx obsolete. Flowers usually dioecious from abortion. Petals of the male flowers lanceolate,

ending in an involute point; of the hermaphrodite flowers ovate, with a short inflexed point. Fruit ovate; ribs filiform, rather prominent; furrows without vittæ, or furnished with 1 vitta each. Carpophore flat, bipartite from the base.—Umbels disposed in a panicle or thyrse, without any involucra; involucels usually wanting.

41 Heloscia'dium. Margin of calyx 5-toothed, or obsolete. Petals ovate, entire, with a straight or inflexed point. Styles short. Fruit ovate or oblong; ribs filiform, rather prominent; furrows furnished with 1 vitta each. Carpophore entire. Involucra variable in the different sections.

42 Discopleu'ra. Teeth of calyx 5, subulate, permanent (f. 61. *e.*). Petals ovate, emarginate (f. 61. *b.*), with a replicate point (f. 61. *f.*). Fruit ovate (f. 61. *c.*). Three dorsal ribs filiform, exserted, and acutish: 2 lateral ones somewhat concrete with the thick accessory margin, forming a disk on both sides of the fruit; furrows furnished with 1 vitta each. Carpophore bifid.—Involucels of a few linear setaceous leaflets (f. 61. *g.*).

43 Leptocau'lis. Margin of calyx obsolete (f. 62. *a.*). Petals elliptic, entire. Styles permanent. Fruit ovate (f. 62. *a.*); ribs hardly prominent; furrows furnished with 1 vitta. Carpophore bifid at the very apex.—Involucra wanting; involucels short, few-leaved.

44 Ptycho'tis. Margin of calyx 5-toothed. Petals obovate, bifidly emarginate, furnished by a transverse plait in the middle, which emits a little segment. Fruit ovate or oblong; ribs filiform; furrows furnished with 1 vitta each. Carpophore bipartite.—Involucrum variable; involucels of many leaves.

45 Falca'ria. Margin of calyx 5-toothed; tube wanting in the sterile flowers, but cylindrical in the fertile ones. Petals obovate, curved, having a broad emarginate recess, with a reflexed point. Styles divaricate. Fruit oblong; ribs filiform; carpophore distinct, bifid; furrows furnished with 1 filiform vitta each.—Involucrum of many leaves. Involucel somewhat dimidiate from the inner leaflets being small on one side.

46 Si'son. Margin of calyx obsolete. Petals roundish, curved, deeply emarginate, with an inflexed point. Styles very short. Fruit ovate; ribs filiform; vittæ 1 in each furrow, short, rather club-shaped; carpophore bipartite.—Involucra and involucels of few leaves.

47 Schu'ltzia. Margin of calyx obsolete. Petals elliptic, with a short inflexed point. Stylopodium conical. Styles erect, somewhat capitate at the apex, permanent. Fruit cylindrically prismatic; ribs filiform; vittæ 1 in each furrow. Carpophore undivided.—Involucra and involucels of many multifid leaves.

48 A'mmi. Margin of calyx obsolete. Petals obovate, with an inflexed point, emarginately 2-lobed; lobes unequal, irregular; those on the outside of the umbels the largest. Fruit ovate-oblong; ribs filiform; vittæ 1 in each furrow. Carpophore distinct, 2-parted.—Involucra of many trifid or pinnatifid leaves; involucels of many leaves.

49 Ægopo'dium. Margin of calyx obsolete. Petals obovate. emarginate, with an inflexed point. Stylopodium distinct, conical, terminated by the long deflexed styles. Fruit ovate; ribs filiform; furrows without vittæ; carpophore setaceous, forked at the apex.—Involucra and involucels wanting.

50 Ca'rum. Margin of calyx obsolete. Petals regular, obovate, emarginate, with an inflexed point. Stylopodium depressed; styles deflexed. Fruit ovate or oblong, contracted from the sides; ribs filiform; vittæ 1 in each furrow, and 2 in the commissure, which is flat; carpophore distinct, forked at the apex.—Involucra and involucels variable in the different species.

51 Chamæscia'dium. Margin of calyx toothed a little. Petals ovate-lanceolate, quite entire, with an oblique or inflexed point. Stylopodium depressed; styles at length deflexed. Fruit ovate-oblong; mericarps solid; ribs filiform; vittæ 3-4 in each furrow, and 4-6 in the commissure; carpophore adnate, bifid at the apex.—Involucra and involucels of many leaves.

52 Bu'nium. Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point. Fruit linear-oblong; ribs filiform, obtuse; vittæ 2-3 in each furrow, and 4 in the commissure, all superficial. Carpophore distinct, bifid.—Involucra variable in the different species; involucels of few leaves.

53 Cryptotæ'nia. Margin of calyx obsolete. Petals obovate, nearly entire, narrowed into an inflexed point. Fruit contracted from the sides, linear-oblong, crowned by the short stylopodium and straight styles; ribs filiform, obtuse: 2 lateral ones placed in front of the margins; vittæ numerous in the furrows, covered by a corky pericarp, and are not visible, unless when the pericarps are cut transversely.—Involucra wanting; involucels few-leaved.

54 Pimpine'lla. Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point. Fruit ovate, contracted from the sides, crowned by the cushion-like stylopodium and styles, which are reflexed and somewhat capitate at the apex: ribs filiform; vittæ numerous on the furrows; carpophore distinct, bifid.—Involucra and involucels wanting.

55 Si'um. Margin of calyx 5-toothed, but at length obsolete. Petals obovate, emarginate, with an inflexed point. Stylopodium pulvinate, with a depressed margin. Styles divergingly reflexed, somewhat capitate at the apex. Fruit compressed or contracted from the sides, crowned by the stylopodium and styles; ribs filiform, bluntish; vittæ many, both in the furrows and commissure. Carpophore bipartite, having the mericarps adhering to its parts.—Involucra of many leaves, rarely of 1 leaf; involucels of many leaves.

56 Bupleu'rum. Margin of calyx obsolete. Petals roundish, entire, closely involute, ending in a broad retuse segment. Fruit crowned by the depressed stylopodium; ribs winged, acute, filiform, or obsolete; furrows either with or without vittæ, smooth or granular.—Involucra variable in the different species. Flowers white, yellow, and greenish.

57 Heteromórpha. Margin of calyx 5-toothed. Petals roundish, entire, closely involute, ending in a broad retuse point. Fruit obovately pear-shaped, 3 winged; mericarps of 2 forms: outer one 2-winged: inner one 3-winged; the wings running from the teeth of the calyx; vittæ 1 in each furrow, and 2 in

the commissure.—A shrub with yellow flowers and ternate leaves. Involucra and involucels of many short leaves.

TRIBE V.

SESELI'NEÆ. *Fruit terete, or nearly so, with a transverse section; or the mericarps are rather compressed on the back, with 5 filiform or winged ribs: the lateral ones marginating, equal to the others, or broader. Seeds teretely convex on the back. Raphe marginal or submarginal.*

58 LICHTENSTEI'NIA. Margin of calyx acutely 5-toothed. Petals elliptic, with a long, inflexed point. Fruit nearly terete, crowned by the conical stylopodium and short styles; ribs filiform, equal; vittæ large solitary under the ribs, but none in the furrows nor commissure.—Involucra and involucels of many short leaves. Flowers yellow.

59 OTTÒA. Margin of calyx obsolete. Petals equal, with an inflexed subulate point. Styles arched, capitate at the apex. Fruit oblong, rather compressed at the commissure; ribs membranous.—Involucra and involucels none. Flowers polygamous.

60 ŒNA'NTHE. Margin of calyx 5-toothed, permanent. Petals obovate, emarginate, with an inflexed point. Stylopodium conical. Fruit cylindrically ovate, crowned by the long erect styles; ribs rather convex, obtuse, marginating ones rather the broadest; vittæ 1 in each furrow; carpophore indistinct.—Involucra variable in the different species, sometimes wanting; involucels of many leaves.

61 ANNESORHI'ZA. Margin of calyx 5-toothed, permanent. Petals elliptic, with an inflexed point. Fruit prismatically quadrangular, crowned by the calyx and reflexed styles; mericarps of 2 forms, one 3-winged, and the other 4-winged from the ribs; vittæ 1 in each furrow and 2 in the commissure. Carpophore bipartite.—Involucra and involucels of many leaves.

62 SCLEROSCIA'DIUM. Calycine teeth 5, conical, permanent (f. 56. *F. h.*). Petals obcordate, with an inflexed point (f. 56. *F. b.*), which is bi or tridentate at the apex. Stylopodium conical; styles filiform (f. 56. *F. e.*). Fruit ovate-globose, solid (f. 56. *F. g. h.*); ribs much elevated, bluntish, equal; vittæ 1 in each furrow and 2 in the commissure; carpophore distinct, undivided (f. 56. *F. k.*).—Involucra almost wanting; involucels of 5-7 leaves.

63 DASYLÒMA. Margin of calyx obsolete. Petals unknown. Stylopodium depressed; styles short. Fruit ovate; mericarps not separating at maturity; ribs corky, cellular: 3 dorsal ones small: 2 lateral ones large and obtuse; furrows narrow, and furnished with 1 vitta each, but the commissure is flat, and furnished with 2; carpophore indistinct.—Involucra and involucels wanting.

64 CYNOSCIA'DIUM. Calycine teeth 5 (f. 63. *c.*), subulate, permanent. Petals obovate, or nearly elliptic, entire, with an inflexed point (f. 63. *e.*). Stylopodium conical; styles short, reflexed (f. 63. *d.*). Fruit oval-oblong or ovate (f. 63. *b.*), tapering at the apex; ribs thick, corky; vittæ 1 in each furrow, and 2 in the commissure.—Involucra and involucels of many leaves (f. 63. *f. g.*).

65 ÆTHU'SA. Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point; outer petals radiating. Fruit ovate-globose; ribs elevated, thick, acutely keeled: lateral ones rather the broadest; vittæ 1 in each furrow, and 2 arched ones in the commissure; carpophore bipartite.—Involucrum wanting or of 1 leaf; involucels of 1-3-5 leaflets, on one side of the umbellule.

66 FŒNI'CULUM. Margin of calyx tumid, obsolete. Petals roundish, entire, involute, with a rather quadrate retuse point; ribs rather prominent, bluntly keeled: lateral ones rather the broadest; vittæ 1 in each furrow, and 2 in the commissure.—Involucra and involucels wanting, or nearly so. Flowers yellow.

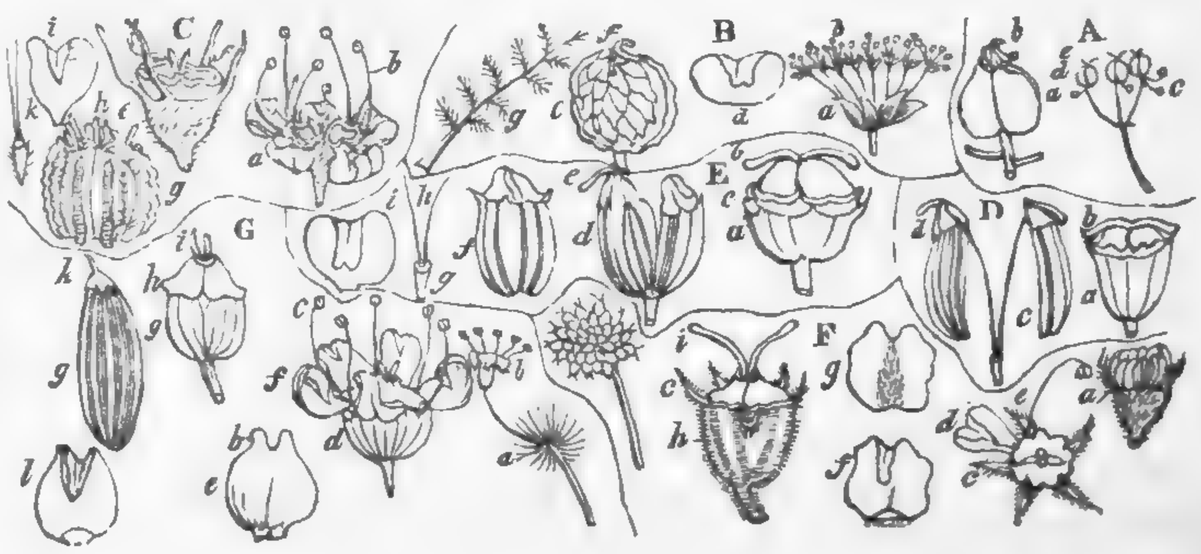
67 KUNDMA'NNIA. Margin of calyx 5-toothed. Petals roundish, entire, involute, with a broad retuse point. Stylopodium conical. Fruit terete, 10-furrowed; mericarps with 5 filiform, obtuse, equal ribs; vittæ many, both in the furrows and commissure; carpophore undivided.—Involucra and involucels of many filiform reflexed leaves.

68 DEVE'RRA. Margin of calyx obsolete. Petals ovate, with an inflexed acumen. Styles short. Fruit ovate or roundish, hispid from scales or hairs; mericarps semi-terete, with obsolete ribs; vittæ 1 in each furrow, and 2 in the commissure. Carpophore bipartite.—An aromatic almost leafless shrub.—Involucra of 4-6 leaves; involucels of 4-6 ovate-lanceolate leaves.

69 SORA'NTHUS. Margin of calyx obsoletely toothed. Petals broadly ovate, acuminated, permanent, with an inflexed point. Fruit a little compressed from the back: crowned by the divaricate styles; mericarps with 5, hardly prominent ribs; vittæ 1 in each furrow, and 4 in the commissure. Carpophore bipartite.—Involucra nearly wanting; involucels of 5-7 spreadingly reflexed leaves.

70 SE'SELI. Margin of calyx 5-toothed; teeth short, thickish. Petals obovate, emarginate or nearly entire, with an inflexed point (f. 55. *E. i.*). Fruit (f. 55. *E. d.* f. 55. *D. a. b.*) oval or oblong, crowned by the reflexed styles (f. 55. *E. b.*); ribs filiform or elevated, rather prominent, thick, corky: lateral ones a little broader than the rest; vittæ 1 in each furrow, sometimes 2 in the outer furrows, but always 2 or 4 in the commissure.—Involucra almost wanting; involucels of many leaves.

FIG. 55.



71 Libano'tis. This genus agrees in every respect with *Séseli*, but differs in the lobes of the calyx being slender, subulate, elongated (f. 55. *F. c.*), and coloured, deciduous.—Involucra and involucels of many leaves.

72 Cenolòphium. Margin of calyx obsolete. Petals obovate, emarginate (f. 55. *G. b. f.*), with an inflexed point (f. 55. *G. l.*); ribs equal, sharp, a little winged, hollow inside; vittæ 1 in each furrow, and 2 in the commissure.—Involucra wanting, or of 1 leaf; involucels of many leaves (f. 55. *G. a.*).

73 Cni'dium. Differs from *Cenolòphium* in the ribs of the fruit being furnished with membranous wings.—Involucra variable in the different species; involucels of many leaves.

74 Peti'tia. This genus differs from *Séseli* and *Libanòtis* by the margin of the calyx being entire; and from *Cnìdium* in the petals not being emarginate, and in the ribs of the fruit not being winged.

75 Endre'ssia. This genus differs from all the rest in the present tribe, in the fruit being compressed from the sides, in the ribs being obtuse and filiform, not winged; vittæ 6 in the commissure, and 3 or 4 in the furrows.

76 Tha'spium. Margin of calyx 5-toothed. Petals elliptic, with a long inflexed acumen. Fruit nearly elliptic; ribs winged; vittæ 1 in each furrow, and 2 in the commissure.—Involucra wanting; involucels of 3 leaves on one side.

77 Trochisca'nthes. Margin of calyx 5-toothed. Petals on long claws, spatulately obovate, with a triangular inflexed segment; ribs sharp, rather winged, equal; vittæ 3-4 in each furrow, and 8 in the commissure. Carpophore bipartite.—Involucrum wanting, or of 1 leaf; involucels of 2-5 leaves.

78 Athama'ntha. Margin of calyx 5-toothed. Petals obovate or entire: with a very short, inflexed, unguiculated point; fruit attenuated into a neck; ribs filiform, wingless, equal; vittæ 2-3 in each furrow.—Involucra few-leaved; involucels of many leaves.

79 Ligu'sticum. Margin of calyx 5-toothed or obsolete. Petals obovate, acute, emarginate, with an inflexed point; ribs short, rather winged, equal; vittæ many, both in the furrows and commissure.—Involucra variable; involucels many-leaved.

80 Sila'us. Margin of calyx obsolete. Petals obovate-oblong, entire, or rather emarginate, with an inflexed point; ribs sharp, rather winged, equal: vittæ many in each furrow, and so close together as to appear one; commissure furnished with 4-6 vittæ.—Involucra wanting or of few leaves; involucels of many leaves. Flowers cream-coloured or greenish.

81 Wallro'thia. Calycine teeth 5, ovate-lanceolate, acute (f. 56. *A. b.*). Petals elliptic, entire, acute at both ends (f. 56. *A. d.*). Mericarps with rather prominent, equal ribs; vittæ numerous in the furrows.—Involucra of 1-3 unequal leaves; involucels of 5-8 unequal leaves.

82 Me'um. Margin of calyx obsolete. Petals entire, elliptic, acute at both ends. Mericarps with rather prominent, equal, keeled ribs; vittæ many in each furrow, and 6-8 in the commissure.—Involucra wanting; involucels of many leaves.

83 Ga'ya. Margin of calyx obsolete. Petals obovate, more or less emarginate, with a broad inflexed point. Fruit oval, a little compressed; ribs elongated, wing-formed, contiguous at the base, at equal distances, obtuse; vittæ none. Carpophore bipartite.—Involucra few-leaved.

84 Conioselìnum. Margin of calyx obsolete. Petals obcordate or obovate, with an inflexed point. Styles at length reflexed. Fruit compressed or convex from the back; ribs winged: lateral ones twice the breadth of the rest; vittæ 3 in each furrow, but in the dorsal furrows sometimes only 2: and 4-8 unequal ones in the commissure; carpophore bipartite.—Involucra wanting, or of few leaves; involucels of 5-7 linear-subulate leaves.

85 Cri'thmum. Margin of calyx obsolete. Petals roundish, entire, involute, with an obovate point. Mericarps with 5 elevated, sharp, somewhat winged ribs: the lateral ribs a little broader than the rest; pericarp spongy from large cells.—Involucra and involucels of many leaves. Seed semi-terete, constituting a distinct nucleus, covered with copious vittæ.

Tribe VI.

Angeli'ceæ. *Fruit compressed from the back, girded by 2 wings on each side, from the raphe being central, or nearly so; mericarps furnished with 5 ribs: the 3 dorsal ribs filiform or winged: and the 2 lateral ones always expanded into wings, and broader than the dorsal ones. Seed rather convex on the back, and flattish in front.*

86 Levi'sticum. Margin of calyx entire. Petals incurved, roundish, entire, with a short point. Mericarps with 5 wings; wings of the lateral ribs the broadest; vittæ 1 in each furrow, and 2-4 in the commissure. Carpophore bipartite.—Involucra and involucels of many leaves.

87 Selìnum. Margin of calyx obsolete. Petals obovate, emarginate. Mericarps with 5 membranous wings; the wings of the lateral ribs twice the breadth of the rest; vittæ 1 in each furrow, but in the outer ones usually 2, and always 2 in the commissure. Carpophore bipartite.—Involucrum of few leaves; involucels of many leaves.

88 Oste'ricum. Calyx 5-toothed; teeth broad. Petals unguiculate, obovate, emarginate, with an inflexed point. Mericarps with 5 ribs: the 3 dorsal ones elevated and filiform: the 2 lateral ones dilated into wings, much broader than the rest; vittæ 1 in each furrow. Carpophore bipartite.—Involucra of few leaves; involucels of many leaves.

89 Ange'lica. Margin of calyx obsolete. Petals lanceolate, entire, with a straight or incurved point. Mericarps with 5 ribs: the 3 dorsal ones filiform and elevated: and the 2 lateral ones dilated into membranous wings, which are broader than the rest; vittæ 1 in each furrow. Carpophore bipartite.—Involucrum wanting, or of few leaves; involucels of many leaves.

90 Archange'lica. Margin of calyx with 5 short teeth. Petals elliptic, entire, with an incurved point. Mericarps with 5 thickish, keeled ribs: the 3 dorsal ones elevated: and the 2 lateral ones dilated into wings. Seed not adhering to its covering, but constituting a free nucleus, covered all over with copious vittæ. Carpophore bipartite.—Involucra nearly wanting; involucels of many leaves, unilateral.

Tribe VII.

Peuceda'neæ. *Fruit compressed from the back, or lenticularly*

compressed, girded by a smooth, winged, flattened, or rather convex, dilated, entire margin. Mericarps with 5 filiform ribs, rarely winged; lateral ribs contiguous to the dilated margin, or lost in it. Raphe marginal, hence the fruit is only furnished with 1 *wing on each side, not with 2 wings, as in the last tribe, where the raphe is central. Seed flattened, or rather convex on the back.*

91 Opo'panax. Margin of calyx obsolete. Petals roundish, entire, involute, with an acutish point. Stylopodium broad, thick; styles very short; mericarps with 3 dorsal, filiform, very slender ribs: the 2 lateral ones wanting, or not distinct from the margin; vittæ 3 in each furrow, and 6-10 in the commissure. Seed flat. —Involucra and involucels of many leaves. Flowers yellow.

92 Fe'rula. Margin of calyx with 5 short teeth. Petals ovate, entire, with an ascending or incurved point. Fruit girded by a dilated flat margin; mericarps with 3 dorsal filiform ribs: the 2 lateral ones very obsolete, or not distinct from the dilated margin; vittæ 3 or more in the dorsal furrows, and 4 or more in the commissure. Seed flat. Carpophore bipartite.—Involucra and involucels variable. Flowers yellow.

93 Dore'ma. The large, cup-shaped, epigynous disk, and the solitary vittæ in the furrows of the fruit, distinguish this genus from *Férula* and *Opópanax*. The flowers being completely sessile is also a remarkable character.

94 Eriosy'naphe. Calyx bluntly 5-toothed. Petals ovate, entire, with a short, incurved point (f. 56. *E. f.*). Fruit compressed (f. 56. *E. k.*) from the back, girded by a thickish margin: the 3 dorsal ribs filiform: and the 2 lateral ones running into the thickish margin, which is spongy inside; furrows broad, 2-3-striped, bearing 2-3 vittæ in each; and the commissure is without vittæ, but marked with a middle nerve and 2 marginal ones, rather hollow and tomentose between the nerves. Seed flattish.—Involucra and involucels wanting. Flowers yellow.

95 Pali'mbia. Margin of calyx obsolete. Petals elliptic, with an acute inflexed point. Fruit oblong or oval. Mericarps compressed from the back: with 5 filiform, bluntish ribs: 2 marginal ones a little broader than the rest; vittæ 3 in each furrow, and 2 broad ones in the commissure. Seed oblong, free, striped. —Involucrum few-leaved or wanting. Flowers cream-coloured.

96 Peuceda'num. Margin of calyx 5-toothed. Petals obovate, emarginate, or entire, with an inflexed point. Fruit girded by a flat margin; the 3 dorsal ribs filiform: and the 2 lateral ones more obsolete, contiguous to the dilated margin; vittæ in each furrow usually 1, and in the commissure 2. Carpophore bipartite. Seed flat in front.—Involucra variable in the different species; involucels of many leaves.

97 Imperatòria. All as in *Peucedànum*, but the margin of the calyx is obsolete.—Involucra wanting; involucels of few leaves.

98 Calli'sace. Margin of calyx rather 5-toothed, or nearly obsolete. Petals oval, with an incurved point. Fruit nearly orbicular, emarginate at the base, with a winged margin; the 3 dorsal ribs obtuse and nerve-formed: the 2 lateral ones expanded into wings, which lie over the whole surface: vittæ 1 in each furrow, and 1 on each side of the commissure. Forks of carpophore adhering to the mericarps.—Involucra wanting, or of few leaves; involucels of many setaceous leaves.

99 Bu'bon. Margin of calyx obsolete. Petals obovate, entire, with an acute involute point. Fruit girded by a flattened, dilated margin; the 3 intermediate ribs filiform, and the 2 lateral ones going into the margins; vittæ covering the whole seed, 4 dorsal and 2 in the commissure. Carpophore bipartite. Seed flat in front and convex on the back.—Cape shrubs. Involucra and involucels of many leaves. Flowers greenish yellow.

100 Ane'thum. Margin of calyx obsolete. Petals roundish, entire, with a rather square retuse point. Fruit girded by a flat margin; the 3 intermediate ribs acutely keeled, and the 2 lateral ones more obsolete, and running into the margin; vittæ broad, solitary in the furrows, and filling them, and twin in the commissure. Seed rather convex on the back.—Involucra and involucels wanting. Flowers yellow.

101 Córtia. Teeth of calyx elongated, acute. Petals lanceolate, acuminated, entire. Stylopodium conical; styles diverging. Fruit elliptic, rather retuse at both ends; ribs winged: lateral one the broadest; vittæ 1 in each furrow, and 2 in the commissure, which is flat. Seed flattish.—Involucra of 2-3 multifid leaves; involucels of 5 linear, entire, or 2-3-cleft leaves.

102 Capnophy'llum. Margin of calyx obsolete. Petals oblong, rather emarginate, tapering into an inflexed acumen. Fruit girded by a flat, dilated margin; the 3 intermediate ribs thickish, keeled, rather flexuous, tubercular: the 2 lateral ones going into the dilated margin; vittæ 1 in each furrow, and 2 in the commissure. Seed rather convex on the back.—Involucra and involucels of 3-6 leaves.

103 Tiedema'nnia. Margin of calyx 5-toothed (f. 64. *a.*). Petals acuminated, reflexed. Fruit nearly ovate (f. 64. *c.*); mericarps with 5 filiform, subcarinated, approximate ribs: lateral ones dilated into a membranous margin, which is nearly the breadth of the fruit; vittæ solitary in the furrows, and filling them, and twin in the commissure. Carpophore bipartite. Seed flat.—Involucra and involucels of 4-5 subulate leaves.

104 Archemo'ra. Margin of calyx 5-toothed. Petals obcordate, with an inflexed point. Fruit compressed from the back, oval or obovate; mericarps with 5 filiform, rather keeled, approximate ribs: lateral ribs dilated into a broad membrane; vittæ solitary in the furrows, and filling them, and twin in the commissure. Carpophore bipartite. Seed flattened.—Involucra wanting or few-leaved; involucels of many leaves.

105 Pastina'ca. Margin of calyx obsolete, or minutely denticulated. Petals roundish, entire, involute, with a broad retuse point. Fruit compressed from the back, girded by a flat dilated margin: the 3 intermediate ribs filiform, equidistant: lateral ones contiguous to the dilated margin; vittæ linear, acute, hardly shorter than the ribs, solitary in the furrows, and twin or more in the commissure. Carpophore bipartite. Seed flattened.—Involucra and involucels wanting or few-leaved. Flowers yellow.

106 Leiótulus. Teeth of calyx obsolete. Petals roundish, entire, involute, with a broad retuse segment. Fruit compressed, with a thickened dilated smooth margin; the 3 intermediate ribs approximate, and the 2 lateral ones marginal and remote; vittæ 1 in each furrow, filiform, distant in the commissure. Involucra wanting; involucels of a few very fine leaves.

107 Astyda'mia. Margin of calyx 5-toothed (f. 56. *D. a. d. f.*). Petals obovate, entire, with an inflexed point. Stylopodium thick; styles very short (f. 56. *D. g.*). Fruit compressed from the back (f. 56. *D. k.*), girded by a thick dilated margin; the 3 dorsal ribs crested, approximate: the 2 lateral ones running into the margin; dorsal vittæ very few, the commissural ones wanting or covered.—Involucra and involucels of many leaves. Flowers yellow.

108 Symphyolòma. Margin of calyx obsolete. Petals equal, emarginate, with an inflexed point. Stylopodium without a margin; styles reflexed. Fruit elliptic, compressed from the back; mericarps closely connate by their margins; with 5 filiform ribs: 3 dorsal ribs equi-distant: lateral ones more remote, marginating; vittæ wanting or obsolete. Seed flattened. Carpophore none. Flowers red.

109 Heracle'um. Calyx 5-toothed. Petals obovate, emarginate, with an inflexed point: exterior petals usually radiating and bifid. Fruit compressed from the back, girded by a flat, dilated margin; mericarps with very fine ribs: 3 dorsal ones equidistant: 2 lateral ones remote, contiguous to the dilated margin: vittæ 4 on the back, solitary in the furrows, but usually with 2 in the commissure, all shorter than the fruit, and usually club-shaped; carpophore bipartite. Seed flat.—Involucra caducous, usually of few leaves; involucels of many leaves.

110 Zozi'mia. Calyx 5-toothed. Petals obovate, emarginate, with an inflexed point. Fruit compressed from the back, rather convex in the middle, hairy, girded by a smooth, thickened, dilated margin; ribs very thin: dorsal ones at equal distances: 2 lateral ones more remote, contiguous to the dilated margin; vittæ covering the whole seed, solitary in the furrows, and twin in the commissure. Carpophore bipartite. Seed flat.—Involucra and involucels of many leaves.

111 Polytæ'nia. Calyx 5-toothed. Petals oval, emarginate, with an inflexed point. Fruit oval, compressed on the back, convex in the middle, glabrous; with a smooth tumid margin, and a depressed furrow on the back; ribs very slender, hardly distinct; vittæ twin between the ribs, but 6 in the commissure; carpophore indistinct. Seed flat.—Involucra none; involucels setaceous.

112 Johre'nia. Teeth of calyx obsolete, very blunt. Petals unknown. Stylopodium short, conical, furrowed a little. Styles short, diverging. Fruit oval, lenticularly compressed on the back (f. 56. *C. b.*), quite glabrous; with a smooth tumid margin, and a flat, dorsal, coloured furrow; mericarps with 3 dorsal, filiform ribs, which probably contain vittæ: 2 lateral ones running into the dilated margin, hardly distinct, usually rufous, and the form of vittæ; commissure spongy, furnished with 2 lines, but without vittæ. Carpophore 2-parted (f. 56. *C. b. a.*). Seed flat.—Involucrum wanting, or of 1 leaf; involucels of 4-5 linear, setaceous leaves.

Tribe VIII.

Tordyli'neæ. *Fruit lenticularly or flatly compressed from the back, girded by a thickened, nodulose, or plaited, dilated margin. Mericarps with 5 very fine or obsolete ribs: lateral ones contiguous to the dilated margin, or forming the same. Seeds flattened. This tribe differs from Peucedàneæ in the margin of the fruit being plaited or nodulose, not smooth and entire.*

113 Hasselqui'stia. Margin of calyx 5-toothed. Petals obovate, emarginate, with an inflexed point; outer petals radiating and bifid. The outer fruit of the umbel are compressed, girded by an accessory, winged, thickened margin, which is hardly wrinkled; those of the disk dissimilar: one of the mericarps contracted into an hemispherical urceolus around the other, which is abortive; ribs very slender: the 3 dorsal ones equidistant: and the 2 lateral ones contiguous to the thickened margin, or hidden by it; vittæ 1 in each furrow, and 2 in the commissure. Carpophore bipartite. Seed flat.—Involucra of many leaves.

114 Tordy'lium. All as in *Hasselquístia*, except that the vittæ are either solitary or numerous in the furrows, and either 2 or more in the commissure; and in the fruit being equal, and girded by a tubercularly wrinkled, accessory, thickened margin.—Involucra of many leaves.

115 Tordylópsis. Margin of calyx 5-toothed; teeth acute: outer teeth the largest, dilated at the base, and cuspidate at the apex. Outer petals of umbels larger, and obcordately 2-lobed: the rest smaller, ovate, and cuspidate, usually entire, rarely somewhat 2-lobed. Stylopodium conical. Styles erect, elongated. Fruit hairy.—Involucra and involucels of 5-6 lanceolate-linear leaves.

** *Fruit furnished with both primary and secondary ribs.*

Tribe IX.

Sileri'neæ. *Fruit lenticularly compressed from the back. Mericarps with 5 primary ribs: the lateral ones marginating; and usually with 4 secondary, less prominent ones; all filiform and wingless. Seeds flattish in the front.*

116 Krube'ra. Margin of calyx 5-toothed. Petals obovate, emarginate, with an inflexed point. Mericarps with 5 plicately crenated, thick ribs: the 3 intermediate elevated, obtuse, and keeled: 2 lateral marginating and roundish, keeled near the raphe; vittæ none. Carpophore bifid.—Involucra 2-5-leaved; involucels 4-5-leaved.

117 Pachypleu'rum. Margin of calyx obsolete, or minutely denticulated. Petals permanent; those of the inner flowers obovate-oblong, emarginate, with an acute, inflexed point; those of the ray flowers of 2 forms: the 3 inner, ovate, hardly emarginate, with an acute inflexed point: 2 outer nearly orbicular, and profoundly emarginate, also with an inflexed point. Mericarps with elevated, thick, and corky ribs: the lateral ones marginating, and a little broader than the others; vittæ none.—Involucra and involucels of many leaves.

118 Agasy'llis. Margin of calyx obsolete. Petals lanceolate, incurved. Fruit oval. Mericarps with 5 primary ribs: the 2 lateral ones placed in front of the accessory margin; the secondary ribs hardly visible. Seeds furnished with 8-10 dorsal vittæ, and 5-6 commissural ones.—Involucra wanting; involucels of many setaceous leaves.

119 Stenocœ'lium. Margin of calyx 5-toothed. Petals obovately orbicular, somewhat emarginate, with an inflexed

point. Mericarps with 5 rounded, thick, equal ribs; vittæ 1 in each furrow.—Involucra and involucels of many leaves.

120 Si`ler. Margin of calyx 5-toothed. Petals obovate, emarginate, with an inflexed point. Ribs filiform, elevated, obtuse: primary ones 5: lateral ones of these marginating: secondary ones 4, less prominent; vittæ 1 in each furrow, under the secondary ribs.—Involucra none, or few-leaved, caducous.

121 Ga'lbanum. This genus differs from *Sìler* in the absence of dorsal vittæ to the fruit, and the commissure being furnished with only 2.

Tribe X.

Cumi'neæ. *Fruit contracted from the sides; mericarps with 5 filiform, primary ribs: the lateral ones of these marginating; and 4 secondary more prominent ones; all wingless. Seed straight, flattish in front.*

122 Cumi`num. Calyx with 5 lanceolate, unequal, permanent teeth. Petals oblong, emarginate, with an inflexed point. Primary ribs minutely muricated: secondary ones prickly; vittæ 1 in each furrow under the secondary ribs. Carpophore bipartite. Seed concave in front, and convex on the back.—Involucra of 2-4 simple or divided leaves; the involucels dimidiate, of 2-4 reflexed leaves.

123 Trepoca'rpus. Calyx with 5 subulate teeth, which fall off at length. Petals obcordate, inflexedly emarginate. Fruit pyramidly angular, nearly terete; mericarps convex on the back; primary ribs margined with a fuscous, vittæ-formed line on each side; secondary ones furnished with 1 vitta on their inner side; commissure thick, furrowed in the middle, and furnished with vittæ inside. Seed straight, rather compressed on the back.—Involucra 1-3-leaved; involucels dimidiate, of 4-5 linear, unequal leaves.

Tribe XI.

Thapsie`æ. *Fruit compressed from the back; mericarps with 5 filiform primary ribs, which are now and then bristly: lateral ones seated in the flat commissure; secondary 4: inner ones of these filiform, and the outer ones or all are winged: wings undivided, hence the fruit is either 8-winged, or furnished with 2 wings on each side. Seed flattish, or teretely convex, flat in front.*

124 Tha'psia. Margin of calyx 5-toothed. Petals elliptic, entire, with an inflexed or involute point; 2 lateral secondary ribs winged, hence the fruit is 2-winged on each side; furrows under the secondary ribs furnished with 1 vitta each. Carpophore bipartite. Seed flattish.—Involucra and involucels wanting, or of few leaves. Flowers yellow.

125 Cymo'pterus. Calyx minutely 5-toothed. Petals roundish-oval, inflexed at the apex. Fruit nearly elliptic, compressed, 7-8-winged, from all the secondary ribs being winged; wings undulated; furrows flat, 1-nerved; commissure naked, 3-striped. Carpophore not separable from the mericarps.—Involucra wanting; involucels dimidiate, 5-7-parted.

126 Laserpi'tium. Margin of calyx 5-toothed (f. 55. *C. f.*). Petals obovate, emarginate (f. 55. *C. a.*), with an inflexed point (f. 55. *C. i.*). Fruit compressed from the back (f. 55. *C. g.*), or nearly terete, 8-winged, in consequence of the 8 secondary nerves being winged; vittæ 1 in each furrow, under the secondary ribs. Carpophore free, bipartite (f. 55. *C. k.*).—Involucra and involucels of many leaves.

127 Lophoscia`dium. Margin of calyx 5-toothed. Petals elliptic, entire, acuminated, involute at the apex (f. 55. *B. d.*). Fruit compressed (f. 55. *B. e.*) on the back; the 2 lateral secondary ribs expanded into a subserrated wing each: the 2 dorsal ones expanded into an interrupted wing each, at first sight appearing like retrograde scales (f. 55. *B. e.*).—Involucra of 5-7 ovate-lanceolate leaves (f. 55. *B. a.*); involucels of 5-7 narrower leaves (f. 55. *B. b.*). Flowers yellow.

128 Melanoselìnum. Margin of calyx 5-toothed. Petals obovate, emarginate, with a reflexed point. Fruit compressed from the back; the 2 inner secondary ribs filiform and very slender: the 2 outer ones expanded into a membranous serrated wing each; with oleiferous canals under all the ribs. Carpophore bipartite. Seed flat.—A shrub. Involucra and involucels of many leaves, the first composed of cut leaves, and the second of entire leaves.

Tribe XII.

Dauci'neæ. *Fruit lenticularly compressed from the back; mericarps with 5 bristly, filiform, primary ribs; lateral ones of these seated in the flat commissure, as in Thapsièæ; and with 4 secondary ones, which are more prominent and prickly; the prickles free, or joined into a wing. Seeds flattish, or subsemiterete, or convex on the back, and flattish in front.*

129 Arte`dia. Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point: those on the outer part of the umbel radiating and bipartite. Secondary ribs 4: the 2 inner ones filiform: the outer ones expanded into a sinuately lobed wing each; vittæ none. Carpophore bipartite. Seed flat.—Leaves of involucra and involucels divided into linear lobes.

130 Orla`ya. Margin of calyx 5-toothed. Petals obovate, emarginate, with an inflexed point: those in the ray of the umbel profoundly bifid. Secondary ribs of fruit furnished with 2 or 3 rows of prickles, outer ones more prominent, or a little winged; prickles hooked or rayed at the apex; vittæ 1 in each furrow under the secondary ribs. Carpophore bifid or undivided? Seed convex on the back.—Involucra variable; involucels of many leaves.

131 Dau'cus. Margin of calyx 5-toothed. Petals obovate, emarginate, with an inflexed point: outer ones usually radiating, and profoundly bifid. Fruit oval or oblong; the 4 secondary ribs more prominent and winged, divided into a simple series of prickles; vittæ 1 in each furrow, under the secondary ribs. Seed flattish in front.—Involucra of many trifid or pinnatifid leaves; involucels of many entire or trifid leaves.

Suborder II. Campylospe'rmæ. Albumen involute, or marked by a longitudinal furrow or channel on the inner side.

§ 1. *Mericarps furnished with both primary and secondary ribs.*

Tribe XIII.

Elæoselíneæ. *Fruit cylindrical, more compressed from the*

back than from the sides; mericarps with 5 primary filiform ribs; and 4 secondary ones: the 2 dorsal ones of these last nerve-formed, but the 2 lateral ones are expanded into a wing each; with the margins nerve or rib-formed. Seeds involute, semi-lunate.

132 Elæoselìnum. Margin of calyx hardly 5-toothed. Petals obovate, emarginate, with an inflexed point. Fruit nearly terete, 4-winged; the 2 lateral primary ribs seated between the wings and the nerve-formed margins; vittæ under all the ribs abounding in oil, those under the primary ribs narrower and slenderer: in the commissure there are 4.—Involucra and involucels of many cuspidate, linear leaves. Flowers yellow.

Tribe XIV.

Caucali′neæ. *Fruit contracted from the sides, or nearly terete. Mericarps with 5 filiform, bristly, or prickly, primary ribs: lateral ones of these seated in the commissure, which is flat; the secondary 4 more prominent and very prickly. Seeds involute, or inflexed on the margin.*

133 Cau′calis. Teeth of calyx 5, ovate-lanceolate. Petals obovate, emarginate, with an inflexed point: outer ray ones profoundly bifid. Fruit rather compressed from the sides; secondary ribs deeply cleft into a simple series of prickles; vittæ solitary in each furrow, under the secondary ribs, and 2 in the commissure. Carpophore stiff, cleft at the apex.—Involucra none, or of 1-2 leaves; involucels of 3-8 lanceolate leaves.

134 Turge′nia. Teeth of calyx 5, setaceous. Petals obovate, emarginate, with an inflexed point: outer ones radiating and bifid. Fruit subdidymous; lateral primary ribs with a simple series of warts or prickles, all the rest furnished with 2 or 3 rows of equal prickles; furrows furnished with 1 vittæ each under the secondary ribs. Carpophore setaceous, bifid.—Involucra and involucels of 3-5 ovate, concave, equal leaves.

135 Torì′lis. Teeth of calyx 5, triangularly lanceolate, acute, permanent. Petals obovate, emarginate, with an inflexed point: outer ones larger and bifid. Secondary ribs having abundance of prickles occupying the whole furrows, which are furnished with 1 vitta each under the prickles. Carpophore setaceous, bifid. Involucra of 1-5 leaves; involucels of 5-6 lanceolate ciliated leaves.

§ 2. *Mericarps only furnished with primary ribs.*

Tribe XV.

Scandici′neæ. *Fruit evidently compressed, or contracted from the sides, usually beaked; mericarps with 5 filiform ribs, which are at length winged: lateral ribs marginating, all equal, but sometimes all obliterated at the base, and only conspicuous at the apex. Seeds teretely convex, having a deep furrow in front, or somewhat involute on the margin.*

136 Sca′ndix. Margin of calyx obsolete, or somewhat 5-toothed. Petals obovate, truncate, or emarginate, usually furnished with an inflexed point. Fruit compressed from the sides, with a very long beak; vittæ wanting, or nearly obsolete. Carpophore undivided, forked at the apex—Involucra wanting, or of 1 leaf; involucels of 5-7 leaves.

137 Anthri′scus. Margin of calyx obsolete. Petals obovate, truncate, or emarginate, with a very short inflexed point. Fruit contracted from the sides: having a beak, which is shorter than the seed; mericarps nearly terete, destitute of ribs, the beak alone being furnished with 5 ribs. Carpophore bifid at the apex.—Involucra wanting; involucels of many leaves.

138 Chærophy′llum. Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point. Fruit compressed from the sides, without any beak; commissure deep; vittæ 1 in each furrow. Carpophore bifid.—Involucra wanting, or of few leaves; involucels of many leaves.

139 Calda′sia. Margin of calyx obsolete. Petals ovate, with an entire somewhat involute point. Fruit ovate-oblong, rather compressed from the sides, crowned by the short diverging styles; furrows between the ribs broad, flat, striated, and furnished with 1 vitta each; commissure furrowed in the middle. Carpophore bipartite. Seed rather convolute at the commissure.—Umbels simple, surrounded by a 20-leaved involucrum.

140 Sphalleroca′rpus. Teeth of calyx 5, subulate. Petals obovate-cuneated, emarginate, with an inflexed point (f. 56. *L. b.*): the outer ones of the umbel radiating. Stylopodium rather urceolate, toothed; styles short. Fruit elliptic-oblong (f. 56. *L. d.*), contracted from the sides, without a beak; furrows between the ribs convex, furnished with 2-3 vittæ each, and the commissure with 4-6. Carpophore bipartite (f. 56. *L. h.*).—Involucra wanting; involucels of 5-6 lanceolate leaves (f. 56. *L. a.*).

141 Molopospe′rmum. Calyx 5-toothed, foliaceous. Petals lanceolate, entire, ending in a long ascending point. Fruit contracted from the sides. Mericarps with 5 winged ribs. Seed bluntly tetragonal or angular; channels empty between the seed and the commissure of the pericarp; furrows having 1 broad brown vitta each, but the commissure is very narrow, and without any vittæ. Carpophore bipartite.—Involucra of many elongated, membranous leaves, which are sometimes multifid; involucel of many leaves.

142 Velæ′a. Margin of calyx obliterated. Petals unknown. Stylopodium conically depressed, short (f. 56. *G. b.*); styles erect, filiform. Fruit ovate (f. 56. *G. e. b.*), without a beak; mericarps rather compressed from the sides, with 5 ribs: the 2 lateral ones filiform, and the 3 dorsal ones winged; vittæ 3, and sometimes 2 in each furrow, and 4 in the commissure. Carpophore bipartite (f. 56. *G. h.*) from the base.—Involucra and involucels none.

143 My′rrhis. Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point. Fruit compressed from the sides. Seeds involute, covered by a double membrane: outer membrane furnished with 5 acutely keeled, sharp, equal ribs, hollow inside: inner one adnate to the seed; vittæ none. Carpophore cleft at the apex.—Involucra none; involucels of many lanceolate ciliated leaves.

144 Osmorhìza. Margin of calyx obsolete. Petals obovate, hardly emarginate, with a short inflexed point. Fruit elon-

gated, tapering into a tail at the base, solid, acutely angular; mericarps with hispid, rather furrowed angles; ribs 5, acute; commissure furrowed; furrows flat, without vittæ. Carpophore semi-bifid.—Involucra of 2-3 lanceolate, ciliated leaves; involucels of 5 lanceolate, ciliated leaves.

145 Grammoscia'dium. Teeth of calyx stiff (f. 56. *H. g.*), permanent. Petals obcordate, with an inflexed point. Styles short, conical (f. 56. *H. b.*), diverging. Fruit cylindrical (f. 56. *H. a. b.*), without a beak; mericarps with 5 primary, flattish white ribs; furrows flat, furnished with 1 vitta each, and the commissure with 2.—Involucra of 5-7 multifid leaves; involucels of linear-subulate, rarely cut leaves (f. 56. *H. e.*).

Tribe XVI.

Smy'rneæ. *Fruit turgid, usually compressed, or contracted from the sides; mericarps with 5 ribs: lateral ones marginating, or situated in front of the margin; the ribs sometimes almost obliterated. Seed involute, or with a furrow on the inside, semilunar or complicate.*

146 Lagœ'cia. Calycine lobes large, pectinated. Petals obcordately bifid, shorter than the calyx; lobes awned. Ovarium 2-celled, with 1 of the cells abortive. The fruit is therefore ovate, crowned by the calyx, pubescent: marked by a furrow on one side, indicating the place of the abortive seed.—Involucra of 8-10 pectinated leaves; and the involucel of 4.

147 Olive'ria. Margin of calyx 5-toothed. Petals profoundly obcordate: lobes involute on the margin at the base, and excavated at the sides, undulated and reflexed at the apex. Fruit obovate, hairy: mericarps nearly terete; with 5 blunt ribs. Carpophore bifid at the apex.—Involucra of 3-4 trifid leaves, with the lobes usually tridentate; involucels of many cuneiform, trifid leaves.

148 Anisoscia'dium. Calycine lobes of the outer flowers of the umbel, large, ovate, and foliaceous: of the outer central ones stiff and hooked: of the other inner ones wanting or tooth-formed. Petals very unequal: outer ones obcordately bifid: inner ones small. Fruit rather downy, oblong-cylindrical, crowned by the calyx, and stiff conical styles; mericarps with 5 blunt ribs; vittæ brown, 1 in each furrow, but none in the commissure.—Involucra of 4-5 oblong, acute, unequal leaves; involucels of 4-5 leaves.

149 Echinóphora. Margin of calyx 5-toothed. Petals emarginate, with an inflexed point: outer ones larger and bifid. Styles of the female flowers elongated, filiform (f. 65. *h.*). Fruit ovate (f. 65. *c.*), nearly terete, inclosed in a hollow receptacle: with a short, emersed beak; mericarps with 5 undulated, equal depressed ribs; vittæ covered with a cobwebbed membrane, 1 in each furrow.—Involucra and involucels of many leaves (f. 65. *a.*).

150 Exoaca'ntha. Flowers polygamous: central ones fertile, the rest sterile. Calyx in the sterile flowers obsolete. Petals obcordate, equal, inflexed. Young fruit of the sterile flowers obovate, striated; of the central flowers much more ovate, somewhat papillose, and crowned by 15 elongated stiff bristles.—Involucra of 10-12 large, channelled, spinose leaves; involucels of 7-11 spinose, very unequal leaves on one side.

151 Arctòpus. Flowers polygamous. Margin of calyx 5-toothed. Petals lanceolate, with an incurved acute entire point. Fruit ovate, beaked, crowned by the calyx, conferruminated from the base to the middle with the involucrum, depressed in front, and marked by a furrow, not separable into 2 parts, but bilocular, 1 of the cells abortive.—Involucra of 4-5 concrete leaves.

152 Ca'chrys. Margin of calyx 5-toothed, rarely obsolete. Petals ovate, entire, involute at the apex or inflexed. Stylopodium depressed, hardly distinct in the mature fruit. Mericarps with 5 thick ribs, variable in the different sections of the genus; commissure almost the breadth of the mericarps. Seed constituting a free nucleus covered with abundance of vittæ.—Involucra and involucels of many leaves. Flowers yellow.

153 Pra'ngos. Margin of calyx 5-toothed. Petals ovate, entire, involute at the apex. Stylopodium depressed, hardly prominent in the fruit. Commissure broad. Mericarps compressed from the back, with 5 smooth ribs, which are thick at the base, and ending in vertical membranous wings on the back. Seed girded by an abundance of vittæ.—Flowers yellow.

154 Colladònia. Margin of calyx entire. Petals oval, entire, involute at the apex. Stylopodium depressed, hardly prominent in the fruit. Mericarps compressed from the sides, ending in 5 vertical membranous wings on the back, having 1 vitta in each furrow; commissure narrow, furnished with 2 vittæ.—Involucra and involucels of many undivided leaves.

155 Lecòkia. Margin of calyx with 5 short teeth. Petals ovate, with an inflexed point. Stylopodia 2, distinct. Styles subulate. Fruit ovate, didymous, with a narrow commissure; mericarps semi-terete, with 5 obtuse, spongy ribs, which are beset with prickles on all sides. Seeds girded by copious vittæ. Involucels of 5-8 subulate leaves.

156 Magyda'ris. Margin of calyx obsolete. Petals obcordate, with an inflexed point. Fruit ovate (f. 56. *I. b.*), tomentose; mericarps with 5 thick, blunt ribs, and narrow furrows. Seeds clothed on every side with very slender vittæ, convex on the outside, and involute with a deep furrow on the inside.—Involucra and involucels present, of many undivided leaves.

157 He'rmas. Margin of calyx 5-parted, foliaceous, permanent. Petals oval-oblong, acute, keeled, entire, equal. Fruit ovate; mericarps rather inflated, compressed from the back, 5 ribbed: the dorsal rib exserted: the 2 middle ones larger: and the 2 marginal ones small, under the commissure; vittæ many in the furrows between the ribs, which are broad. Seed not adnate to its covering, rather hollow inside.—Involucra of many leaves; involucels of 3 leaves.

158 Cònium. Margin of calyx obsolete. Petals obcordate, rather emarginate, with a short inflexed point. Fruit compressed from the sides, ovate; mericarps with 5, rather prominent, equal ribs, which are undulately crenulated; having the furrows between the ribs, furnished with many stripes, but without any vittæ. Carpophore bifid at the apex. Seed with a

deep narrow furrow inside.—Involucra of 3-5 leaves; involucels of 3-5 leaves, dimidiate.

159 Vica'tia. Margin of calyx obsolete. Petals unknown. Styles short. Fruit ovate-oblong; mericarps nearly semi-terete, with 5 filiform, hardly prominent ribs; vittæ small, many in the furrows, which are broad and flat; commissure narrow. Carpophore thick, somewhat bifid at the apex. Albumen furnished with a furrow at the commissure, convex outside.—Involucra, and generally the involucels, are wanting.

160 Arraca'cha. Margin of calyx obsolete. Petals lanceolate or ovate, entire: with an inflexed point, which is curbed above the middle nerve. Fruit ovate-oblong, somewhat compressed from the sides; mericarps with 5 equal ribs; vittæ many in the furrows. Albumen nearly semi-terete, furnished with a furrow at the commissure.—Involucra wanting, or of 1 leaf; involucels of 3 leaves. Flowers polygamous.

161 Pleurospe'rmum. Margin of calyx 5-toothed. Petals obovate, entire, flat, or attenuated and inflexed at the apex. Fruit ovate, somewhat compressed from the sides; mericarps furnished with a double membrane: outer one furnished with 5 winged hollow ribs: the inner one adnate to the seed, and furnished with 5 elevated ribs under those of the outer membrane; furrows of the inner membrane furnished with 1-2 vittæ each, and the commissure with 2. Carpophore filiform, bipartite.—Involucra and involucels of many leaves.

162 Hymenolæ'na. Margin of calyx obsolete. Petals obovate, entire, flat, or attenuated and inflexed at the apex. Fruit ovate or oblong; mericarps with 5 exserted, nearly equal wings; commissure flat, furnished with 2 vittæ, and the furrows with 1. Seed with a furrow in front, convex on the outside. Carpophore bipartite.—Involucra and involucels of many leaves.

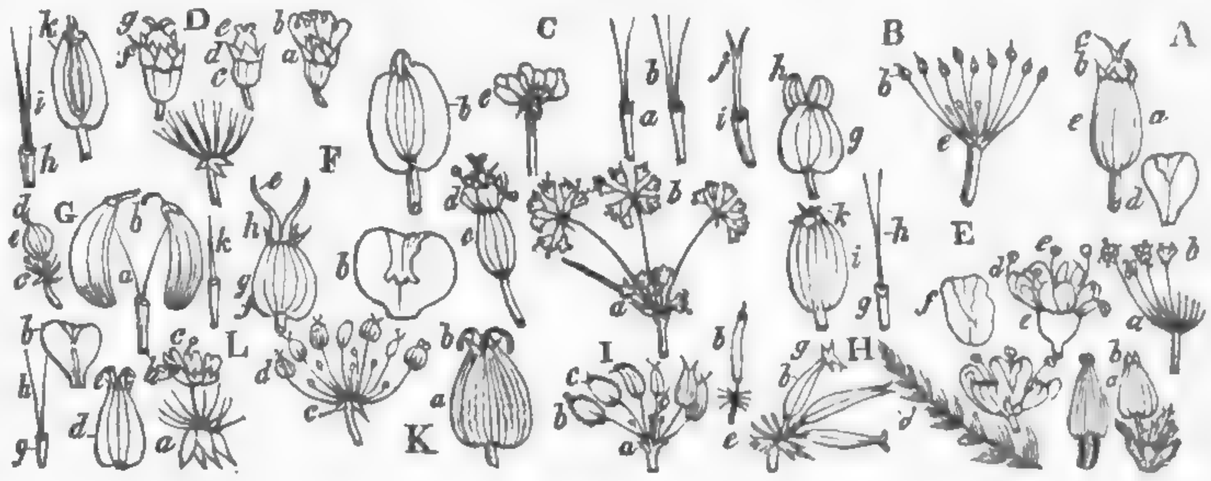
163 Physospe'rmum. Margin of calyx 5-toothed. Petals obovate, somewhat emarginate, with an inflexed point. Fruit contracted from the sides; mericarps reniformly globose, didymous, with 5 filiform equal slender ribs: the lateral ribs placed before the margins; vittæ broad, 1 in each furrow. Seed semilunar.—Involucra and involucels of many leaves.

164 Smy'rnium. Margin of calyx obsolete. Petals lanceolate or elliptic, entire, with an inflexed point. Fruit contracted from the sides; mericarps reniformly globose, didymous: with 3 dorsal, rather prominent ribs, and 2 lateral, marginating, nearly obliterated ones; vittæ many in each furrow; carpophore bipartite. Seed involute.—Involucra and involucels variable in the different species.

165 Eu'lophus. Margin of calyx 5-toothed (f. 56. *K. b.*). Petals unknown. Fruit a little contracted from the sides (f. 56. *K. a.*); mericarps ovate, rather didymous, with 5 hardly prominent ribs; furrows having 3 convex stripes, more prominent than the ribs, which are hollow inside and filled with oil; commissure furnished with 4 similar vittæ. Seed semi-lunar. Carpophore bipartite.—Involucra and involucels of many linear leaves (f. 56. *K. c.*).

166 Scalige'ria. Margin of calyx entire. Petals obcordate, with a short inflexed obtuse point. Stylopodia thick (f. 56. *B. h.*), parallel. Styles filiform, bent outwardly. Fruit rather didymous; mericarps ovate, contracted at the raphe, hardly compressed from the sides, with 5 filiform ribs; vittæ 2-3 in the furrows, which are rather convex, and 4-6 in the commissure, which is flattish. Albumen furnished with a furrow on the inside.—Involucra wanting; involucels of a few small linear leaves.

FIG. 56.



Suborder III. Cœlospe'rmæ. Albumen involutely curved from the base to the apex.

Tribe XVII.

Coria'ndreæ. *Fruit globose, or of 2 subglobose mericarps. Mericarps furnished with 5 primary, depressed, and flexuous ribs: lateral ribs placed before the accessory margin; and 4 more prominent secondary ones; all wingless.*

167 Bífora. Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point: outer ones nearly equal or radiating and bifid. Fruit didymous; mericarps ventricosely subglobose, granularly wrinkled: marked with 5 impressed, obsolete stripes: the 2 lateral stripes semicircular, placed in front of the accessory margin; vittæ wanting; commissure having 2 holes. Carpophore bipartite, adnate on both sides.—Involucra and involucels wanting, or of 1 leaf.

168 Astòma. All as in *Bifòra*, but the fruit is evidently didymous; and the commissure is narrow, not perforated, nor dilated at the apex; styles rather diverging.—Involucra of 5-6 lanceolate leaves; involucels of 4-5 leaves.

169 Atre'ma. Teeth of calyx 5, acute, small, permanent. Petals obovate, emarginate, with an inflexed point. Fruit rather didymous; mericarps nearly globose, ventricose, marked with 5 rather prominent ribs, without any vittæ; commissure narrow, closed.—Involucra and involucels of many leaves.

170 Coria'ndrum. Teeth of calyx 5, acute, unequal, permanent. Petals obovate, emarginate, with an inflexed point: outer ones radiating, bifid. Fruit globose, 10-ribbed, hardly divisible; the 4 secondary ribs on each mericarp are more prominent than the primary ones, and keeled; vittæ 1 in each furrow, and 2 in the commissure; carpophore free in the middle, but adnate at the base and apex. Seed hollow in front, covered by a loose membrane.—Involucra none; involucels usually of 3 leaves, dimidiate.

171 Cymboca'rpum. Margin of calyx obsolete. Petals equal, obcordate, with an inflexed point. Stylopodium depressed; styles

reflexed. Fruit nearly globose; mericarps solid, hemispherical: with 5 primary, filiform, usually obliterated ribs, without any secondary ribs or vittæ. Carpophore bipartite, free in the middle, but adnate at the base and apex. Seed hollowed in front.—Involucra and involucels composed of linear leaves.

SUBORDER I. ORTHOSPE'RMÆ (from *ορθος, orthos*, straight, and *σπερμα, sperma*, a seed). D. C. prod. 4. p. 58. Albumen flat on the inner side, neither involute, nor convolute.

§ 1. *Umbels simple or imperfect. Fruit destitute of vittæ.*

Tribe I.

HYDROCOTY'LEÆ (plants agreeing with *Hydrocótyle* in important characters), or Orthospérmeæ, Imperféctæ, Umbellàtæ, Compréssæ, D. C. prod. 4. p. 58.—Hydrocotýleæ, Spreng. in Schultes, syst. 6. p. 32. Koch, umb. p. 141. exclusive of many genera. Fruit contracted from the sides; back of carpella or mericarps convex, rarely acute; the 5 primary ribs or nerves becoming immediately obsolete: lateral ribs marginating, or thrown back into the flat commissure: secondary ones permanent and filiform, sometimes absent or nearly so. Albumen flattish in front. Petals spreading, entire, acute, straight, or rather inflexed at the point. This tribe represents the forms of nearly all in the different genera; it is distinguished from nearly all the suborder *Orthospérmæ*, in the umbels of flowers being imperfect; from *Sanicùleæ* in the lateral compression of the fruit, and from *Mulíneæ* in the commissure not being gradually contracted.

I. HYDROCO'TYLE (from *ὑδωρ, hydor*, water, and *κοτυλη, kotyle*, a cavity; in reference to the plants growing in moist situations, and in the leaves being hollowed like a bowl). Tourn. inst. t. 173. Thunb. diss. 1798. in diss. ed. Pers. 2. p. 410. Spreng. umb. prod. p. 10. A. Rich. diss. 1820. in ann. sc. phys. vol. 4. p. 1. Lag. am. nat. 2. p. 102. Koch, umb. p. 144. f. 64. and 65. D. C. coll. mem. v. p. 26.—Hydrocótyle and Chondrocárpus (or Glycèria), Nutt. gen. amer. 1. p. 177.

LIN. SYST. *Pentándria, Digýnia*. Tube of calyx rather compressed: limb with an obsolete margin. Petals ovate, entire, acute, with a straight apex. Fruit flatly compressed from the sides, biscutate. Mericarps or carpella without vittæ: having the 5 ribs or nerves nearly filiform: the carinal and lateral ones usually obsolete, and the 2 intermediate ones joined. Seed carinately compressed.—Usually slender bog herbs, rarely subshrubs. Umbel simple, surrounded by a few-leaved involucrum. Flowers sessile or pedicellate, white. This genus is composed of a heterogeneous mass of species, and is therefore probably divisible into several genera.

SECT. I. EUHYDROCO'TYLE (this section is supposed to contain the true species of the genus). D. C. prod. 4. p. 59. Hydrocótyle, Lin. gen. no. 325. Stems herbaceous, of nearly all the species, creeping. Fruit compressed; mericarps furnished with 1-2 ribs on each side.

§ 1. *Leaves peltate.*

1 H. INTERRU'PTA (Muhl. cat. p. 10.) leaves peltate, doubly crenated, 11-nerved, and are, as well as the petioles, glabrous; flowers disposed in many, rather distant whorles: ultimate ones umbellate; fruit rather attenuated at the base, coloured. ♃. B. H. Native of Carolina, Porto-Rico, Cape of Good Hope, Japan, New Holland, Sandwich Islands, &c. in marshy places. H. vulgàris, Michx. fl. bor. amer. 1. p. 161. H. verticillàta, Thunb. diss. 2. p. 415. t. 3. H. vulgàris *β*, Rich. l. c. t. 50. f. 1. b. H. commùnis, Cham. et Schlecht. in Linnæa. 1. p. 356.

Var. β, tuberòsa (D. C. prod. 4. p. 59.) stems tumid at the nodes, and tuberous.

Var. γ, platyphýlla (D. C. prod. 4. p. 667.) leaves 11-13-nerved, twice the size. ♃. H. Native of Tropical Africa, in marshes at Cayor.

Interrupted-flowered Penny-wort. Fl. May, June. Pl. cr.

2 H. VULGA'RIS (Lin. spec. p. 338.) leaves peltate, orbicular, doubly crenated, 9-nerved; petioles pilose at the apex; umbels capitate, usually 5-flowered; fruit somewhat emarginate at the base, of one colour. ♃. B. H. Native nearly throughout the whole of Europe, in marshy boggy places, and on the margins of clear rivulets, particularly on a peat soil; plentiful in some parts of Britain; also of North America, in Canada. Fl. dan. t. 90. Smith, engl. bot. t. 751. Curt. lond. 6. t. 19. Schkuhr, handb. t. 59. Rich. hydr. no. 1. t. 50. f. 1. and t. 52. f. 1. exclusive of the variety. Stems creeping, rooting at the nodi. Peduncles of the umbels or scapes much shorter than the petioles. Flowers reddish white or rose-coloured. There is a variety, but it is rather rare, with smooth petioles, and with the limbs emarginate at the base or nearly entire, and with the scapes drawn out beyond the umbels of flowers, and bearing 2 umbels each. Gerarde calls this plant *water penny-wort, sheep-killing penny-grass;* in the north of England it is called *white-rot*, to distinguish it from *red-rot;* in Norfolk *flowk-wort*, from its being supposed to occasion the flukes in the liver of rotten sheep; and by the husbandman *sheep's-bane*, "because it killeth sheep that do eat thereof." This, however, is a vulgar error; for the rot in sheep is owing to their feeding in wet grounds, and perhaps to an insect (the Fasciòla hepática), which from its shape is called a fluke or flounder, and abounds in such situations, adhering to stones and plants, as well as to the liver and biliary ducts of sheep affected with the rot. This, together with *Drósera* or *Sundew*, and *Pinguícula* or *Butter-wort*, are common in marshy places, and therefore the rot in sheep has been ascribed to these; but it is pretty certain that neither sheep nor any other quadruped feed on these plants.

Common Penny-wort. Fl. May, June. Britain. Pl. cr.

3 H. PUSI'LLA (Rich. hydro. p. 27. t. 52. f. 2.) plant rather hairy; leaves orbicular, not emarginate at the base, obsoletely crenated, 7-nerved; flowers umbellate; umbels hardly containing so many as 12 flowers; scapes equal in length to the petioles. ♃. F. Native about Monte Video, in arid places; and on shady rocks at Rio Paquaquer, in the province of Rio Janeiro; also of Buenos Ayres. Cham. et Schlecht. in Linnæa. 1. p. 357. Flowers small. Petioles biauriculate at the base, and as if they were minutely stipulate (Rich.). Fruit smooth; mericarps marked with a single elevated line on each side. The Buenos Ayrean plant differs from the Brazilian one in being perfectly glabrous.

Small Penny-wort. Pl. creeping.

4 H. MODE'STA (Cham. et Schlecht. l. c. p. 358.) leaves on long petioles, orbicularly reniform, glabrous, 9-nerved; petioles pilose at the apex, as well as the young branches; umbels on short peduncles, many rayed; fruit small, emarginate at both ends. ♃. B. F. Native of Brazil, in the province of Monte Video; and of Chili about Valparaiso. Petioles 3-12 inches long. Peduncles an inch long, rarely more, and sometimes only 3 lines. Fruit smaller than in any other species; mericarps marked with a hardly elevated line on the sides.

Modest Pennywort. Pl. cr.

5 H. BARBARO'SSA (Cham. et Schlecht. l. c. p. 360.) leaves on long petioles, peltate, orbicular, 8-nerved, 8-lobed, and crenated, and are, as well as the petioles, clothed with rufous hairs; umbels on long peduncles, many (50-60) rayed; fruit nearly globose, ovoid, rather emarginate, acutely ribbed. ♃. F. Native of Brazil, in shady woods near New Friburg. Petioles 4-8

inches long, but rather shorter than the peduncles; pedicels 3-6 lines long.

Barbarossa Penny-wort. Pl. cr.

6 H. UMBELLA'TA (Lin. spec. p. 234.) plant glabrous; leaves peltate, orbicular, emarginate at the base, doubly crenated, usually 11-12 nerved; scapes rather shorter than the petioles; umbels 20-30-flowered; flowers distinctly pedicellate. ♃. B. F. Native of the West Indies, Peru, and at Tampico in the Bay of Mexico, as well as of Cuba and North America. Spreng. umb. p. 1. t. 1. f. 1. Rich. hydr. p. 28. t. 52. f. 3. Umbels proliferous in the specimens received from Tampico, but simple in those from Cuba. Corolla white.—Acaricoba, Piso, bras. p. 9.—Cotylèdon aquática, Sloane, jam. 1. p. 212.

Var. β, umbellulàta (Michx. fl. bor. amer. 1. p. 161.) leaves obsoletely crenated, 9-nerved; scapes rather longer than the petioles; umbels 12-16-flowered. ♃. B. H. Native of Carolina and Virginia. Rich. hydr. p. 29. t. 53. f. 4. H. umbellàta, Pursh, Ell.

Umbellate-flowered Penny-wort. Fl. July, Aug. Clt. 1795. Pl. cr.

7 H. BONARIE'NSIS (Lam. dict. 3. p. 147.) plant glabrous; leaves peltate, orbicular, 15-20-nerved, doubly crenated; scapes hardly longer, but often shorter than the petioles, umbellate at the apex, and umbellately branched; flowers disposed in interrupted whorles along the branchlets. ♃. B. F. Native of South America, in marshy places not far from the sea, where it assumes various forms. Cham. et Schlecht. in Linnæa. 1. p. 357. H. umbellàta β, Bonariénsis, Rœm. et Schult. syst. 6. p. 345.

Var. α, multiflòra (Ruiz et Pav. fl. per. 3. p. 24. t. 246. f. a.) rays of umbel 8-10; whorles consisting of 15-20 flowers each. ♃. B. G. Native of Brazil, Peru, Buenos Ayres. H. Bonariénsis, Rich. Cav. icon. 5. t. 488.

Var. β, tribótrys (Ruiz et Pav. l. c. f. b.) rays of umbel 3; whorles 5-6-flowered. ♃. B. Native of Peru and Brazil. H. polystàchya α, Rich. hydr. p. 31.

Buenos Ayrean Penny-wort. Fl. July, Aug. Clt. 1810. Pl. tr.

8 H. PETIOLA'RIS (D. C. prod. 4. p. 60.) plant quite glabrous; leaves peltate, orbicular, 10-12-nerved, simply and broadly crenated, on long petioles; scapes equal in length to the petioles, umbellate at the apex, and umbellately branched; branches 2-5, interruptedly verticillate. ♃. B. F. Native of the Mauritius. H. vulgàris, Bory, voy. ex Rich. H. quinqueradiàta, Pet. Th. mss. ex Rich. H. polystàchya β, Rich. hydr. p. 31. Nearly allied to *H. Bonariénsis*, but differs in the lobes of the leaves being simply crenated, in the petioles and scapes being nearly a foot high. Fruit nearly orbicular, emarginate at the base; mericarps furnished with one rib on each side.

Petiolar Water Penny-wort. Pl. 1 foot, cr.

9 H. LANGSDO'RFII (D. C. prod. 4. p. 60.) plant glabrous or rather pilose on the leaves while young; leaves peltate, nearly orbicular, with 5-7 short lobes, crenated, 5-7-nerved; peduncles much longer than the petioles; umbel simple, containing 15-20 pedicellate flowers, surrounded by an 8-10-leaved reflexed involucrum. ♃. B. F. Native of Brazil, in the Island of St. Catharine. Stems long, creeping, slender. Peduncles 5-8 inches high. Adult leaves glabrous on both surfaces; lobes either acute or obtuse. Pedicels 3 times the length of the involucrum.

Langsdorf's Penny-wort. Pl. cr.

10 H. GRA'CILIS (Ruiz et Pav. fl. per. 3. p. 26. t. 247. f. 6.) leaves peltate, orbicular, 7-angled, 7-nerved, glabrous, crenated; petioles and scapes hairy; scapes shorter than the petioles; umbels 5-7-flowered. ♃. B. F. Native of Peru, in stagnant watery places, and on the edges of rivulets. Rich. hydr. p. 32. Stems creeping. This species differs from all others in the present section in the leaves being acutely angled.

Slender Penny-wort. Pl. cr.

11 H. HUMBO'LDTII (Rich. hydr. p. 33. t. 53. f. 6.) leaves peltate, 5-6-lobed, hairy on both surfaces: lobes short, ovate, acute, doubly serrated; petioles, stems, and peduncles glabrous; umbels simple, 20-flowered; fruit orbicular, nearly without ribs. ♃. B. F. Native of the kingdom of Quito. ♃. B. et Kunth, nov. gen. amer. 5. p. 32. but H. Humbóldtii, Willd. herb. is distinct from this, but is referrible to *H. Bonplándii*.

Humboldt's Penny-wort. Pl. cr.

12 H. ASTE'RIAS (Cham. et Schlecht. in Linnæa. 1. p. 361.) stems decumbent, at length glabrous; leaves peltate, petiolate, 3-5-lobed, at length glabrous: lobes lanceolate, unequally serrated; peduncles longer than the petioles; umbels simple, 14-18-flowered; fruit tubercular, emarginate at the base, with conspicuous ribs. ♄. B. S. Native of Brazil, within the tropics. Lobes of leaves usually 4, of various breadths. H. vàrians, Pohl, in litt.

Starry Penny-wort. Pl. decumbent.

13 H. ACONITIFÒLIA (Rich. hydr. p. 35. t. 53. f. 5.) leaves peltate, orbicular, hairy on both surfaces, 7-lobed, 7-nerved: lobes lanceolate, acute, doubly serrated; petioles, peduncles, and stems glabrous; umbels simple, 20-30-flowered; fruit orbicular, nearly without ribs. ♃. B. G. Native of New Granada, in shady places. H. B. et Kunth, nov. gen. amer. 5. p. 23.

Monk's-hood-leaved Penny-wort. Pl. cr.

14 H. MACROPHY'LLA (Pohl, in litt. 1828.) plant creeping; leaves peltate, 7-cleft, 7-nerved, rather hispid above, especially along the nerves, glabrous beneath; lobes lanceolate, doubly serrated; petioles and peduncles very long, glabrous; umbels simple, 40-50-flowered; fruit ribbed, emarginate at both ends. ♃. B. F. Native of Brazil. Leaves 6 inches in diameter. Hairs crowded at the tops of the petioles at the insertion of the leaves.

Large-leaved Penny-wort. Pl. cr.

15 H. QUINQUE'LOBA (Ruiz et Pav. fl. per. 3. p. 25. t. 248. f. b.) plant hairy; leaves peltate, 5-nerved, palmately 5-cleft: lobes acute, doubly serrated: the terminal or middle lobe longer than the rest; peduncles equal in length to the petioles; umbels simple, many flowered, globose. ♃. B. F. Native of Peru, in woods at Pillao; and of Brazil near Corvo-Sicco. Rich. hydr. p. 34. Cham. et Schlecht. in Linnæa. 1. p. 360. The whole plant is rufous from pili. Pedicels 40-50 in each umbel, and when bearing the fruit they are about 3 lines long. Fruit emarginate at the base; mericarps acutely 3-ribbed on the back.

Five-lobed-leaved Penny-wort. Pl. cr.

16 H. STE'LLA (Pohl, in litt. 1828. ex D. C. prod. 4. p. 61.) stems decumbent, villous; leaves on long petioles, peltate, 5-nerved, 5-cleft, villous on both surfaces: lobes broad-lanceolate, doubly serrated, rather unequal; umbels on long peduncles, many rayed; fruit pilose, ribbed, emarginate at the base. ♃. B. F. Native of Brazil. Perhaps sufficiently distinct from the preceding species.

Star-leaved Penny-wort. Pl. decumbent.

17 H. BATRACHIOÌDES (D. C. prod. 4. p. 667.) plant glabrous; stems rooting at the nodi; leaves on long petioles, somewhat peltate, 3-5-parted: lobes cuneated, obtuse at the apex, entire or 2-3-cleft; peduncles much shorter than the petioles; umbels 3-5-flowered. ♃. B. F. Native of Chili, in inundated places near Rancagua, and in ditches. H. ranunculoìdes, Bertero, herb.; but not of Lin. Habit almost of *Ranúnculus aquátilis* or *R. tripartìta*.

Batrachium-like Penny-wort. Pl. cr.

18 H. POEPPI'GII (D. C. l. c.) plant furnished with a few scattered hairs; stems weak, elongated, not rooting at the nodi; petioles long, hairy at the apex; leaves orbicular, cordate with the recess open, 9-nerved, bluntly 9-lobed, toothed; peduncles axillary, and opposite the leaves, shorter than the petioles;

flowers 15-20 in an umbel, on long pedicels. ♃. B. F. Native of Chili. Habit of *H. Zeylánica*, but the flowers are not capitate. The inflorescence is that of *H. geranioìdes* or *H. alchemilloìdes*, but the stems are not radicant.

Poeppig's Penny-wort. Pl. trailing.

§ 2. *Leaves more or less cordate at the base.*

* *Flowers umbellate, distinctly pedicellate.*

19 H. ACUTIFÒLIA (Ruiz et Pav. fl. per. 3. p. 25. t. 248. f. a.) plant rather villous; leaves cordate, acute, sinuated at the base, unequally crenate-toothed on all sides; peduncles a little longer than the petioles; umbels many flowered, simple, globose; pedicels of flowers distinct; fruit almost didymous, bicostate on both sides. ♃. B. F. Native of Peru, at Pillao. Spanánthe sinuàta, Spreng. syst. 1. p. 878. Allied to *H. quinquéloba*, but differs in the leaves not being peltate.

Acute-leaved Penny-wort. Pl. cr.

20 H. GERANIOÌDES (Rich. hydr. no. 32. f. 21.) plant hairy; leaves orbicularly reniform, 9-nerved, bluntly 9-lobed, crenated; petioles pubescent, rather higher than the peduncles; umbels 20-flowered; flowers pedicellate. ♃. B. F. Native of Peru. Petioles a finger in length. Pedicels 3-4 lines long. Involucrum many leaved: leaflets ovate, acute, small. Fruit nearly orbicular, didymous.

Geranium-like Penny-wort. Pl. cr.

21 H. ALCHEMILLOÌDES (Rich. hydr. no. 28. f. 31.) plant beset with spreading hairs; leaves orbicularly reniform, 9-nerved, a little lobed, doubly crenated, cleft at the base into a narrow recess; petioles elongated, pilose; peduncles slender, shorter than the petioles; umbels 20-flowered; flowers distinctly pedicellate; mericarps of fruit 3-ribbed. ♃. B. F. Native of Peru, in shady humid places: and of New Andalusia, on Mount Cocollar. H. B. et Kunth, nov. gen. amer. 5. p. 24. Petioles 6-8 inches long. Pedicels 4-5 inches long.

Alchemilla-like Penny-wort. Pl. cr.

22 H. LAXIFLÒRA (D. C. prod. 4. p. 61.) plant villous; leaves orbicular, cordate, 9-nerved, 9-lobed: lobes obtuse, denticulated; peduncles opposite the cauline leaves, about twice the length of the petioles; umbels 40-45-flowered; pedicels and fruit glabrous. ♃. B. F. Native of New Holland. Pedicels about 3 lines long; the rest of the plant very like *H. densiflòra*.

Loose-flowered Penny-wort. Pl. cr.

23 H. BONPLA'NDII (Rich. hydr. no. 27. f. 7.) plant hairy; leaves reniform, 9-nerved, doubly crenated; peduncles an inch long, about equal in length to the petioles; umbels 10-12-flowered; flowers distinctly pedicellate. ♃. B. G. Native near Santa Fe de Bogota, H. B. et Kunth, nov. gen. amer. 5. p. 24. H. capitàta, Willd. herb. and in Schultes, syst. 6. p. 356. but not of Banks, nor Pet. Th. H. Humbóldtii, Willd. herb. and Schultes, syst. 6. p. 356. but not of Rich.

Var. β, Chilénsis (Cham. et Schlecht. in Linnæa. 1. p. 263.) umbels more dense; pedicels very short; leaves 7-lobed, 7-nerved; petioles an inch and a half long. ♃. B. F. Native of Chili, near Talcaguano.

Bonpland's Penny-wort. Pl. cr.

24 H. MEXICA'NA (Cham. et Schlecht. in Linnæa. vol. 5. p. 208.) stems creeping; branches erect; leaves reniform, usually 9-nerved, deeply lobed, hairy; umbels on long peduncles, many flowered, loose, globose; hairs on the petioles and peduncles reversed; styles spreading. ♃. H. Native of Mexico, near Jalapa in shady woods. Said to be allied to *H. leucocéphala* and *H. Bonplándii*.

Mexican Penny-wort. Pl. cr.

25 H. HUMIFU'SA (Pohl, in litt. 1828. ex D. C. prod. 4. p. 62.) plant creeping, glabrous; leaves on long petioles, reniform, nearly orbicular, broadly crenated, 9-nerved; peduncles length of the petioles; umbels 20-flowered; flowers distinctly pedicellate; fruit ribbed, emarginate at both ends. ♃. B. G. Native of Brazil. Leaves nearly like those of *H. Americàna*, but differs in the flowers being umbellate, not capitate. Perhaps Hydrocótyle, Lœfl. itin. p. 281. is referrible to this species.

Trailing Penny-wort. Pl. tr.

26 H. LEUCOCE'PHALA (Cham. et Schlecht. in Linnæa. 1. p. 364.) plant creeping; leaves orbicularly reniform, usually 9-nerved, doubly toothed or crenated, beset with a few scattered hairs on both surfaces, as well as on the peduncles and petioles; umbels 20-30-flowered, nearly globose; flowers distinctly pedicellate; mericarps of fruit smooth, at first cream-coloured, and acutely 3-ribbed. ♃. F. Native throughout the whole of Brazil. Link et Otto, abbild. t. 21. Petioles 2-4 inches long. Pedicels of the umbel, which is milk-coloured, a line and a half long.

White-headed Penny-wort. Pl. cr.

27 H. NA'TANS (Cyr. pl. rar. neap. 1. t. 6. f. β.) plant creeping, glabrous; leaves orbicular, with a narrow cordate recess, reniform, bluntly and unequally 9-11-lobed, and 9-11-nerved, crenated; peduncles much shorter than the petioles; umbels capitate, 5-6-flowered; flowers on short pedicels. ♃. B. H. Native of the kingdom of Naples, in bogs, ditches, and rivers; and in the river Anapo near Syracusa, and elsewhere in Sicily; Dombey gathered the same plant in Peru, and Chamisso at St. Francisco in North California.—Column. ecphr. p. 316. with a figure. Rich. hydr. no. 29. f. 20. Cham. et Schlecht. in Linnæa. 1. p. 373. Petioles 3-10 inches long. Peduncles hardly an inch long. Stems having numerous roots, issuing from the joints. Fruit cordate, wrinkled a little.

Natant Penny-wort. Fl. July, Aug. Clt. 1819. Pl. trailing and floating.

28 H. MULTÍFIDA (Rich. hydr. no. 44. f. 34.) plant glabrous; leaves palmately cut; segments 5, somewhat 3-lobed: middle segment the longest; peduncles glabrous, longer than the petioles, which are pilose; umbels 5-6-flowered; flowers distinctly pedicellate; fruit didymous, furnished with 2 ribs on both sides. ♃. B. F. Native of New Granada, on the Andes, in humid shady places near Almaguer. H. B. et Kunth, nov. gen. amer. 6. p. 25. Willd. in Schultes, syst. 6. p. 656.

Multifid-leaved Hydrocotyle. Pl. cr.

** *Umbels capitate, 3-8-flowered, sometimes the lower ones are only 1-flowered.*

29 H. ASIA'TICA (Lin. spec. p. 234.) plant rather villous; leaves orbicularly reniform, equally crenated, 7-nerved; petioles and peduncles in fascicles, pubescent; umbels capitate, on short peduncles, 3-4-flowered; fruit orbicular, furnished with 4 ribs on both sides. ♃. B. F. Native nearly throughout the southern hemisphere, as well as within the tropics, in humid watery places. Rich. hydr. no. 15. f. 11. Spreng. in Schultes, syst. 6. p. 348. Cham. in Schlecht. Linnæa. 1. p. 365. This species assumes many forms, especially in Manilla, Radacca, Chili (which there becomes H. triflòra, Ruiz et Pav. fl. per. 3. p. 24. t. 245. f. 6.), Brazil, and the Cape of Good Hope (which is H. Thunbergiàna, Spreng. neue entd. 1. p. 283. exclusive of the synonyme H. nàtans, Thunb. which is not obvious).

Asiatic Penny-wort. Fl. July, Aug. Clt. 1690. Pl. cr.

30 H. REPA'NDA (Pers. ench. 1. p. 302.) plant villous; leaves cordate, reniform, on long petioles, 9-nerved, repandly toothed; petioles villous, much exceeding the peduncles; umbels capitate, 3-flowered; fruit orbicular, furnished with 4 ribs on each side. ♃. B. H. Native of Louisiana, Carolina, Georgia, Chili, and the West India Islands, in humid and inundated places. Rich. hydr. no. 13. f. 14. exclusive of the synonyme of Ruiz et Pav.

H. erécta, Lin. fil. suppl. 177.? H. renifórmis and H. cordàta, Walt. fl. car. 113. H. ficarioìdes, Michx. fl. bor. amer. 1. p. 161. but not of Lam. H. renifórmis, Bosc. Poir. suppl. 3. p. 21. H. repánda, Spreng. umb. no. 4. t. 2. f. 4. Glycèria repánda, Nutt. gen. amer. 1. p. 177. Perhaps a variety of H. Asiática, ex Cham. et Schlecht. in Linnæa. 1. p. 369.

Repand-leaved Penny-wort. Fl. June, July. Clt. 1806. Pl. creeping.

31 H. FICARIOÌDES (Lam. dict. 3. p. 153. but not of Michx.) plant glabrous; leaves cordately reniform, repand, 5-nerved, usually in fascicles; petioles longer than the limbs; umbels capitate, 3-5-flowered; peduncles one-half shorter than the petioles. ♃. B. S. Native of the Mauritius. Rich. hydr. no. 12. f. 12. Flowers sessile in the umbels. Involucrum 3-5-leaved. Stems creeping. Fruit unknown.

Ficaria-like Penny-wort. Pl. cr.

32 H. DIA'NTHA (D. C. prod. 4. p. 63.) plant glabrous; leaves distant, on short petioles, reniform, 7-9-toothed, nearly veinless; umbels opposite the leaves, on short peduncles, 2-flowered; fruit flatly compressed, orbicularly cordate, with the mericarps having 2 ribs on both sides. ♃. B. F. Native of New Holland, at King George's Sound. Stems weak, dichotomous, climbing a little. Leaves hardly twice the size of the fruit. Pedicels of the fruit longer than the peduncles of the umbel.

Two-flowered Penny-wort. Pl. trailing or climbing.

33 H. ABBREVIA'TA (Rich. hydr. no. 17. f. 19.) leaves reniform, with a broad recess, shorter than broad, with 9-11 crenatures, 7-nerved, glabrous; petioles pubescent, longer than the limbs; peduncles longer than the petioles; fruit rather turgid, furnished with 4 ribs on each side, reticulated. ♃. B. F. Native of Madagascar and Cochin-china, in humid places. Trisánthus Cochinchinénsis, Lour. coch. p. 176. Stems tufted, creeping. Petioles 7-8 lines long; limbs of leaves 6 lines broad, and 2 lines long. Pedicels an inch long. Involucrum 2-leaved. Very nearly allied to *H. dentàtum*, but differs in the leaves being much shorter.

Short-leaved Penny-wort. Pl. cr.

34 H. NUMMULARIOÌDES (Rich. hydr. no. 11. f. 9.) leaves cordately reniform, 5-nerved, obsoletely crenated, with a narrow recess; petioles pubescent, longer than the limbs; umbels capitate, 3-flowered, on short peduncles; fruit orbicularly subglobose, striated. ♃. B. S. Native of the Island of Bourbon, creeping along river banks. H. Asiática var. Cham. et Schlecht. l. c. Leaves 4-5 lines in diameter. Petioles 8-12 lines long. Peduncles 2-3 lines long. The central flower in each umbel is fertile, and the 2 lateral ones sterile.

Money-wort-like Penny-wort. Pl. cr.

35 H. HEBECA'RPA (D. C. prod. 4. p. 63.) leaves orbicularly reniform, toothed at the base, 7-9-nerved, crenated at the apex, glabrous, on long petioles; surculi sarmentose, prostrate; peduncles axillary, villous, much shorter than the petioles; umbels capitate, few-flowered; fruit villous, reticulated; mericarps furnished with 2-3 ribs on each side. ♃. B. F. Native of the Island of Timor. Petioles of radical leaves 4 inches long: limbs of leaves 2 inches broad. Three of the fruit in each umbel coming to perfection, rather large.

Hairy-fruited Penny-wort. Pl. prostrate.

36 H. INÆ'QUIPES (D. C. prod. 4. p. 63.) leaves when young, rather villous, but glabrous in the adult state: radical ones on long petioles, with a reniform crenated 9-nerved limb, and a broad recess; umbels radical, on very short incurved, rather villous peduncles; leaflets of involucrum 2, ovate; fruit glabrous; mericarps furnished with 4 stripes on each side. ♃. S. Native about Rio Janeiro. Petioles of radical leaves nearly a foot long. Peduncles half an inch long. Stems short, rather sarmentose, bearing leaves, which stand on short petioles.

Unequal-petioled Penny-wort. Pl. 1 foot.

37 H. PA'LLIDA (D. C. prod. 4. p. 63.) leaves reniform, glabrous, broadly and shortly crenate-toothed; petioles rather dilated at the base, longer than the peduncles; leaves of involucrum 2, ovate, obtuse, glabrous; umbels 3-flowered. ♃. B. F. Native of the Cape of Good Hope. Burch. cat. geogr. no. 1907. Fruit cordate, truncate at the apex, marked on both sides by 3 veins, glabrous. Herb prostrate, pale green.

Var. β *? subintègra* (D. C. prod. 4. p. 63.) leaves nearly entire, broadly reniform; peduncles rather villous, shorter. ♃. B. F. Native of the Cape of Good Hope.

Pale Penny-wort. Pl. prostrate.

38 H. BRE'VIPES (D. C. prod. 4. p. 63.) stems elongated, prostrate, rooting at the nodi; leaves on long petioles, reniform, with broad large obtuse lobe-like teeth, pilose above, and on the petioles, smoothish beneath; peduncles axillary, very short; umbels few-flowered, capitate, villous. ♃. B. S. Native of Jamaica. H. leptóstachys ex Jamaica, Spreng. syst. 1. p. 876. Allied to *H. eriántha*, but differs in being prostrate, as well as to *H. mácrodus*, but differs in the teeth of the calyx being blunt; also to *H. leptóstachys*, but the inflorescence is truly distinct.

Short-peduncled Penny-wort. Pl. prostrate.

39 H. BRACTEA'TA (D. C. prod. 4. p. 668.) leaves reniformly cordate, bluntly crenated, on long petioles; nerves, petioles, and peduncles rather hairy; peduncles much shorter than the petioles; umbels capitate, 2-3-flowered; leaves of involucrum 2, permanent, ovate, rather villous on the outside; mericarps very much compressed, reticulately 3-5-nerved, having the back hairy at the apex. ♃. S. Native of Africa, at Cape Verd, in marshes at Khami. Allied to *H. eriántha* and *H. pállida*.

Bracteated Penny-wort. Pl. cr.

40 H. ERIA'NTHA (Rich. hydr. no. 18. f. 13.) leaves nearly orbicularly reniform, crenately toothed, glabrous; petioles dilated at the base, clasping the stem, length of the slender hairy peduncles: leaflets of involucrum 4, very pilose, exceeding the flowers; stems somewhat sarmentose, erectish. ♃. G. Native of the Cape of Good Hope, in sandy places on the Table Mountain. Cham. et Schlecht. in Linnæa. 1. p. 370. Sieb. fl. cap. no. 247. H. cuspidàta, Willd. in Schultes, syst. 6. p. 396. H. renifórmis, Spreng. neue entd. 1. p. 382. syst. 2. p. 290. but not of Thunb. nor Walt. Fruit somewhat cordate, striated, ex Rich.

Hairy-flowered Penny-wort. Pl. sarmentose.

41 H. MA'CRODUS (Spreng. syst. 1. p. 877. exclusive of the synonymes,) the whole plant covered with spreading hairs; leaves cordately reniform, coarsely 3-9-toothed: teeth or lobules acute, equal, quite entire; peduncles shorter than the petioles; umbels capitate, few-flowered; leaves of involucrum 2, large, ovate, acuminated, pilose; fruit ovate, with many ribs, wrinkled. ♃. G. Native of the Cape of Good Hope, on the Table Mountain. Cham. et Schlecht. in Linnæa. 1. p. 372. H. moschàta, Spreng. in Schultes, syst. 6. p. 351. but not of Thunb.

Long-toothed-calyxed Penny-wort. Pl. tr.

42 H. CALLÍODUS (Cham. et Schlecht. in Linnæa. 1. p. 371.) leaves reniformly orbicular, 5-nerved, coarsely, sharply and unequally toothed, glabrous; peduncles hardly pubescent, capillary, in fascicles, almost longer than the petioles; leaves of involucrum smooth, one-half shorter than the fruit, which is obovate and many ribbed. ♃. G. Native of the Cape of Good Hope. Allied to *H. eriántha*, but easily distinguished from it by its smoothness, by the teeth of the calyx being acute, and by the nerves of the leaves being 5, not 7, &c.

Beautiful-toothed-leaved Penny-wort. Pl. prostrate.

43 H. AMERICA'NA (Lin. spec. 234.) plant quite glabrous; leaves orbicularly reniform, a little lobed, doubly crenated, 9-nerved; umbels capitate, 5-flowered: upper ones nearly sessile: lower ones on short peduncles. ♃. B. H. Native of North America, in boggy or swampy places, from Canada to

Carolina; and probably of South America, if the synonyme of Lœfling, itin. p. 281. is referrible to the species. Lam. dict. 3. p. 152. Rich. hydr. no. 19. f. 10. Spreng. umb. no. 3. t. 2. f. 3.

Var. α, flexicaúlis (Michx. fl. bor. amer. 1. p. 162.) stems more firm, shorter, and as if they were flexuous.

Var. β, gràcilis (Michx. l. c.) plant more slender, filiform, not flexuous; leaves smaller.

American Penny-wort. Fl. May, Aug. Clt. 1790. Pl. cr.

44 H. MULTICAU'LIS (Pohl, in litt. 1828. ex D. C. prod. 4. p. 64.) plant creeping; leaves on long petioles, glabrous, reniformly orbicular, 9-nerved, and somewhat 9-lobed: each lobe with 3 crenatures; petioles shorter than the peduncles, both bearded with pili at the apex; umbels capitate, 15-20-flowered; fruit glabrous, ribbed, emarginate at both ends. ♃. B. S. Native of Brazil. Leaves and inflorescence like those of *H. Americàna*.

Many-stemmed Penny-wort. Pl. cr.

45 H. ROTUNDIFÒLIA (Roxb. hort. beng. p. 21.) plant tufted and creeping; leaves petiolate, reniformly orbicular, 7-nerved, bluntly 7-lobed, dentately crenated, hispid beneath, glabrous above; umbels opposite the leaves, nearly sessile, 7-9-flowered; fruit glabrous, acutely 5-ribbed. ♃. B. F. Native of the east of Bengal, in Silhet. Petioles twice the length of the limbs of the leaves, and are as well as the stems glabrous.

Round-leaved Penny-wort. Pl. cr.

46 H. TENE'LLA (D. Don, prod. fl. nep. p. 183.) plant tufted and creeping; leaves reniform, somewhat 7-lobed, crenated, quite glabrous, shining; umbels capitate, sessile, few-flowered. ♃. B. H. Native of Nipaul. Allied to *H. nitídula*, but differs in the leaves being less lobed, in the petioles being shorter, and in the umbels being sessile.

Pliant Penny-wort. Pl. cr.

47 H. ALA'TA (Rich. hydr. no. 50. f. 28.) plant quite glabrous; stems erect, winged, compressed; leaves cordate, bluntly hastate, on short petioles; peduncles longer than the petioles; umbels 4-6-flowered; pedicels quite distinct; fruit lenticular, compressed, furnished with 10 ribs on both sides. ♃. B. F. Native of New Holland. H. pusílla, R. Br. ined. but not of Rich.

Winged Penny-wort. Pl. $\frac{1}{4}$ to 1 foot.

48 H. MUSCÒSA (R. Br. in Rich. hydr. no. 45. f. 27.) plant rather hairy; leaves palmate; segments 3-5, narrow, cuneated, tridentate at the apex; peduncles shorter than the petioles; umbels somewhat capitate, 6-8-flowered, fruit orbicular, rather compressed, having 2 ribs on both sides. ♃. F. Native of New Holland. Petioles nearly an inch long, glabrous.

Mossy Penny-wort. Pl. cr.

49 H. TRIPARTI'TA (R. Br. in Rich. hydr. no. 46. f. 25.) plant rather pilose; leaves palmate: segments 3, cuneated, deeply toothed: lateral ones usually bifid; peduncles much shorter than the petioles; umbels rather capitate, 6-10-flowered; fruit orbicular, didymous, furnished with 2 ribs on both sides. ♃. F. Native of New Holland. Sieb. pl. exsic. nov. holl. no. 628. Flowers nearly sessile in the umbel, but after the flowers have decayed the pedicels lengthen a little.

Tripartite-leaved Penny-wort. Pl. cr.

*** *Umbels capitate, many-flowered, especially with from* 8 *to* 30 *nearly sessile flowers.*

50 H. PLEBE'IA (R. Br. in Rich. hydr. no. 20. f. 23.) plant glabrous; leaves reniform, doubly crenated, 7-9-nerved; peduncles shorter than the petioles; umbels capitate, globose, 12-15-flowered; fruit furnished with 2 ribs on each side. ♃. B. F. Native of New Holland. Heads of flowers small: leaves of involucrum ovate, acute. Stems trailing. Petioles 1-2 inches long.

Plebeian Penny-wort. Fl. May, Aug. Clt. 1823. Pl. tr.

51 H. POLYRHÌZA (D. C. prod. 4. p. 65.) plant trailing, rooting at the joints; leaves orbicular, cordate, with a narrow recess, crenated, 9-11-nerved, glabrous on both surfaces, as well as on the petioles; peduncles villous at the apex; umbels 20-flowered, densely capitate; pedicels elongated after flowering, the fruit is therefore pedicellate; fruit orbicular, minutely dotted; mericarps furnished with one rib on each side. ♃. B. S. Native of Brazil, in the neighbourhood of Rio Janeiro. Peduncles shorter than the petioles, rarely longer. The disposition of the flowers is intermediate between the first and second division of the genus.

Many-rooted Penny-wort. Pl. cr.

52 H. INCRASSA'TA (Ruiz et Pav. fl. per. 3. p. 26. but not of Rafin.) plant glabrous; leaves reniform, 7-9-lobed, crenately serrated; serratures thickened, whitish; petioles long; umbels many flowered, globose. ♃. G. Native of Peru, in shady places at Tarma. Rich. hydr. no. 47.

Thickened Penny-wort. Pl. cr.

53 H. NEPALE'NSIS (Hook. exot. fl. 1. t. 30.) the whole plant scabrous from short scattered hairs; leaves orbicularly reniform, 7-lobed, crenately toothed; flowers monoecious; umbels globose, many flowered, dense; fruit turgid, without ribs. ♃. B. H. Native of Nipaul, in wet places. Some of the umbels apparently contain only male flowers, while others contain only female ones; these flowers are on short pedicels while young, but afterwards these pedicels gradually lengthen out. It comes very near to *H. capitàta*, and according to Sprengel is probably not distinct from it.

Var. α, brévipes (D. C. prod. 4. p. 65.) peduncles at their greatest length shorter than the petioles.

Var. β, lóngipes (D. C. l. c.) peduncles when bearing the fruit longer than the petioles. H. híspida, D. Don, fl. nep. p. 183.

Nipaul Penny-wort. Fl. July. Clt. 1820. Pl. cr.

54 H. CAPITA'TA (Pet. Th. fl. trist. d'ac. p. 43. t. 12. but not of Willd. nor Banks,) the whole plant hispid from long bristles; leaves orbicularly reniform, bluntly and obscurely 7-lobed, unequally crenated; flowers monoecious; umbels globose, many flowered, dense, on short peduncles; fruit rather turgid, dotted, almost without ribs. ♃. B. F. Native of the Island of Tristan da Cunha. Rich. hydr. no. 22. t. 62. f. 29. Carm. fl. no. 15. H. crinìta, Pet. Th. in herb. Juss.

Capitate-flowered Penny-wort. Pl. cr.

55 H. GLOBIFLÒRA (Ruiz et Pav. fl. per. 3. p. 25. t. 247. f. a.) plant hairy from short down; leaves roundish-reniform, 13-nerved, rather lobulate, crenated; peduncles a little shorter than the petioles; umbels globose, many flowered. ♃. B. F. Native of Peru, in humid places in woods by stagnant water, near Muna. Nerves of leaves and fruit fulvous. Leaves of involucrum numerous, linear, and short. Flowers in each umbel about 200.

Globe-flowered Penny-wort. Pl. cr.

56 H. CITRIODÒRA (Ruiz et Pav. fl. per. 4. p. 26.) leaves reniform, 7-9-lobed, crenated, and are, as well as the petioles, hairy, but pubescent beneath, as well as on the branches; peduncles densely villous, length of the petioles; umbels small, many flowered, globose. ♃. B. F. Native of Chili, in shady humid places about Conception; and of Peru, in the tract of Huanaco, as well as of Brazil according to Pohl.

Citron-scented Penny-wort. Pl. cr.

57 H. RANUNCULOÌDES (Lin. fil. suppl. p. 177.) plant glabrous; leaves orbicularly reniform, 5-nerved, and somewhat 5-lobed; lobes obtuse, somewhat crenated: middle lobe more prolonged than the rest; peduncles shorter than the petioles; umbels 5-12-flowered; flowers pedicellate. ♃. B. H. Native of North America, in Pennsylvania and Mexico; and of South

America, as in Cuba and Chili. Spreng. umbel. 2. t. 1. f. 1. Rich. hydr. no. 30. f. 18. Cham. et Schlecht. l. c. no. 372. H. ranunculoìdes var. α, Schultes, syst. 6. p. 349. exclusive of the synonymes. H. cymbalarifòlia, Muhl. cat. p. 30. Ell. sketch. 1. p. 346. Fruit orbicular, somewhat cordate, smooth, ex Cham. et Schlecht.

Crowfoot-like Penny-wort. Fl. July, Aug. Clt. 1800. Pl. cr.

58 H. SPLE'NDENS (Blum. bijdr. p. 884.) stems creeping; leaves orbicularly cordate, obsoletely 7-9-lobed, unequally crenated, shining on both surfaces, downy beneath; umbels capitate, 8-10-flowered, solitary, pedunculate. ♃. B. S. Native of Java, in humid grassy places, about Buitenzorg.

Shining-leaved Penny-wort. Pl. cr.

59 H. SIBTHORPIOÌDES (Lam. dict. 3. p. 153.) plant quite glabrous; leaves orbicularly reniform, doubly crenated, obsoletely 7-lobed, 7-nerved; peduncles slender, about equal in length to the petioles; umbels 6-8-flowered, capitate; fruit rather didymous, furnished with 2 ribs on each side. ☉. F. Native of the Mauritius. Cham. et Schlecht. in Linnæa. 1. p. 273. in a note. H. ranunculoìdes β, Schultes, syst. 6. p. 349. Chondrocárpus sibthorpioìdes, Sweet, hort. brit. p. 185.

Sibthorpia-like Penny-wort. Fl. May, July. Clt. 1806. Pl. creeping.

60 H. E'LEGANS (Rich. hydr. no. 33. f. 32.) plant glabrous; leaves semi-5-cleft: lobes tridentate at the apex; peduncles 3 times shorter than the petioles; umbels capitate, 6-8-flowered; fruit didymous, furnished with 2 ribs on each side. ♃. B. F. Native of New Holland. Leaves 4 lines in diameter: petioles nearly an inch long.

Elegant Penny-wort. Pl. cr.

61 H. PULCHE'LLA (R. Br. in Rich. hydr. no. 34.) plant glabrous; leaves reniform, rather peltate, 5-nerved, 5-lobed: lobes bluntly tridentate; peduncles equal in length to the petioles; umbels capitate, 10-flowered; fruit didymous, furnished with 2 ribs on each side. ♃. B. G. Native of New Holland, near Port Jackson. Petioles an inch long. Heads of flowers small.

Neat Penny-wort. Pl. cr.

62 H. NITI'DULA (Rich. hydr. no. 35. f. 33.) plant quite glabrous; leaves orbicularly reniform, 5-7-lobed: lobes tridentate; petioles 2 or 3 times longer than the peduncles; umbels capitate, 6-10-flowered. ♃. B. S. Native of Java. Hook. exot. fl. 1. t. 29. Allied to H. pulchélla. Perhaps the same as H. ranunculoìdes var. incìsa, Blum. bijdr. p. 884.

Small-shining Penny-wort. Pl. cr.

63 H. MINU'TA (Pohl, in litt. 1828. ex D. C. prod. 4. p. 66.) stems creeping; leaves on short petioles, orbicular, cordate, with a narrow recess, crenated, 7-nerved, pilose above, and on the upper part of the petioles; peduncles rather pilose, 3 times longer than the petioles; umbels 8-10-flowered, rather capitate; fruit small, roundish. ♃. B. F. Native of Brazil. Petioles 2 lines long. Limb 2-3 lines in diameter. There is a variety with glabrous leaves according to Pohl.

Minute Penny-wort. Pl. cr.

64 H. INDECO'RA (D. C. prod. 4. p. 668.) stems creeping, smoothish; petioles hairy, 5 times longer than the limbs of the leaves, which are orbicularly cordate, 3-lobed, toothed, and rather pilose; peduncles hairy, a little shorter than the petioles; fruit small, ovate, glabrous, densely aggregate into a globose head; mericarps furnished with one rib on each side. ♃. B. F. Native of Chili. Poepp. pl. exsic. no. 98. Habit of *H. sibthorpioìdes* or *H. minùta*.

Undecked Penny-wort. Pl. cr.

65 H. HETEROME'RIA (Rich. hydr. no. 36.) plant glabrous; leaves reniform, 7-nerved, 7-lobed: lobes obtuse, crenated; peduncles much shorter than the petioles, which are flaccid; umbels 6-8-flowered, capitate; fruit smooth on one side, and tubercular on the other, wrinkled and discoloured, furnished with one rib on both sides. ♃. B. H. Native of New Zealand. H. flàccida, R. Br. mss. Petioles 2-4 inches long.

Variable-parted Penny-wort. Pl. cr.

66 H. COMPA'CTA (Rich. hydr. no. 37.) plant villous; leaves orbicularly reniform, small, 7-nerved, deeply toothed; peduncles very short, in fascicles; umbels 15-20-flowered, densely capitate; fruit rather didymous, furnished with 2 ribs on each side. ♃. H. Native of New Zealand. H. capitàta, Banks and Sol, mss. but not of Pet. Th.

Compact-headed Penny-wort. Pl. cr.

67 H. PEDUNCULA'RIS (R. Br. in Rich. hydr. no. 38. f. 26.) leaves small, orbicularly reniform, deeply toothed, rather 5-cleft, glabrous above, hairy beneath; peduncles equal in length to the petioles; umbels capitate, 6-8-flowered; fruit lenticular, with 2 nearly obsolete ribs on both sides. ♃. B. F. Native of New Holland. Perhaps the same as H. pedunculàris, Sieb. nov. holl. exsic. no. 114. which is said to be glabrous; or it is perhaps referrible to *H. pulchélla*.

Peduncular Penny-wort. Fl. May, Aug. Clt. 1823. Pl. cr.

68 H. INTERTE'XTA (R. Br. in Rich. hydr. no. 39.) plant glabrous; leaves irregularly 3-5-lobed, 3-5-nerved: lobes denticulated: middle lobe more prolonged than the rest; petioles and peduncles equal among themselves; umbels densely capitate, 12-15-flowered; fruit scabrous from wrinkles, furnished with 2 ribs on both sides; carpophore permanent, undivided. ♃.? F. Native of New Holland.

Interwoven Penny-wort. Pl. cr.

69 H. HI'RTA (R. Br. in Rich. hydr. no. 40.) leaves orbicularly reniform, hairy on both surfaces, 7-nerved, obsoletely 7-lobed, crenated; petioles hairy; peduncles one-half shorter than the petioles; umbels densely capitate, 20-flowered; fruit rather didymous, furnished with 2 ribs on each side. ♃. B. F. Native of New Holland. Leaves distant. Petioles hardly an inch long. Stipulas membranous, permanent.

Hairy Penny-wort. Pl. cr.

70 H. NÒVÆ-ZEELA'NDIÆ (D. C. prod. 4. p. 67.) leaves orbicularly reniform, hairy on both surfaces, as well as on the petioles, 7-nerved, obsoletely 7-lobed, acutely and irregularly toothed; peduncles glabrous, 4 times shorter than the petioles; umbels densely capitate, 10-12-flowered; fruit rather didymous, furnished with one rib on each side. ♃.? H. Native of New Zealand. Petioles 12-15 lines long. Stipulas as in *H. hírta*.

New-Zealand Penny-wort. Pl. cr.

71 H. DENSIFLÒRA (D. C. prod. 4. p. 66.) plant hairy; leaves orbicular, cordate at the base, 7-9-nerved, 7-9-lobed: lobes broad, hardly acute, a little toothed; peduncles opposite the leaves, about equal in length to the petioles; umbels densely capitate, 30-40-flowered; fruit rather didymous, and are as well as the pedicels glabrous; mericarps furnished with one rib on both sides. ♃.? F. Native of New Holland. Nearly allied to *H. hírta*, but differs from it in the peduncles being the length of the petioles, not very short, and in the leaves being cordate, not reniform.

Dense-flowered Penny-wort. Pl. cr.

72 H. HIRSU'TA (Blum. bijdr. p. 884. but not of Swartz nor Spreng.) stems creeping; leaves orbicular, cordate, somewhat 5-lobed, crenated, villous; umbels capitate, 7-11-flowered, pedunculate, usually solitary; mericarps furnished with 3 ribs. ♃.? S. Native of Batavia, in grassy places by the sea side. It differs in the inflorescence from H. hirsùta of Swartz, which is the H. spicàta of Lam. H. hirsùta of Spreng. is a congeries of species very different from each other.

Hairy Penny-wort. Pl. cr.

73 H. GLOBA'TA (Blum. bijdr. p. 883.) stems creeping: leaves roundish-cordate, angular, and are, as well as the peduncles,

hairy; umbels glomerate, solitary or crowded, many flowered. 4.? S. Native of the Island of Java, at the foot of Mount Tjerimai. Said to be allied to *H. hirsùta*.

Globose-flowered Penny-wort. Pl. cr.

74 H. JAVA'NICA (Thunb. diss. 2. p. 415. no. 17. t. 3.) plant glabrous; leaves orbicular, 7-lobed, 7-nerved; lobes angular, acute, crenated; peduncles shorter than the petioles; umbels densely capitate, 20-flowered; fruit orbicular, didymous, dotted with purple. 4. B. S. Native of the Island of Java. Rich. hydr. no. 41. Lobes divided nearly to the middle of the limb, ex Rich., but less divided in the figure given by Thunberg. Peduncles 6-8 lines long, ex Rich., 1 inch long, ex Thunb.

Java Penny-wort. Pl. cr.

75 H. ZEYLA'NICA (D. C. prod. 4. p. 67.) leaves glabrous, orbicularly reniform, 7-nerved, 7-lobed: lobes acutish, coarsely crenated; petioles long, puberulous at the apex, as well as the stems; peduncles puberulous: ultimate ones opposite the vanished leaves, racemosely umbellate; umbels densely capitate, 20-flowered. 4.? S. Native of Ceylon, near Candy, in fertile places. Perhaps only a variety of *H. Javánica*. The heads or umbels being disposed in racemes on the peduncles, distinguishes it from all the species in this respect. Fruit when young purple, dotted, but at length becoming fucescent.

Var. β, Heyneàna (Wall. in litt. ex D. C. prod. 4. p. 67.) peduncles bearing 8-10 small umbels at the apex; pedicels beset with retrograde hairs. H. ranunculoìdes, Heyne, mss. ex Wall. Native of the East Indies.

Ceylon Penny-wort. Pl. cr.

76 H. SUNDA'ICA (Blum. bijdr. p. 883.) stems sarmentose; leaves roundish-cordate, a little lobed, coarsely and unequally crenated; petioles and peduncles hairy below; umbels sessile, a little branched; flowers in dense glomerules. 4. B. S. Native of the Malay Islands, in humid places.

Sunda Penny-wort. Pl. sarmentose.

77 H. CHAMÆMÒRUS (Cham. et Schlecht. in Linnæa. 1. p. 303.) leaves reniform, somewhat 7-lobed, doubly crenated, glabrous; peduncles short, and are, as well as the petioles, covered with retrograde hairs; umbels 20-30-flowered, capitate; fruit full of resinous dots; mericarps with 3 ribs: ribs smooth: furrows convex. 4. B. F. Native of Chili, near Talcaguano.

Cloud-Berry-like Penny-wort. Pl. cr.

78 H. GAUDICHAUDIA'NA (D. C. prod. 4. p. 67.) plant smoothish, dwarf, filiform; leaves reniform, nearly orbicular, 9-nerved, 9-lobed, puberulous beneath, glabrous above: lobes ovate, tridentate; peduncles much shorter than the petioles, which are puberulous; umbels capitate, 10-flowered; fruit glabrous; mericarps ovate, with hardly prominent ribs. 4. F. Native of New Holland, near Bathurst. Allied to *H. moschàta*. Stipulas broad, ovate, dotted.

Gaudichaud's Penny-wort. Pl. cr.

79 H. MOSCHA'TA (Forst. prod. 136. but not of Schultes,) plant hairy in every part; leaves reniform, somewhat 5-lobed, toothed, 5-nerved: lobes acute; peduncles shorter than the petioles, and more slender; umbels capitate, 10-flowered; fruit orbicular, didymous, furnished with 2 ribs on both sides. 4.? F. Native of New Zealand. Petioles 1-1½ inch long. Limbs of leaves 6 lines in diameter. Thunb. diss. 2. p. 414. Rich. hydr. no. 42. f. 24.

Musky-scented Penny-wort. Pl. cr.

80 H. GROSSULARIOÌDES (Rich. hydr. no. 43. f. 30.) plant hispid; leaves somewhat reniform, deeply 5-cleft; lobes cuneiform, obtuse, doubly serrated; peduncles length of petioles; umbels capitate, 10-flowered. 4. B. S. Native of the Island of Bourbon. Leaves of involucrum small, ovate-oblong. Petioles and peduncles 6-8 lines long.

Gooseberry-like-leaved Penny-wort. Pl. cr.

******** *Flowers disposed in verticillate interrupted spikes.*

81 H. SPICA'TA (Lam. dict. 3. p. 153.) leaves reniformly cordate, roundish, 7-nerved, crenated, rather hairy on both surfaces from scattered hairs; petioles and peduncles hairy, peduncles 3 times longer than the petioles; flowers in glomerate whorles, disposed in interrupted spikes; fruit didymous, without ribs. 4.? B. S. Native of St. Domingo and Porto Rico, &c. in humid parts of mountain woods. Rich. hydr. no. 25. f. 15. Spreng. in Schultes, syst. 6. p. 351. H. hirsùta, Swartz, fl. ind. occ. 2. p. 560. but not of Spreng. nor Blum.

Spike-flowered Penny-wort. Fl. July, Aug. Clt. 1810. Pl. cr.

82 H. BRACHYSTA'CHYA (D. C. prod. 4. p. 68.) stems filiform, low, smoothish; leaves reniform-roundish, 7-nerved, crenated, pilose on both surfaces; petioles shorter than the leaves, hairy; peduncles twice the length of the petioles, hairy; spikes oblong, continuous; fruit didymous, without ribs. 4.? S. Native of St. Domingo.

Short-spiked Penny-wort. Pl. cr.

83 H. LEPTOSTA'CHYA (Rich. hydr. no. 26. t. 16. exclusive of the country,) leaves reniform, 7-nerved, crenated, rather pilose above, glabrous beneath; petioles nearly 3 times longer than the limbs, and are, as well as the peduncles, pilose; flowers disposed in interrupted spikes, with the whorles of flowers very remote; fruit orbicular, didymous, without ribs. 4. B. S. Native of Cuba, in humid places near the Havannah. H. B. et Kunth, nov. gen. amer. 5. p. 23. Spreng. syst. 1. p. 875. exclusive of the variety from Jamaica. Very like *H. spicàta*, but differs in the leaves being glabrous beneath, in the whorles being remote, and containing few flowers; and in the peduncles not exceeding the leaves.

Slender-spiked Penny-wort. Pl. cr.

SECT. II. CENTE'LLA (meaning unknown to us). Lin. gen. 1051. Lag. obs. aparas. 26. D. C. prod. 4. p. 68. Stems shrubby, erectish. Leaves cuneated at the base, with the exception of only one species, neither peltate nor cordate, as in the first section. Fruit less compressed, with many ribs.—This section will perhaps form a distinct genus when the fruit of the species is better known.

***** *Petals villous.*

84 H. VILLÒSA (Lin. fil. suppl. p. 175.) the whole plant more or less villous; leaves cordate, acute, nearly entire, 3-nerved; stem erectish, branched; peduncles shorter than the petioles; umbels 3-flowered, capitate. ♄. G. Native of the Cape of Good Hope. Thunb. diss. 2. p. 413. Cham. et Schlecht. l. c. p. 273. Mercuriàlis A'fra, Lin. mant. p. 298. Centélla villòsa, Lin. syst. veg. 13. p. 708. There is a larger variety with leaves an inch long, and a smaller variety with leaves hardly 3-4 lines long. Leaves nearly entire, obtuse, with a little point. Pedicels 1-flowered, some of them shorter than the petioles, but usually longer.

Villous Penny-wort. Fl. Aug. Clt. 1795. Pl. ½ foot.

85 H. TRIDENTA'TA (Lin. fil. suppl. 176. Thunb. prod. p. 49. diss. 2. p. 415. t. 3.) the whole plant clothed with tomentum; leaves oblong-cuneiform, narrow, 3-5-toothed at the apex; stem erectish; peduncles rising in fascicles, very short; fruit elliptic, compressed, furnished with 4 ribs on each side. ♄. G. Native of the Cape of Good Hope. Rich. hydr. no. 51. f. 37. Spreng. in Schultes, syst. 6. p. 354. Bòlax tridentàta, Spreng. umb. prod. p. 34. Allied to *H. villòsa* from the villous petals, and to *H. Solándra* in the form of the leaves.

Tridentate-leaved Penny-wort. Pl. ⅛ foot.

****** *Petals glabrous.*

86 H. TRI'LOBA (Thunb. diss. 2. p. 416. t. 3.) plant glabrous; leaves broadly wedge-shaped, 3-5-nerved, 3-5-toothed at the apex: teeth broad, acute; peduncles shorter than the

petioles; umbels capitate, 3-flowered; fruit compressed, somewhat didymous, furnished with 2 ribs on each side. ♄. G. Native of the Cape of Good Hope. Rich. hydr. no. 52. f. 36. Cham. et Schlecht. Linnæa. 1826. p. 354. Bòlax tríloba, Spreng. umb. prod. p. 34. Allied to *H. tridentàta*, but differs in the smoothness of all parts of the plant. Bracteas longer than the flowers. Middle flower in each umbel fertile: lateral 2 sterile.

Three-lobed-leaved Penny-wort. Fl. June, Aug. Clt. 1810. Pl. $\frac{1}{4}$ foot.

87 H. Sola'ndra (Lin. fil. suppl. 176.) the whole plant clothed with hoary tomentum, the petals only excepted; leaves petiolate, obovately cuneiform, bluntly 7-toothed at the apex; umbels pedunculate, 5-6-flowered; flowers on short pedicels; leaves of involucrum ovate-lanceolate, glabrous inside. ♄. G. Native of the Cape of Good Hope, on hills. Lam. dict. 3. p. 155. Rich. hydr. no. 53. H. tomentòsa, Thunb. diss. 2. p. 416. Spreng. in Schultes, syst. 6. p. 593. Solándra Capénsis, Lin. spec. 1407. exclusive of the synonymes. Perhaps numerous species are here confused.

Var. α, lóngipes (D. C. prod. 4. p. 69.) peduncles exceeding the leaves in length.

Var. β, commùnis (D. C. l. c.) peduncles length of the leaves. —Lam. ill. t. 188. f. 5. Sieb. cap. exsic. no. 140.

Var. γ. ? longifòlia (D. C. l. c.) peduncles much shorter than the leaves; leaves cuneate, elongated. Native of the Cape of Good Hope. Burchell. Perhaps a proper species.

Solander's Penny-wort. Pl. $\frac{1}{8}$ foot.

88 H. Cente'lla (Cham. et Schlecht. in Linnæa. 1. p. 375.) plant shrubby; leaves oblong, cuneated or lanceolate, 3-nerved, quite entire; umbels pedunculate, 3-5-flowered, with usually only one male flower; leaves of involucrum ovate-lanceolate; petals glabrous. ♄. G. Native of the Cape of Good Hope, where the plant varies much in form and habit.

Var. α, glabréscens (D. C. prod. 4. p. 69.) adult leaves glabrous, oblong-lanceolate. H. glabràta, Lin. fil. suppl. p. 176. Spreng. syst. 1. p. 878. Centélla glàbra, Lin. amœn. 6. afr. p. 100. H. glàbra, Thunb. fl. cap. 251.

Var. β, latifòlia (D. C. l. c.) leaves glabrous, cuneiformly oval. H. bupleurifòlia, Rich. hydr. no. 55. f. 39.

Var. γ, linifòlia (D. C. l. c.) leaves clothed with canescent hairs, linear-spatulate.—H. linifòlia, Lin. fil. suppl. 176. Thunb. diss. 2. p. 413. Rich. l. c.

Var. δ, plantagínea (D. C. l. c.) leaves canescent from hairs, oblong.—H. plantagínea, Spreng. neue entd. 1. p. 284. grundz. t. 8. f. 5-7.

Centella Penny-wort. Pl. $\frac{1}{4}$ foot.

89 H. monta'na (Cham. et Schlecht. in Linnæa. 1. p. 374.) plant shrubby, when young villous, at length glabrous; leaves lanceolate, quite entire or somewhat tridentate, 3-nerved; petioles villous; umbels 3-flowered, on short peduncles; leaves of involucrum 2, twice the length of the nearly orbicular corrugate fruit. ♄. G. Native of the Cape of Good Hope, on the tops of mountains. A humble depressed branched shrub. Mericarps tumid, with 5 filiform ribs, and flattish furrows.

Mountain Penny-wort. Shrub depressed,

90 H. virga'ta (Lin. fil. suppl. p. 176.) plant shrubby, erect, branched; leaves linear-filiform, quite entire; umbels pedunculate, 1-3-flowered; flowers hardly pedicellate; leaves of involucrum lanceolate; fruit orbicular, obcordate, furnished with 2 ribs on each side. ♄. G. Native of the Cape of Good Hope, ex Cham. et Schlecht. in Linnæa. 1. p. 379.

Var. α, glabérrima (D. C. prod. 4. p. 69.) plant twiggy, quite glabrous; flowers polygamous and monoecious. H. virgàta, Lam. ill. t. 188. f. 3. Spreng. syst. 1. p. 878.

Var. β, lanuginòsa (D. C. l. c.) plant twiggy, clothed with lanuginous villi; flower polygamo-monoecious; leaves expanded into linear lamina at the apex. Cham. et Schlecht.

Var. γ, macrocárpa (D. C. l. c.) plant twiggy, glabrous; flowers polygamo-dioecious; fruit larger.—H. macrocárpa, Rich. hydr. no. 57. f. 40.—Pluk. alm. t. 310. f. 7.

Var. δ, nàna (D. C. l. c.) plant short, glabrous; flowers polygamo-dioecious.

Twiggy Penny-wort. Pl. $\frac{1}{8}$ to $\frac{1}{4}$ foot.

† *Species not sufficiently known.*

91 H. flu'itans (D. C. prod. 4. p. 69.) stems submersed, straight, fistular; leaves peltate, orbicular, shining, floating; petioles thickened from the base to the apex. ♃. W. H. Native of Louisiana, floating in lakes and tranquil rivers, through immense tracts. H. incrassàtum, Rafin. fl. lud. p. 81. but not of Ruiz et Pav. Hydrocótyle Robin, Louis, p. 461. ex Rafin. It grows also in water in Florida, very common. The stems have numerous fibres, issuing from the joints. The leaves are on long petioles, orbicular, peltate, and 15-20-nerved, glabrous, bluntly somewhat lobed, and crenated. Very like *H. nàtans*, but differs in the leaves being peltate.

Floating Penny-wort. Pl. floating.

92 H. hederæfòlia (Burch. cat. geogr. no. 558. trav. 1. p. 46.) plant decumbent, villous; leaves reniform, 3-5-angled; angles acute. ♃. G. Native of the Cape of Good Hope. The rest unknown.

Ivy-leaved Penny-wort. Pl. decumbent.

93 H. racemòsa (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 4. p. 70.) plant glabrous; leaves petiolate, orbicularly reniform, broadly crenated, with a narrow recess; peduncles twice the length of the leaves; flowers pedicellate, verticillate, disposed in interrupted racemes; fruit nearly globose. ♃. F. Native of Mexico. Stems creeping. Leaves rising from the nodi of the stems in fascicles; petioles 12-15 lines long. Allied to *H. interrúpta*, but the leaves are not peltate; and to *H. spicàta*, but the flowers are evidently pedicellate.

Racemose-flowered Penny-wort. Pl. cr.

94 H. grumòsa (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 4. p. 70.) plant glabrous; stems ascending; root grumose, fascicled; petioles dilated and stem-clasping at the base; leaves orbicular, cordate, crenated; umbels in fascicles; flowers distinctly pedicellate. ♃. B. F. Native of Mexico.

Grumose-rooted Penny-wort. Pl.

95 H. pinnati'fida (Spreng. pug. 2. p. 47.) stems erect, glabrous; leaves pinnatifid; segments oblong, a little cut; umbels usually 3-flowered, involucrated.—Native country unknown. In Sprengel's subsequent works this plant is not admitted, and the name is omitted as a synonyme: it is therefore very doubtful.

Pinnatifid-leaved Pennywort. Pl.?

Cult. All the species are of the most easy culture, but require to be kept moist. The stove, greenhouse, and frame kinds should be grown in pots, under which should be placed pans of water.

II. CRA'NTZIA (in honour of Henry John Nepom Crantz, author of Stirpium Austriacarum, 4to. Vienna, 1762-1768; Classis Umbelliferarum Emendata, &c.) Nutt. gen. amer. 1. p. 177. Koch, in litt. ex D. C. coll. mem. 5. p. 27. prod. 4. p. 70. —Hydrocótyle species, Michx.

Lin. syst. *Pentándria, Digýnia.* Tube of calyx nearly globose; limb very short or hardly any. Petals roundish, entire, obtuse. Styles obtuse. Fruit roundish, with the commissure nearly orbicular from the excavation; mericarps unequal, furnished with 3 ribs on the back (ex Nutt.), but according to Koch 5 filiform ribs: the lateral ones marginal, broader, thick

white and spongy inside; the channels between the ribs furnished with 1 brown distinct vitta each, and the commissure with 2 vittæ.—Small, glabrous, creeping herbs. Leaves sessile, narrow, obtuse, quite entire, lined with 5 transverse nerves, as the seminal leaves and petioles of *Eryngium corniculàtum*. Peduncles axillary, erect. Umbels simple, 8-10-flowered. Involucrum 5-6-leaved. Flowers white, pedicellate, hermaphrodite, uniform.

1 C. LINEA'TA (Nutt. l. c.) leaves sessile, cuneate-linear, obtuse; peduncles length of leaves; umbels 8-10-flowered. ♃. B. H. Native of North America, in saltish, boggy, or inundated places, from New Jersey to Florida. Hydrocótyle lineàta, Michx. fl. bor. amer. 1. p. 162. Rich. hydr. no. 54. f. 38. Ell. sketch. 1. p. 247. H. ligulàta, Bosc. herb. H. Chinénsis, Spreng. in Schultes, syst. 6. p. 355. and perhaps of Lin. spec. p. 339.

Lined-leaved Crantzia. Fl. June, Aug. Clt. 1818. Pl. cr.

2 C. ATTENUA'TA (Hook. et Arn. in bot. misc. 2. p. 346.) leaves elongated, attenuated, 3-times longer than the peduncles. ♃. B. F. Native of Buenos Ayres. Differing from *C. lineàta* remarkably in its much longer and attenuated foliage.

Attenuated-leaved Crantzia. Pl. cr.

Cult. See *Hydrocótyle* above for culture and propagation.

III. DIMETO'PIA (from *διμετωπος, dimetopos*, having 2 faces; in reference to the mericarps of the fruit being unlike each other). D. C. prod. 4. p. 71.

LIN. SYST. *Pentándria, Digýnia.* Teeth of calyx obsolete. Petals oval-oblong, entire. Styles short. Fruit didymous; mericarps nearly globose, rather contracted at the commissure, of unequal shape and size: the one muricated with rows of blunt compressed tubercles, the other echinated by conical tubercles, which are drawn out at the apex into soft prickles. Seed ?—An annual herb, hardly a finger in height. Stem short, branched, beset with scattered pili. Leaves tripartite; lobes cuneate, linear-oblong, bluntly tridentate at the apex, or trifid. Peduncles opposite the leaves, and longer than them. Umbels simple, usually 5-flowered. Involucrum of 5 linear-lanceolate leaves, which are the length of the flowers. Flowers white.—Habit almost of *Erigènia;* the fruit agrees with that of *Sanícula*, and the petals with those of *Hydrocótyle*.

1 D. PUSI'LLA (D. C. l. c.). ☉. H. Native of New Holland, at King George's Sound, and at Port Western.

Small Dimetopia. Pl. ¼ foot.

Cult. Sow the seeds in a warm sheltered situation, in the open ground.

IV. ERIGE'NIA (from *ηριγενεια, erigeneia*, the name of Aurora, the harbinger of day or of the spring; in allusion to the early appearance of the plant in spring). Nutt. gen. amer. 1. p. 187. D. C. coll. mem. 5. p. 27. prod. 4. p. 71.—Hydrocótyle species, Pursh. and Spreng.—Sìson, spec. of Michx.

LIN. SYST. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals equal, obovate, expanded, entire. Styles permanent, subulate, very long. Fruit oval-lanceolate, laterally compressed; mericarps gibbously convex, marked with 3 stripes; commissure flat, without a margin.—A small, smooth herb. Root tuberous, globose. Leaves 1-2, radical, petiolate, biternate. Umbels irregular, imperfect, 3-4-rayed: umbellules 3-5-flowered. True involucrum wanting, but in place of it there is a multifid leaf; leaves of involucel few, unequal. Petals white. Anthers exserted, dark purple. This genus agrees with *Ammi* in the compound inflorescence, and with *Bùnium* in the tuberous root.

1 E. BULBÒSA (Nutt. l. c.). ♃. B. H. Native of North America, in Pennsylvania, Ohio, Missouri, Tenessee, &c. in humid and inundated places. Sìson bulbòsum, Michx. fl. bor. amer. 1. p. 169. Hydrocótyle compósita, and H. ambígua, Pursh. and Spreng. ex Nutt. l. c. Spreng. umb. spec. 5. t. 5. f. 9.

Bulbous-rooted Erigenia. Pl. ½ foot.

Cult. This plant should be grown in a pot, under which should be placed a pan of water.

V. MICROPLEU'RA (from *μικρος, micros*, small, and *πλευρα, pleura*, a rib; the ribs of the fruit are small and capillary). Lag. obs. aparas. p. 15. D. C. coll. mem. 5. p. 27. prod. 4. p. 71.

LIN. SYST. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals equal, entire, acute. Fruit deeply cordate at the base, rather foliaceous, emarginate at the apex; mericarps compressed from the sides, obliquely ovate, 7-ribbed; ribs capillary, curvilinear, ventricose below: the marginal 2 are shorter, and form a straight line; the commissure is very narrow, one half shorter than the mericarps.—Caulescent glabrous herbs, natives of Chili, with the habit of *Hydrocótyle;* but the umbels are rarely compound. Mericarps of fruit probably 9-ribbed, having 2 of them obsolete or hidden.

1 M. RENIFÒLIA (Lag. l. c.). Native of the Island of Chiloe. Petioles dilated at the base. Leaves alternate, petiolate, cordately reniform, 6-9-nerved, and veined, crenate, rather membranous. Umbels terminal, pedunculate, 4-5-rayed; involucrum foliaceous, composed of 1 leaf; umbellules 3-4-rayed, surrounded by small, 3-4-leaved involucels. Flowers 3, middle one fertile and nearly sessile, and the 2 lateral ones are male, on short pedicels.

Kidney-leaved Micropleura. Pl. cr.

Cult. See *Hydrocótyle* for culture and propagation, p. 255.

VI. DIDI'SCUS (from *δις, dis*, twice, and *δισκος, diskos*, a disk; the mericarps appear like 2 disks). D. C. coll. mem. 5. p. 28. t. 4. Hook. bot. mag. t. 2875.—Lámpra, Lindl.—Hugèlia, Rchb. consp. t. 144.

LIN. SYST. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals oval, entire, bluntish (f. 57. *c.*), imbricate in æstivation. Styles diverging. Fruit nearly like that of *Biscutélla*, hence the name, emarginate at the base; mericarps very much compressed from the sides, without any vittæ, a little muricated, or beset with dot-like hairs, 5-ribbed; ribs filiform: the 2 inner ones near the commissure, very short: the 2 middle ones short and curvilinear: and the dorsal one a little winged. Seed much compressed. Carpophore undivided.—Herbs, natives of New Holland. Stems terete, branched. Leaves variously parted, or lobed: lobes rather cuneated, cut. Umbels simple. Involucrum of many leaves, which are concrete at the base (f. 57. *a.*). Perhaps merely a section of *Trachymène*, but the margin of the calyx is obsolete, not 5-toothed; the petals obtuse, not acute, and the fruit is compressed, not inflated, &c.

1 D. CŒRU'LEUS (Hook. bot. mag. 2875. D. C. coll. mem. 5. t. 4.) plant hairy; leaves petiolate, 3-parted; having the partitions 2-3-cleft, and the lobes 2-3-toothed; umbels simple, on long peduncles; involucrum of many leaves, when young reflexed. ☉. F. Native of New Holland. Trachymène cyanæ'a, Cunningh. mss. Trachymène cœrùlea, Graham, in edinb. phil. journ. 1828. Sept. p. 373. Lindl. bot. reg. no. 1225. Hugèlia cyanæ'a, Rchb. icon. exot. t. 201. Flowers blue; each umbel having

FIG. 57.

the appearance of a head of the flowers of *Scabiòsa Caucásica*, but the flowers are on longer pedicels: pedicels, after flowering, twisted inwards, bearing the fruit, which lies within the involucel, but erect at maturity. Fruit, when young, rather hairy, but in the adult state it is covered with minute tubercles. This is one of the most showy plants of the order.

Blue-flowered Didiscus. Fl. July, Sept. Clt. 1827. Pl. 1 to 2 feet.

2 D. albiflòrus (D. C. prod. 4. p. 72.) plant glabrous; radical leaves on long petioles, palmate; segments dilated at the apex, cut, toothed; cauline leaves few, small; umbels simple, on long peduncles. ♃. G. Native of New Holland, at Port Jackson. Trachymène incìsa, Rudg. in Lin. trans. 10. p. 300. t. 21. f. 2. Fruit much compressed, beset with minute tubercles. Petals white.

White-flowered Didiscus. Clt. 1819. Pl. 1½ foot.

Cult. Sow the seed of these plants on a slight hot-bed in spring, and when the plants are 2 inches high, plant them separately into small pots, and shift them from size to size of pots as they grow.

VII. TRACHYME'NE (from τραχυς, *trachys*, rough, and ὑμην, *hymen*, a membrane; channels of fruit). Rudge, in Lin. trans. 1811. vol. 10. p. 300. Spreng. umb. spec. p. 8. Koch. umb. p. 143. D. C. coll. mem. 5. p. 28. prod. 4. p. 72.—Azorélla, Labill. nov. holl. 1. p. 74. Rich. hydr. p. 21. t. 52. f. 6. but not of Lam.—Azorélla species, Cav.—Fischèra species, Spreng. umb. prod. p. 27. but not of D. C.—Fischèra, Lag. am. nat. 2. p. 93. but not of D. C.—Catèpha, Leschen. ined.—Siebèra, Rchb.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 5-toothed. Petals elliptic, entire, acutish, straight at the apex, rather valvate in æstivation; styles diverging. Fruit didymous, compressed, and contracted from the sides; mericarps gibbously convex, without any vittæ, 5-ribbed: the 3 dorsal ribs and their channels muricated with tubercles: lateral ones marginal. Carpophore undivided. Seed gibbously convex, flattish in front.—Herbs or subshrubs, all natives of New Holland. Umbels compound, many-rayed: umbellules containing 3-12 flowers. Involucrum of many leaves. This genus agrees with *Hydrocótyle* in the fruit being compressed; the rest agrees with *Azorélla*. *Poranthèra* of Rudge agrees with this genus in habit, but the structure of the flowers is very different, and most probably belongs to the order *Tremándreæ*.

Sect. I. Platyme'ne (from πλατυς, *platys*, broad; stems compressed). D. C. prod. 4. p. 72. Plant herbaceous. Stems much compressed. Leaves small, cut.

1 T. a'nceps (D. C. prod. 4. p. 73.) plant glabrous, nearly leafless; stem 2-edged, branched; leaves also at the tops of the branches cut into a few fine lobes. ♃. G. Native of New Holland. It agrees with *T. compréssa* in the stem being compressed, but it is one half narrower, the leaves more finely cut, the umbel more slender. The fruit has not been seen, but the analogy of the herb with the following species is sufficient to indicate its belonging to the same genus.

Two-edged-branched Trachymene. Pl. 1 foot.

2 T. compre'ssa (Spreng. umb. spec. p. 9. exclusive of the Chili specimen) plant glabrous, nearly leafless; leaves very few, small, binate or ternate: upper ones linear, entire; stem 2-edged, branched. ♃. G. Native of New Holland, on the sandy coast. Azorélla compréssa, Labill. nov. holl. 1. p. 75. t. 101. Fruit compressed, obovate; mericarps convex on the back, 3-ribbed: ribs wrinkled from the tubercles. Involucrum shorter than the pedicels.

Compressed Trachymene. Pl. 1 foot.

Sect. II. Dendrome'ne (from δενδρον, *dendron*, a tree; in reference to the species being shrubby). D. C. prod. 4. p. 73. Plants shrubby. Leaves entire.

3 T. linea'ris (Spreng. umb. spec. p. 7.) plant quite glabrous, shrubby; leaves scattered, erect, linear, subulate and acute at the apex. ♄. G. Native of New Holland, at Port Jackson. Sieb. pl. exsic. nov. holl. no. 126. Azorélla linearifòlia, Cav. icon. 5. t. 485. Azorélla linearifòlia, Pers. ench. 1. p. 303. Fruit obovate, compressed; mericarps 3-ribbed; ribs rough from rows of tubercles. Flowers yellow.

Linear-leaved Trachymene. Fl. Ju. Aug. Clt. 1824. Sh. 1 to 2 feet,

4 T. te'nuis (D. C. prod. 4. p. 73.) shrubby; branches terete, beset with glandular hairs at the apex; leaves scattered, spreading, linear, acute; umbels few-flowered. ♄. G. Native of New Holland. Branches very slender. Leaves hardly ¼ line broad, and 3-4 lines long. Umbel trifid: umbellules 3-5-flowered. Ribs of fruit scabrous from tubercles. Very like *T. ericoìdes*.

Slender Trachymene. Shrub 1 foot.

5 T. subvelutìna (D. C. l. c.) shrubby; branches terete; leaves linear, thickish, acute, velvety from short crowded down, as well as the branchlets; umbels crowded. ♄. G. Native of New Holland, at Port Jackson. The leaves are almost like those of *T. ericoìdes*, but differ in being velvety and erectish. Branches hardly diverging.

Rather-velvety Trachymene. Shrub 1 foot.

6 T. ericoìdes (Sieb. pl. exsic. nov. holl. no. 121.) shrubby; branches rather angular, glabrous; leaves linear, acute, spreading; umbels crowded. ♄. G. Native of New Holland. Branches numerous, spreading. Leaves a line broad, with the margins hardly revolute when dried. Umbels 5-cleft: umbellules 5-6-flowered. Fruit scabrous from tubercles on the ribs.

Heath-like Trachymene. Shrub.

7 T. lanceola'ta (Rudge, l. c. Spreng. syst. 1. p. 879.) shrubby; branchlets rather angular, glandular, and velvety when examined by a lens; leaves lanceolate-linear, nerved, erect; umbels crowded, many-flowered. ♄. G. Native of New Holland. Azorélla lanceolàta, Labill. nov. holl. 1. p. 74. t. 99. Leaves an inch and a half long, and 2 lines broad. Leaves of the involucrum the length of the umbel. Umbels 5-8-rayed; umbellules 8-10-flowered. Branches sometimes terminated by an 8-10-flowered, simple umbel.

Lanceolate-leaved Trachymene. Shrub 1 foot.

8 T. myrtifòlia (Sieb. pl. exsic. nov. holl. no. 125.) shrubby; branches rather angular, hardly glandular or puberulous, even when examined by a lens: leaves oval-oblong, rather attenuated at both ends; umbels crowded, many-flowered. ♄. G. Native of New Holland. Very nearly allied to *T. lanceolàta*, but differs in the leaves being 9-10 lines long, and 3 lines broad. Umbels 8-10-rayed: umbellules 8-12-flowered.

Myrtle-leaved Trachymene. Shrub.

9 T. ova'lis (D. C. prod. 4. p. 73.) shrubby; branches densely clothed with short hairs; leaves oval, nerved, scattered, nearly sessile, hardly attenuated at either end; umbels many-flowered, crowded. ♄. G. Native of New Holland. T. ovàta, Spreng. umb. spec. p. 8. (exclusive of the syn. of Labill.). Sieb. pl. exsic. nov. holl. no. 124. Perhaps only a variety of *T. myrtifòlia*.

Var. β, *conférta* (D. C. l. c.) leaves and branchlets much crowded. ♄. G. Native of New Holland, at Port Jackson. Perhaps a proper species.

Oval-leaved Trachymene. Shrub 1 foot.

10 T. ova'ta (Rudge, l. c. but not of Spreng. nor Sieb.) shrubby: branches smoothish; leaves broadly ovate, nearly sessile, hardly longer than broad; umbels crowded, many-flowered.

ħ. G. Native of New Holland. Azorélla ovàta, Labill. nov. holl. 1. p. 74. t. 100. T. buxifòlia, Sieb. pl. exsic. nov. holl. no. 122. Leaves 4 lines long, and 3 lines broad. Umbels much crowded, small, 8-10-rayed.

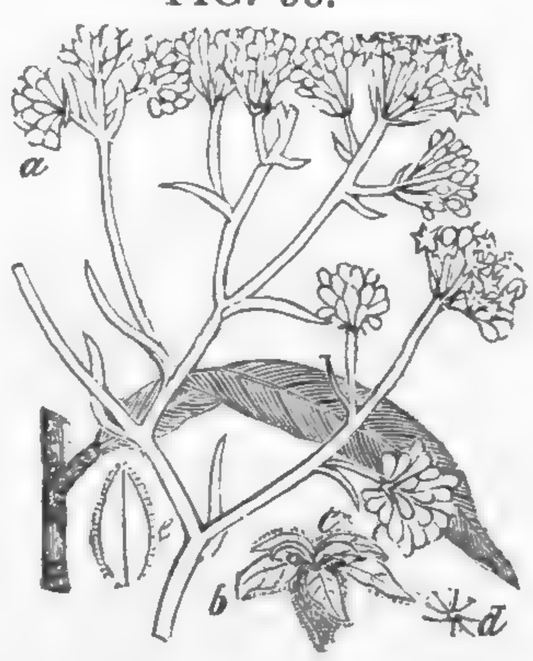
Ovate-leaved Trachymene. Shrub.

Cult. All the species of *Trachymène* will grow well in a mixture of loam, peat, and sand; and they may be increased by cuttings, under a hand-glass, or by seeds.

VIII. ASTRO'TRICHA (from *αστρον, astron*, a star, and *θριξ τριχος, thrix trichos*, a hair; in allusion to the starry down on the outside of the petals). D. C. coll. mem. 5. p. 29. t. 5. and 6. prod. 4. p. 74.—Bòlax species, Sieb.

Lin. syst. *Pentándria, Digýnia.* Tube of calyx ovate; limb small, hardly 5-toothed. Petals oval, acutish (f. 58. *b*), permanent, flat, velvety from stellate down on the outside. Styles 2, filiform (f. 58. *c*.), not gradually thickening to the base. Fruit crowned by the calycine lobules and petals; mericarps ovate-oblong, contracted at the commissure; ribs very blunt, hardly prominent: of the primary ones there are 3 dorsal, and 2 marginal, which are more acute and not so evident: of the secondary ones 4; vittæ wanting on the back, but there are 2 rather prominent ones in the commissure, which are covered by a spongy pellicle.—Australian, branched subshrubs, having the branches, petioles, under side of leaves, and umbels beset with white stellate hairs. Peduncles panicled, each ending in a simple, many-flowered umbel. Bracteas under the branches and branchlets solitary. Leaves of involucrum few and linear. Habit almost of *Hérmas*, but the fruit is very different. It differs from *Bòlax* in habit, and in the fruit not being tetragonal.

FIG. 58.



1 A. floccòsa (D. C. l. c. t. 5.) the whole plant is clothed with flocky lanuginose down; leaves ovate-lanceolate, obtuse at the base, and acuminated at the apex. ħ. G. Native of New Holland. Bòlax floccoìdes, Sieb. exsic. nov. holl. no. 258. Leaves 3-6 inches long and 12-15 lines broad; petioles half an inch long.

Flocky Astrotricha. Shrub.

2 A. ledifòlia (D. C. l. c. t. 7.) plant clothed with short adpressed down; leaves oblong-linear, coriaceous, acutish at both ends. ħ. G. Native of New Holland. Bòlax ledifòlius, Sieb. exsic. nov. holl. no. 257. Leaves 20 lines long and 3 broad; petioles 2 lines long.

Ledum-leaved Astrotricha. Shrub.

Cult. See *Trachymène* above for culture and propagation.

IX. XANTHO'SIA (from *ξανθος, xanthos*, yellow; in allusion to the plants being clothed usually with yellow down) Rudge, in Lin. trans. 1811. 5. 10. p. 361. t. 22. f. 1. Spreng. in Schultes, syst. 6. p. 27. and 314. D. C. coll. mem. 5. p. 31. prod. 4. p. 74.—Leucolæ'na, R. Br. gen. rem. without a description.—Cruciélla, Lesch. mss.

Lin. syst. *Pentándria, Digýnia.* Tube of calyx ovate, compressed; limb 5-lobed; lobes ovate, acute, coloured a little. Petals stipitate, oval, cuspidate at the apex, replicate. Stamens opposite the calycine lobes. Stylopodia (glands, Rudge) 2, thick, villous at the tops of the mericarps. Styles 2, filiform, rising from the inner bases of the stylopodia. Fruit compressed, striated; mericarps contracted at the commissure, 7-9-ribbed: ribs filiform: 2 lateral ones marginal; channels without vittæ, as well as the commissure, which is very narrow.—Australian subshrubs, usually covered with stellate hairs. Leaves alternate, simple, or tripartite. Umbels variable.

Sect. I. Euxanthòsia (this section is supposed to contain the true species of *Xanthòsia*, from *eu*, well, and *Xanthòsia*). D. C. prod. 4. p. 74. Umbels axillary, simple, or bifid. Leaves of involucrum small.

1 X. monta'na (Sieb. fl. nov. holl. exsic. no. 248.) the whole plant clothed with villi: some of them starry, and others simple and elongated; leaves ternate, rarely 3-lobed; umbels axillary, nearly sessile, simple, 1-flowered; involucra and involucels 2-leaved. ħ. G. Native of New Holland, on the mountains. X. pilòsa, Rudge; the flowers are only referrible to this plant.

Mountain Xanthosia. Shrub.

2 X. hirsu'ta (D. C. prod. 4. p. 74.) the whole plant clothed with hairs, some of which are stellate, and others simple and elongated; leaves sinuated, rarely 3-lobed; umbels axillary, pedunculate, bifid; umbellules 1-flowered; involucrum 2-leaved; involucels 3-leaved. ħ. G. Native of New Holland, near Port Jackson. X. pilòsa, Rudge, only in the form of the leaves. Sieb. pl. exsic. nov. holl. no. 247.

Hairy Xanthosia. Shrub.

3 X. tridenta'ta (D. C. prod. 4. p. 75.) young branches strigose: adult ones glabrous; leaves cuneated, acutely tridentate at the apex, tomentose from starry down beneath, but glabrous in the adult state; umbels pedunculate, axillary, bifid: umbellules 1-flowered; involucrum 2-leaved; involucels 2-3-leaved: leaves lanceolate. ħ. G. Native of New Holland, at Port Jackson. Leucolæ'na tridentàta, R. Br. mss. ex herb. mus. par.

Tridentate-leaved Xanthosia. Shrub.

Sect. II. Leucolæ'na (from *λευκος, leucos*, white, and *χλαινα, chlaina*, a garment; in reference to the involucrum). D. C. prod. 4. p. 75. Umbels terminal, 3-4-rayed. Leaves of involucrum large, white.

4 X. rotundifòlium (D. C. prod. 4. p. 75.) branches densely clothed with hairs, or rather rough from deciduous down; leaves reniformly orbicular, coarsely and acutely toothed; umbels 3-4-rayed: umbellules many-flowered; involucra and involucels 3-leaved. ħ. G. Native of New Holland, on the eastern coast. Cruciélla cándida, Lesch. in herb. Juss. Leaves of involucrum lanceolate, hairy at the base: those of the involucels broader, somewhat cordate, apiculated, glabrous. Fruit more compressed in the young state.

Round-leaved Xanthosia. Shrub.

Cult. For culture and propagation see *Trachymène*, above.

X. BOWLE'SIA (in honour of William Bowles, an Irish botanist). Ruiz. et Pav. fl. per. prod. p. 44. t. 34. fl. per. 3. p. 28. Spreng. umb. prod. p. 24. Lag. am. nat. 2. p. 94. Rich. hydro. p. 21. t. 51. f. 3. Koch, umb. p. 142. D. C. coll. mem. 5. p. 31. prod. 4. p. 75. but not of Poir.

Lin. syst. *Pentándria, Digýnia.* Tube of calyx compressedly tetragonal; limb 5-toothed. Petals elliptic, entire, acute. Fruit ovate, much contracted at the raphe, turgid, rather tetragonal, flattish on both sides at the back; mericarps without vittæ, marked on the back by an oval impression; with 5 obsolete ribs: the 3 middle ones on the back: and the 2 lateral ones placed in the commissure, which is flat.—Weak, South American herbs, usually scabrous from stellate down. Leaves petiolate, opposite, simple, lobed, or toothed. Umbels simple, axillary, few-flowered. This genus is allied to *Spanánthe*.

1 B. palma'ta (Ruiz et Pav. fl. per. 3. t. 251. f. a.) plant

erectish, beset with scattered, stellate hairs in every part; leaves palmately parted; segments 3-5, jagged; umbels 3-flowered: upper ones on short, and the lower ones on long peduncles. ⊙. H. Native of Peru, in the province of Chancay, on sandy hills. Plant 2 feet high, brittle, perhaps erect.

Palmate-leaved Bowlesia. Pl. 2 feet.

2 B. loba'ta (Ruiz et Pav. l. c. t. 251. f. b.) plant decumbent, covered all over with fascicles of bristles or stiffish hairs; leaves reniform, 5-7-cleft, or with 5-7 deep crenatures; umbels 3-5-flowered, pedunculate. ⊙. H. Native of Peru, in bushy places, on the Andes towards Pillao. The bristles on the upper surface of the leaves are 3-5 in a fascicle: those on the rest of the plant are 8, and stellate.

Lobed-leaved Bowlesia. Pl. decumbent.

3 B. inca'na (Ruiz et Pav. l. c. t. 268. f. a.) plant procumbent, hoary from crowded stellate fascicles of hairs; leaves reniform-roundish, bluntly 3-5-cleft; lobes entire or tridentate; umbels axillary, on short peduncles. ⊙. H. Native of Peru, on hills in the tract at Huanaco Rondos and Pillao. Spreng. umb. spec. p. 13. t. 5. f. 10. Petioles permanent, rather tendril-formed. In cultivation the plant however becomes smoother, longer, and more procumbent than in the wild state.

Hoary Bowlesia. Pl. procumbent.

4 B. tropæolifòlia (Gill. and Hook. in bot. misc. 1. p. 325.) plant clothed with stellate down; stems procumbent, slender; leaves palmately 5-7-parted; segments lanceolate, bluntish, quite entire, with acute sinuses: peduncles 3-flowered; fruit small. ♃. F. Native of Chili, in shady places at El Salto de San Isidro, and in the valleys of the Andes, towards Mendoza. Stems filiform.

Var. β, tripartìta (Hook. et Arn. in bot. misc. 3. p. 346.) the 2 lower lobes of the leaves approximating, small, coarsely tridentate from the middle. ♃. F. Native of Chili, about Valparaiso.

Tripæolum-leaved Bowlesia. Pl. pr.

5 B. te'nera (Spreng. syst. 1. p. 860.) plant clothed with stellate pubescence; stems procumbent, slender; leaves on long petioles, reniform, 5-7-lobed: lobes obtuse, bifid or trifid; peduncles short, bearing a 3-flowered umbel each. ♃. H. Native of Chili, about Conception, Valparaiso, Buenos Ayres, and Talcaguana; of Peru, on the mountains about Huanaco; and of Brazil, in dry fields about Monte Video, and at Porto Allegretto. Link. et Otto, abbild. t. 4. B. nodiflòra, Presl, in Hænk. herb. ex D. C. prod. 4. p. 75. B. geraniifòlia, Cham. et Schlecht. in Linnæa. 1. p. 382. Hook. et Gill. in bot. misc. 1. p. 324. B. incàna, Hort. par.

Slender Bowlesia. Fl. June, Aug. Clt. 1827. Pl. pr.

6 B. dichótoma (Pœppig, diar. no. 363. pl. exsic. 95.) plant erect, dichotomous, hoary from stellate fascicles of hairs; leaves short, petiolate, obovate, coarsely tridentate at the apex; umbels 5-7-flowered, on long peduncles. ⊙. H. Native of Chili, about Valparaiso and the baths of Collina. Peduncles of umbels about equal in length to the leaves, or longer; sometimes simple, bearing an umbellule at the apex: sometimes bifid at the apex, bearing 2 linear leaves, each of the branches bearing an umbellule. This species, like the others, varies much in the proportionate length of the peduncles: they are, however, usually much shorter than the petioles.

Dichotomous-peduncled Bowlesia. Pl. 1 foot.

Cult. The seeds may be reared on a hot-bed in spring; and when the weather gets warm, the plants may be planted out into the open ground, in any warm sheltered situation.

XI. FRAGO'SA (in honour of John Fragosa, first physician to Philip II. King of Spain). Ruiz. et Pav. fl. per. prod. p. 43. t. 34. Lag. am. nat. 2. p. 93. Rich. hydr. in am. gen. sc. phys. 4. t. 51. f. 4. D. C. prod. 4. p. 76.—Bòlax, spec. Spreng. Koch.—Azorélla, spec. Lam. and Pers.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 5-toothed, permanent. Petals oval, entire. Styles short. Fruit ovate, almost didymous; mericarps rather compressed from the back and contracted at the commissure; dorsal ribs filiform, with 2 other obsolete ones very like them at the commissure, vittæ wanting.—Small, tufted, nearly stemless herbs, natives of the Andes of Peru. Leaves small, toothed, or 3-5-cleft, usually pilose. Umbels sessile or pedunculate; pedicels about equal in length to the involucrum.

1 F. corymbòsa (Ruiz et Pav. fl. per. 3. p. 27. t. 250. f. a.) leaves imbricate, cuneiform, trifid, small, pilose on both surfaces; umbels simple, few-flowered. ♃. F. Native of Peru, on the humid tops of the mountains called Muna at Tambo-Nuevo. Azorélla corymbòsa, Pers. Bòlax lycopodioìdes, Spreng. in Schultes, syst. 6. p. 361. Habit of *Lycopòdium* or *Bòlax*. Umbels 2-4-flowered. Superior leaves expanded in a stellate manner.

Corymbose-flowered Fragosa. Pl. ¼ foot.

2 F. multífida (Ruiz et Pav. fl. per. 3. p. 27. t. 249. f. a.) leaves ovate, deeply toothed, strigose above; petioles ciliated with bristles; umbels simple, ♃. F. Native of Peru, on the Andes, near Huassa-Huassi. Azorélla multífida, Pers. Bòlax multífidus, Spreng. Roots fusiform. Herb very short. Leaves 3-4 lines long. Leaves of involucrum subulate. Umbels few-flowered. Rich. ann. gen. sc. phys. 4. t. 51. f. 4. fruit only.

Multifid-leaved Fragosa. Pl. ¼ foot.

3 F. crena'ta (Ruiz et Pav. fl. per. 3. p. 27. t. 249. f. c.) leaves obovate, or roundish-ovate, crenately toothed, beset with bristly hairs on both surfaces, and on the petioles; umbels sessile, simple. ♃. F. Native of Peru, on cold hills at Huassa-Huassi, in the province of Tarma, and in New Granada, ex H. B. et Kunth, nov. gen. amer. 5. p. 26. Azorélla crenàta, Pers. Bòlax crenàtus, Spreng. Branches pilose, very short. Herb low, tufted. Leaves numerous, 6-8 lines long. Umbels containing about 14 flowers. Involucrum composed of 7 linear-lanceolate leaves.

Crenated-leaved Fragosa. Pl. ¼ foot.

4 F. cladorhìza (Ruiz et Pav. fl. per. 3. p. 27. t. 250. f. b.) leaves ovate, deeply serrated, shining above: each serrature terminated by an acumen; petioles winged, pilose, ciliated; umbels simple, nearly sessile, many-flowered. ♃. F. Native of Peru, on cold hills in the tract of Chavin, near Huamalies. Azorélla cladorhìza, Pers. Bòlax cladorhìzus, Spreng. Root thick, much branched. Limbs of leaves length of petioles, about 3-4 lines long. Leaves of involucrum ciliated with pili.

Branch-rooted Fragosa. Pl. ¼ foot.

5 F. renifórmis (Ruiz et Pav. fl. per. 3. p. 26. t. 249. f. b.) the whole plant densely clothed with pili; leaves reniform, crenated; petioles more than twice the length of the limbs; scapes much shorter than the petioles; umbels simple, many-flowered. ♃. F. Native of Peru, in shady places, at Huassa-Huassi, in the province of Tarma. Azorélla renifórmis, Pers. Petioles 3-4 inches long, with the limbs 1½ inch in diameter. Scapes of umbels 10-12 lines long.

Reniform-leaved Fragosa. Pl. ⅛ foot.

Cult. If any of the species of this genus should ever be introduced to our gardens, we would advise their being grown in pots, in a mixture of sand and peat, and placed among other alpine plants, so that they may be protected in winter by a frame.

XII. AZORE'LLA (meaning not explained). Gaud. in ann.

sc. nat. 5. p. 104. t. 1. f. 1. but not of Rich. D. C. prod. 4. p. 77.—Azorélla species, Lam.—Bòlax species, Spreng. Koch.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 5-toothed, permanent. Petals oval, entire. Styles short. Fruit ovate, contracted at the raphe, and rather compressed from the back; mericarps semi-ovate, without any ribs or vittæ; ribs filiform, hardly conspicuous.—Humble tufted herbs, natives of Magellan. Leaves imbricate, entire or trifid, with the petioles sheathing or dilated. Umbels nearly sessile, 2-8-flowered; pedicels about equal in length to the involucrum. Perhaps this genus is hardly distinct from *Fragòsa*.

1 A. aretioìdes (Willd. herb. ex D. C. prod. 4. p. 77.) leaves imbricate, tripartite, coriaceous; lobes oblong, acutish; petioles thick and rather corky, villous at the apex; umbels nearly sessile, simple, 4-flowered; leaves of involucrum 4, equal in length to the pedicels. ♃. F. Native of Quito, on the high mountain of Antisana. Fragòsa aretioìdes, H. B. et Kunth, nov. gen. amer. 5. p. 27. t. 424. Bòlax aretioìdes, Spreng. umb. spec. p. 11. exclusive of the synonymes and character. B. cæspitòsa, Spreng. in Schultes, syst. 6. p. 358. exclusive of the synonymes. Fruit a little ribbed. (ex Kunth.)

Aretia-like Azorella. Pl. $\frac{1}{8}$ foot.

2 A. lycopodioìdes (Gaud. in ann. sc. nat. 5. p. 105. t. 3. f. 1.) leaves imbricate, sheathing at the base, trifid, coriaceous; lobes subulate, acute; sheaths funnel-shaped, ciliately toothed; umbels almost sessile, 2-3-flowered; leaves of involucrum 2, serrated. ♃. F. Native of the Maclove or Falkland Islands. D'Urvil, fl. mal. p. 47. This is a very different plant from *Bòlax lycopodioìdes*, Spreng, which is now *Fragòsa corymbòsa*.

Club-moss-like Azorella. Pl. $\frac{1}{8}$ foot.

3 A. filamentòsa (Lam. ill. t. 189. f. 1. Vahl. symb. 3. p. 47.) leaves oblong, coriaceous, quite entire, crowded; petioles dilated, ciliated with long bristles; umbels nearly sessile; leaves of involucrum somewhat ciliated and bristly. ♃. F. Native of the mountains of Magellan and the Maclove Islands. A. chamìtis, Pers. ench. no. 3. D'Urv. fl. mal. p. 46. Bòlax filamentòsus, Spreng. in Schultes, syst. 6. p. 359. There are varieties of this plant with either an elongated or crowded habit: and with the umbels either few or many-flowered, and the lower ones 1-flowered. Perhaps the same as *Chamìtis integrifòlia*, Gærtn. fruct. t. 22. f. 4.

Filamentose Azorella. Pl. $\frac{1}{8}$ foot.

4 A. Gillie'sii (Hook. et Arn. in bot. misc. 3. p. 346.) plant densely tufted; leaves petiolate, trifid; umbels pedunculate, 4-10-flowered; fruit utricular. ♃. F. Native of Chili, in the valley of Uspallata, on the Andes of Mendoza, at the elevation of from 6000 to 12,000 feet. Bòlax Gillièsii, Gill. et Hook. in bot. misc. 1. p. 325. t. 63. Root long, descending. Plant 2 inches high. This plant yields abundantly a gummy substance, which is gathered by the natives, and employed by them in the cure of headache.

Gillies's Azorella. Pl. 2 inches.

5 A. cæspitòsa (Cav. icon. 5. p. 57. t. 484. f. 2.) leaves imbricated, spreading at the apex, thick, quite entire, and quite glabrous; umbels on short peduncles, 6-8-flowered; leaves of involucrum one half shorter than the pedicels. ♃. F. Native of Chili, on the higher mountains, called the Cordillera del Planchon. A. crassifòlia, Pers. ench. 1. no. 2. Fruit ovate; having the mericarps furnished with 3 slender stripes on the outside, as in the genus *Fragòsa*.

Tufted Azorella. Pl. $\frac{1}{8}$ foot.

6 A. daucoi'des (D'Urv. fl. mal. p. 45.) leaves all radical, long, pinnate; segments or leaflets remote, opposite, short, pinnatifid: lobes alternate, acutely cut; scapes short, very hairy; involucrum 8-10-leaved; fruit glabrous, striated, nearly sessile. ♃. F. Native of the Straits of Magellan, along the rivulet called Bougainville River. Root thick, fusiform. Umbels 3-8-flowered. Leaves hardly an inch long, but still longer than the scape.

Carrot-like Azorella. Pl. 1 inch.

7 A. ranu'nculus (D'Urv. fl. mal. 1. p. 46.) stem stoloniferous, very short; leaves on long petioles, 5-parted; partitions 3-lobed at the apex, obtuse; umbels axillary, on short peduncles; leaves of involucrum 5, lanceolate, acute, ciliated at the base, about equal in length to the flowers. ♃. F. Native of the Straits of Magellan, along with the last. Habit of a small *Hydrocótyle* or *Ranúnculus*. Fruit round, hardly pedicellate, crowned by the calycine teeth. Umbels 4-6-flowered. Petals greenish yellow.

Crowfoot-like Azorella. Pl. $\frac{1}{4}$ foot.

Cult. See *Fragòsa*, p. 259. for culture and propagation.

XIII. PECTOPHY'TUM (from πηκτος, *pektos*, compact, and φυτον, *phyton*, a plant; a compact tufted plant). H. B. et Kunth, nov. gen. amer. 5. p. 28. D. C. prod. 4. p. 78.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx entire. Petals unequal, acute, and a little inflexed at the apex. Styles short, straight. Fruit ovate-elliptic; mericarps rather convex on the back, semi-oval, 5-ribbed, without any vittæ; ribs filiform; commissure flattish.—A tufted herb. Leaves crowded, imbricate, coriaceous, trifid, glabrous; petioles permanent. Flowers white, in crowded fascicles at the tops of the branches, and solitary in the axils of the bracteas, pedicellate. Bracteas ciliately toothed.—This genus is allied to *Bòlax* and *Fragòsa*, but it differs from the first in the form of the fruit, and from the last in the margin of the calyx being entire.

1 P. peduncula're (H. B. et Kunth, nov. gen. amer. 5. p. 29. t. 425.) ♃. F. Native of Quito, in plains on the top of Mount Antisana. Bòlax pedunculàtus, Spreng. umb. spec. p. 10. Azorélla pedunculàta, Willd. herb.

Peduncled-flowered Pectophytum. Pl. $\frac{1}{4}$ foot.

Cult. See *Fragòsa*, p. 259. for culture and propagation.

Tribe II.

MULI'NEÆ (this tribe contains plants agreeing with *Mulinum* in important characters), or Orthospérmæ imperfectè Umbellàtæ, parallelè biscutàtæ, D. C. prod. 4. p. 78.—Hydrócotýleæ Mulíneæ, D. C. coll. mem. 5. p. 32. Mericarps much contracted at the commissure, without any vittæ; ribs 5, usually filiform. Fruit compressed from the back, hence it is square. Petals spreading, flat, entire in all the genera, with the exception of *Asteríscium*.

XIV. BO'LAX (from βωλαξ, *bolax*, a synonyme of βωλος, *bolos*, a bole or lump; the plant grows in dense tufts, hollowed in the middle). Comm. in Juss. gen. p. 226. Gaud. fl. mal. in ann. sc. nat. 5. p. 104. t. 3. f. 1. D. C. prod. 4. p. 78.—Bòlax species, Spreng. Azorélla species of Lam.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx entire, hardly conspicuous. Petals oval, entire. Styles short. Fruit tetragonal, concave in the disk; mericarps with 5 nerve-formed smooth ribs, 1 dorsal, 2 in the middle forming the angles, and 2 filiform inner ones; commissure very narrow.—A tufted herb, with the habit of *Arètia*. Leaves imbricate, trifid, glabrous, coriaceous: lobes ovate, obtuse; petioles membranous, rather corky, with the margins not ciliated. Umbels simple, nearly sessile, 4-flowered. Leaves of involucrum 4, about equal in length to the pedicels. Fruit while young furnished with stellate down.

1 B. Cleba'ria (Comm. ined. ex Gaud. ann. sc. nat. 5. p. 104. t. 3. f. 2.) ♃. F. Native of the Straits of Magellan, on the mountains; in the Maclove or Falkland Islands; Chili and

Patagonia. D'Urv. fl. mal. p. 47. Gommier, Pern, voy. 2. p. 7. and 65. ex D'Urv. Hydrocótyle gummífera, Lam. dict. 3. p. 156. ill. p. 189. f. 21. Bòlax gummífera and B. complicàta, Spreng. umb. spec. p. 9. and p. 10. Azorélla cæspitòsa, Vahl, symb. 3. p. 48.

Clebaria Bolax. Pl. $\frac{1}{4}$ foot.

Cult. See *Fragòsa*, p. 259. for culture and propagation.

XV. MULI'NUM (an ancient name of an umbelliferous plant). Pers. ench. 1. p. 309. Lag. am. nat. 2. p. 94. D. C. coll. mem. 5. p. 32. D. C. prod. 4. p. 79. but not of Gaudin.—Bòlax species of Spreng.—Selìnum species of Cav.

Lin. syst. *Pentándria*, *Digýnia*. Limb of calyx 5-toothed, permanent. Petals oval-oblong, acute, flat. Styles acute. Fruit 4-winged or parallelly biscutate; mericarps without vittæ, very much contracted at the commissure, compressed on the back, 5-ribbed; middle rib on the back nerve-formed, as well as the 2 lateral ones, the 2 intermediate ones expanded into ample lateral wings.—Suffruticose tufted herbs, natives of Chili. Leaves 3-5-cleft or undivided; petioles sheathing. Umbels simple; pedicels longer than the many leaved involucrum. Flowers yellow. This genus, according to Lagasca, is probably divisible into several.

1 M. spinòsum (Pers. ench. 1. p. 309.) cauline leaves trifid; segments subulate and spiny: lateral segments bipartite; petioles sheathing, glabrous; peduncles longer than the leaves; leaves of involucrum distinct, short, spreading a little; fruit orbicular. ♃. F. Native of Chili, on the highest mountains, called Cordillera del Planchon and del Portillo, towards Mendoza; between Los Ojos de Agua, and El Rio de Los Ojos de Agua; Andes of Chili, and Cordillera of Chili, at the elevation of 5,500 or 7,000 feet. Selìnum spinòsum, Cav. icon. 5. p. 59. t. 487. f. 1. Bòlax spinòsus, Spreng. in Schultes, 6. p. 362. exclusive of the synonymes. Stems half a foot high. Umbels 10-12-flowered. Petals of a reddish yellow-colour.

Spiny Mulinum. Pl. $\frac{1}{2}$ foot.

2 M. proli'ferum (Pers. l. c.) cauline leaves trifid; segments subulate, spinose; petioles sheathing, glabrous; leaves of involucrum short, distinct, rather spreading; umbels pedunculate, longer than the leaves; fruit orbicular. ♃. F. Native of South America, at Port Desire; and of Chili, on the Andes of Mendoza between San Isedro and Portezuela, on the declivities of mountains at the elevation of 5,000 to 10,000 feet. Selìnum prolíferum, Cav. icon. 5. p. 58. t. 486. f. 1. Bòlax prólifer, Spreng. in Schultes, syst. 6. p. 361. Root twisted. Stems 3-4 inches high, covered by the sheaths. Leaves glabrous. Umbels 5-7-flowered, sometimes proliferous. Petals yellow.

Proliferous Mulinum. Pl. $\frac{1}{3}$ foot.

3 M. cunea'tum (Hook. and Arn. in Beech. bot. 1. p. 26.) leaves wedge-shaped, trifid, and sometimes 5-6-cleft: each lobe ending in a spiny point; sheaths of leaves elongated, stiff, ciliated; umbels many flowered, on short peduncles. ♃. F. Native of Chili, about Valparaiso, and on the mountains of Valparaiso; and at Huilquilema, in the province of Rare. Azorélla spinòsa, Pers. ench. 1. p. 303. Fragòsa spinòsa, Ruiz et Pav. fl. per. 3. p. 27.

Cuneated-leaved Mulinum. Pl. $\frac{1}{8}$ foot.

4 M. uli'cinum (Gill. et Hook. in bot. misc. 1. p. 328. t. 64.) leaves trifid: segments subulate, spiny; umbels nearly sessile, terminating the very short branches; fruit elliptic. ♄. F. Native of Chili, near La Cienega de Bonillo, near the tops of the Uspallata range of mountains, at the elevation of 9,500 feet. M. echìnus, D. C. prod. 4. p. 79. Bòlax echìnus, Presl. mss. A glabrous, much branched, humble, odoriferous plant. Petals marked by an elevated longitudinal line in the middle. Leaves of involucrum linear-subulate.

Furze-like Mulinum. Shrub $\frac{1}{8}$ to $\frac{1}{4}$ foot.

5 M. microphy'llum (Pers. l. c.) cauline leaves imbricate, minute, tripartite: lobes linear-lanceolate, each terminated by a hair; petioles stem-clasping, ciliated at the base. ♄. F. Native of South America, at Port Desire. Selìnum microphýllum, Cav. icon. 5. p. 59. t. 486. f. 2. Petals reddish, yellow in the dried state. Stem shrubby, 3 inches long, branched, covered by the sheaths.

Small-leaved Mulinum. Pl. $\frac{1}{4}$ foot.

6 M. albovagina'tum (Gill. et Hook. in bot. misc. 1. p. 328.) leaves trifid; segments ovate-lanceolate, mucronate; umbels axillary, small, few-flowered, sessile. ♄. F. Native of Chili, at Cerro de la Polcura, on the Andes of Mendoza. Shrub branched, dichotomous.

White-sheathed Mulinum. Pl. $\frac{1}{4}$ foot.

Cult. See *Fragòsa*, p. 259. for culture and propagation.

XVI. LARE'TIA (*Llareta* is the vernacular name of the plant). Gill. et Hook. in bot. misc. 1. p. 329. t. 65.

Lin. syst. *Pentándria*, *Digýnia*. Margin of calyx 5-toothed. Petals ovate, entire. Fruit elliptic, square, flatly compressed from the back, 4-winged; mericarps lenticular, with dorsal ribs, and 2 lateral marginal ones, destitute of vittæ. Seed flat.

1 L. acau'lis (Gill. et Hook. l. c.) ♃. F. Native of the Andes of Chili, in Ell Valle de Fray Carlos, at the elevation of 10,000 feet; Cordillera of Chili, Los Ojos de Agua. Mulìnum acaúle, Pers. ench. 1. p. 309. Selìnum acaúle, Cav. icon. 5. p. 59. t. 487. Root thickish, rather fusiform, woody. Plant tufted. Leaves ovate, attenuated at the base; umbel radical, sessile.

Stemless Laretia. Pl. $\frac{1}{8}$ foot.

Cult. See *Fragòsa*, p. 259. for culture and propagation.

XVII. DRU'SA (in honour of M. Le Dru, a French botanist and traveller). D. C. ann. mus. 10. p. 466. t. 38. Spreng. umb. prod. p. 15. f. 6. Lag. am. nat. 2. p. 94. D. C. prod. 4. p. 80.

Lin. syst. *Pentándria*, *Digýnia*. Limb of calyx entire, not perspicuous. Petals oval, entire. Fruit oval; mericarps much compressed on the back, without any vittæ: the dorsal rib and the 2 inner ones linear, and not prominent: the 2 intermediate ones are drawn out into marginal repandly sinuated wings, having the sinuses obtuse, and the angles furnished with hooked stellate spinules. Seed much compressed.—A decumbent slender stoniferous herb, native of Teneriffe. Leaves opposite, petiolate, broadly 3-lobed, crenated. Hairs on divers parts of the plant very different, some of which are stiff, stellate, and hooked at the apex; others are soft, simple, solitary, or in stellate fascicles. Umbels axillary, pedunculate, 1-2-flowered, without any involucrum. Flowers small, white. Plant with the habit of *Bowlèsia*, but the fruit is very different.

1 D. oppositifòlia (D. C. l. c.) ☉. H. Native of Teneriffe, on shady rocks between Port Orotava and Monte Verde. Sícyos glandulòsa, Poir. dict. 7. p. 155. Bowlèsia oppositifòlia, Buch. uebers. can. p. 34. Poir. ill. gen. 3. p. 590. t. 934.

Opposite-leaved Drusa. Fl. July, Aug. Clt. 1824. Pl. cr.

Cult. Sow the seeds of this plant in the open ground in any warm situation.

XVIII. HUANA'CA (meaning not explained). Cav. icon. 6. p. 18. t. 528. f. 2. D. C. coll. mem. 5. p. 32. prod. 4. p. 80.—Oenánthe species, Spreng.—Spanánthe species, Lag. am. nat. 2. p. 93.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx hardly 5-toothed. Petals lanceolate, entire. Styles 2, divaricate. Fruit ovate, acutish; mericarps rather compressed on the back: flat inside, and with one furrow: convex on the outside, and furnished with 3 lines: lines or ribs rather elevated; carpophore bifid.—Herbs perennial. Roots thick. Leaves radical, petiolate, palmately 5-parted; petioles dilated and ciliated at the base. Stems or scapes naked. Umbels simple. Involucrum of many spiny-ciliated leaves. Flowers on long pedicels, of a reddish yellow-colour: outer ones of each umbel male. Allied to *Mulìnum* and *Spanánthe.*

1 H. Cavanille'sii (D. C. prod. 4. p. 81.) stems scape-formed, trifid at the apex, and bearing 2 opposite sessile tripartite leaves; umbels 3 on each stem: lateral ones on long, and the middle on a short peduncle; segments of leaves filiform, multifid. ♃. F. Native of South America, at the Straits of Magellan, and Port Desire. H. acaúlis, Cav. icon. 6. t. 528. f. 2. Oenánthe Huanàca, Spreng. umb. prod. p. 37. and in Schultes, syst. 6. p. 628. Spanánthe Huanàca, Lag. l. c.

Cavanilles's Huanaca. Pl. ½ foot.

2 H. geraniifòlia (D. C. prod. 4. p. 81.) scapes leafless, simple, bearing only one simple umbel; segments of leaves linear, undivided. ♃. F. Native of Mexico. Bòlax geraniifòlius, Presl, mss. Herb 1-2 inches high. Scapes numerous, a little longer than the petioles. Umbels 15-20-flowered. Leaves of involucrum linear, few, ciliated at the base.

Geranium-leaved Huanaca. Pl. ¼ foot.

Cult. See *Fragòsa*, p. 259. for culture and propagation.

XIX. DIPO'SIS (from *δις, dis*, twice, and *ποσις, posis*, a husband; in reference to there being 2 male flowers in each umbellule, and only one fertile). D. C. coll. mem. 5. p. 33. t. 3. f. O. prod. 4. p. 81.—Hydrocótyle species, Lam. Cav.—Spanánthe species, Spreng.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx bluntly 5-toothed. Petals oval, flat, entire. Styles short. Fruit orbicular, biscutate; mericarps compressed from the back, joined with the narrow commissure, and therefore constituting 2 parallel disks; dorsal rib filiform, 2 lateral ones hidden, and the middle ones girding the disk; vittæ wanting; furrows between the ribs broad and flat.—Stemless glabrous herbs, natives of Chili and Brazil. Leaves all radical, petiolate, ternate: leaflets wedge-shaped, toothed or cut at the apex; the lateral segments sometimes 2-parted. Scapes longer than the leaves. Umbels compound, 6-8-rayed; peduncles much longer than the involucrum, which is 4-5-leaved. Umbellules 3-flowered, middle flower fertile, lateral 2 male; hence the generic name. Flowers white. The fruit is like that of *Mulìnum*, and the inflorescence that of *Petágnia.*

1 D. saniculæfòlia (D. C. l. c.) roots fusiform; leaves ternate: leaflets wedge-shaped, tridentate: lateral leaflets sometimes 2-parted; umbels 6-8-rayed. ♃. F. Native of Monte Video. Hydrocótyle saniculæfòlia, Lam. dict. 3. p. 154. Cav. icon. 5. p. 60. t. 488. f. 2. Spanánthe saniculæfòlia, Spreng. in Schultes, syst. 6. p. 357. Mulìnum saniculæfòlium, Desv. in herb. Juss.

Sanicle-leaved Diposis. Pl. ¼ to ½ foot.

2 D. Bulboca'stanum (D. C. prod. 4. p. 668.) root tuberous, globose; leaves many-parted. ♃. F. Native of Chili, in sterile pastures, at Rancagua. Bùnium Bulbocástanum? Bertero, herb. Herb glabrous. Root black on the outside, nearly like that of *Càrum denudàtum* or *C. Bulbocástanum.* Umbels compound, 3-4-rayed, surrounded by a 3-5-leaved involucrum; umbellules 3-flowered. Fruit parallelly biscutate.

Earth-nut Diposis. Pl. 1 to 2 feet.

Cult. See *Fragòsa*, p. 259. for culture and propagation.

XX. SPANA'NTHE (from *σπανος, spanos*, rare, and *ανθος, anthos*, a flower; flowers few in the umbels). Jacq. coll. 3. p. 247. Spreng. umb. prod. p. 34. Rich. hydr. p. 20. t. 50. f. 2. Koch, umb. p. 142. f. 66-68. D. C. prod. 4. p. 81.

Lin. syst. *Pentándria, Digýnia.* Limb of calyx 5-toothed. Petals elliptic, entire, acutish, with a straight apex. Fruit ovate, much compressed at the raphe, flat, and compressed from the back on both sides; mericarps flat, without any vittæ; ribs 5, very slender, equal, 3 intermediate ones on the back, and the 2 lateral ones seated in the commissure, which is flat. Seed flat.—A South American branched erect herb, glabrous in every part, except on the petioles, which are ciliated along the sheaths, and ornamented with a collar of hairs under the origin of the limb. Leaves cordate, toothed, acute. Umbels rather compound, proliferous. Involucra composed of many leaves. Flowers white on long pedicels.

1 S. paniculàta (Jacq. l. c. and icon. rar. 3. t. 350.) ⊙. S. Native of South America, in Trinidad, and the Spanish Main, as well as of Peru. Hydrocótyle spanánthe, Willd. spec. 1. p. 1363. Phellándrium ciliàtum, Willd. herb. Perhaps the Peruvian plant is the same as that from the Spanish Main, but it is much smaller and hardly panicled.

Panicled Spananthe. Fl. July, Aug. Clt. 1795. Pl. 1 to 2 ft.

Cult. The seeds of this plant should be raised on a hot-bed, and when the plants are of sufficient size plant them into separate pots, and then place them in the stove, where they will flower and seed; and some may be planted out in the open ground. Not worth cultivating except in botanic gardens.

XXI. HOMALOCA'RPUS (from *ὁμαλος, homalos*, equal, and *καρπος, karpos*, a fruit). Hook. and Arn. in bot. misc. 3. p. 348.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 5-toothed: teeth subulate, minute, hardly permanent. Petals ovate, concave, entire. Styles 2, divaricate, short. Fruit roundish-ovate; mericarps compressed on the back, flat, wingless, constituting 2 parallel disks; commissure very narrow; ribs 5, filiform, very slender, hidden in the substance of the pericarp, one dorsal, 2 lateral ones near the raphe, 2 middle ones forming the angles, without any vittæ; carpophore entire. Seed less than the cavity of the fruit.—Herb annual, erectish, hoary from stellate hairs, dichotomously branched. Root slender, simple. Leaves petiolate, reniform-roundish, somewhat 5-lobed; lobes equal, ovate, obtuse, quite entire or deeply lobed; lower leaves alternate: superior ones opposite. Peduncles axillary and terminal, about equal in length to the petioles. Umbels simple, 3-6-flowered. Teeth of calyx pilose, almost emulating a fascicle of hairs. Fruit nearly twice the length of their pedicels, which are a line long. This genus comes near to *Spanánthe.*

1 H. bowlesioìdes (Hook. et Arn. l. c.) ⊙. H. Native of the Cordillera of Chili. The ridges or ribs of the fruit are only to be seen on a transverse section of the fruit, because they are sunk in a thin substance of the pericarp. The middle ridges do not expand into wings as in *Mulìnum*, and some other allied genera.

Bowlesia-like Homalocarpus. Pl. ¼ to ½ foot.

Cult. See *Spanánthe* above for culture and propagation.

XXII. POZO'A (name given by Lagasca in honour of some Spanish botanist of the name of Pozo). Lag. gen. et spec. nov. p. 13. no. 163. am. nat. 2. p. 93. D. C. prod. 4. p. 82. Gill. et Hook. in bot. misc. 1. p. 330. t. 66.

Lin. syst. *Pentándria, Digýnia.* Calyx 5-toothed, perma-

nent. Petals entire. Fruit prismatically tetragonal, 5-ribbed, crowned by the calyx, emarginate at the apex; mericarps concave and channelled on the back: lateral ribs close, nearly in straight lines; commissure much contracted.—Herb. Leaves on long petioles, simple, cuneated, profoundly toothed at the apex, quintuple nerved. Umbels simple. Involucrum obsoletely lobed, crenately toothed, many nerved: nerves branched a little.—This genus is allied to *Astrántia* and *Mulìnum*.

1 P. coria'cea (Lag. gen. et spec. l. c.) ♃. F. Native of the Cordillera of Chili, in various places at Santa Madre Los Impossibles, and other places on the Andes of Chili between Mendoza and Chili. Mulìnum angulàtum, D. C. prod. 4. p. 86. Hacquétia bracteógama, D. C. prod. 4. p. 668.

Coriaceous Pozoa. Pl. ½ foot.

N.B. There are two other species of this genus mentioned by Lagasca in am. nat. 2. p. 94. under the names of *P. denticulàta* and *P. incìsa*, but these he has not described.

Cult. See *Fragòsa*, p. 259. for culture and propagation.

XXIII. ASTERI'SCIUM (from *αστηρ*, *aster*, a star; in reference to the starry involucels or umbels). Cham. and Schlecht. in Linnæa. 1. p. 254. t. 25. f. 1. D. C. prod. 4. p. 82.—Pozòa, spec. Spreng. syst. 2. p. 116.—Cassidocárpus, Presl, in herb. Hænke.

Lin. syst. *Pentándria*, *Digýnia*. Calyx 5-toothed, permanent: teeth ovate. Petals ending in an inflexed point, emarginate, with the recess callous. Fruit compressed, tetragonally prismatic, crowned by the calyx, rounded at the base; mericarps 5-ribbed, 2 intermediate ribs expanded into wings, central one as well as the 2 placed near the raphe stripe-formed: having the furrows between the ribs destitute of vittæ; commissure very narrow. Seed unknown.—Quite glabrous perennial herbs. Stems terete, branched, few-leaved. Leaves petiolate, simple, roundish-cuneated, unequally toothed, somewhat 3-lobed, 3-5-nerved, rather coriaceous. Umbels simple, nearly globose. Involucrum many leaved, shorter than the umbel. Flowers either sterile and male, on long pedicels, or fertile and hermaphrodite in the same umbel.—This genus differs from *Pozòa* and *Mulìnum* in the petals being emarginate, not entire.

1 A. Chile'nsis (Cham. et Schlecht. l. c.) leaves 3-lobed, deeply serrated; peduncles elongated, scattered; petals deeply emarginate, ending in a long involute point; fruit narrowest at the base; leaves of involucrum lanceolate, cut. ♃. F. Native of Chili, in dry sandy places about Talcaguano, and about Conception; Cuesta de Zapata, at the elevation of 6,000 feet; cliffs by the sea side at Valparaiso. Hook. bot. misc. 1. p. 332. t. 67. A. Anisillo vulgo Mouchu, Feuill. chil. 3. t. 2.

Var. β, *Hœ'nkei* (D. C. prod. 4. p. 82.) lower leaves roundish, undivided, acutely few-toothed at the apex: upper leaves trifid. ♃. F. Native of Chili. Cassidocárpus Chilénsis, Presl, in herb. Hænke. Eryngium tricuspidàtum, Domb. herb.

Chili Asteriscium. Pl. ¼ foot.

2 A. Poeppi'gii (D. C. prod. 4. p. 82.) leaves deeply trifid; lobes obovate, obtuse, regularly toothed. ♃. F. Native of Chili. Very like the preceding, but differs in the lobes of the leaves and recesses being obtuse, and regularly toothed all around.

Poeppig's Astericium. Pl. ¼ foot.

3 A. polyce'phalum (Gill. et Hook. in bot. misc. 1. p. 332. t. 67. β,) plant leafless? peduncles corymbose, numerous, sometimes abortive and spinose; petals entire, acute, with an involute apex; fruit broadly oblong; leaves of involucrum linear, entire. ♃. F. Native of Chili, in the valleys on the Andes near Ladera de la Jaula, and towards Uspallata in the province of Mendoza, at the elevation of 7,500 feet. Mulìnum Dipterýgia, D. C. prod. 4. p. 80. The reflexed petals of this species and the next forbid their being united to *Mulìnum*.

Many-headed Asteriscium. Pl. ¼ foot.

4 A. isatidica'rpum (Hook. et Arn. in bot. misc. 3. p. 352.) stem much branched; branches terete; umbels many, few-flowered, disposed in panicles; involucra of few leaves; fruit oval, parallelly biscutate; mericarps approximate. ♃. F. Native of the Cordillera of Chili. Mulìnum isatidicárpum, D. C. prod. 4. p. 80. Dipterýgia isatidicárpa, Presl, mss. Umbels small, very numerous. Carpophore bipartite; mature mericarps yellow, rather cuneated at the base.

Isatis-fruited Asteriscium. Pl. ¼ foot.

Cult. See *Fragòsa*, p. 259. for culture and propagation.

Tribe III.

SANICU'LEÆ (this tribe contains plants agreeing with *Sanícula* in important characters). D. C. prod. 4. p. 82. or Umbellàtæ imperféctæ Orthospérmæ túrgidæ, Koch. umb. 138.—Umbellàtæ disciscéntes, Spreng. in Schultes, syst. 6. p. 30. exclusive of 3 genera. Transverse section of fruit nearly terete. Mericarps covered with scales, furnished with 5 equal primary ribs, without any secondary ones, and destitute of vittæ. Transverse section of seed semi-terete, flattish in front. Petals erect, bent inwards from the middle, and emarginate. Umbels fasciculate or capitate, simple or irregularly subcompound.

XXIV. ACTINO'TUS (from *ακτιν ακτινος*, *actin actinos*, a ray; involucrum). Labill. nov. holl. (1804) 1. p. 67. t. 92. R. Br. gen. rem. p. 25. D. C. prod. 4. p. 83.—Eriocàlia, Smith, exot. bot. (1805) 2. p. 37. t. 78-79. Spreng. in Schultes, syst. 6. p. 31. and 639. Lag. am. nat. 1821. no. 2. p. 105.—Proústia, Lag. in litt. 1807. but not of D. C.

Lin. syst. *Pentándria*, *Digýnia*. Tube of calyx ovate, contracted at the top; limb 5-lobed: lobes oval-oblong. Petals wanting. Stamens opposite the calycine lobes. Styles 2, thickened at the base and villous, but setaceous at the apex. Ovarium 1-ovulate. Fruit ovate, villous, marked by 5 stripes, and crowned by the calyx.—Erect branched Australian herbs. Leaves alternate, petiolate, variously cut. Umbels simple, many flowered, capitate; pedicels very short; involucrum many leaved, radiating, longer than the flowers.

1 A. Helia'nthi (Labill. nov. holl. 1. p. 67. t. 92.) the whole plant clothed with tomentose wool; leaves bipinnatifid: lobules bluntish; involucrum 10-18-leaved, clothed with soft tomentum. ♂. G. Native of New Holland, about Port Jackson, &c. Eriocàlia màjor, Smith, exot. bot. t. 78. Involucrum expanded 1½ or 2 inches in diameter, yellow. Flowers white.

Sun-flower Actinotus. Fl. June. Clt. 1821. Pl. 2 feet.

2 A. mi'nor (D. C. prod. 4. p. 83.) plant smoothish; leaves clothed with adpressed villi beneath, ternate; segments or leaflets trifid, acute; involucrum 9-10-leaved, acute, clothed with silky villi. ⊙. H. Native of New Holland, on the Eastern coast. Eriocàlia mìnor, Smith, exot. bot. t. 79. Sieb. pl. exsic. nov. holl. no. 127. Involucrum expanded, 5 lines in diameter, red.

Smaller Actinotus. Pl. 1 foot.

Cult. The seeds of these plants may be reared on a hot-bed in spring, and in the month of May the plants should be planted out in the open border in a warm situation, where they will flower and seed freely.

XXV. PETA'GNIA (in honour of Vincent Petagna, a Neapolitan botanist, author of Institutiones Botanicæ, in 5 vols. 8vo. Naples, 1785-1787). Guss. prod. fl. sic. 1. p. 311. and in litt. D. C. coll. mem. v. p. 35. but not of Gmel. nor Rafin.—Heterosciàdium, D. C. mss. in herb. Balb.

Lin. syst. *Pentándria*, *Digýnia*. Umbellules containing only

3 flowers; central one hermaphrodite, fertile, sessile: 2 lateral ones male, pedicellate; the pedicels rather concrete at the base, with the calyx of the fertile or central flower. Male flowers with the tube of the calyx almost wanting, but with an obsolete somewhat 5-toothed limb; petals oval-oblong, acute at both ends, inflexed at the apex; stamens 5, alternating with the petals, and longer than them. Female or hermaphrodite flowers, having the tube of the calyx ovate and compressed, and the limb obsolete: petals the same shape as those of the male flowers, rather membranous, permanent; stamens 5, caducous; styles 2, filiform, divaricate, very long; fruit ovate, compressed, 8-nerved, with 3 nerves on each side, particularly one central, indicating where the raphe is, 2 in the middle, and 2 more conspicuous, seated on the dorsal angle of the mericarps. Mericarps and carpophore not distinct. Fruit empty or containing one ovulum, from one of the mericarps being abortive.—Herb perennial, smooth. Root or rhizoma like that of *Adóxa* or *Hacquètia*. Leaf radical, on a long petiole, rather peltate, 5-parted: partitions oval-cuneated, somewhat 3-lobed at the apex, and toothed: teeth mucronate. Stem solitary, hardly half a foot high, bearing at the apex 2 almost sessile opposite 3-lobed toothed leaves. Branches 2, bifid at the apex. Bracteas or leaves of involucrum 2, opposite, oblong, acute, mucronately serrated, seated just under the branches. Branches or rays of umbel 2, short, bearing each 3 flowers at the apex, furnished with 2 small bracteas under the ramifications. This very singular genus is allied to *Hacquètia* and *Sanícula*.

1 P. saniculæfòlia (Guss. l. c.) ♃. H. Native of Sicily, in groves by the sides of rivulets, in cool places. Sìson Gussoniànum, Balb. herb. Sìson Gussònii, Spreng. cur. post.

Sanicle-leaved Petagnia. Pl. ½ foot.

Cult. See *Hacquètia*, p. 265. for culture and propagation.

XXVI. SANI'CULA (from *sano*, to heal or cure; supposed healing effects of the *S. Europæ'a*). Tourn. inst. p. 326. t. 173. Lin. gen. no. 326. Lam. ill. 191. Hoffm. umb. prod. 65. t. 1. f. 1. Spreng. umb. p. 24. Lag. am. nat. 2. p. 105. Koch. umb. p. 139. D. C. coll. mem. v. p. 35.

Lin. syst. *Pentándria, Digýnia.* Tube of calyx echinated; lobes foliaceous (f. 59. *c.*), permanent. Petals erect, conniving, obovate, emarginate, with an inflexed point (f. 59. *g.*). Fruit nearly globose, not separable into 2 parts spontaneously; mericarps destitute of ribs, but furnished with many vittæ, and densely clothed with hooked prickles; carpophore not distinct. Seed semiglobose.—Perennial herbs. Leaves radical, petiolate, palmate lobed: lobes cuneated, deeply toothed at the apex. Stems either naked or furnished with a very few leaves. General umbel with few rays; leaves of involucrum few, and usually divided. Umbellules of many rays; leaves of involucel many, entire. Flowers male, female, and hermaphrodite in the same umbel.

Sect. I. Sani'cla (an alteration from the generic name). Tube of calyx echinated. Leaves palmate lobed.

1 S. Europæ'a (Lin. spec. 339.) leaves radical, palmate-parted; lobes trifid, toothed; flowers polygamous, all nearly sessile, disposed in umbellules; lobes of calyx denticulated. ♃. H. Native throughout the whole of Europe and Caucasus, in woods and groves, and particularly by the sides of rivulets. Oed. fl. dan. 293. Schkuhr, handb. t. 60. Hoffm. umb. p. 67. Smith, engl. bot. t. 98. Blackw. herb. t. 63. S. officinàrum, Neck. gallob. p. 137. Astrántia Diapénsia, Scop. carn. 304. S. mas. Fuchs. hist. p. 671. S. officinàlis, Gouan, hort. 131. Caúcalis Sanícula, Crantz. Flowers white or tinged with red, sessile, disposed in little heads. The plant was much celebrated formerly as a vulnerary. It discovers to the taste a bitterness and roughness. It has, however, been long discarded in medicine, and in Sir James Smith's opinion it seems to partake of that poisonous acrimony, which is found in most umbelliferous plants growing in a moist rich soil.

Var. β, *Capénsis* (Cham. et Schlecht. in Linnæa. 1. p. 253.) plant taller than the species; stems leafy, branched; panicle dichotomous. ♃. G. Native of the Cape of Good Hope. S. Canadénsis, Thunb. fl. cap. 254. exclusive of the synonymes. Perhaps a proper species.

European Sanicle. Fl. June, July. Britain. Pl. 1½ foot.

2 S. Maryla'ndica (Lin. spec. 339.) leaves quinately digitate, deeply serrated: lower ones pedate, on long petioles; flowers polygamous: male ones pedicellate; lobes of calyx entire. ♃. H. Native of North America, and as far as the Saskatchawan; Newfoundland; undulating gravelly soils, near Fort Vancouver; as well as of Carolina, Maryland, and Pennsylvania. Jacq. icon. rar. t. 348. Lam. ill. t. 91. f. 2. S. Canadénsis, Lin. spec. p. 339. Flowers whitish or yellowish.

Maryland Sanicle. Fl. June, July. Clt. 1765. Pl. 2 feet.

3 S. Mexica'na (D. C. prod. 4. p. 84.) radical leaves, as well as the cauline ones, palmate; leaflets on short petioles, rather cuneated at the base: lateral leaflets parted: middle one, and inner lobe of the lateral ones, somewhat trifid: all cuspidately toothed, and quite smooth; umbels 3-rayed; rays hardly longer than the floral leaf; male flowers on short pedicels. ♃. H. Native of Mexico, between Tampico and Real del Monte. Stem simple, hardly a foot high, furnished with 3-4 alternate leaves. Allied to *S. Marylándica*, but differs as above.

Mexican Sanicle. Pl. 1 foot.

4 S. Li'berta (Cham. et Schlecht. in Linnæa. 1. p. 253.) leaves 5-parted; partitions cuneated, 3-lobed, deeply serrated; serratures cuspidate by bristles; flowers polygamous: male ones few, on capillary pedicels: female ones sessile. ♃. G. Native of South America, near Caripe; and of Chili near Talcaguano and Conception; valleys near Valparaiso, where it is called *Pato de Leon* by the natives. S. crassicáúlis, Poepp. diar. no. 227. pl. exsic. no. 92. Plant 4 feet high.

Freed Sanicle. Pl. 4 feet.

5 S. Menzie'sii (Hook. et Arn. in Beech. bot. voy. p. 142.) plant caulescent; leaves on long petioles, cordate, deeply trifid: segments broad, obovate, cuneated, variously lobed, deeply serrated: serratures very acute, ending each in a bristly point; umbels rather compound; leaves of involucels lanceolate, acute, equal in length to the umbellules. ♃. H. Native of the north-west coast of America; on the banks of the Columbia in dry sandy places; as well as of California. Hook. fl. bor. amer. 1. p. 290. t. 90. Root fusiform. Plant smooth. Stem leafy, panicled at the apex. Male flowers on short pedicels. Segments of cauline leaves lanceolate.

Menzies's Sanicle. Pl. 1 to 1½ foot.

6 S. ela'ta (Hamilt. ex D. Don, prod. fl. nep. p. 183.) leaves ternate or tripartite, glabrous; segments or leaflets sessile, ovate, acute, lobed, and serrated, cuneated at the base: lateral segments usually 2-parted; stem dichotomous at the apex; umbels trifid, few-flowered; flowers polygamous: male ones pedicellate. ♃. H. Native of Nipaul. S. Canadénsis, Thunb. fl. jap. p. 116. Stem 1-2 feet high, erect, simple.

Tall Sanicle. Pl. 1 to 2 feet.

7 S. hermaphrodi'ta (Hamilt. ex D. Don, prod. fl. nep. p. 183.) leaves ternate, glabrous; leaflets ovate, acute at both ends, lobed, and serrated; umbels trifid, usually 5-flowered; flowers all hermaphrodite and sessile. ♃. H. Native of Upper Nipaul, at Suembu. Stem erect, branched, slender, flexuous, a span high or more.

Hermaphrodite Sanicle. Pl. ½ to 1 foot.

8 S. Java'nica (Blum. bijdr. p. 832.) leaves palmately 5-lobed, setaceously serrated; lobes rather trifid; male flowers

numerous, pedicellate. ♃. S. Native of Java, on the top of Mount Gede. Perhaps this is the same as S. Javánica, Juss. from the description of the leaves; but the umbels are nakedish above, in the forks of the stem, and on the tops of the branches, each umbel bearing 3 nearly sessile fruit afterwards.

Java Sanicle. Pl. 1 foot.

9 S. monta'na (Reinw. in Blum. bijdr. p. 832.) leaves all ternate; leaflets somewhat 3-lobed, rather ovate-rhomboid, deeply and setaceously serrated; flowers all pedicellate. ♃. S. Native of Java, in mountain woods in humid places. Said to be nearly allied to *S. Canadénsis*.

Mountain Sanicle. Pl. 1 to 2 feet.

10 S.? Tricli'nium (D. C. prod. 4. p. 85.) leaves on long petioles, glabrous, ternate; leaflets oblong, unequally toothed, lobed at the apex; radical leaves rather palmate: lateral segments bipartite; flowers all hermaphrodite. ♃. H. Native of Louisiana. Pànax, Robin. voy. Louis. p. 469. Triclínium odoràtum, Rafin. fl. lud. p. 79. Flowers greenish, sweet-scented. Said to be a congener of *S. Marylándica*.

Triclinium Sanicle. Pl. 1 to 2 feet.

11 S. bipinnatífida (Dougl. mss. ex Hook. fl. bor. amer. 1. p. 258. t. 92.) plant caulescent; leaves bipinnatifid: lower ones on long petioles; segments remote, obovate or obovate-lanceolate, acute, deeply serrated: serratures very acute; rachis winged, acutely toothed; peduncles elongated; umbels compound, somewhat proliferous; umbellules globose. ♃ H. Native of the north-west coast of America, at Fort Vancouver, on the Columbia. Root rather fusiform. Plant glabrous. Stem erect, branched, furnished with a few leaves. Segments of the upper cauline leaves narrow. Male flowers on short pedicels.

Bipinnatifid-leaved Sanicle. Pl. 1 foot.

12 S. arctopodioi'des (Hook. et Arn. in Beech. voy. pt. bot. p. 141.) plant almost stemless; leaves on long petioles, profoundly 3-parted; segments long, cuneated: lateral ones bifid: intermediate one trifid; all are somewhat ciliately pinnatifid; peduncle hardly longer than the leaves; leaves of involucrum foliaceous, lanceolate, quite entire, longer than the simple compact umbel. ♃. H. Native of the north-west coast of America, and North California. Hook. fl. bor. amer. 1. p. 258. t. 91. Root fusiform. Habit of the genus *Arctòpus*.

FIG. 59.

Arctopus-like Sanicle. Pl. ½ foot.

Sect. II. Sanicòria (an alteration from the generic name). D. C. prod. 4. p. 85. Tube of calyx smooth, but perhaps only in the flowering time. Leaves bipinnate-parted.

13 S. grave'olens (Poepp. diar. no. 222. pl. exsic. no. 93.) leaves bipinnate-parted; segments pinnatifid: lobes obtuse; flowering branches elongated, nearly naked, trifid at the apex; umbellules by threes, on short peduncles; flowers 12-15 in each umbellule: male ones nearly sessile: female one central. ♃. F. Native of Chili. Leaves almost like those of *Scrophulària canìna*. Umbels truly compound. Flowers yellowish in the dried state. Petals cuneate, emarginate, having the segment at the top reflexed. Filaments of young stamens inflexed. Styles very long. Male flowers more numerous in the umbels than the sessile female flowers. Calyx of the male flowers smooth, of the female echinated.

Strong-scented Sanicle. Pl. 1 foot.

Cult. The species of *Sanícula* grow best in a shaded rather moist situation, and they are easily propagated by dividing at the root. Some of the species being natives of warm climates, will require to be protected in winter.

XXVII. HACQUE'TIA (in honour of Balth Hacquet; author of Plantæ Alpinæ Carniolicæ, 4to. Vienna, (1782) Neck. elem. (1790) no. 306.) D. C. prod. 4. p. 85.—Dóndia, Spreng. mem. soc. mosc. 5. p. 8. umb. prod. p. 21. f. 2. Lag. am. nat. 2. p. 96. Koch, umb. p. 140.—Astrántia species, Lin. fil.—Dondìsia, Rchb. but not of D. C.

Lin. syst. *Pentándria*, *Digýnia*. Tube of calyx furnished with 10 ribs, and 5 lobes: lobes foliaceous, permanent. Petals erect, connivent, obovate: with the segment at the apex length of the limb of the petal, and bent in from the middle. Fruit crowned by the calyx, contracted from the sides; mericarps gibbously convex, furnished with 5 filiform ribs.—A small perennial herb. Leaves radical, petiolate, palmate; leaflets 3-cuneated, 2-3-cleft, mucronately serrated. Scapes 1-3, bearing at their tops simple umbels. Involucrum of 5-6 obovate leaves, which are toothed at the apex, and longer than the umbels. Flowers yellow, on short pedicels, some male, and some female. Fruit compressed from the sides; mericarps with 5 broad ribs, which are rather connate at the base, but separated by channels above.

1 H. Epipa'ctis (D. C. prod. 4. p. 85.) ♃. H. Native of Rhætia, on the mountains in the valley of Angustana; Carinthia, Carniola, &c. Astrántia Epipáctis, Lin. fil. supp. p. 177. Scop. carn. t. 6. Jacq. austr. 5. t. 11. Sturm, deutschl. fl. with a figure. Dóndia Epipáctis, Spreng. in Schultes, syst. 6. p. 241. —Lob. icon. t. 664. Flowers yellow.

Epipactis Hacquetia. Fl. March, April. Clt. 1823. Pl. ¼ to ½ foot.

Cult. See *Sanícula* above for culture and propagation. The plant, however, does best in a pot in a mixture of sand and peat, placed among other alpine plants.

XXVIII. ASTRA'NTIA (from *αστρον*, *astron*, a star, and *αντι*, *anti*, in composition signifying comparison; in reference to the appearance of the umbels of flowers). Tourn. inst. 166. Lam. ill. t. 191. Lag. am. nat. 2. p. 97. Koch, umb. p. 137. f. 42, 43. D. C. prod. 4. p. 86.—Astrántia species, Lin. gen. no. 327. Spreng. prod. p. 19.

Lin. syst. *Pentándria*, *Digýnia*. Tube of calyx 10-ribbed, with tubercular plaits; lobes 5, foliaceous. Petals erect, connivent, oblong-obovate: bent in from the middle by a segment, which is nearly the length of the petal. Fruit rather compressed from the back; mericarps without any vittæ, but having 5 elevated obtuse plicately toothed inflated ribs, inclosing in the cavity of each a smaller fistular rib; carpophore not distinct. Seed semi-terete.—Perennial herbs, natives of Europe and Caucasus. Roots blackish. Radical leaves petiolate, palmately lobed: cauline ones few, sessile. Universal umbels irregular, of few rays, surrounded by variable involucra; partial umbels regular, and containing many flowers, surrounded by many leaved involucels. Flowers white or rose-coloured, pedicellate, usually polygamous, the female ones alone fertile.

1 A. mi'nor (Lin. spec. p. 340.) leaves palmate; segments 7-9, lanceolate, acute, profoundly and acutely toothed; leaves of involucrum entire, about equal in length to the umbel. ♃. H. Native of the higher Alps of France, Switzerland, Italy, Germany, &c. Lam. ill. 191. f. 2. Sturm, deutschl. fl. with a good figure. Lodd. bot. cab. t. 93. A. mìnor var. α and β, D. C. fl. fr. 4. p. 353. A. digitàta, Mœnch, meth. p. 94. Hall. hist. no. 791. Leaves of involucrum white and acute. Flowers white.

Var. β, macrodónta (D. C. prod. 4. p. 86.) segments of leaves lanceolate-linear, profoundly and sharply serrated; leaves of involucrum exceeding the umbel. ♃. H. Native of the Alps of Piedmont.—Bocc. pl. sic. p. 10. t. 5. f. 111.

Smaller Master-wort. Fl. May, June. Clt. 1686. Pl. ½ to ¾ foot.

2 A. pauciflòra (Bertol, journ. bot. 1813. p. 76. am. itin. 96. and 347.) leaves palmate; segments 5-7, entire at the base, but finely and sharply serrated from the middle to the apex; leaves of involucrum entire, exceeding the umbel. ♃. H. Native of the mountains of Abruzzo and Naples. Very like *A. mìnor*. There is a variety having the segments of the leaves linear or oval-oblong.

Few-flowered Master-wort. Fl. June, July. Clt. 1820. Pl. 1 ft.

3 A. Carnio'lica (Jacq. fl. austr. 6. t. 10.) radical leaves palmate-parted: lobes 5-7, oblong, acuminated, unequally serrated, toothed; leaves of involucrum 12-13, quite entire, exceeding the umbel. ♃. H. Native of Carinthia, Carniola, in alpine meadows. Sturm, deutschl. fl. with a figure. A. màjor *β*, Spreng. in Schultes, syst. 6. p. 341. A. mìnor, Scop. fl. carn. no. 305. t. 7. Smith, exot. bot. 2. t. 77. Habit of *A. mìnor*, but with the character of *A. màjor*. Leaves of involucrum white, with a green line running along the middle of each, tinged with red. Petals white. Cauline leaves 3-lobed or simple. Root dark brown, having an aromatic balsamic smell, with a taste at first slightly aromatic, but nauseous, and afterwards acid.

Carniolan Master-wort. Fl. May, June. Clt. 1812. Pl. ½ to 1 foot.

4 A. ma'jor (Lin. spec. p. 339.) radical leaves palmate-parted: lobes 5, ovate-lanceolate, acute, rather trifid, toothed, ciliated with bristles; leaves of involucrum 15-20, linear-lanceolate, quite entire, hardly longer than the umbel. ♃. H. Native nearly throughout the whole of Europe and Eastern Caucasus, in mountain meadows and woods. Lam. ill. t. 191. f. 1. Nees, off. pfl. 12. t. 6. Hayn. arz. gew. 1. t. 13. Smith, exot. bot. 2. t. 76. Rivin. t. 68. Plenck, icon. t. 225. A. nìgra, Lob. icon. t. 681. Scop. carn. no. 306. Blackw. t. 470. A. cándida, Mill. dict. no. 2. A. alpìna, Munt. phyt. t. 111. Helléborus nìger, Gard. aix. t. 46. A. màjor *α*, Spreng. in Schultes, syst. 6. p. 341.

Var. α; leaves of involucel white; flowers white.

Var. β; leaves of involucel purplish; flowers tinged with red.

Larger Master-wort. Fl. May, Sept. Clt. 1596. Pl. 1 to 2 ft.

5 A. interme'dia (Bieb. suppl. p. 194.) radical leaves palmate-parted: lobes 5, rarely only 3, oval-oblong, deeply biserrated, and ciliated with bristles; cauline leaves nearly palmate; leaves of involucrum 12-13, oblong-lanceolate, bearing from 1 to 3 spines each at the apex, exceeding the umbel a little. ♃. H. Native of Caucasus, in mountain meadows. A. trífida, Hoffm. umb. ed. 2. vol. 1. p. 8. A. Caucásica, Spreng. umb. p. 17. syst. 8. p. 874. exclusive of the synonymes. Flowers pink?

Var. β; leaves of involucel nearly entire. ♃. H. Native of Caucasus and the mountains of Naples. A. màjor, Bieb. fl. and suppl. no. 509.

Intermediate Master-wort. Fl. June, July. Clt. 1818. Pl. 1 ft.

6 A. helleborifòlia (Salisb. par. lond. 1. t. 60.) radical leaves palmate-parted; lobes 3, ovate-lanceolate, unequally serrated, ciliated with bristles; leaves of involucrum 12-13, ovate-lanceolate, exceeding the umbel a little, ciliated with bristles their whole length. ♃. H. Native of Eastern Caucasus, in the more elevated meadows. A. máxima, Pall. nov. act. petrop. 7. p. 357. t. 11. Sims, bot. mag. 1553. A. heterophýlla, Willd. nov. act. berol. 3. p. 419. Bieb. fl. taur. 1. p. 202. suppl. p. 196. Involucrum and flowers pink. There are varieties of this species having the cauline leaves either 3-lobed or undivided.

Hellebore-leaved Master-wort. Fl. June, July. Clt. 1804. Pl. 1 to 2 feet.

Cult. The species of this genus grow well in any common garden soil, and are well adapted for ornamenting flower-borders, being rather pretty; they are easily increased by dividing at the root. *A. mìnor* and *A. Carniólica*, being more tender than the rest, should be grown in pots, and placed among other alpine plants.

XXIX. ALEPI'DEA (meaning unknown to us). Laroch. eryng. p. 19. t. 1. D. C. prod. 4. p. 87.—Astrántia species of Lin. fil.

Lin. syst. *Pentándria, Digýnia.* Tube of calyx beset with minute tubercles. Petals inflexed. Transverse section of fruit terete, ovate, tubercular on the outside; mericarps without ribs, and without vittæ; carpophore adnate its whole length to the seeds.—An herb, with the habit of *Eryngium nudicaúle*, native of the Cape of Good Hope. Radical leaves petiolate, oblong, ciliately toothed from spinescent bristles. Stems nearly naked, branched, umbellate at the apex. Leaves under the branches small, and stem-clasping. Umbels like those of *Astrántia*. An intermediate genus between *Astrántia* and *Eryngium*.

1 A. cilia'ris (Laroch. l. c.) ♃. G. Native of the Cape of Good Hope. Tratt. arch. t. 204. Astrántia ciliàris, Lin. fil. suppl. 177. Thunb. fl. cap. 2. p. 196. Jasìone Capénsis, Berg. act. ups. 3. p. 187. t. 10. Umbel 3-rayed, surrounded by a 2-3-leaved involucrum. Leaves of involucel 10, coloured, broad-lanceolate, acute, longer than the flowers.

Ciliated-leaved Alepidea. Pl. 1 foot.

Cult. Any light rich soil will suit this plant, and it will be easily increased by dividing at the root.

XXX. HORSFIE'LDIA (in honour of Thomas Horsfield, M.D. F.R.S. F.L.S. &c.; author of numerous works on Indian zoology). Blum. mss. but not of Willd. D. C. prod. 4. p. 87.—Schubértia, Blum. bijdr. p. 884. but not of Mart. nor Mirb.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete, quite entire. Petals ovate, cuspidate, flat. Fruit compressed, villous; mericarps 3-ribbed on the back.—A prickly shrub. Leaves cordate, 5-lobed: upper ones 3-lobed, clothed with stellate tomentum beneath. Panicle terminal, densely clothed with stellate tomentum. Umbels capitate, sessile, surrounded by a many-leaved involucrum; receptacle of flowers chaffy.

1 H. aculea'ta (Blum. l. c.) ♄. S. Native of Java, on Mount Tjerimai, in the province of Cheribon, where it is called *Gompong*. The rest unknown.

Prickly Horsfieldia. Shrub.

Cult. Any light rich soil will suit this shrub, and cuttings will be easily rooted in the same kind of earth under a hand-glass, in heat.

XXXI. ERY'NGIUM (from *ερευγω, ereugo*, to belch. Dioscorides declares that the plant is a specific for all complaints arising from flatulence). Tourn. inst. p. 327. t. 173. Lin. gen. no. 324. Gærtn. fruct. 1. p. 77. t. 20. Laroch. eryng. 1. vol. in fol. Par. 1808. Lag. am. nat. 2. p. 105. Koch, diss. p. 139. in nov. act. nat. cur. 12. p. 1.

Lin. syst. *Pentándria, Digýnia.* Tube of calyx rough from vesicles and scales; lobes 5, foliaceous. Petals erect, connivent, oblong-obovate: bent in from the middle by a segment as long as the limb of the petal, which consequently appears emarginate. Fruit obovate, scaly or tubercular, with the transverse section nearly terete; mericarps semi-terete, without ribs, and without vittæ; carpophore adnate its whole length to the seeds.—Herbs, usually perennial and spiny. Radical leaves, as well as the cauline ones, sheathing more or less at the base. Flowers congregated into oblong or roundish dense heads. Lower bracteas usually the largest, and forming an involucrum round the head of flowers; the rest like chaff, mixed among the flowers.

§ 1. *Ramosinérvia* (from *ramosus*, branched, and *nervus*, a

sinew or nerve; in reference to the nerves of the leaves being more or less branched and diverging). *D. C. prod.* 4. *p.* 88. *Limbs of radical leaves more or less distinct from the petioles: having the nerves more or less branched, and diverging, but never parallel.*

* *Limbs of radical leaves multifid.*

1 E. CAMPE'STRE (Dod. pempt. 730. f. 2. Lin. spec. 337.) radical leaves nearly ternate; segments pinnatifid: lobes ovate; cauline leaves auriculated; stem panicled; leaves of involucrum linear-lanceolate, nearly entire, exceeding the head of flowers, which is roundish; paleæ among the flowers subulate. ♃. H. Native of South and Middle Europe, and Caucasus; very common in dry sandy fields. In Britain not very common; on the coast near the ferry from Plymouth to Cornwall; and near the Devil's Point at Stonehouse, Plymouth; near Newcastle upon Tyne; on the shore called Friar's Goose, below Melling, in Yorkshire; also far inland opposite Brookhall, near Daventry, in Northamptonshire. Laroche, eryng. p. 22. Oed. fl. dan. t. 554. Hayne, arz. gew. 7. t. 1. Smith, eng. bot. 57. Jacq. austr. 2. t. 155. Plench. t. 173. E. vulgàre, Bauh. pin. 368. E. Mediterràneum, Ger. 999. Corollas blue, but sometimes white and yellow. Roots creeping. Plant rather glaucous.

Var. β; radical leaves nearly entire. ♃. H. Native of Portugal and the Levant.

Field Eryngo. Fl. July, Aug. Britain. Pl. 1 to 2 feet.

2 E. BOURGA'TI (Gouan. ill. p. 7. t. 3.) radical leaves orbicular, tripartite; lobes pinnatifid or cut in a forked manner, quite entire between the divisions; stems simple, a little branched at the apex; leaves of involucrum 10-12, lanceolate, pungent, erect, furnished with 1 or 2 teeth on each side, much longer than the head of flowers, which is ovate; paleæ among the flowers entire. ♃. H. Native of the Pyrenees, but has not been found elsewhere. D. C. fl. fr. 4. p. 355. Laroch. eryng. p. 24. Tratt. arch. t. 207. E. amethýstinum, Lam. fl. fr. 3. p. 401. but not of Lin. E. Bourgàti, E. plànum, and E. alpìnum, Lapeyr. abr. p. 137. There are varieties of this species with either sky blue or pale flowers: and with the stems either bearing one or more heads of flowers. Plant glaucous.

Bourgati's Eryngo. Fl. June, Aug. Clt. 1731. Pl. 1 to 2 ft.

3 E. BILLARDIE'RI (Laroch. eryng. p. 25. t. 2.) radical leaves nearly orbicular, tripartite; lobes lanceolate, pinnatifid, spiny, profoundly toothed all round; stems branched at the apex; leaves of involucrum 8, linear-lanceolate, 3 times higher than the head of flowers, which is globose; paleæ among the flowers entire. ♃. H. Native of the Levant; and in fields on the mountains at the limits of the Turkish districts called Khoi, in the province of Aberdeidjen. Tratt. arch. t. 356. Very nearly allied to *E. Bourgàti*, but differs in the lobes of the leaves being toothed all round, and in the paleæ being hardly longer than the calyxes. Flowers blue.

La Billardier's Eryngo. Pl. 1 foot.

4 E. SPÌNA-A'LBA (Vill. dauph. 2. p. 660. t. 15.) radical leaves 3-5-parted; lobes profoundly toothed, or cut in a forked manner; stem thick, nearly simple; leaves of involucrum 9-10, pinnatifid, very stiff, pungent, about equal in length to the head of the flowers, which is of an ovate-cylindrical form; paleæ among the flowers entire, or usually tricuspidate. ♃. H. Native of Dauphiny, Provence, &c. in arid exposed places of mountains. D. C. fl. fr. p. 356. Laroch. eryng. p. 26. t. 3. E. rígidum, Lam. dict. 4. p. 752. E. alpìnum, Lin. mant. p. 349. but not of his spec. E. alpìnum β, Schultes, syst. 6. p. 323. E. palléscens, Mill. dict. no. 5. Spìna álba, Dalech. lugd. 1462. Both heads of flowers and herb are white. There are varieties with either dwarf stems, or a foot high.

White-spined Eryngo. Fl. July, Aug. Clt. 1731. Pl. 1 foot.

5 E. DILATA'TUM (Lam. dict. 4. p. 755.) radical leaves pinnatifid: lobes spiny-toothed; upper leaves the largest; petioles pectinately ciliated from the base; stems nearly simple, bearing few heads; leaves of involucrum 5-7, lanceolate, spiny toothed, longer than the head, which is roundish; paleæ among the flowers variable: outer ones furnished with one tooth on each side: inner ones entire. ♃. H. Native of Portugal, Spain, Mauritania, Etruria; and Turkey, in fields about Constantinople. Laroch. eryng. p. 26. t. 4. E. purpuràtum, Smith in Rees' cycl. vol. 13. E. Bourgàti, Vahl, symb. 2. p. 48. Host. austr. 1. p. 341. E. fœ'tidum, Forsk. cat. const. p. 135. E. austràle, Wulf. et West, in Schultes, syst. 6. p. 333. E. amethýstinum, Salzm. pl. exsic.—Barrel. icon. t. 36. Heads of flowers and stem of a violaceous colour.

Dilated-petioled Eryngo. Fl. July, Aug. Clt. 1821. Pl. 1 to 2 feet.

6 E. CRINI'TUM (Presl, del. prag. p. 139.) radical leaves pinnatifid: outer lobes trifid, spiny toothed: lower ones much smaller and bristly, or jagged into bristle-formed teeth; petioles ciliated with bristles from the base; stems nearly simple, bearing few heads; leaves of involucrum 5-6, lanceolate, spiny ciliated, exceeding the head of the flowers, which is roundish; paleæ exceeding the flowers, outer ones spiny ciliated. ♃. H. Native of Spain. Very nearly allied to *E. dilatàtum*, but it differs from it and all the others in the bristles being yellowish, and rather spiny along the petioles and the lower lobes of the leaves. Flowers blue?

Hairy Eryngo. Pl. 1 to 2 feet.

7 E. AMETHY'STINUM (Lin. spec. p. 337. var. α,) radical leaves pinnatifid: lobes cut, spiny, somewhat pinnatifid; petioles entire at the base; stems smoothish, corymbosely branched at the apex; leaves of involucrum 7-8, lanceolate, furnished with a few teeth at the base, much exceeding in length the head of flowers, which is globose; paleæ among the flowers entire: outer ones hardly furnished with a tooth on each side. ♃. H. Native of Dalmatia, Croatia, and Belgium, but in the last mentioned country it has probably escaped from the gardens. Waldst. et Kit. hung. 3. t. 215.—Besl. hort. eyst. ord. t. 8. f. 4. Tratt. arch. 206. E. campéstre azùreum, Lejeun, in herb. Gay. E. cærùleum, Bauh. hist. 3. t. 86. f. 1. The upper part of the stem, and also the heads of flowers, are of the finest amethyst colour, so that they make a very fine appearance. This species is often confused with *E. dilatàtum*, but is easily distinguished from that species in the petioles being entire, not pectinated.

Amethystine-flowered Eryngo. Fl. July, Aug. Clt. 1648. Pl. 1 to 2 feet.

8 E. ANDERSÒNII (Lag. in litt. Loud. hort. brit. p. 101.) radical and cauline leaves pinnatifid: 3 terminal segments large, lanceolate, and 3-lobed at the apex: the rest of the segments small; all spiny toothed; stem smooth, striated, corymbosely and trichotomously branched; leaves of involucrum 7-8-lanceolate, spiny toothed, much longer than the head of the flower, which is rounded, furnished with retrograde forked or simple prickles on the lower side at the very base; upper paleæ among the flowers linear, entire, and the lower ones trifid, ending in spiny points, about the length or longer than the flowers. ♃. H. Native country unknown. E. amethýstinum, Hort. Chelsea. Upper part of stem, and heads of flowers of a beautiful blue.

Anderson's Eryngo. Fl. July, Aug. Clt.? Pl. 1 to 2 feet.

9 E. SCARIÒSUM (Laroch. eryng. p. 28. t. 5.) leaves pinnatifid; lobes linear, distant, trifid, or entire; petioles with scarious margins; stem furrowed, branched at the apex; leaves of involucrum 5-8, linear, much longer than the head of flowers, which is globose; paleæ among the flowers entire. ♃. H. Native of the Levant. Tratt. arch. t. 775. E. pentechìnum, Sieb. herb. palest. Allied to *E. amethýstinum*. Heads of flowers pale green.

Scarious-petioled Eryngo. Pl. 1 to 2 feet.

10 E. GLOMERA'TUM (Lam. dict. 4. p. 755.) leaves bipinnatifid; lobes linear, very stiff, divaricate; heads of flowers small, collected into a thyrse; flowers small; leaves of involucrum much longer than the head of flowers, and are as well as the paleæ nearly entire, and spinose. ♃. H. Native of Crete. Laroch. eryng. p. 29. t. 6. Tratt. arch. t. 760. E. parviflòrum, Smith, prod. fl. græc. 1. p. 175. Herb white, densely beset with leaves. Perhaps the *E. glomeràtum*, Sieb. herb. crete, which he gathered at the foot of Mount Ida, is the same, but it differs from the figure given by Laroche, in the heads of flowers being disposed in a corymb, in the lobes of the leaves being broader, and in the leaves of the involucrum being furnished with a spine-like subulate divaricate tooth on each side.

Glomerate-headed Eryngo. Fl. Jul. Aug. Clt. 1826. Pl. 1 ft.

11 E. ROSTRA'TUM (Cav. icon. 6. t. 552.) radical leaves long, lanceolate: outer ones spiny-ciliated: inner ones pinnatifid; stems a little branched; leaves of involucrum entire, rather shorter than the head of flowers, which is globose; paleæ among the flowers, entire: upper paleæ ending in a horn each, much longer than the flowers. ♃. H. Native of Chili, at Talcahuano, Conception, &c. Laroch. eryng. p. 29. This species is intermediate between the section *Ramosinérvia* and *Parallelinérvia*.

Beaked-scaled Eryngo. Pl. 3 to 4 feet.

12 E. COMO'SUM (Laroch. eryng. p. 30. t. 7.) radical leaves bipinnatifid; lobes linear, winged; stem dichotomous at the apex, bearing many heads; leaves of involucrum 5-6, trifid, longer than the head of flowers, which is ovate; paleæ among the flowers simple: upper paleæ spiny-toothed, drawn out into a tuft. ♃. F. Native of Mexico, in temperate places between Rio Sacra and Tolucco. H. B. et Kunth, nov. gen. amer. 5. p. 30. Flowers blue?

Tufted-scaled Eryngo. Fl. Jul. Aug. Clt. 1818. Pl. $\frac{1}{2}$ to 1 ft.

13 E. CRE'TICUM (Lam. dict. 4. p. 754.) cauline leaves almost pinnatifid; lobes lanceolate, spinose, ciliately toothed at the base; stems much branched at the apex, divaricate; leaves of involucrum 5, lanceolate-subulate, bearing 1-2 spiny teeth on each side, much longer than the head of flowers, which is roundish; paleæ among the flowers, tricuspidate. ♃. H. Native of the islands of Candia, Samos, and in all the islands of the Archipelago; frequent. Laroch. eryng. p. 30. t. 80. D'Urv. enum. 29. Sieb. herb. cret. E. cyàneum, Sibth. fl. græc. t. 258. prod. 1. p. 175. Tratt. tab. t. 350. Stems and heads of flowers of an amethyst colour. Floriferous branches elongated, or short and crowded.

Cretan Eryngo. Pl. 1 to $1\frac{1}{2}$ foot.

14 E. MULTI'FIDUM (Sibth. et Smith, fl. græc. t. 259. prod. 1. p. 175.) leaves all bipinnatifid, somewhat lyrate, and palmate-parted at the apex; lobes deeply lobed; stems corymbose, coloured at the top; leaves of involucrum linear-lanceolate, pinnatifid, or nearly entire, exceeding the head of flowers, which is ovate; paleæ among the flowers, entire. ♃. H. Native of the hills of the Morea and Sicily. E. alpìnum, elàtius, &c. Cup. pamph. 1. t. 29. Guss. prod. fl. sic. 1. p. 305. Top of stem and heads of flowers blue. Allied to *E. amethýstinum* and *E. Créticum*.

Multifid Eryngo. Pl. 2 feet.

15 E. OVI'NUM (Cunning. in Field's new south wales, p. 358.) stems erect, furrowed, dichotomous; leaves bipinnatifid; lobes linear, stiff, spinose, divaricate; heads of flowers spherical, pedunculate; leaves of involucrum linear, mucronate, stiff. ♃. G. Native of New Holland, near Bathurst. Flowers white. The plant when young is much sought after by sheep.

Sheep Eryngo. Fl. July, Aug. Clt. 1824. Pl. $1\frac{1}{2}$ foot.

* * *Limbs of radical leaves cordate at the base, undivided, or a little lobed.*

16 E. MARI'TIMUM (C. Bauh. pin. p. 386. Lin. spec. p. 337.) leaves of a whitish glaucous hue, coriaceous; radical leaves on long petioles, roundish, cordate, spiny-toothed: superior ones stem-clasping, palmately lobed; leaves of involucrum 5-7, ovate, spiny-toothed, exceeding the head of flowers, which is roundish; paleæ among the flowers, tricuspidate, about equal in length to the calyxes. ♃. H. Native throughout Europe, among the sand along the sea-shore; and on both sides of the Mediterranean Sea. It is to be found plentiful in some parts of Britain, on the sea-shore. Oed. fl. dan. t. 718. Tratt. arch. t. 209. Woodv. med. bot. t. 102. Smith, engl. bot. t. 718. Roots creeping. Flowers very pale blue. By English writers the *Sea eryngo* has been called *sea holly*, *sea hulver*, and *sea holme*. The young flowering shoots of the plant, eaten like asparagus, are very nourishing, according to Linnæus. The leaves are sweetish, with a slight aromatic warm pungency. The roots are supposed to have the same aphrodisiacal virtues as the *Orchis* tribe. They are kept in the shops candied, and are still regarded by the Arabs as an excellent restorative. Eryngo roots were first candied at Colchester about the beginning of the 17th century by Robert Buxton, apothecary. His apprentice, Samuel Great, continued this business, and it has ever since been carried on by the posterity of the latter.—Morant's Colchester, p. 92.

Sea Eryngo or Holly. Fl. July, Oct. Brit. Pl. 1 to $1\frac{1}{2}$ ft.

17 E. OLIVERIA'NUM (Laroch. eryng. p. 37. t. 12.) radical leaves on long petioles, roundish cordate; lower cauline leaves petiolate, 3-lobed, and deeply toothed: upper cauline ones stem-clasping, 3-parted, and cut; leaves of involucrum 10-12, lanceolate, stiff, having 5-6 teeth on each side, which are more crowded towards the base, exceeding the head of flowers; paleæ among the flowers, tricuspidate, and entire. ♃. H. Native of the Levant. E. alpìnum γ, Schultes, syst. 6. p. 323. Heads of flowers blue. Nearly allied to *E. alpìnum*, but is constant to its characters, even in cultivation: it differs from it in the radical leaves being much less cordate, in the lower ones being more dissected, and in the leaves of the involucrum being stiff, and having fewer teeth. The colour of the herb is green.

Oliver's Eryngo. Pl. 1 to 2 feet.

18 E. GIGANTE'UM (Bieb. fl. taur. 1. p. 201.) radical leaves on long petioles, profoundly cordate, crenate-toothed; cauline leaves stem-clasping, deeply lobed, spiny-serrated; leaves of involucrum 8-9, large, ovate-lanceolate, deeply spiny-serrated, longer than the head of flowers, which is ovate; paleæ among the flowers tricuspidate. ♃. H. Native of the Alps of Caucasus, Armenia, and Iberia. E. glaúcum, Willd. herb. ex Stev. in litt. E. asperifòlium, Laroch. eryng. p. 36. t. 11. Poir. suppl. 3. p. 289. Tratt. arch. t. 355. Stem dichotomously branched, 3-4 feet high, blue at the top as well as the heads of flowers. Lower leaves roughish, pubescent or glabrous beneath, reticulated with anastomosing nerves.

Giant Eryngo. Fl. Jul. Aug. Clt. 1820. Pl. 3 to 4 feet.

19 E. ALPI'NUM (Lin. spec. p. 337.) radical and lower cauline leaves on long petioles, deeply cordate, serrate-toothed: upper cauline leaves palmately lobed, ciliately serrated; serratures spinulose; leaves of involucrum 10-20, rather soft, a little longer than the head of flowers, pinnatifidly serrated, having 12-15 cilia-formed serratures on each side: and with the lower serratures pinnatifid; paleæ among the flowers tricuspidate or entire. ♃. H. Native of Switzerland, Piedmont, Germany, Croatia, Carniola, &c. in alpine pastures. Jacq. icon. rar. 1. t. 55. Sims, bot. mag. t. 922. Tratt. arch. t. 205. Involucrum along with the upper part of the herb and the flowers are of a beautiful blue colour; but there is also a variety which is white in the last-mentioned parts: and another which has the paleæ among the flowers pinnatifid. Herb green.

Alpine Eryngo. Fl. July, Aug. Clt. 1597. Pl. 1½ to 2 ft.

20 E. PLA'NUM (Math. comm. p. 505. with a figure. Lin. spec. p. 337.) lower leaves on long petioles, oval, cordate at the base, crenated, flat: middle cauline leaves sessile, undivided: superior ones 5-parted, serrated; leaves of involucrum 6-7, lanceolate, remotely spiny-serrated, spreading, about equal in length to the head of flowers, which is round; paleæ among the flowers entire, but the lower or outer ones are tricuspidate. ♃. H. Native of Austria, Russia, Siberia, Transylvania, Galicia, Caucasus, Mauritania, Provence, &c. in meadows. Jacq. aust. t. 391. Tratt. arch. t. 214. Laroch. eryng. p. 40. Upper part of the stem, leaves of involucrum, and heads of flowers blue; there is, however, a variety equally common in the gardens with white flowers. Herb green.

Flat-leaved Eryngo. Fl. July, Aug. Clt. 1596. Pl. 2 ft.

21 E. TRI'QUETRUM (Vahl. symb. 2. p. 46.) radical leaves petiolate, cordate, 3-lobed; lobes deeply spiny-toothed; cauline leaves 3-5-parted, palmate; peduncles triquetrous; leaves of involucrum 3-4, lanceolate, pungent, keeled, entire, exceeding the head of flowers, which is round; paleæ among the flowers entire. ♃. H. Native of Tunis and Sicily in fields and on hills. Desf. atl. 1. p. 225. t. 54. Laroch. eryng. p. 43. Tratt. arch. 779.—Zan. ist. t. 74. and therefore E. Zanònii, Lam. dict. 4. p. 754. E. Créticum, Jan. ex Guss. prod. fl. sic. 1. add. p. 7. Heads of flowers blue.

Triquetrous-peduncled Eryngo. Fl. Jul. Aug. Clt. 1824. Pl. 1 ft.

22 E. FALCA'TUM (Laroch. eryng. p. 40. t. 13.) radical leaves on long petioles, cordate, unequally spiny-serrated; cauline leaves sessile, palmately parted: lobes lanceolate, spreading, spiny-serrated; leaves of involucrum 5-8, lanceolate, furnished with 1-2 teeth on each side, twice the length of the head of flowers; outer paleæ tricuspidate: middle ones entire. ♃. H. Native on Mount Lebanon. Tratt. arch. t. 363. E. dichótomum β, Schultes, syst. 6. p. 321. The plant is easily distinguished from *E. dichótomum* by the form of the radical leaves. Heads of flowers blue?

Falcate Eryngo. Pl. 1 to 2 feet.

23 E. DICHÓTOMUM (Desf. atl. 1. p. 226. t. 55.) radical leaves petiolate, oblong, cordate at the base, toothed; cauline leaves palmately parted, spreading: lobes spiny-toothed; leaves of involucrum lanceolate, furnished with a few spiny teeth, much longer than the head of flowers, which is globose; outer paleæ tricuspidate, the rest entire. ♃. H. Native of Asia Minor, Caucasus, Mount Lebanon, Candia, Mauritania, Sicily, and about Montpelier, in exposed places. Upper part of stems, leaves of involucrum, and heads of flowers blue.

Var. α; stem tall, flexuous, much branched. Desf. l. c. Tratt. arch. t. 362. E. cœrùleum, Bieb. fl. taur. 1. p. 200.—Mor. ox. sect. 7. t. 37. f. 13. and therefore E. Syrìacum, Lam. dict. 4. p. 759.

Var. β; stems dwarf; flowers crowded at the neck of the plant. Laroch. eryng. p. 40. t. 14.

Dichotomous Eryngo. Fl. Jul. Aug. Clt. 1820. Pl. 1 to 2 ft.

24 E. DIFFU'SUM (Torr. rock. mount. no. 177.) leaves all digitately palmate; segments oblong, deeply serrated, spinose; stem dichotomously branched, diffuse; heads of flowers globose; leaves of involucrum 4-6, trifid, deeply serrated, longer than the head of flowers; ovaries scaly. ⊙. H. Native of North America, on the banks of the Canadian river. Perhaps this species will form a proper section.

Diffuse Eryngo. Pl. 1 foot.

* * * *Limbs of radical leaves oblong-obovate, or oval, never cordate at the base.*

25 E. PUSI'LLUM (Lin. spec. p. 337.) radical leaves lanceolate, entire, toothed or pinnatifid, attenuated at the base, petiolate: cauline leaves palmately parted, sessile; heads of flowers sessile; leaves of involucrum subulate, longer than the head of flowers, furnished with an appendage, or tooth at the base; paleæ among the flowers, entire. ♃. H. Native of Spain, Portugal, Mauritania, Sicily, Sardinia, &c. Laroch. eryng. p. 44. Tratt. arch. t. 212.—Barrel. icon. t. 1247. Heads of flowers greenish. This species is nearly allied to *E. dichótomum*, but differs from it in the radical leaves being attenuated at the base, never in any way cordate.

Var. β, *odoràtum* (D. C. prod. 4. p. 91.) stem small, decumbent; heads few-flowered. Laroch. l. c. E. odoràtum β, Lam. dict. 4. p. 756.

Var. γ, *galioìdes* (D. C. l. c.) stem erectish; lower leaves somewhat pinnatifid, small; heads few-flowered. Laroch. l. c. E. galioìdes, Lam. dict. 4. p. 757.

Var. δ, *paludòsum* (D. C. l. c.) stem nearly erect; lower leaves pinnatifid, large; heads few-flowered. Laroch. l. c. t. 16. E. odoràtum α, Lam. l. c.

Small Eryngo. Fl. June, Aug. Clt. 1640. Pl. ½ to 1 foot.

26 E. TERNA'TUM (Poir. suppl. 4. p. 295.) radical leaves undivided, linear, spiny-toothed; cauline leaves tripartite; leaves of involucrum lanceolate, cuspidate. ♃. H. Native of Candia, on hills in rugged places. Tausch. hort. canal. with a figure and description. E. Tournefortiànum, Sternb. syll. pl. nov. 17. p. 32. ex Tausch. E. trifòlium, P. Alp. exot. 152. with a figure.—Mor. ox. 3. sect. 7. t. 36. f. 24. Laroch. eryng. p. 65. Heads of flowers blue?

Ternate-leaved Eryngo. Clt.? Pl. 1 foot.

27 E. TRIPARTI'TUM (Desf. cat. hort. par. 1828.) radical leaves glabrous, petiolate, trifid; leaves obovate-oblong, cuneated at the base, coarsely serrated: serratures distant, ending in spiny points; stem much branched; cauline leaves nearly sessile, 3-5-parted: lobes lanceolate, coarsely serrated; leaves of involucrum twice the length of the head of flowers, which is ovate-globose; outer paleæ tricuspidate: inner ones undivided. ♃. H. Native country unknown.

Tripartite-leaved Eryngo. Pl. 1 foot.

28 E. AQUIFÒLIUM (Cav. ann. sc. nat. 3. p. 32.) radical leaves obovate-oblong, nearly sessile, attenuated at the base, coarsely ciliated or spiny-toothed from the base; cauline leaves somewhat stem-clasping, broadest at the base; leaves of involucrum 8, ovate-lanceolate, spiny-toothed, longer than the head of flowers, which is roundish; paleæ ending in 3 or 5 points. ♃. H. Native of Spain. Laroch. eryng. p. 34. t. 10. Tratt. arch. t. 753. E. marìtimum β, Pers. ench. p. 299. exclusive of the syn. of Fl. dan. Heads of flowers blue. The plant cultivated under this name has the lower leaves much longer and narrower at the base than those in the figure cited. Plant glaucous.

Holly-leaved Eryngo. Fl. Jul. Aug. Clt. 1815. Pl. 1 ft.

29 E. CORNICULA'TUM (Lam. dict. 4. p. 758.) radical leaves oblong-lanceolate, spiny-toothed; petioles fistular, septiferous; cauline leaves stem-clasping, trifid; leaves of involucrum 5, linear-subulate, quite entire, pungent; paleæ among the flowers, entire: ultimate ones drawn out each into a long horn at the apex. ♃. H. Native of Portugal and Spain, in boggy places. Brot. fl. lus. 1. p. 416. Laroch. eryng. p. 42. t. 15. Tratt. arch. t. 756. Sims, bot. mag. 1427. E. cornùtum, Donn, hort. cant. ed. 4. E. suavèolens, Brouss. ined. E. odoràtum, Hort. par. E. paludòsum, Hort. madr. Heads of flowers whitish, sweet-scented. Plant glaucous. The leaves of the involucrum when the plant grows in dry places, about equal in length to the head of flowers. Horns sometimes on 2-3 of the paleæ, which are usually joined together.

Horned Eryngo. Fl. Jul. Aug. Clt. 1803. Pl. 1 foot.

30 E. TRICUSPIDA'TUM (Lin. spec. p. 337.? Desf. atl. 1. p 224.) radical and lower cauline leaves on long petioles, orbicular,

cordate, acutely toothed; cauline leaves sessile, palmate-parted: lobes lanceolate, spiny-serrated; leaves of involucrum lanceolate, spiny-serrated, exceeding the head of flowers, which is nearly globose; paleæ tricuspidate, longer than the calyxes. ♂. H. Native of Mauritania, Sardinia, Sicily, and the Morea, in cultivated fields and exposed places. Laroch. eryng. p. 33. t. 9. Tratt. arch. t. 211. E. Boccòni, Lam. dict. 4. p. 754.—Bocc. sic. 88. t. 47. Heads of flowers greenish. Flowers purplish. There are varieties of this species with tall and humble stems; and with the lobes of the leaves either linear or lanceolate.

Tricuspidate Eryngo. Fl. Sept. Clt. 1699. Pl. 1 to 2 ft.

31 E. ILICIFO'LIUM (Lam. dict. 4. p. 757.) radical leaves and lower cauline ones on short petioles, obovate, coarsely spiny-toothed; petioles quite entire; leaves of involucrum 5-6, dilated at the apex, and coarsely spiny-toothed, exceeding the head of flowers, which is ovate-oblong; paleæ tricuspidate, longer than calyxes. ⊙. H. Native of Mauritania, Spain, and Portugal. Brot. fl. lus. 1. p. 419. Desf. atl. 1. p. 225. t. 53. Cav. ann. sc. 3. p. 51. Laroch. eryng. p. 34. Heads of flowers blue? Herb a hand high, stiff. There are varieties of this plant having the leaves of the involucrum cut or pinnatifid.

Ilex-leaved Eryngo. Pl. ½ foot.

32 E. TE'NUE (Lam. dict. 4. p. 755.) radical leaves obovate-spatulate, deeply toothed: cauline ones palmate-parted: lobes linear, spreading, spiny-toothed; leaves of involucrum linear, spreading, spiny-toothed, exceeding the head of flowers, which is roundish; paleæ tricuspidate, bearing spines on the back, longer than the calyxes. ⊙. H. Native of Spain, Portugal, and Mauritania, in cultivated fields, and on hills. Laroch. eryng. p. 32.—Clus. hist. 2. p. 159. f. 1. E. pusíllum, J. Bauh. hist. 3. p. 87.—Lob. icon. 2. t. 23. Flowers blue?

Slender Eryngo. Fl. July, Aug. Clt. 1814. Pl. ½ to 1 ft.

33 E. NASTURTIIFO'LIUM (Juss. in Laroch. eryng. p. 46. t. 17.) leaves all lanceolate, dilated at the apex, and somewhat pinnatifid; branches decumbent; heads of flowers lateral, sessile, ovate; leaves of involucrum lanceolate-subulate, elongated, and entire, as well as the paleæ. ⊙. S. Native of South America. Tratt. arch. t. 768. Allied to *E. vesiculòsum*, but differs in the angles of the calyx being 5, and in being rough from scales, not from vesicles.

Nasturtium-leaved Eryngo. Pl. decumbent.

34 E. CERVANTE'SII (Laroch. eryng. p. 47. t. 18. f. 1.) surculi decumbent; floral leaves trifid: lobes linear; heads of flowers axillary, pedunculate, roundish; leaves of involucrum 5, subulate, spreading, exceeding the head of flowers a little. ♃. H. Native of Mexico. Tratt. arch. t. 359. E. vivíparum, Cerv. mss. Calyxes scaly. Allied to *E. vesiculòsum*.

Cervantes's Eryngo. Fl. Jul. Oct. Clt. 1820. Pl. dec.

35 E. PROSTRA'TUM (Nutt. in litt. ex D. C. prod. 2. p. 92.) surculi creeping, filiform; leaves petiolate, ovate, unarmed, membranous, some entire, and others are furnished with a tooth or lobule on each side; heads of flowers ovate, pedunculate, axillary; leaves of involucrum 5, oblong-linear, entire, deflexed; paleæ linear, small; calyx papulose from vesicles. ♃. H. Native of North America, in the Arkansa territory. Petioles variable in length, some shorter than the limbs of the leaves, and others longer. Leaves rosulate, at the neck of the plant, but crowded at the node of the surculi, sometimes opposite. Peduncles 1 or 1½ inch long. Heads 2-3 lines long.

Prostrate Eryngo. Pl. prostrate.

36 E. BALDWI'NI (Spreng. syst. 1. p. 870.) leaves petiolate, oval, entire, or serrated; stem much branched, slender, usually prostrate; heads of flowers small, numerous; leaves of involucrum 2, tripartite: lobes linear, a little toothed at the base. ⊙. H. Native of Florida, in pine woods around St. Maria, and along the sea-shore near Augustine. E. gràcile, Baldw. in Nutt. gen. amer. 1. p. 175. Ell. sketch. 1. p. 345. but not of Laroch. E. réptans, Willd. herb. ex Spreng.

Baldwin's Eryngo. Pl. prostrate.

37 E. VESICULO'SUM (Labill. nov. holl. 1. p. 73. t. 98.) surculi creeping; radical leaves lanceolate, cuneate, and attenuated at the base, deeply toothed, almost pinnatifid; floral leaves trifid, with linear lobes; heads of flowers lateral, on short peduncles; leaves of involucrum 5, lanceolate-subulate, and are as well as the paleæ entire; calyx papulose. ♃. G. Native of Van Diemen's Land. Laroch. eryng. p. 47. Tratt. arch. t. 780. Poir. suppl. 4. p. 291.

Bladdery-calyxed Eryngo. Pl. cr.

38 E. SUBACAU'LE (Cav. icon. 6. t. 556. f. 2.) radical leaves petiolate, lanceolate, nearly quite entire; scape naked, bearing only 1 head of flowers, longer than the leaves: leaves of involucrum 8, lanceolate, spinose, spreading, furnished each with 1 tooth on each side, longer than the head of flowers, which is hemispherical; paleæ subulate, shorter than the calyx.—Native of Mexico, in Chalma. Laroch. eryng. p. 56. Tratt. arch. t. 778. Plant hardly more than a finger in height.

Nearly-stemless Eryngo. Pl. ¼ to ½ foot.

39 E. RADICIFLO'RUM (Tratt. arch. t. 764.) radical leaves sessile, ovate, spiny-serrated; heads of flowers solitary, roundish, sessile at the neck of the plant; leaves of involucrum 6, ovate-lanceolate, tridentate at the apex, discoloured, longer than the head; paleæ entire.—Native of New Granada, on the mountains of Pasto. E. hùmile γ. Laroch. eryng. p. 34. t. 18. f. 2. H. B. et Kunth, nov. gen. amer. p. 34.

Root-flowered Eryngo. Pl. ¼ foot.

40 E. FLA'CCIDUM (Hook. et Arn. in bot. misc. 3. p. 350.) radical leaves flaccid, on long petioles, deeply pinnatifid; segments linear, spinescent, bent downwards; stem slender, panicled at the apex; leaves of involucrum linear-lanceolate, stiff, acute, quite entire, about equal in length to the head of flowers, which is elliptic; paleæ hardly equal in length to the flowers. ⊙. H. Native of Buenos Ayres.

Flaccid-leaved Eryngo. Pl. ½ foot.

41 E. CORONA'TUM (Hook. et Arn. in bot. misc. 3. p. 350.) radical leaves lanceolate, spinosely pinnatifid; segments lanceolate-subulate, spreading; stem panicled at the top, many-headed; leaves of involucrum linear-subulate, spiny, quite entire, reflexed, about equal in length to the head, which is cylindrical; paleæ oblong, acute, pale, equal in length to the flowers, the 2 or 4 superior ones protruding in long horns, which emulate the leaves of the involucrum. ♃. H. Native of Buenos Ayres. Stem 6-8 inches high.

Crowned-headed Eryngo. Pl. ½ to ¾ foot.

42 E. HU'MILE (Cav. ann. p. 115. icon. t. 556. f. 1.) radical leaves on long petioles, oval-oblong, spiny-serrated; cauline leaves 1 or 2, oblong, sessile, serrated; stems bearing only 1 head of flowers, shorter than the radical leaves; leaves of involucrum 10, ovate-lanceolate, tridentate at the apex, coloured above, exceeding the head of flowers, which is globose and depressed at the apex; paleæ entire. ♃. G. Native of Peru, on the mountains of Chimborazo and St. Antonio. E. hùmile α, Laroch. eryng. p. 55. Tratt. arch. t. 763.

Var. β; leaves of involucrum entire. Laroch. eryng. p. 55. H. B. et Kunth, l. c. On the mountains of Pichinca and Antisana. E. ranunculoìdes, Willd. herb.

Humble Eryngo. Pl. ½ foot.

43 E. STELLA'TUM (Mutis, in Laroch. eryng. p. 55. t. 25.) lower leaves petiolate, linear-lanceolate, crenated: upper ones sessile, opposite; branches elongated, bearing 1 head of flowers each; leaves of involucrum ovate, spiny-toothed, discoloured, exceeding the head; paleæ subulate, exceeding the flowers.

♃. G. Native of Santa Fe de Bogota. Tratt. arch. t. 777. H. B. et Kunth, nov. gen. amer. 5. p. 33. Leaves of involucrum smooth, yellow above.

Stellate Eryngo. Pl. 1 foot?

44 E. PHYTEU'MA (Laroch. eryng. p. 51. t. 21.) cauline leaves few, petiolate, linear-lanceolate, unarmed, crenated; crenæ mucronate; stem nearly simple, bearing 2 heads of flowers; heads oblong, crowned by exserted foliaceous paleæ; leaves of involucrum 3-10, linear, deflexed. ♃. F. Native of Mexico, in meadows, near the town of Tolucco. H. B. et Kunth, nov. gen. 5. p. 30. Heads of flowers white.

Phyteuma-like Eryngo. Pl. 1 to 1½ foot.

45 E. GRA'CILE (Laroch. eryng. p. 54. t. 24. but not of Nutt.) radical leaves petiolate, elliptic, very blunt at the base, crenated; stem nearly naked, few-flowered; leaves of involucrum 8, linear-lanceolate, pungent, a little toothed, twice the length of the head of flowers; paleæ subulate, entire, longer than the calyxes. ♃. F. Native of Mexico, in humid places. H. B. et Kunth, nov. gen. amer. 5. p. 33. Plant a foot high. Heads of flowers of an amethyst blue colour. Leaves of involucrum smooth and yellow above, but green beneath.

Weak Eryngo. Fl. July, Aug. Clt. 1824. Pl. 1 foot.

46 E. BONPLA'NDI (Laroch. eryng. p. 52. t. 22.) radical leaves petiolate, ovate-oblong, crenated; stem nearly naked, 1-3-flowered; leaves of involucrum 8, and are as well as the paleæ lanceolate; paleæ scarcely exceeding the calyxes, of equal size and shape. ♃. G. Native of Mexico, in shady woods. Tratt. arch. t. 754. E. Bonplandiànum, H. B. et Kunth, nov. gen. amer. p. 31. Tube of calyx tubercular.

Bonpland's Eryngo. Pl. 1 to 1½ foot.

47 E. NUDICAU'LE (Lam. dict. 4. p. 759. t. 187. f. 2.) radical leaves obovate, coarsely spiny-toothed: teeth ciliated; stem dichotomous, nearly naked, bearing few heads; leaves of involucrum lanceolate, spinose, equal in length to the head of flowers, which is roundish; paleæ subulate. ♃. H. Native of Monte Video; and of Chili, in the province of San Louis, on the tops of the mountains called Cerro del Morro, at the elevation of 4500 feet. Laroch. eryng. p. 51. Tratt. arch. t. 769. Cham. et Schlecht. in Linnæa. 1. p. 251. There are varieties of this species with bracteas all entire; or the outer ones are spiny-toothed, and the rest entire; or all spiny-toothed ex Cham. et Schlecht. l. c. The teeth of the leaves are sometimes entire and not again ciliated, and this brings the species very near *E. serràtum*.

Naked-stemmed Eryngo. Pl. ½ foot.

48 E. SERRA'TUM (Cav. ann. 2. p. 132. icon. 6. t. 554.) radical leaves petiolate, lanceolate, profoundly serrated; stem nearly naked, and almost simple, few-flowered; leaves of involucrum 8-10, subulate, spreading, length of the head of flowers, which is globose; paleæ entire, subulate, exceeding the flowers a little. ♃. G. Native of Mexico. Laroch. eryng. p. 55. Tratt. arch. t. 776. Calyx covered with white scales. Stem a foot high. Perhaps the same as *E. serràtum*, Link, enum. 1. p. 260. but the leaves are not doubly serrated as described by him, but acutely crenated. Heads of flowers blue?

Serrate-leaved Eryngo. Fl. Jul. Aug. Clt. 1800. Pl. 1 to 2 ft.

49 E. CARLI'NÆ (Laroch. eryng. p. 53. t. 23.) radical leaves lanceolate, deeply spiny serrated, acute; cauline leaves palmatifid: lobes deeply serrated; stem branched, bearing few heads; leaves of involucrum 7-9, ovate-lanceolate, deeply serrated; paleæ subulate, simple. ♃. G. Native on the mountains about the town of Mexico, and between Joya and Las Vigas, near Perote, and on Mount Orizaba. H. B. et Kunth, nov. gen. amer. 5. p. 32. Leaves of involucrum yellow above. Flowers blue.

Var. α, *eréctum* (D. C. prod. 4. p. 94.) stem erect, solitary; leaves of involucrum ovate, twice the length of the head of flowers. ♃. G. Laroch. eryng. l. c. with a figure. Tratt. arch. t. 358.

Var. β, *decúmbens* (D. C. l. c.) stem simple, diffuse; leaves of involucrum equal in length to the head of flowers, which is oblong. ♃. G.

Carlina-like Eryngo. Pl. 1 foot.

50 E. HORMINOI'DES (D. C. prod. 4. p. 94.) leaves glabrous: radical ones unknown: cauline ones ending in a spine-like point: uppermost ones opposite; stem branched, bearing many heads; leaves of involucrum 10-12, oblong-lanceolate, spiny-serrated at the apex, white inside; paleæ forming a tuft at the top of the head of flowers. ♃. G. Native about the town of Mexico. Allied to *E. carlinæ*, but differs in the heads of flowers being oval and tufted at the apex.

Horminum-like Eryngo. Pl. 1 foot.

51 E. CILIA'TUM (Cham. et Schlecht. in Linnæa. 2. p. 249.) radical leaves obovate-lanceolate, pectinately serrated: teeth stiff, bristly; stem naked, bearing 1-3 heads: heads elliptic, echinated from the paleæ, which are subulately acuminated and smooth, and exceed the flowers; leaves of involucrum similar to the paleæ. ♃. G. Native of Brazil, in the provinces of Cisplatine and Rio Grande, in fields. Heads coloured, 8-9 lines long.

Ciliated-leaved Eryngo. Pl. 1 foot.

52 E. E'LEGANS (Cham. et Schlecht. in Linnæa. 2. p. 248.) leaves linear-lanceolate, spiny-serrated, ciliated, tricuspidate at the apex; stem bearing many heads; heads globose, echinated; leaves of involucrum 10, lanceolate, spiny-toothed, tricuspidate at the apex; paleæ tricuspidate, a little longer than the flowers, smooth. ♃. G. Native of Brazil, in the provinces of Monte Video and Rio Grande do Sul. Root nearly globose, size of a filbert. Leaves 10 inches long, and 9 lines broad. Heads of flowers small, of one colour.

Elegant Eryngo. Pl. 1 foot.

53 E. NU'DUM (Gill. et Hook. in bot. misc. 1. p. 334.) stem tall, panicled; leaves linear-subulate, channelled, spiny-ciliated: spines 2-3 together; heads of flowers globose. ♃. G. Native about Buenos Ayres, in the plains called the Pampas. Stem 4-5 feet. Allied to *E. ebracteàtum*, Lam.

Naked Eryngo. Pl. 4 to 5 feet.

54 E. DIVARICA'TUM (Hook. et Arn. in bot. misc. 3. p. 350.) stems prostrate, dichotomously divaricate, leafy, rigid; lower leaves bipinnatifid: cauline leaves pinnatifid: segments linear, spinescent, divaricate; peduncles short, axillary, and in the forks of the stem; leaves of involucrum subulate, reflexed, 4 times shorter than the head of flowers, which is elliptic. ♃. F. Native of Buenos Ayres.

Divaricate Eryngo. Pl. 1 foot.

55 E. SE'RRA (Cham. et Schlecht. in Linnæa. 2. p. 246.) leaves ensiform, spiny-serrated, ciliated; stem panicled, bearing many heads; heads ovate, echinated; leaves of involucrum and outer paleæ lanceolate, subulately acuminated, spiny-toothed, smooth: inner paleæ entire, a little smaller than the outer ones. ♃. F. Native of Brazil, in the province of Cisplatine, and near Monte Video. Radical leaves half a foot long. Heads unguicular, of one colour.

Saw-leaved Eryngo. Pl. 1 foot.

56 E. UNCINA'TUM (Cham. et Schlecht. in Linnæa. 2. p. 247.) leaves lanceolate, serrated; serratures ending in recurved spines, ciliated; stem bearing few heads; heads globose, echinated; paleæ scabrous, tricuspidate; leaves of involucrum spinosely pinnatifid. ♃. G. Native of the south of Brazil.

Hooked-spined Eryngo. Pl. 1 foot.

57 E. FLORIBU'NDUM (Cham. et Schlecht. in Linnæa. 1. p. 245.) leaves ensiform, spiny-serrated, ciliated; stem panicled, bearing many heads; heads echinated by scabrous, subulately mucronulated paleæ; leaves of involucrum ovate, acuminated,

subulate, hardly different from the paleæ. ♃. G. Native of the south of Brazil. Stem fistular at the base.

Bundle-flowered Eryngo. Pl. 1 foot.

58 E. AROMA'TICUM (Baldw. in Ell. sketch. 1. p. 344.) leaves cuspidate, pinnate, trifid at the apex, with cartilaginous margins; stem leafy, bearing many heads, corymbose; leaves of involucrum 5, trifid, about equal in length to the head of flowers; paleæ tricuspidate. ♃. H. Native of Florida, in dry pine woods. Stems 9-10 inches high, numerous. Root aromatic.

Aromatic-rooted Eryngo. Pl. 1 foot.

59 E. FŒ'TIDUM (Lin. spec. p. 336. exclusive of the syn. of Gron.) radical leaves lanceolate, bluntish, attenuated at the base, spinulosely serrated; floral leaves palmate-parted, sessile; heads nearly sessile, cylindrical; leaves of involucrum lanceolate, spiny-serrated, much longer than the heads; paleæ among the flowers entire. ♃. S. Native of Jamaica, Cayenne, Demerara, Florida, Brazil, &c. in fields and woods. Laroch. eryng. p. 50. Michx. fl. bor. amer. 1. p. 163. Sloane, hist. 1. t. 156. f. 3-4.—Herm. lugd. t. 237. Plant with an ungrateful odour when bruised. Flowers white. Calyx ornamented with roundish vesicles, not scales. The radical leaves are sometimes trifid at the apex in the plants we have seen growing in Brazil. The plant named *E. fœ'tidum* by Ucria, a native of Sicily, is probably distinct from this. All parts of the plant are reckoned very powerful antihysterics, and much used by the negroes and poorer whites on all occasions of that nature, whence they call it *fitweed*. It is chiefly administered in decoctions or infusions.

Fetid Eryngo. Fl. Aug. Oct. Clt. 1714. Pl. 1 foot.

60 E. HÆ'NKEI (Presl, in herb. Hænke, ex D. C. prod. 4. p. 94.) radical leaves lanceolate, 1-nerved, obtuse, attenuated at the base, furnished with spiny serratures from the base to the apex; cauline leaves pinnatifidly serrated, palmately lobed at the apex: floral ones short, half stem-clasping; cymes twice forked; heads terminal, roundish; leaves of involucrum 5, much longer than the head of flowers, lanceolate-subulate, entire. ♃. G. Native of Mexico, in grassy places towards Jalapa. E. Schiedeànum, Cham. et Schlecht. in Linnæa. 5. p. 206. Habit of *E. pusillum* on the one hand, and of *E. fœ'tidum* or *E. virgàtum* on the other.

Hænke's Eryngo. Pl. 1 to 3 feet.

61 E. VIRGA'TUM (Lam. dict. 4. p. 757.) leaves all on very short petioles, ovate, toothed: lower ones hardly subcordate at the base; stem very simple, but branched divaricately at the apex; leaves of involucrum 6-7, linear, furnished with 1 tooth on each side, exceeding the head of flowers, which is globose; paleæ among the flowers tricuspidate. ♃. H. Native of North America, in New Jersey, Carolina, and Georgia, in moist meadows and woods. Laroch. eryng. p. 40. t. 20. Tratt. arch. t. 781. E. ovalifòlium, Michx. fl. bor. amer. 1. p. 165. Flowers pale blue?

Twiggy Eryngo. Fl. June, July. Clt. 1810. Pl. 1 foot.

62 E. VIRGINIA'NUM (Lam. dict. 3. p. 759.) leaves linear-lanceolate, a little serrated; leaves of involucrum 7-8, longer than the head of flowers, entire or trifid; paleæ among the flowers tricuspidate. ♂. H. Native of North America, in pastures, by the sides of rivers, and in marshes which are inundated by the sea. Laroch. eryng. p. 48. t. 19. Tratt. arch. t. 782. Pursh, fl. amer. sept. 1. p. 189. E. aquáticum, Michx. fl. bor. amer. 1. p. 163. E. aquáticum β, Lin. spec. p. 336.—Pluk. alm. t. 396. f. 3. Stem fistular. Heads of flowers pale blue.

Virginian Eryngo. Fl. Jul. Sept. Clt.? Pl. 2 feet.

63 E. MICROCE'PHALUM (Willd. herb. no. 5558. Spreng. syst. 1. p. 871.) radical leaves oblong, glaucescent beneath, with cartilaginously crenated margins, having the recesses between the crenæ glandular; cauline leaves very few; peduncles elongated, naked; leaves of involucrum with cartilaginous margins, lanceolate, ending in spiny points, shorter than the head of flowers, which is small. ♃. G. Native of South America, according to Humb. trav. but the particular place is unknown. Leaves 1½ inches long, and 5-6 lines broad. Heads 3 lines in diameter. Paleæ not different from the leaves of the involucrum, unless that they are smaller, longer, and terminated by a mucrone, but without the cartilaginous margins.

Small-headed Eryngo. Pl. 1 foot.

64 E. DEPRE'SSUM (Hook. et Arn. l. c. 3. p. 351.) plant stemless; radical leaves linear-oblong, spatulate, spiny-toothed, having the nerves in the limb branched, with the branches diverging; branches of stem tufted, diffuse, dichotomous, numerous from the neck of the plant; heads of flowers terminating the branches, and in the forks; leaves of involucrum and paleæ subulate, about equal, spiny, and entire, or furnished with a short spine on each side at the middle, much exceeding the flowers, which are sessile. ⊙. H. Native of Chiloe; and of Chili, near Valparaiso, in Vina de la Mar.

Var. α, *rígidum* (Hook. et Arn. l. c.) branches stiff, forked a little, about equal in length to the leaves.

Var. β, *fláccidum* (Hook. et Arn. l. c.) branches elongated, slender, trichotomously divided. Chili at Valparaiso and Casa Blanca.

Depressed Eryngo. Pl. ½ foot.

65 E. ANÓMALUM (Hook. et Arn. in bot. misc. 3. p. 350.) root simple; leaves coarsely serrate-toothed at the apex: radical ones roundish, cuneated at the base, petiolate: upper cauline ones cuneated; heads on short peduncles; leaves of involucrum and chaff about equal, oblong, spiny-mucronate, quite entire, much exceeding the flowers, which are sessile; fruit papillose from vesicles. ⊙. H. Native of Chili, about Valparaiso. The fruit and the paleæ among the flowers has induced the authors to refer this plant to *Erýngium*, to which its appearance is altogether foreign.

Anomalous Eryngo. Pl. ½ to 1 foot.

§ 2. *Parallelinérvia* (from *parallelus*, parallel, and *nervus*, a nerve; nerves of leaves parallel). *D. C. prod.* 4. *p.* 95. *Nerves of radical leaves parallel and longitudinal. Leaves narrow, and probably reduced to the dilated petioles.*

66 E. AQUA'TICUM (Lin. spec. 336. var. α. exclusive of the syn. of Gron.) leaves broadly linear, with parallel nerves, remotely spiny-ciliated: lower leaves rather ensiform: floral ones lanceolate, toothed; leaves of involucrum 8-9, shorter than the head of flowers, which is globose, and are as well as the paleæ entire; stems dichotomous. ♃. H. Native of North America, from Pennsylvania to Virginia; also of the Society Islands, California, and Buenos Ayres, in marshes, inundated pastures, and on the banks of rivers. Jacq. icon. rar. t. 347. Laroch. eryng. p. 5. Ker. bot. reg. t. 372. E. yuccæfòlium, Michx. fl. bor. 1. p. 164.—Pluk. alm. t. 975. f. 4.—Mor. ox. 3. p. 167. sect. 7. t. 37. f. 21. Stem erect, 2-3 feet high, terete, simple below. Flowers white, or very pale blue. In North America the plant is called *Rattle-snake-weed*, from its use in curing the bite of that venomous reptile.

Aquatic Eryngo. Fl. July, Sept. Clt. 1699. Pl. 2 to 3 ft.

67 E. LONGIFÒLIUM (Cav. ann. 2. p. 133. icon. 6. t. 555.) leaves broadly linear, with parallel nerves, remotely spiny-ciliated; stem many times forked; leaves under the branches opposite, very short, 3-5-cleft; leaves of involucrum 10, deflexed, lanceolate, rather shorter than the head of flowers, which is nearly globose; paleæ entire, exceeding the flowers. ♃. G. Native of Mexico, about Pachuca and Real del Monte. Laroch. eryng. p. 58. Tratt. arch. t. 766. Flowers white.

Long-leaved Eryngo. Fl. Jul. Aug. Clt. 1820. Pl. 2 to 3 ft.

68 E. ANGUSTIFÒLIUM (D. C. prod. 4. p. 95.) radical leaves linear, with parallel nerves, lobately serrated: serratures distant; cauline leaves few, opposite; heads of flowers short; scales of involucrum and paleæ very long, linear-subulate, very acute. ♃. G. Native of New Holland. Stem terete, a foot high, striated, twice trifid, erect. Leaves of involucrum and paleæ half an inch long, much longer than the flowers.

Narrow-leaved Eryngo. Pl. 1 foot.

69 E. CANALICULA`TUM (Cham. et Schlecht. in Linnæa. 2. p. 238.) leaves very narrow, channelled, with parallel nerves, shining, spiny ciliated; spines often accessory; stem panicled, bearing many heads: heads nearly unarmed, globose; leaves of involucrum connate at the base, smooth, hardly larger than the paleæ. ♃. G. Native of the interior regions of Brazil. Habit of *E. prístis*. Radical leaves 2 lines broad. Spines 7-8 in the space of an inch.

Channelled-leaved Eryngo. Pl. 1 foot.

70 E. PRI'STIS (Cham. et Schlecht. in Linnæa. 2. p. 237.) leaves with parallel nerves, very narrow, flat, striated, spiny-ciliated, often with accessory spines; stem panicled, bearing many heads: heads globose, echinated from subulate-spinescent bracteas; leaves of involucrum ovate, acuminated, scabrous, twice the length of the calyxes, hardly different from the paleæ. ♃. G. Native of Brazil, in the province of Rio Grande. Stem 4 feet high and more, solid. Radical leaves tufted, a foot and a half long.

Grampus Eryngo. Pl. 4 feet.

71 E. PANDANIFÒLIUM (Cham. et Schlecht. in Linnæa. 2. p. 236.) leaves with parallel nerves, linear, obsoletely and remotely spiny-toothed: stem panicled, bearing many heads: heads disposed in umbels, egg-shaped, unarmed; leaves of involucrum ovate, acuminated, smooth, hardly different from the paleæ, which are rather longer than the calyxes. ♃. F. Native of Brazil, in the province of Cisplatine. Heads semi-unguicular, coloured. Radical leaves 18 lines long, broad at the base.

Screw-pine-leaved Eryngo. Pl. 2 to 3 feet.

72 E. PETIOLA`TUM (Hook. fl. bor. amer. 1. p. 259.) leaves with parallel nerves, lanceolate, tapering into long petioles, remotely spiny-ciliated; upper leaves narrow, sessile; leaves of involucrum and paleæ subulate, spiny-ciliated, stiff, twice the length of the flowers. ♃. H. Native of north-west America, in moist soils on the plains of the Multnomak river. Petioles 4-6 inches long. Heads echinated.

Petiolate-leaved Eryngo. Pl. 2 feet?

73 E. PANICULA`TUM (Laroch. eryng. p. 59. t. 26.) leaves with parallel nerves, linear, spiny-ciliated: floral ones very short; stem nearly naked, bearing at the apex umbellate branches; branches bearing 1-3 heads; leaves of involucrum 9-10, lanceolate, and are as well as the paleæ entire. ♃. G.

Var. α, *Chilénse* (D. C. prod. 4. p. 96.) leaves of involucrum hardly different from the paleæ; leaves all spiny-ciliated. ♃. G. Native of Chili. E. paniculàtum, Cav. Domb. Laroch. l. c. E. aquáticum, Cav. icon. 6. p. 17.

Var. β, *olígodon* (D. C. l. c.) leaves of involucrum hardly different from the paleæ; lower leaves entire, or scarcely ciliated on the edges. ♃. G. Native of Brazil. E. paniculàtum, var. α, Cham. et Schlecht. in Linnæa. 2. p. 234.

Var. γ, *bracteòsum* (D. C. l. c.) leaves of involucrum elongated and reflexed. ♃. G. Native of Brazil, in the province of Cisplatine. Cham. et Schlecht. l. c.

Panicled-flowered Eryngo. Pl. 1 foot.

74 E. CYMÒSUM (Laroch. eryng. p. 63. t. 31.) leaves with parallel nerves: lower ones linear, channelled, bearing very long, conjugate, subulate teeth; upper leaves pinnatifid; floral branches umbellate; leaves of involucrum 8-10, linear, quite entire, at length reflexed, longer than the head of flowers, which is round; paleæ subulate, a little longer than the calyxes. ♃. F. Native of Mexico, in the higher plains near Tasco. Tratt. arch. t. 361. H. B. et Kunth, nov. gen. 5. p. 35.

Cymose-headed Eryngo. Pl. 2 feet.

75 E. LUZULÆFÒLIUM (Cham. et Schlecht. in Linnæa. 2. p. 240.) leaves with parallel nerves, linear, denticulated; lower teeth setiferous: upper ones obsoletely spinulose; stem bearing few heads: heads unarmed, globose; leaves of involucrum ovate, acute, roughish, hardly different from the paleæ. ♃. G. Native of the south of Brazil. Leaves 2-3 lines broad. Heads pale straw-coloured, as also the rest of the plant.

Luzula-leaved Eryngo. Pl. 1 foot.

76 E. GRAMI'NEUM (Laroch. eryng. 60. t. 27.) leaves with parallel nerves, narrow-linear, remotely spiny-ciliated; stem bearing only 2 heads; leaves of involucrum 8-9, lanceolate-subulate, nearly entire, spreading, a little shorter than the head of flowers, which is ovate; paleæ subulate, a very little longer than the flowers. ♃. F. Native of Mexico, in shady woods near Santa Rosa. H. B. et Kunth, nov. gen. amer. 5. p. 34. Tratt. arch. t. 761. Stem simple, 2 feet high. Heads of flowers of an amethyst colour.

Grassy-leaved Eryngo. Pl. 2 feet.

77 E. BROMELIÆFÒLIUM (Laroch. eryng. p. 60. t. 28.) leaves with parallel nerves: bearing large subulate teeth, which are shorter than the breadth of the leaves; radical leaves very long, broadly lanceolate-linear: floral ones opposite, keeled, arched; leaves of involucrum 10, lanceolate, acuminated, few-toothed, exceeding the head of flowers, which is round; paleæ entire, twice the length of the calyxes. ♃. F. Native of Mexico, in humid woods. Tratt. arch. t. 357. H. B. et Kunth, nov. gen. amer. 5. p. 34. Flowers white?

Pine-apple-leaved Eryngo. Pl. 3 to 4 feet.

78 E. PECTINA`TUM (Presl, in herb. Hænk. ex D. C. prod. 4. p. 96.) leaves with parallel nerves, bearing twin, subulate teeth, 1 in each pair, very short, and the other longer than the breadth of the leaves; radical leaves long, lanceolate-linear: floral ones opposite; leaves of involucrum 10, lanceolate, acuminated, coarsely spiny-toothed at the base. ♃. F. Native of Mexico. E. Deppeànum, Schlecht. et Cham. in Linnæa. 5. p. 207. Very like *E. bromeliæfòlium*, but differs in the leaves being much narrower. Branches of stem bearing either 1 or 3 heads.

Pectinate-leaved Eryngo. Pl. 2 to 3 feet.

79 E. HUMBÓLDTII (Laroch. eryng. p. 61. t. 29.) leaves with parallel nerves, lanceolate-linear, closely spiny-toothed: spinules in pairs; stem branched above; heads of flowers oblong, conglomerate; leaves of involucrum 7-8, lanceolate, toothed, usually shorter than the head of flowers; outer paleæ toothed: inner ones entire. ♃. G. Native of New Granada, on Mount Quindiu. Tratt. arch. t. 762. E. Humbóldtiànum, H. B. et Kunth, nov. gen. amer. 5. p. 34.

Humboldt's Eryngo. Pl. 2 to 3 feet.

80 E. PROTEÆFLORUM (Laroch. eryng. p. 62. t. 30.) leaves with parallel nerves; cauline leaves densely crowded, rather imbricated, lanceolate, coarsely spiny-toothed; heads of flowers large, oblong; leaves of involucrum 20-22, large, toothed, lanceolate, exceeding the head of flowers; paleæ entire. ♃. F. Native of Mexico, at the foot of the burning Mount Jorullo, and on Mount Orizaba. Tratt. arch. t. 773. H. B. et Kunth, nov. gen. amer. 5. p. 35. Leaves of involucrum smooth and yellow above.

Protea-flowered Eryngo. Pl. 2 to 3 feet.

81 E. MONOCE'PHALUM (Cav. ann. 2. p. 116. icon. t. 553.) lower leaves with parallel nerves, linear, channelled, bearing unequal, ternate, subulate teeth; upper leaves pinnatifid; stem bearing only 1 head of flowers; leaves of involucrum 20-24, lanceolate, furnished each with 1-2 spreading spines, exceeding

the head of flowers, which is roundish. ♃. F. Native of Mexico, near Huanajato and Chilpancingo. Laroch. eryng. p. 62. Tratt. arch. t. 767.

One-headed Eryngo. Pl. 4 feet.

82 E. ju'nceum (Cham. et Schlecht. in Linnæa. 3. p. 241.) leaves with parallel nerves, very narrow, inconspicuously spiny-denticulated, acute; stem bearing few heads; heads nearly unarmed, globose; leaves of involucrum 10-12, connate at the base, ovate, 5-nerved, acuminated, and are as well as the paleæ smooth. ♃. G. Native of Brazil. Heads of one colour, 5 lines in diameter.

Rushy Eryngo. Pl. 1 to 2 feet.

83 E. erióphorum (Cham. et Schlecht. in Linnæa. 3. p. 242.) leaves very narrow, linear, with parallel nerves, quite entire, fringed with villi at the base; stem bearing 1 or few heads; heads between egg-shaped and globose, unarmed; leaves of involucrum as well as the paleæ elongated, acuminated, and striated. ♃. G. Native of Brazil, in the province of Cisplatin and Rio Grande. Stem bearing few leaves, from 1 to 2½ feet high. Leaves a line broad: radical one a foot and more long. Bracteas longer than the flowers. Habit almost of a *Cypèrus*.

Wool-bearing Eryngo. Pl. 1 to 2 feet.

84 E. sanguisórba (Cham. et Schlecht. in Linnæa. 3. p. 239.) leaves linear, with parallel nerves, spiny-serrated: serratures towards the apex of the leaf blunt and retrograde; stem naked, bearing few heads: heads ovate; leaves of involucrum as well as the paleæ subulately acuminated, a little longer than the flowers. ♃. F. Native of the south of Brazil, in the province of Rio Grande. Tube of calyx clothed with scarious scales at the angles. Heads echinated, coloured, 9-10 lines long.

Sanguisorba-like Eryngo. Pl. 2 feet.

85 E. ebractea'tum (Lam. dict. 4. p. 759.) leaves linear, with parallel nerves, usually ciliated at the base with long bristles; stem trichotomously corymbose; heads cylindrical, unarmed; leaves of involucrum as well as the paleæ entire, shorter than the flowers. ♃. G. Native of the south of Brazil. Laroch. eryng. p. 64. t. 32. Tratt. arch. t. 758. Cham. et Schlecht. in Linnæa. 2. p. 244. E. nudiflòrum, Willd. herb. which was collected about Ibague, in New Granada, is the same, according to Cham. et Schlecht. l. c. Stem erect, 2 feet high. Habit of the last species. Calyx rough from scales.

Bractless Eryngo. Fl. July, Aug. Clt. 1817. Pl. 2 feet.

Subgenus II. Lessònia (in honour of — Lesson, a writer on compositæ). Bertero, mss. Hook. bot. misc. 3. p. 351. Small shrubs or trees, with dichotomous branches, which are marked below by the cicatrices of the fallen leaves, but densely leafy at the extremities. Peduncles terminal, bearing a solitary, globose, or hemispherical head of flowers each.

86 E. bupleuroìdes (Hook. et Arn. in bot. misc. 3. p. 352.) arborescent; leaves flat, serrated; leaves of involucrum shorter than the head of flowers. ♄. G. Native of Juan Fernandez, in woody, stony, elevated situations at El Portezuelo. Lessònia bupleuroìdes, Bertero, mss. Lessònia, Bertero, in ann. sc. nat. vol. 21. t. 348. Stem 5-6 feet high, with forked terete branches. Leaves 3-4 inches long. Heads of flowers dense, hemispherical.

Bupleurum-like Eryngo. Shrub 5 to 6 feet.

87 E. sarcophy'llum (Hook. et Arn. in bot. misc. 3. p. 352.) arborescent; leaves cylindrical, fleshy; leaves of involucrum wanting. ♄. G. Native at Massa Fuera, near Juan Fernandez. The heads of flowers are exactly globose, without any involucra. Branches dichotomous.

Fleshy-leaved Eryngo. Shrub 5 to 6 feet.

† *Species not sufficiently known.*

88 E. palle'scens (Mill. dict. no. 5.) radical leaves roundish, multifid; heads pedunculate. ♃. H. Native of Europe. E. alpìnum amethýstinum, capitulo majore pallescénte, Tourn. inst. 327. Allied to *E. amethýstinum*, according to Mill. but distinct from it.

Pale-blue-flowered Eryngo. Fl. Jul. Aug. Clt.? Pl. 1 to 2 ft.

89 E. America'num (Walt. fl. carol. p. 102.) leaves entire: radical ones roundish: cauline ones ovate-lanceolate: uppermost ones trifid; stem procumbent. ♃. H. Native of Carolina.

American Eryngo. Pl. procumbent.

90 E. carthamoìdes (Smith, in Rees' cycl. vol. 13.) leaves oblong, toothed, undivided, cordate at the base, and stem-clasping; stem nearly simple, bearing few heads; leaves of involucrum few and ovate. ♃. H. Native of Mauritania. Perhaps the same as *E. aquifòlium?*

Carthamus-like Eryngo. Pl. 1 foot.

91 E. cœru'leum stella'tum montis Liba'ni. Mant. phyt. p. 26. t. 127. differs from *E. dichótomum* in the radical leaves being bipinnatifid. ex Laroch. eryng. p. 66.

Starry-blue Eryngo of Mount Lebanon. Pl. 1 foot.

92 E. pa'rvum palma're, fòliis serra'tis. Mor. oxon. sect. 7. t. 36. f. 13.

Small Eryngo with serrated leaves.

93 E. Mexica'num fòliis lòngis denta'tis. Moris. oxon. p. 167. sect. 7. t. 37. f. 22. Scórdii spìna, Hern. mex. p. 222. E. aquáticum β, Lam. dict. 4. p. 758. Native of Mexico.

Mexican Eryngo with long toothed leaves. Pl. 1 foot.

N.B. E. lateriflòrum (Lam. dict. 4. p. 473.) or *Gràmen orientàle spicàtum* (Tourn. cor. p. 39.) is not a *Cénchrus*, as had been supposed by Linnæus, nor an *Eryngium* but *Corispérmum púngens*.

Cult. Most of the species of this genus are extremely handsome and beautiful, and particularly so the hardy kinds, which are therefore well fitted for decorating borders. They all succeed well in common garden soil; but the lighter and more sandy the soil is the better they will grow. The greenhouse or frame kinds should be grown in pots, so that they may be sheltered in winter. All are readily increased by dividing at the root, or by seed.

XXXII. ACTINA'NTHUS (from *ακτιν*, *actin*, a ray, and *ανθος*, *anthos*, a flower; involucels). Ehrenb. in Linnæa. 4. p. 398. D. C. prod. 4. p. 668.

Lin. syst. *Pentándria, Digýnia.* Flowers monoecious, female ones capitate: male ones in capitate umbels: marginal ones joined, abortive, and spinescent, having the receptacle destitute of paleæ. Teeth of calyx permanent. Petals oblong, complicate at the apex, rather cirrhose. Fruit compressed from the sides; mericarps with the 5 alternate sutural ribs strongest: having the furrows between the ribs furnished with 1 vittæ each, and the commissure with 2 vittæ; carpophore adnate.—A stiff, squarrose plant. Lower leaves ternately bipinnate. Involucrum none; involucels of many leaves. Flowers white. This genus comes between *Oenánthe* and *Eryngium*, according to the fruit, but from the inflorescence it is analogous to *Echinóphora*.

1 A. Syri'acus (Ehrengb. l. c.). ♃. H. Native of Syria, between the towns of Sachle and Balbec.

Syrian Actinanthus. Pl. 1 foot.

Cult. See *Eryngium* above for culture and propagation.

§ 2. *Umbels compound or perfect. Vittæ on the fruit variable, rarely wanting.*

* *Fruit having only primary ribs present.*

Tribe IV.

AMMI'NEÆ (plants agreeing with *Ammi* in important

characters) or Orthospe'rmæ paucijuga'tæ contra'ctæ. Koch. umb. p. 114.—D. C. prod. 4. p. 98. Fruit evidently compressed from the sides, and for the most part contracted and didymous; mericarps with 5 filiform ribs, which are at length a little winged: lateral ribs marginal; all equal. Seed terete or gibbously convex, flattish in front, or terete in every part. Umbels perfectly compound.

XXXIII. RU'MIA (a mythological name; the goddess of young infants). Hoffm. umb. 171. in tit. f. 3-4-17-21. Koch. umb. p. 129. in add. no. 61. D. C. coll. mem. 5. p. 36. prod. 4. p. 98. but not of Link.—Càchrys. species, Spreng.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 5-toothed. Petals oblong, ovate, entire, spreading, having an inflexed or involute point. Fruit roundish or ovate, didymous, plicately wrinkled; mericarps solid, with 5 thick, very blunt, circularly plicate ribs, covering the furrows; each furrow furnished with a vitta, and ornamented with plicate tubercles. Carpophore bipartite. Seed gibbously convex, flat in front.—Perennial smooth herbs, natives of the Levant. Leaves decompound. Umbels numerous. Universal involucrum wanting or few-leaved; involucels 3-8-leaved. Flowers yellow, dioecious, or polygamous. This genus differs from *Càchrys* in the seed not being involute nor free, but straight, and adnate to the calyx. It differs from *Séseli* in the form of the petals and sunk ribs of the fruit, and from *Hippomaràthrum* in the seeds being flattish in front, not with involute margins.

1 R. Tau'rica (Hoffm. umb. et Koch. umb. l. c.) leaves decompound; segments linear; involucrum wanting; male flowers numerous in the umbellules: but the fructiferous ones are few; fruit nearly ovate, rugosely plicate. ♃. H. Native of Tauria, on grassy hills about Odessa and Karassusabar. Càchrys Taúrica, Willd. spec. 1. p. 1410. Bieb. fl. cauc. 1. no. 548. Schultes, syst. 6. p. 444. Artèdia squamàta, Pall. nov. act. petrop. 10. p. 308. Sanícula crithmifòlia, Willd. neu. scrift. d. berl. ges. 3. p. 419. Laserpítium Armènum ferulæfòlia, semine crispo, Tourn. cor. p. 23.

Taurian Rumia. Fl. July. Clt. 1819. Pl. 1½ foot.

2 R. microca'rpa (Hoffm. umb. 175. fig. in tit. 3 and 21.) leaves decompound; segments linear-setaceous; involucrum many-leaved; flowers for the most part hermaphrodite; fruit subglobose, wrinkled. ♃. H. Native of Caucasus at Narzana, and of Iberia. Càchrys microcárpa, Bieb. fl. taur. 1. p. 218. (exclusive of the syn. of Mor.) suppl. p. 216. Spreng. in Schultes, syst. 6. p. 445. Càchrys Sícula, Güld. trav. p. 154-190. ex Bieb. Fruit roundish, rather didymous; ribs thick, concrete into a mass, which is grumose inside; furrows narrow, each furnished with 1 vitta. Habit almost of *Càchrys crispa*, but differs in the true involucra not being pinnatifid, but the leaves are multifid and disposed in whorles under the flowering branches beneath the true umbel.

Var. β, rigídula (D. C. prod. 4. p. 98.) leaves more stiff and glaucous than the species. ♃. H. Native of the Levant.

Small-fruited Rumia. Pl. 1 foot.

3 R. seseloìdes (Hoffm. umb. p. 174. tit. f. 4.) leaves decompound; segments cuneiform-lanceolate, cut; fruit oval, with tubercular ribs; involucrum of 1 leaf. ♃. H. Native of Siberia and Altaia. Càchrys seseloìdes, Bieb. fl. taur. suppl. p. 217. in a note. Leaves of involucels setaceous, numerous, minute. Séseli montànum, or Séseli glabràtum, Willd. herb. in Schultes, syst. 6. p. 406. Trínia seseloìdes, Led. fl. ross. alt. ill. t. 8. fl. alt. 1. p. 357.

Seseli-like Rumia. Fl. July. Clt. 1820. Pl. 1 foot.

4 R. leogòna (Meyer, verz. pflanz. p. 125.) leaves supradecompound; leaflets bifid or trifid; segments linear, shortish; involucels obsolete; fruit ovate; ribs straight, destitute of plaits and tubercles. ♃. H. Native of Caucasus on the higher mountains of Talusch, at the elevation of 5000 to 6000 feet. Trínia Hoffmánni, D. C. prod. 4. p. 104.

Var. β, microcárpa (Meyer, l. c.). Native of Caucasus, on Mount Beschbarmak.

Smooth-angled-fruited Rumia. Clt.? Pl. 1 to 2 feet.

5 R. athamanthoi'des (D. C. prod. 4. p. 98.) leaves decompound; segments cuneiformly-ovate, pinnatifid, pubescent; leaves of both the involucrum and involucel numerous, with membranous margins; fruit ovate, having the ribs tubercular. ♃. H. Native of Siberia. Càchrys athamanthoìdes, Bieb. suppl. p. 217. Athamántha carvifòlia, Willd. herb. is either referrible to this or to the preceding species.

Athamantha-like Rumia. Fl. July. Clt. 1818. Pl. 1 to 2 ft.

Cult. A light soil answers the species of this genus best; and they are easily increased by seeds.

XXXIV. CICU'TA (a name of doubtful meaning, used by Pliny). Lin. gen. no. 354. Hoffm. umb. 177. Spreng. umb. prod. p. 19. Lag. am. nat. 2. p. 96. Koch. umb. 129. f. 53. and f. 54. D. C. prod. 4. p. 99.—Cicutària, Tourn. inst. t. 171. Lam. dict. 2. p. 2. ill. t. 195.—Angélica species, Tourn.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 5-toothed, foliaceous. Petals obcordate, with an inflexed point. Fruit roundish, contracted from the sides, didymous; mericarps with 5 flattish, equal ribs: lateral ribs marginal; furrows furnished with 1 vitta each, which fills them, even in a dried state, but not elevated so much as the ribs. Commissure furnished with 2 vittæ; vittæ under a loose membrane; carpophore bipartite. Transverse section of seed terete.—Perennial, glabrous, aquatic, poisonous herbs. Stems terete, fistular. Leaves tripinnate, or biternate. Involucrum wanting or of very few leaves; involucels many-leaved. Flowers white.

* *European species. Fibres of roots cylindrical and slender.*

1 C. virò̀sa (Lin. spec. p. 368.) trunk of root hollow, divided into cells by transverse dissepiments; fibres of roots disposed in whorled fascicles; leaves triternate; segments lanceolate, serrated; umbels opposite the leaves and terminal. ♃. W. H. Native of the north of Europe, from Lapland to Germany; and of Siberia in ditches, lakes, rivers; North America between lat. 54° and 64°. In England it is not common, but is found at Isleworth, in the Coln, near Colnbrook, and Uxbridge; on Hounslow Heath; in the Isle of Ely; Lovingland, in Suffolk; near Norwich and Yarmouth, &c. In Scotland it is more common, as in the Lake of Forfar, and other lakes in Strathmore, &c. Oed. fl. dan. t. 208. Nees. off. pflz. 12. t. 8. Hayne, arz. gew. 1. t. 37. Bull. herb. t. 31. Smith, engl. bot. t. 479. Blackw. t. 574. Plench, icon. t. 213. C. aquática, Wepfer. mon. phil. trans. 44. t. 237. t. 4-5. Cicutària aquática, Lam. dict. 2. p. 2. Coriándrum Cicùta, Roth. germ. 1. p. 130. Sìum Cicùta, Vest. ench. no. 311. Flowers white; anther reddish. Towards the end of autumn the root for the succeeding summer is formed out of the lower part of the stalk; this is divided transversely into many large unequal cells, so that it becomes specifically lighter than water, and in winter, when the rivers or pools swell, is buoyed up. The old root then rots, floats all the winter, and in rivers is frequently carried to great distances, In the spring the old root is washed away, and the new one, on coming near the soil, sends out many slender fibres, by which it is again fixed, grows, and flowers. Watson, in phil. trans. It is one of the rankest of our vegetable poisons. Numerous instances are recorded of its fatality to the human species by Wepfer, Haller, and others, and in the phil. trans. by Dr. Watson. Linnæus relates its fatal effects on kine; and Dr. Withering relates that early in the spring cows often eat it, and are killed by it, but as the summer advances, and its scent becomes

stronger, they carefully avoid it: that goats, however, devour it greedily with impunity, and that horses and sheep eat it with safety. Strong emetics are the most approved remedy for this poison.

Var. β, tenuifòlia (Schrank, akad. munch. philos. class. 7. p. 56. t. 4. f. 1.) trunk of root slender, bearing fascicles of cylindrical fibres; leaves bipinnate; segments linear, entire, and subserrated; umbels opposite the leaves, and terminal. ♃. W. H. Native of Germany, near Fussen.

Poisonous Water Hemlock or Cowbane. Fl. July. Britain. Pl. 2 to 3 feet.

* * *American species. Fibres of roots oblong and fleshy.*

2 C. bulbi'fera (Lin. spec. p. 367.) fibres of roots oblong, tuberous, fleshy; leaves biternate; segments linear-lanceolate, rather serrated; umbels terminal and axillary; axils and rays bearing bulbs. ♃. W. H. Native of North America, in temperate and cold parts, from the river Delaware to Canada, in water, and on banks of lakes and rivers. Michx. fl. bor. amer. 1. p. 165. Torr. fl. un. st. 1. p. 308. Big. fl. bost. ed. 2. p. 115. Flowers white, having the smell of cumin-flowers.

Bulb-bearing Cowbane. Fl. July, Aug. Clt. 1810. Pl. 1 to 2 feet.

3 C. macula'ta (Lin. spec. p. 367.) fibres of roots oblong, fleshy, tuberous; leaves biternate; segments lanceolate or ovate-lanceolate, acuminated, mucronately serrated; umbels terminal and lateral; stem spotted. ♃. W. H. Native of North America, in watery places, from Carolina to New England, and between lat. 54° and 64° north in the woody country; Canada, Lake Huron, Straits of De Fuca, and on the west coast. Bigel. fl. bost. 2. p. 115. amer. med. bot. 1. t. 12. Torrey, fl. un. st. 1. p. 308. Rafin. med. bot. 1. t. 22. Cicutària maculàta, Lam. dict. 2. p. 2. Flowers white. Fruit a little larger than that of *C. viròsa*.

Var. β, angustifòlia (Hook. fl. bor. amer. 1. p. 259.) leaflets narrower. On the banks of the Saskatchawan.

Spotted-stemmed Cowbane. Fl. July, Aug. Clt. 1759. Pl. 2 to 3 feet.

Cult. The species should be planted in ponds or ditches, where they will increase without any further care.

XXXV. ZI'ZIA (in honour of J. B. Zizii, a German botanist; author of a Flora of the Palatinate of the Rhine, in conjunction with Koch). Koch. umb. p. 129. D. C. prod. 4. p. 99.—Smýrnium species of Lin.—Smýrnium, Ell. sketch. 1. p. 359.—Smýrnium and Tháspium, Nutt. gen. amer. 1. p. 195 and 196.—Smýrnium species of authors.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete, or with 5 very short teeth. Petals elliptic, tapering into a long inflexed acumen. Fruit contracted from the sides, rather didymous, roundish or oval; mericarps with 5 filiform, prominent, equal ribs: lateral ribs marginal; furrows between ribs furnished with 1 vitta each, and the commissure with 2 vittæ; carpophore bipartite. Seed teretely convex, scarcely flattish in front.—Perennial herbs, natives of North America. Stems nearly simple, erect. Leaves ternate or biternate; segments oblong, ovate, or cordate. Involucrum wanting; involucels few-leaved, variable. Flowers yellow, rarely white, or dark purple. This genus differs from *Smýrnium* in the seed not being involute, and from *A'pium* in the petals ending in a long inflexed acumen each.

1 Z. au'rea (Koch. l. c.) leaves biternate; segments oblong-lanceolate, attenuated at the base, deeply serrated; involucels 3-leaved, unilateral. ♃. H. Native of North America, on rocky hills and moist pastures, from Carolina to Pennsylvania; and of Canada, about Lake Huron. Smýrnium aúreum, Lin. spec. p. 377. Michx. fl. bor. amer. 1. p. 171. Ell. sketch. 1. p. 359. Nutt. gen. amer. 1. p. 195. Sison aúreus, Spreng. in Schultes, syst. 6. p. 410. Torrey, fl. un. st. 1. p. 305. Tháspium aúreum, Nutt. gen. amer. 1. p. 196. Rays of umbel short. Leaves of involucel 3, unilateral, rather concrete at the base. Flowers golden yellow.—The Smýrnium aúreum, Burm. fl. cap. p. 8. appertains to this species, but the country from which it is said to come is truly doubtful, and is probably a mistake.

Var. β, acuminàta (D. C. prod. 4. p. 100.) intermediate segment of leaves nearly pinnate, with 5 segments. ♃. H. Growing along with the species. Smýrnium acuminàtum, Smith, in Rees' cycl. vol. 33. no. 8.

Golden-flowered Zizia. Fl. May, Ju. Clt. 1699. Pl. 1 to 3 ft.

2 Z. corda'ta (Koch, l. c.) radical leaves undivided, cordate, crenated, petiolate: cauline ones nearly sessile, ternate; leaflets petiolate, ovate-cordate, serrated; involucel usually 1-leaved. ♃. H. Native of Carolina, on moist mountains and pastures; and probably on the mountains of Virginia and Pennsylvania; plains of the Red River, Saskatchawan, and the river Winepeg and prairies of the Rocky Mountains. Smýrnium cordàtum, Walt. fl. carol. p. 114. Ell. sketch. 1. p. 359. Schultes, syst. 6. p. 438. Torr, fl. un. st. 1. p. 307. Sison trifoliàtum, Michx. fl. bor. amer. 1. p. 168. Smýrnium trifoliàtum, Muhl. cat. p. 31. Nutt. gen. amer. 1. p. 195. Flowers golden yellow, very like those of the preceding species; but according to Nutt. they are white, and according to Elliot either white or yellow; there are therefore probably two species confused.

Cordate-leaved Zizia. Fl. Ju. Jul. Clt. 1597. Pl. 1 to 2 ft.

3 Z. intege'rrima (D. C. mem. soc. hist. nat. gen. vol. 4. p. 100.) leaves biternate, rather glaucous; leaflets ovate, quite entire; involucel 1-leaved, very short. ♃. H. Native of Virginia, New York, and Carolina, on moist mountains, particularly on the Alleghany mountains. Smýrnium integérrimum, Lin. spec. p. 1468. Michx. fl. bor. amer. 1. p. 171. Ell. sketch. 1. p. 360. Nutt. gen. amer. 1. p. 195. Sison integérrimus, Spreng. syst. 1. p. 887. Torr. fl. un. st. 1. p. 305. Flowers golden yellow.

Quite entire-leaved Zizia. Fl. Ju. Clt. 1758. Pl. 1 to 2 ft.

Cult. A moist soil suits the species of this genus best; and they are easily increased by dividing or by seeds.

XXXVI. PENTACRY'PTA (from *πεντε, pente,* five, and *κρυπτω, krypto,* to hide; application not evident). Lehm. sem. hort. hamb. 1828. p. 16. D. C. prod. 4. p. 100.

Lin. syst. *Polygàmia, Monœ'cia.* Calyx unknown. Petals equal, lanceolate, acuminated, inflexed. Fruit oblong-elliptic, compressed from the sides; mericarps with 5 ribs, the 3 dorsal ones are elevated and acute, and the 2 marginating ones roundish: each furrow having 1 vittæ. Albumen 5-angled; angles roundish.—Herb suffruticose at the base. Leaves triternately pinnate. Flowers dark purple, polygamous. Perhaps sufficiently distinct from *Tháspium.*

1 P. atropurpu'rea (Lehm. in sem. hort. hamb. 1828. p. 16.) ♃. F. Native of Mexico. Mature fruit brownish, and have a strong scent of parsley, as well as every part of the plant.

Dark-purple-flowered Pentacrypta. Pl. 2 feet.

Cult. This plant will require to be protected in winter; it can only be increased by seeds.

XXXVII. A'PIUM (from *apon,* Celtic for water; habitation of plants). Hoffm. umb. 1. p. 75. t. 1. f. 8. Koch, umb. 128. D. C. coll. mem. 5. p. 36. prod. 4. p. 100. A'pium species, Lin. Spreng. and Lag.

Lin. syst. *Pentándria, Monogýnia.* Margin of calyx obsolete. Petals roundish, entire. Stylopodium depressed. Fruit roundish, contracted from the sides, didymous; mericarps with 5 filiform equal ribs: lateral ribs marginal: furrows between the
